Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Pennsylvania Department of Health Notes Dangers of Conjunctive Use of Alcohol and Drugs

The public shock waves of sudden death from the conjunctive use of alcohol and drugs should have long since cast an unfamiliar phenomenon into a household truth.

That phenomenon is "potentiation," and the remoteness of its meaning from the public mind is still lethal.

Dictionaries define *potentiation* as "the combined action of two drugs being greater than the sum of the effects of each one alone."

Twenty years ago, experiments at the Medical College of Virginia indicated "a synergism between the barbiturates and alcohol." Mortality rates in those experiments jumped an average 60% when sublethal doses of alcohol were given in combination with barbiturates.

Potentiation is what another team of research scientists meant two years later when they concluded a report on their observations in the *American Journal of Clinical Pathology* with the statement:

"Examples are presented in which death was apparently due to the combined effects of alcohol and barbiturates, each of which was present in concentrations not ordinarily considered fatal.

"The danger incident to the indiscriminate use of the two agents at the same time is stressed."

The Virginia researchers also ventured, even then:

"The widespread use of both alcohol and the barbiturates would appear to make important a more thorough knowledge of the effects that may ensue when they are administered jointly."

But those admonitions have been all but lost on contemporary generations.

Today, the need to expound the meaning of potentiation into the common knowledge of a frenetic society is hardly less critical. The recent deaths of prominent personages caused by the alcohol-drug potentiation only beg a flood of the larger questions.

What is the incidence of death from the alcohol-drug problem among Americans generally, including those of lesser importance to the news media?

How many death certificates list the conjunctive ingestion of alcohol and drugs as the primary cause of death?

What are the portents of the incidence of combined use?

Barbiturates are frequently mentioned, but what other drugs are used in combination with alcohol?

What drives people to the conjunctive use of alcohol and drugs? How do they become "trapped by the double addiction"?

To say that the answers to those questions are not readily available would be to understate the case. Pat answers are non-existent. Facts are rare. Data are scattered and spotty. Observations are

Reprinted from *Target* with permission of Miss Margaret Sutton, Chief, Division of Alcoholism Studies and Rehabilitation, Pennsylvania Department of Health.

guarded and meagre.

But thanks to a few lonely explorers in this "new and significant field about which we know so little," there are clues and they form the vague outlines of patterns—however nebulous and disjointed they may at first seem:

Dr. Joseph W. Spelman, chief medical examiner of Philadelphia's Department of Health, reports that preliminary studies of "coroner's deaths" in the city last year (1965) compare with the findings of the unique study made in 1961 when the combined use of alcohol and drugs was found to be the direct cause or major contributing factor in 209 cases of suspicious, unattended deaths.

Dr. Spelman himself emphasizes, however, that the 1961 study was stringently limited; that first, only those deaths "of a type coming under the purview of the coroner" were encompassed by the survey, and that secondly, less than half of those (only cases of instantaneous death) were subjected to specific tests. At best, the 209 cases cited could tell only a small part of the epidemiologic story.

Dr. John A. Dattoli, director of the State Department of Health's Division of Behavioral Problems and Drug Control, also points to the epidemiological limitations. The major difficulties, says Dr. Dattoli, are to be found in the official records, the death certificates.

The inadvertent, justified or intentional omissions of such a concomitant cause of death as the deceased's use of alcohol and drugs have been known to occur. The physician may think in such frames of reference as "primary," "principal" or "secondary" causes of death. The habits of the deceased may be of little concern to him, if, in fact, he has known the deceased well enough to have any more than a suspicion of addiction.

On the other hand, and this point Dr. Dattoli stressed, after listing the known and contributing factors of death the physician may find there is just no space on the certificate for an indication of alcohol and drug abuse.

Fifty Per Cent of Patients Suffering Double Addiction

Dr. Charles Gabos, director of the Department of Alcoholism, St. John's Hospital, Pittsburgh, reports that, on the average, he attends 30 alcoholic patients a month. He freely estimates that 50% of these patients are suffering, or have suffered, the double addiction of alcohol and drugs in combination.

Dr. Gabos offers an arresting epidemiologic sidelight: "In my experience, it seems that the incidence of the combined use of alcohol and drugs is greater among women than among men."

In those observations, Dr. Gabos enjoys the concurrence of Dr. William W. Unangst, director of Norristown State Hospital's alcoholism program and its Center for Alcoholic Study and Therapy (CAST). Says Dr. Unangst:

"Half of our alcoholic patients have been involved also with drugs. Alcoholism frequently is the first step in drug addiction. Many people graduate to the realization that while there remains a stigma with the intemperate use of alcohol, there is no such stigma attached to the use of the recently developed tranquilizers and hypnotic drugs.

"Actually, in some areas the use of such medication has become a status symbol, and housewives openly compare the relative merits of Miltown, Librium, Valium et al."

The specific incidence of combined use among women, or men, or the affluent or the economically depressed, or any other category of the population is, of course, unknown.

The White House Conference Report on Narcotic and Drug Abuse makes a relevant confession: "Adequate data are not available for a precise estimation of the incidence and prevalence of the abuse of drugs with psychotoxic side effects."

Despite that blanket negation and also the fact that the Report is dealing primarily with drugs other than alcohol, the White House panelists offer "some important epidemiologic clues" that again have some relevance to a study of the alcohol-drug potentiation:

"There are large numbers of drug abusers who never come to the attention of community agencies."

"There is an increasing abuse of nonnarcotic drugs concomitant with a decrease in the abuse of narcotic derivaties."

"The frequently cited change from a prewar population of white users with a female majority to one drawn primarily from minority ethnic groups with male preponderance appears to be correct for some geographical areas but incorrect for others where the white still constitute the

majority of abusers."

"There is a possibility that the abuse of barbiturates and amphetamines among juveniles may be increasing because they are so much cheaper, more readily obtainable, and easier to handle."

200,000 New Alcoholics a Year, Authority Estimates

To those clues add the shocker that Dr. Robert Greenhouse dropped at the Pennsylvania Conference on Alcoholism this year:

"Alcoholics in the U.S. are increasing at the rate of 200,000 a year and most of these new alcoholics are young people."

The suggestion of a "potentiation of clues" is inescapable.

How many alcoholics—or just "social drinkers"—of the new persuasions of nihilistic sophistication find it cool and convenient to avoid sweating out an alcohol withdrawal syndrome—or even a hangover—by the conjunctive use of drugs?

How many use barbiturates or any of the new synthetic sedatives as an alternative to alcohol on those occasions when alcohol—because of its odor, ataxic effects, transport or other incriminating attributes—is less convenient?

How many—to retain the euphoria, hide the symptoms, relieve the malaise, dispel the depression of alcoholism when trapped in the intermittent dilemmas of alcohol saturation and withdrawal—simply go for a pill, the right pill at the right time or, if worse comes to worse, any pill, any time? The White House Report again clues the new compulsion:

"The two agents (alcohol and barbiturates) are mutually interchangeable in creating or perpetuating the dependent state. In fact, many alcoholics turn to barbiturates in an attempt to conceal their problem, and avoid the social pressures which stigmatize the alcoholic. . . ."

The Report suggests also that the use of amphetamines to counteract or "to antagonize the depressant effects of alcohol and barbiturates" is a "common type of abuse."

Ten Million Americans Seen Impairing Capacity to Live

Again, Dr. Unangst is less inclined to understate the problem. Citing more recent surveys for support, CAST's director claims:

"In the total arena of addiction, there may be

OCEAN CITY MEETING

The Diplomat Motor Hotel

Medical and Chirurgical Faculty

All resolutions to be presented to the House of Delegated at its meeting on Friday, September 8, 1967 *must* be in the Faculty Office, 1211 Cathedral Street, Baltimore Maryland, no *later* then Friday, July 14, 1967.

10 million people in this country who are impairing their capacities to live fully and function effectively by the use of alcohol and drugs.

"Although cancer and heart disease are still considered the major public health problems in America, I am inclined to hold that when all the destructive factors—economic, social, cultural and emotional—are considered, alcohol and drug addiction is the greatest threat to our society.

"When a man dies of a heart attack or cancer his children are not ashamed to go to school, or his wife to church; but when a man dies of DT's in the gutter or a mother destroys herself by overdoses or potentiation of alcohol and drugs, the scars remain for a full generation."

An empathic, if psychological, approach to the problem of addiction is offered by Dr. James H. Ewing, of Philadelphia's Mercy-Douglass Hospital, who contends, in effect, that man's freedom to dream is as important to his mental health as his freedom to sleep is to his physical health. Constantly recurring interruptions of the dream inceptions and sequences—as have actually been effected in experiments—lead to critical emotional disturbances.

But man has concomitant needs to reflect and to meditate in his waking hours as well as to dream in his sleep. The pressures and tensions of today's society are not always conducive to the inception or integrity of inspirational thought and there results a sustained inner conflict between the daily requirements of work and the need for meditative freedom.

The integration of these two processes is vital to man's peace of mind, if not to his best work. And he finds, inadvertently or otherwise, that the inspirations of syncretic thought can be conjured up like magic through the use of alcohol and drugs. Especially is this said to be true of those upon whose insights, depth of feeling, gifts or talents there is any demand whatever.

The thesis extends naturally to the college generation. "College makes tremendous demands on the student for the organized accumulation of great sums of knowledge," Dr. Ewing points out. "At the same time it stimulates a welling up of emotions along with new interests in the world and new needs for expressive thought. The student is trapped between the requirements for cultural information and the impulsions of creative, inspirational experience. He's in intense conflict; and the resolution of the conflict is in the integration of the two kinds of thinking demanded. Such integration, or syncretic thought, says Dr. Ewing, "isn't adequately encouraged."

So the college student, "just like any creative person who is frustrated by conflict," turns to alcohol and drugs for the "liberation of his inspirations of syncretic thought, the continued exercise of which seems to be essential to his mental health."

But Dr. Ewing hastily points to the limitations:

"The trouble with the use of alcohol and drugs is that while ideas and emotions may be temporarily freed, the complex mental operations which have to do with constructive elaboration, redefinition, and refinement of an idea cannot be brought to share in the creative task. So while the use of alcohol and drugs liberates certain creative functions, it usually fails to facilitate the full complicated and highly-patterned sequence of mental operations essential to the creative act."

Tranquilizers Used With Alcohol Are Deadly Also

drug potentiation, most any drug is vulnerable to indictment. And especially does this seem to be true of the tranquilizers.

Pharmacologists Robert B. Forney and Francis W. Hughes, of the University of Indiana's School of Medicine, in a preface to their research report on the synergistic action of tranquilizers and alcohol, state that:

The increased use of tranquilizers and the "continued, socially acceptable widespread use" of alcohol indicate that "this combination must occur frequently."

The growing suspicion that tranquilizers in combination with alcohol can be as deadly as any other drug gains credence with Dr. Spelman's continuing studies in Philadelphia. In the 1961 survey of suspicious, unattended deaths, the barbiturates were found to be the drug most frequently used in combination with alcohol. Now, Dr. Spelman reveals, tranquilizers, with alcohol, are pushing barbiturates for the infamy of top killer.

In combination with alcohol, not even a "safe" drug is safe. Under most conditions, paraldehyde has been considered a "safe" drug; in fact, it has been known as one of the safest of the hypnotics. Ironically, over the past 80 years, it has frequently been known as the "drug of choice" for treating the symptoms of acute alcoholism.

But last year, researchers Sidney Kaye and the late Harvey B. Haig reported on their study of nine individuals who died suddenly and unexpectedly following paraldehyde therapy for acute alcohol intoxication. All patients were ambulatory, "abusive" and apparently in good health except for the symptoms of alcoholism. Deaths occurred a half hour to four hours after administration of paraldehyde, and autopsies revealed no morphologic causes of death in any case.

The irony of the alcohol-drug potentiation is stated by Dr. C. Nelson Davis, psychiatrist-in-chief, Malvern Institute for Alcoholic and Psychiatric Studies:

"Man's proclivity to abuse a drug, rather than use it properly when administered for its best pharmacological purposes, has the power to completely submerge the drug's usefulness:

"And so the paradox. The drugs that are used in the alcoholic's acute phase become the very instruments of a more serious complication of his disease. The alcoholic patient has in some cases

become dependent on every drug used to alleviate his suffering."

At this point, a provocative observation of Dr. Unangst extends the prognoses of addiction and potentiation to the overall area of emotional illness. Dr. Unangst contends:

"The separation of addiction from the overall, total problem of emotional illness attempts to establish a dangerous and arbitrary dichotomy. Alcoholism is the cancer of emotional illness. And each of the four categories of mental illness—the neuroses, psychoses, character disorders and psychosomatic disturbances—may predispose to, be compounded by, and ultimately be buried beneath the far greater destructive forces of alcohol and drug addiction.

"While one-seventh of all first admissions to public health hospitals in 1960 were alcoholics, a careful scrutiny of pre-admission histories in two separate Pennsylvania hospitals revealed that one-half of all admissions involved the excessive use of alcohol or drugs, or both, during the period of emotional decompensation.

"It must be concluded that the use of alcohol and the injudicious use of any drug represents a realistic threat to those suffering from any form of emotional disorder.

"While the addiction may be technically symptomatic, it ultimately is the primary instrument of the patient's deterioration and destruction."

As though the portents and enigmas of the alcohol-drug potentiation were not challenge enough, the newest problem posed by the Conjurer of Compulsions epitomizes all contemporary addictive sophistications. It's the "spree use" of drugs, a behavioral orgy in which the abuser flits from one drug to another, uncannily avoiding dependence on, or tolerance to any single drug. He may run the whole gamut: alcohol to barbiturates to amphetamine to opiate to cocaine and back to alcohol. And he gains the added advantage of being just as sensitive to each new dose as to the original one.

There is here the subtle suggestion of habituation rather than addiction, and the equally subtle implication of safety. Not so, say the White House panelists. "Spree use" appears to be no less hazardous and may engender the same types of antisocial behavior.

There is, lastly, a further implication: that far more people survive the combined use of alcohol and drugs than succumb to it. Is sudden death the exception? What about the apparently great numbers who from day to day go on and on with their double addiction? Dr. Forney provides the one and only pat answer:

"They're lucky, incredibly lucky."

In the portentous public health area of alcohol and drug abuse, conquest is not likely to temper the zest to explore any more than solutions will void the challenge to empathy—for some time to come.

Aminophylline dura-tabs®

prolonged-medication tablets 4½ gr. (0.3 Gm.)

Precautions: Use with caution in patients with poor renal function as a decreased rate of excretion may lead to accumulation and untoward reactions. Gastric irritation may occasionally be observed in certain patients sensitive to oral aminophylline.

Dosage: Adults, 1 to 2 Aminophylline Dura-Tabs each 8 or 12 hours, with food.

RARELY UPSET THE STOMACH

Oral aminophylline needn't disturb the stomach—nor a good night's sleep. Patients breathe easier all day, sleep better all night, as each Aminophylline Dura-Tab dose provides effective therapeutic activity for up to 12 hours. And unlike conventional tablets, AMINOPHYLLINE DURA-TABS seldom cause gastric distress. The special Dura-Tab process allows the gradual absorption of the medication from the intestinal tract with only a small fraction of the dose released in the stomach.

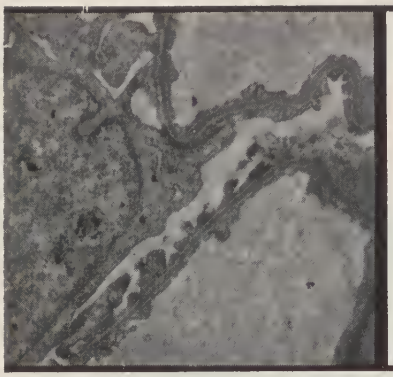
Accidents

A total of 174 deaths due to accidents was reported to the Maryland Psychiatric Case Register in the three years from July 1, 1961 to June 30, 1964, among the 66,006 patients under treatment in a reporting inpatient or community facility at some time during this period. Of these, 103 occurred while the individual was hospitalized and 71 after he was released or while he was under outpatient care. Falls, the leading cause of these deaths, occurred primarily among senile, hospitalized patients. The following table shows the distribution of the deaths by type of accident and by the patient's reported diagnosis. As indicated, these represented only a small proportion of total deaths from these causes among Maryland residents.

Reported Patient Diagnosis	Total	Cause of Death: Motor Vehicle	Poisoning	Falls	Drowning	Suffocation	All Others
Brain Syndromes*	76	4	3	49	1	9	10
Psychotic Disorders	29	4	1	11	2	7	4
Alcoholism	33	5	6	11	3	—	8
Psychoneurotic and Personality Disturbance*	25	12	2	4	2	—	5
All Others	11	2	—	4	1	4	—
Total	174	27	12	79	9	20	27
Percent of all Maryland Deaths from This Cause	4.0%	1.6%	5.4%	8.3%	3.8%	24.%†	2.4%

* Except Alcoholism
† 100% = 80



It should be recognized that these data do not reflect the total number of accidental deaths among individuals who have ever received psychiatric care since they exclude those who had completed treatment prior to July 1, 1961. However, this number is believed to be relatively small.

A previous newsletter reported that suicides were proportionally more frequent among current or former patients than in the general population. While the accidental death rate appears similarly to be somewhat higher, both of these causes accounted for only a small part of all the 4,385 deaths reported to the Register (136 and 174, respectively). In addition, ten deaths due to homicide were reported to the Register.

These data indicate that deaths from violent causes are a relatively minor factor in the high mortality rates reported among individuals who have been under psychiatric treatment. Further, the small number of deaths from motor vehicle accidents, poisoning and falls from one level to another would appear to run counter to the concept that many accidental deaths are disguised suicides.

A recent study‡ by the Register staff of patterns of retention, release and rehospitalization among specified groups of patients admitted to Maryland's three major psychiatric hospitals indicated high mortality rates, particularly among alcoholics. Further detailed analysis is now in preparation.

MITCHELL ROSENHOLTZ, M.D., CHAIRMAN, EDITORIAL COMMITTEE

Doctor, Look at Your Malpractice Insurance!

WALTER BRADLEY KING, JR., MD

All physicians should be aware that malpractice, a subdivision of the broader subject of negligence, is a term addressed to the situation wherein a patient is injured as a result of careless or negligent treatment by a physician or as a result of treatment not up to the accepted standard of medical practice. Thus, a malpractice judgment may be found against a physician when the physician was inadequately skilled or trained to carry out a particular procedure, was careless, or was not using his best judgment.* Error by itself is not grounds for malpractice, assuming that the best judgment of the physician was used. The subject of this brief dissertation, however, is not what constitutes malpractice; rather, it is what does *not* constitute malpractice in the ordinary daily practice of medicine, but is nevertheless a possible source of physician liability.

One approach to discuss what is *not* malpractice, for all practical purposes, is to indicate what insurance companies may *not* cover under their "malpractice" insurance clauses or policies. Specifically, a "malpractice policy" *may not* cover the physician in the ordinary practice of his profession for *personal* liability, ie, damages resulting from personal injury or property damage; similarly, it may not cover *professional* liability *outside* of the physician's literally professional services.

This means, then, that when a physician is not acting as a physician per se, ie, healing the sick, he may not be covered by malpractice insurance against certain lawsuits. Examples might involve injury arising during, but not from acts of diagnosis or treatment what may be considered slander or libel; or an otherwise inconsequential action or comment, or simply the vulnerability of the physician. Clearly, it is difficult to practice medicine today without participating in professional organizations or on hospital committees. It is possible, however, if a physician is candid in ihs approach to such responsibility that anything he says or writes may be misconstrued.

*Cusumano, C.L.;, Malpractice Law Dissected

*Cusumano, C. L.; Malpractice Law Dissected for Quick Grasping, New York: Medicine-Law Press, Inc., 1962.

As a result, he may find himself the uncomfortable recipient of a lawsuit without any protection or, equally as bad, without enough coverage under his "malpractice insurance," and with only legal counsel.

For the physician in private practice, the desirability of having his malpractice insurance with the same company that carries his liability insurance is also a point to consider; then, in the borderline case, there will not be a squabble between two insurance companies as to which should defend the case and/or pay the claim.

This discussion is not meant to be an advertise-

ment for any particular type of insurance or insurance policy—it is only meant to make physicians think about the professional insurance protection for which they are paying and to open their eyes for what they are and are not insured, in contrast to what they *think* their coverage is.

Several examples come readily to mind:

1. Allegation of libel and/or slander against a staff physician who honestly believes that another physician who is applying for hospital privileges is not up to the standards of his hospital and says so. The staff physician is not practicing medicine at that time (in the literal sense, that is, though he is certainly practicing it in the ethical and moral sense) and so *may not* be covered by his "mal practice" insurance policy. Should he be sued, he may find it expensive to fight and *win* the suit, even more so to fight and *lose* the suit.

2. Allegation of "undue familiarity" against the physician by a female patient.

3. Allegation of humiliation in a situation where a physician makes what was intended to be a teasing remark about a patient that is misinterpreted. For example, the physician says jestingly to a patient, in the presence of some visitors, "How is my most difficult patient today?" Jesting, yes, but dangerous!

4. Allegation of personal liability against a cardiologist when a patient doing a Master's Test slips on the waxed floor of his office and breaks his leg.

A list of examples could be almost endless; its only purpose would be to encourage physicians to consider their professional insurance coverage, recognize some of the inadequacies in many existing policies and, thus, prevent their being caught uncovered or inadequately covered, which *could* be both expensive and time-consuming.

See JAMA May 8, 1967 for complete scientific program—forms for advance registration and hotel accommodations.

"Take a laxative" is a harsh sentence

Although there are more than 60 ethical laxatives available for the constipated patient, many, unfortunately, do not really produce an effect much like a normal bowel movement. Instead they whip the bowel, torment it and leave it irritated, inflamed and exhausted.
On the other hand, Dulcolax provides a nearly normal movement. Through its unique contact action, it induces the kind of natural contraction waves of the colon necessary for gentle, complete, comfortable bowel movements.
For your next constipated patient, try Dulcolax–the laxative with the gentle touch.

Dulcolax, brand of bisacodyl tablets (5 mg.)

why wonder about a drug

when you know

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

is effective b.i.d.

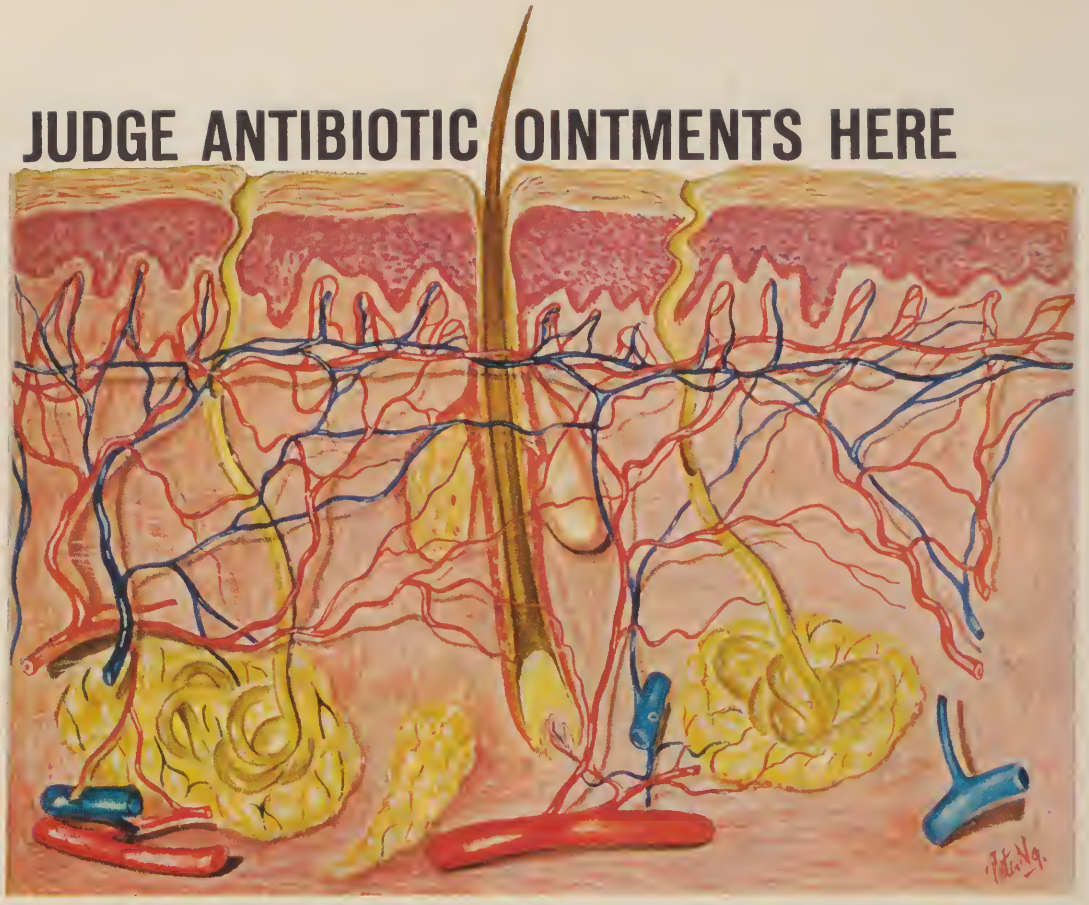
It's made for b.i.d.

Effective in a wide range of everyday infections — respiratory, urinary tract and others — in the young and aged — the acutely or chronically ill — when the offending organisms are tetracycline-sensitive.

Contraindication — History of hypersensitivity to demethylchlortetracycline.

Warning — In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort.

Precautions and Side Effects — Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.



Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York

Lederle

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

THE HAND IN RHEUMATOID ARTHRITIS: Part 1

GAYLORD LEE CLARK, JR., MD
Instructor in Orthopedic Surgery
The Johns Hopkins University School of Medicine
DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

Laine reports that 288 of 305 patients with rheumatoid arthritis had deformities of their hands.[1] The most common deformity was the "buttonhole" (boutonniere), followed by ulnar deviation, tendon nodules in the flexor tendons, "swan-neck" deformity, trigger-finger, tendon nodules in the extensor tendons, baseball-finger (non-traumatic), contracture of collateral ligaments and spontaneous rupture of the extensor pollicis longus.

Inglis recognized four disabling deformities of the rheumatoid hand: thumb deformities, swan-neck (intrinsic plus) in digits 2 to 5, the buttonhole deformity of digits 2 to 5, and ulnar drift.[2] The thumb was involved in 50% of the patients with structural changes in the hand.

Pathogenesis

Three major processes conspire to deform and limit hand function in rheumatoid arthritis: pain, destruction and attenuation of the tendons, and erosion and dislocation of the joints. All of these processes seem to follow proliferation of synovial tissue. The invasion of the joint by synovial tissue is accompanied by pain, swelling, joint fluid and an inflammatory reaction. In the wrist, tendons are often involved in the neoplasm-like growth of synovium. Neither the cause of the synovial proliferation nor the exact mechanism of joint and tendon destruction is clearly understood.

The mechanisms of the development of hand deformities are multiple and differ from patient to patient. On the following pages, three hand deformities are described, illustrated and explained,[3-7] and their physical and/or surgical treatment presented.[8-11]

From the Hand Clinic, and Department of Physical Medicine Baltimore City Hospitals.

Buttonhole Deformity:

Figure 1 shows a digit with a typical buttonhole deformity. The proximal interphalangeal (PIP) joint protrudes posteriorly through the attenuated or destroyed central slip of the lateral interosseous bands of the extensor mechanism. Figure 2 shows one way in which the central slip may be repaired surgically to prevent herniation of the PIP joint.

Swan-neck Deformity:

Figures 3 and 4 illustrate the swan-neck deformity. A number of factors conspire to cause it. If the proximal phalanges are displaced in a volar direction, the intrinsic muscle-pull shifts dorsally. Thus the pull of the intrinsic muscles causes hyper-extension of the PIP joints of digits 2 to 5. The tendon of the flexor digitorum profundus pulls the distal joint into flexion. At later stages the PIP joint may ankylose in extension. Figure 5 shows one type of surgical correction of this abnormality.

Buttonhole and swan-neck deformities are com-

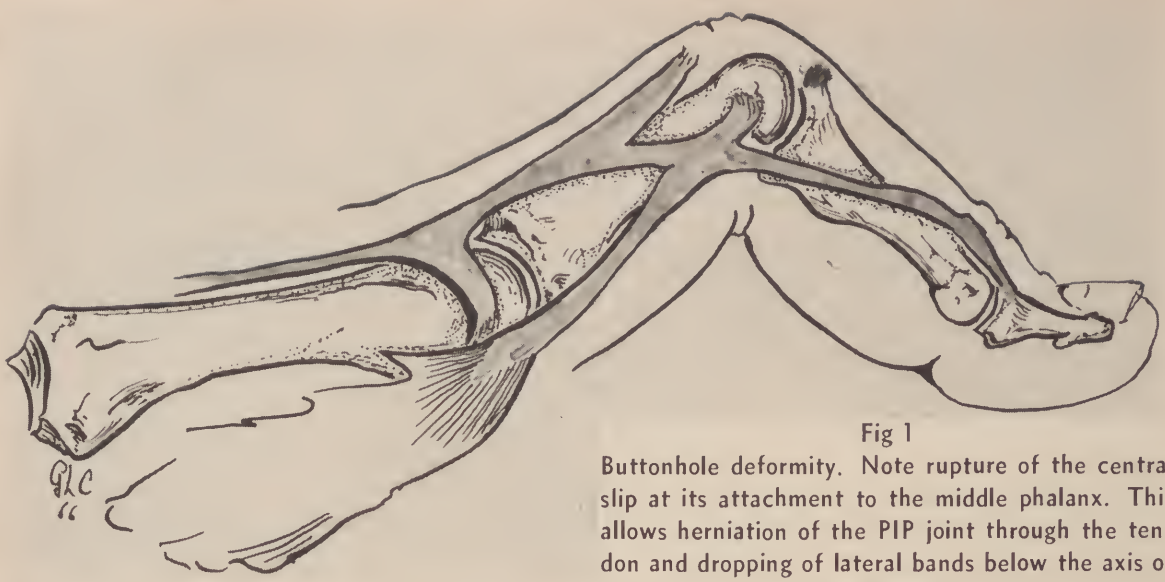

Fig 1
Buttonhole deformity. Note rupture of the central slip at its attachment to the middle phalanx. This allows herniation of the PIP joint through the tendon and dropping of lateral bands below the axis of the joint.

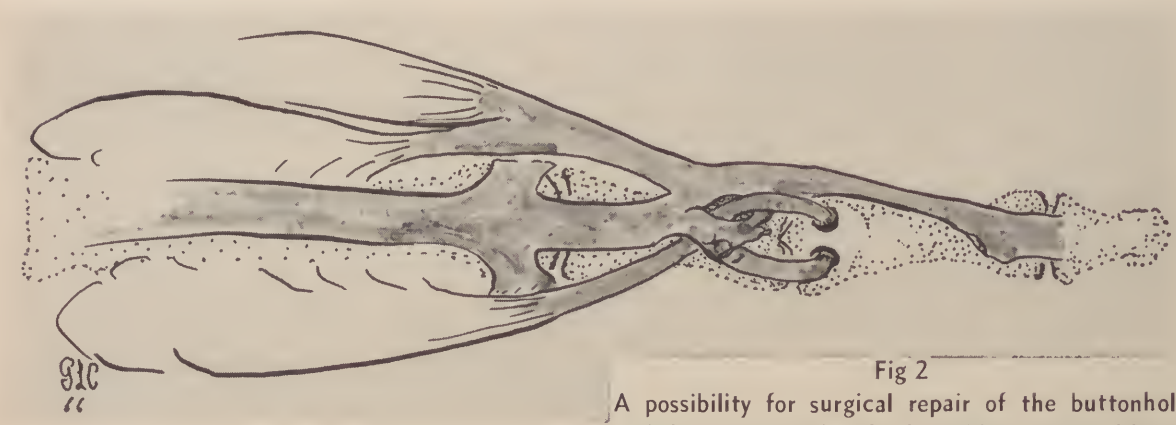

Fig 2
A possibility for surgical repair of the buttonhole deformity described by J. William Littler, MD.

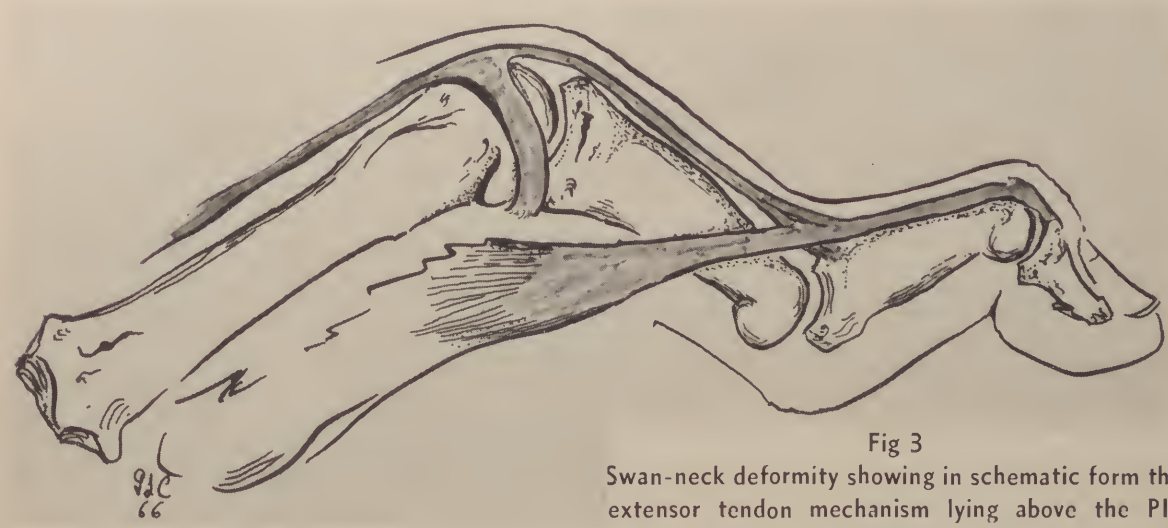

Fig 3
Swan-neck deformity showing in schematic form the extensor tendon mechanism lying above the PIP joint axis.

Fig 4
Swan-neck deformity in a rheumatoid finger with subluxation of the MP joint and articular surface damage.

mon. Properly selected cases respond well to surgical repair. One should be alert for the surgically correctable abnormalities.

Synovitis of the Metacarpal-Phalangeal (MP) Joint:

Figure 6 shows the hand of a patient with rheumatoid arthritis who has extensive synovitis of the MP joints. The proliferating synovium appears to be the immediate cause of destruction of the joint and surrounding tissues. Surgical removal of the synovium results in the slowing down or arrest of destruction of the joint. Figures 7 to 10 illustrate Dr. Vainio's method of arthroplasty of the MP joint. Synovectomy may be performed during this operation of necessary.

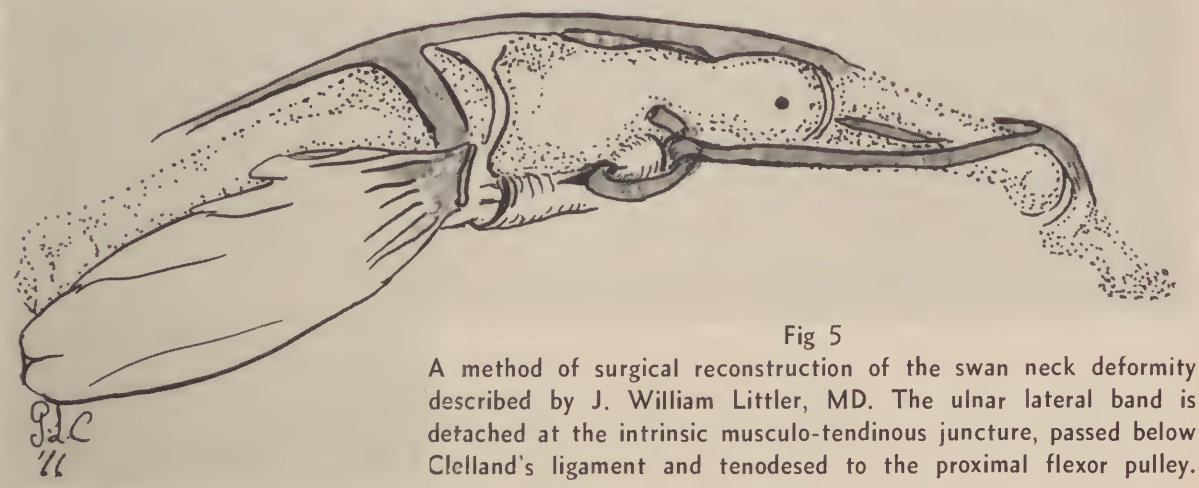

Fig 5
A method of surgical reconstruction of the swan neck deformity described by J. William Littler, MD. The ulnar lateral band is detached at the intrinsic musculo-tendinous juncture, passed below Clelland's ligament and tenodesed to the proximal flexor pulley.

Fig 6—Above
The Vainio Arthroplasty: A rheumatoid hand with synovitis of the MP joints and ulnar drift.

Fig 7—Right
Through a transverse incision, the MP joints are exposed by opening the extensor hood. Note that the extensor tendons have migrated into the ulnar valleys between the metacarpal heads.

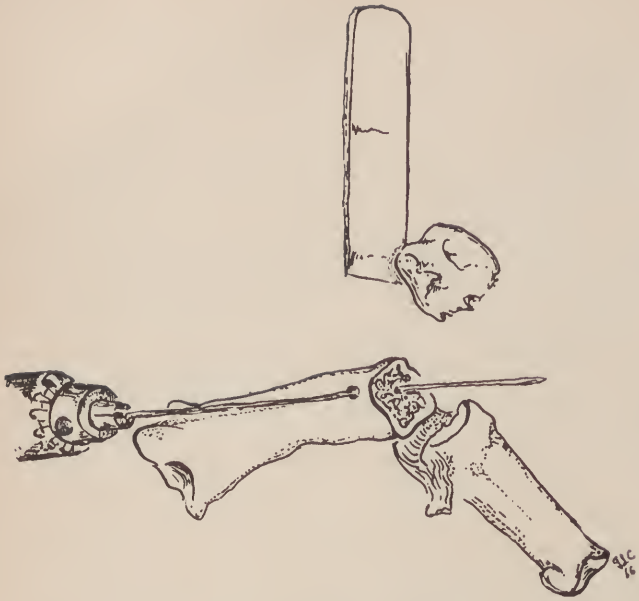

Fig 8

Once exposed, the metacarpal head is excised with a sharp osteotome. A synovectomy is performed and a drill hole for reattachment of the radial collateral ligament is made in the dorsal radial aspect of the metacarpal with a Kirschner wire. The volar plate is left undisturbed.

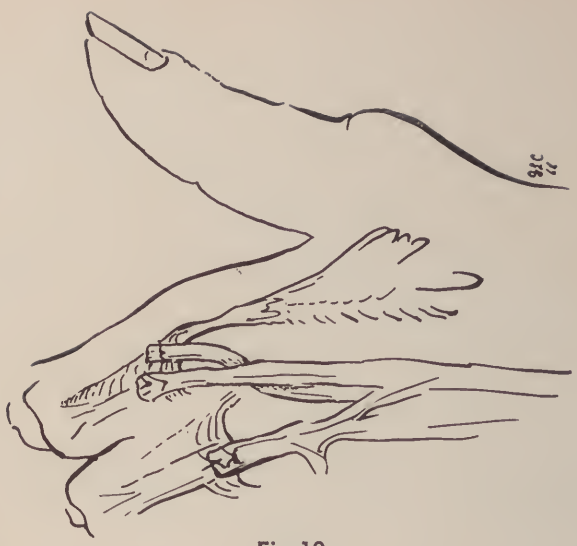

Fig 10

Following the extensor tendon repair on the index finger, the extensor indicis proprius is passed underneath and sutured into the first dorsal interosseous mechanism to add a corrective force to prevent ulnar drift. At the completion of surgery the hand is immobilized for three weeks in a functional attitude; then active exercises are begun. No corrective splinting is used.

Fig 9

The common extensor tendon is divided at the arthroplasty level allowing adequate length on the distal stump for suturing into the volar plate. The proximal tendon stump is then sutured onto the extensor mechanism over the proximal phalanx. The radial collateral ligament is then attached to the metacarpal neck with one suture through the previously made drill hole. The extensor tendon is then replaced over the apex of the joint as shown in the end-on view of the metacarpal at the bottom of the figure.

OPENS ASTHMATIC AIRWAYS—

AND KEEPS THEM OPEN

NUMA® DURA-TABS®

for *prolonged* aid to ventilation

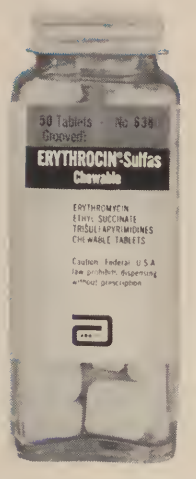
Each Numa Dura-Tab provides:

theophylline	225 mg.
ephedrine HCl	50 mg.
butabarbital	25 mg.

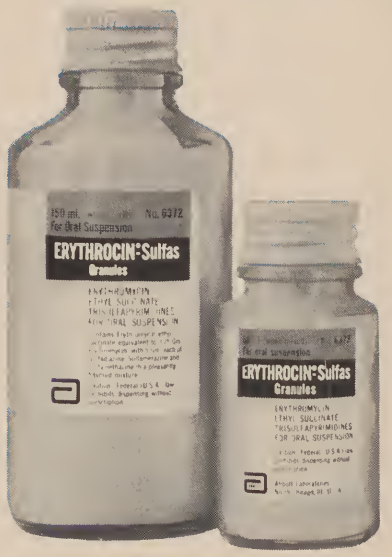
(Warning: butabarbital may be habit-forming.)

Numa Dura-Tabs provide *prolonged* three-way action to ease breathing. Theophylline, a potent bronchodilator with minimal effect on the CNS, opens air passages and reduces bronchial spasm. Ephedrine HCl improves breathing capacity through its decongestant action. Butabarbital, a mild sedative, allays fear and apprehension.

Dosage: One Numa Dura-Tab every 8 to 12 hours helps keep the asthmatic patient symptom-free all day/all night.



Precautions: Use with caution in cardiovascular or hyperthyroid disease, severe hypertension, circulatory collapse, prostatic hypertrophy, or glaucoma.



WYNN Pharmaceuticals, Inc. Phila., Pa. 19132 • Manufacturers of QUINAGLUTE® DURA-TABS®

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

"Livingston... vertigo is my doom!"
Cried Stanley in his doctor's room.

Said the doc, "For your ills
I've got just the pills."

Said Stan,
"Antivert, I presume."

Antivert® tablets/syrup stops vertigo
(meclizine HCl, niacin)

Tablets: (meclizine HCl 12.5 mg. and niacin 50 mg.) Syrup: (each 5 cc. teaspoonful contains meclizine HCl 6.25 mg. and niacin 25 mg.)

Most widely prescribed anti-vertigo agent[1] Complete to moderate relief of symptoms in 9 out of 10 patients[2]

Antivert, the leading anti-vertigo product,[1] combines meclizine HCl, an outstanding drug for treatment of vestibular dysfunction, with niacin, a drug of choice for prompt vasodilation. Prescribe Antivert for your patients with vertigo, Meniere's syndrome and allied disorders.

Precautions and contraindications: Frequent, short-lived reactions include: cutaneous flushing, sensations of warmth, tingling and itching, burning of skin, increased gastrointestinal motility, and sebaceous gland activity. In explaining these reactions to the patient, it is suggested that they be regarded as a desirable physiological sign that the niacin is carrying out its intended function of vasodilation. Because of this vasodilation, severe hypotension and hemorrhage are obvious contraindications to Antivert therapy. Although the incidence of drowsiness and other atropine-like side effects such as dry mouth and blurring of vision is low, the physician should alert the patient to the need for due precautions when engaging in activities where alertness is mandatory. **Use in women of childbearing age:** A review of available animal data reveals that meclizine exerts a teratogenic response in the rat. In one study a dose of 50 mg./kg./day (50 times the maximum recommended human dose) produced cleft palate in 2 of 87 fetuses when administered to the rat at critical times during the first 15 days of gestation. At doses of 125 mg./kg./day, meclizine will produce 100% incidence of cleft palate in the rat. At doses of 25 mg./kg./day, decreased calcification of the vertebrae and relative shortening of the limbs were also produced in the rat, but experts disagree as to whether this is a teratogenic response. While available clinical data are inconclusive, scientific experts are of the opinion that this drug may possess a potential for adverse effects on the human fetus. Consequently, consideration should be given to initial use of a nonphenothiazine agent that is not suspected of having a teratogenic potential. In any case, the dosage and duration of treatment should be kept to a minimum. **Dosage:** One tablet or one to two teaspoonfuls (5-10 cc.) t.i.d. just before meals. Specific requirements for individual patients should be determined by the physician. **Supplied:** Tablets in bottles of 100 and 500. Syrup in pint bottles. RX only.

Neobon®
geriatric + supplement

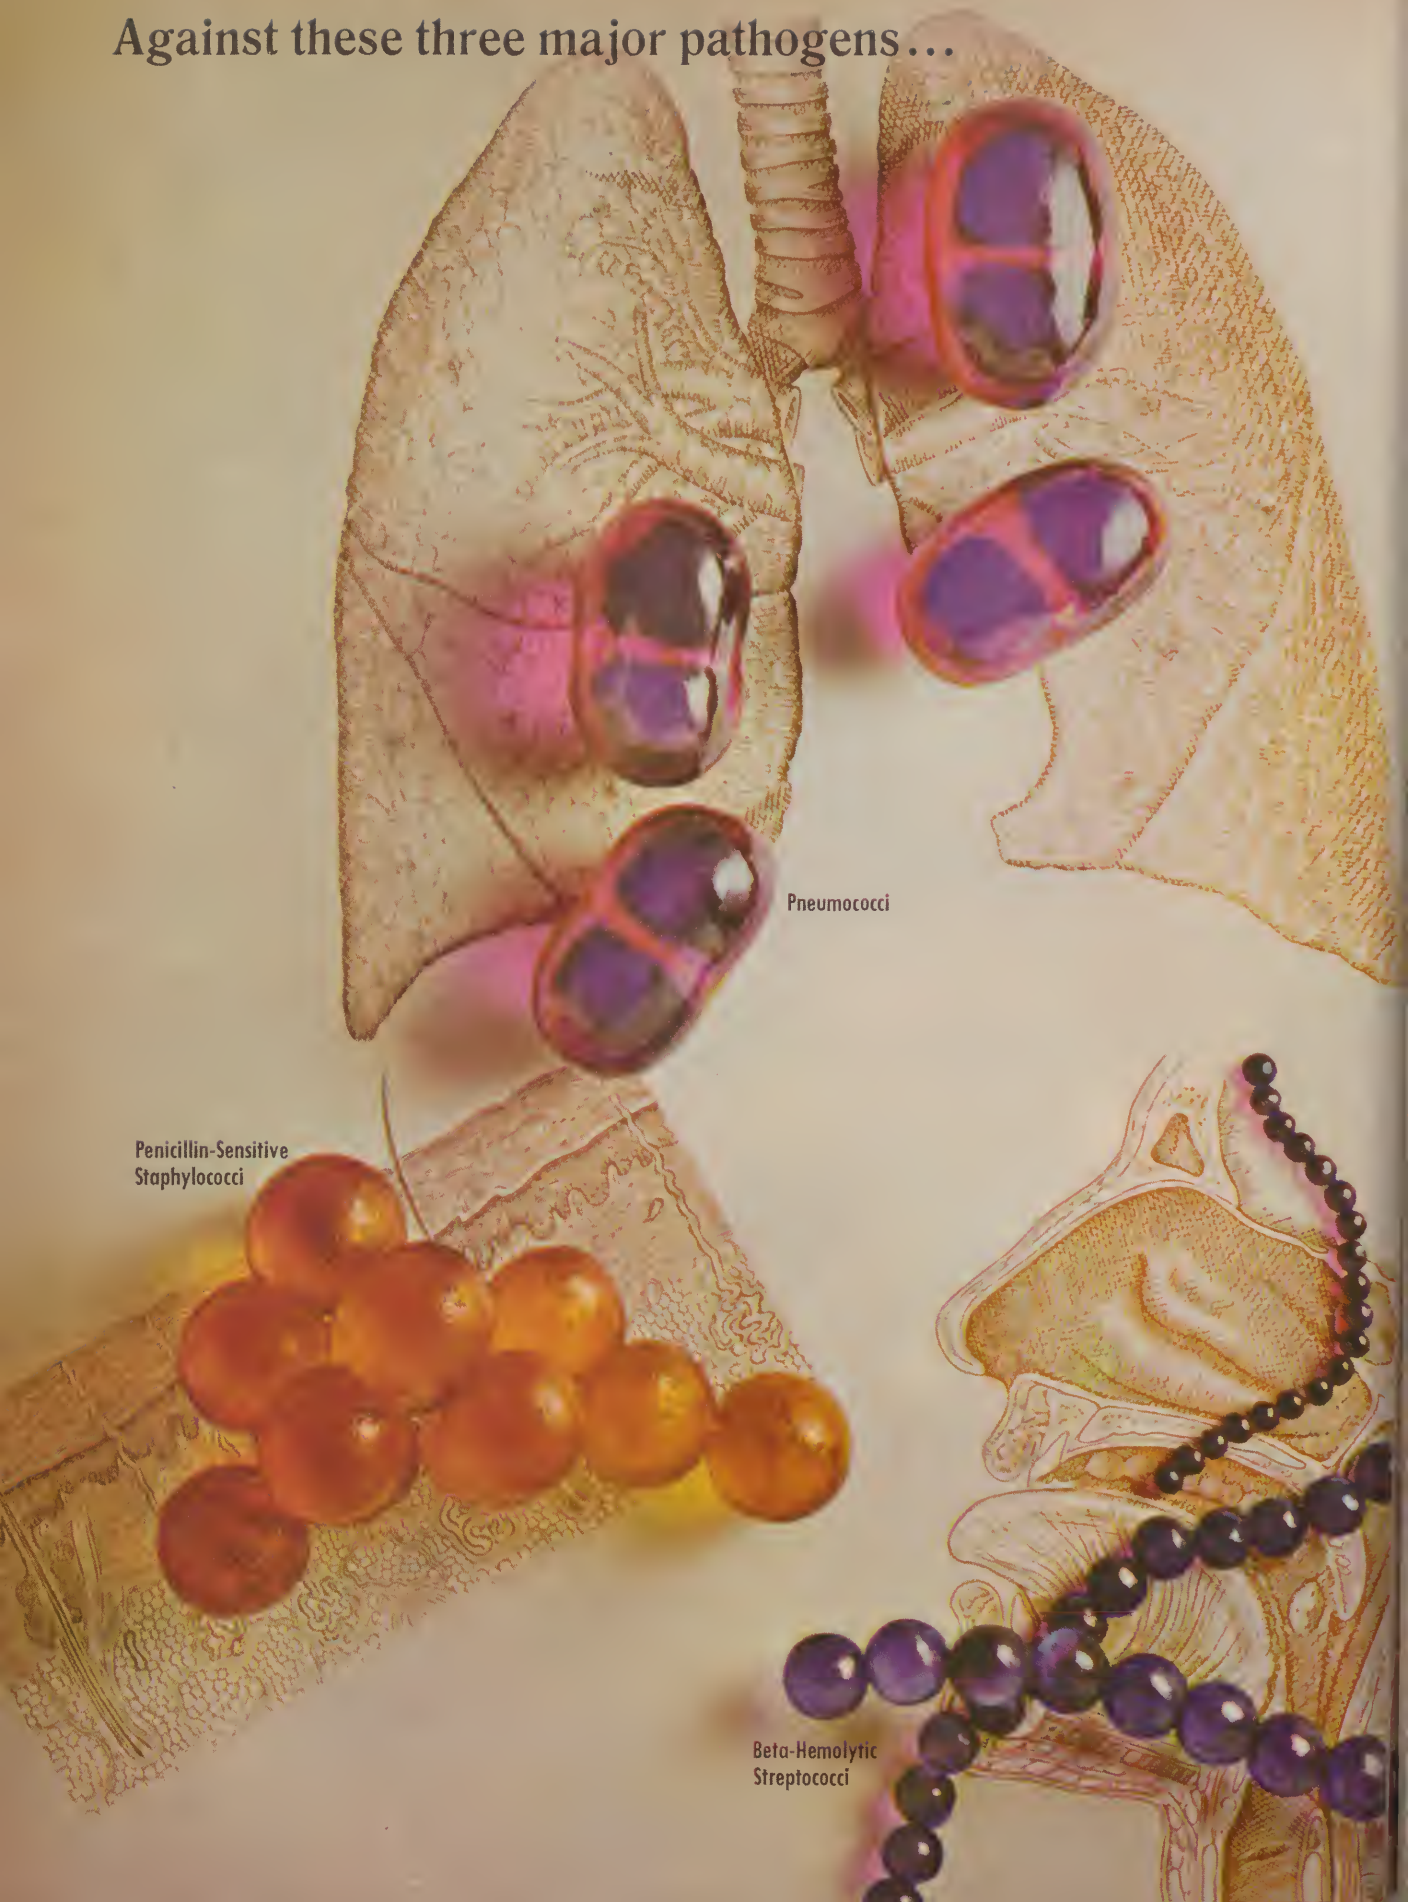
helps keep them 'on the go'

Each capsule contains:

(1) **Vitamins and Minerals**	
Vitamin A (acetate)	2000 U.S.P. units
Vitamin D (ergocalciferol, U.S.P.)	200 U.S.P. units
Vitamin B_1 (thiamine mononitrate, U.S.P.)	0.5 mg.
Vitamin B_2 (riboflavin, U.S.P.)	0.5 mg.
Vitamin B_6 (pyridoxine HCl, U.S.P.)	0.5 mg.
Niacinamide, U.S.P.	50 mg.
Calcium pantothenate, U.S.P.	5 mg.
Vitamin E (di-alpha tocopheryl acetate)	5 I.U.
Rutin	5 mg.
Cobalt (from cobalt sulfate)	0.033 mg.
Molybdenum (from sodium molybdate)	0.066 mg.
Copper (from copper sulfate)	0.33 mg.
Manganese (from manganese sulfate)	0.33 mg.
Magnesium (from magnesium sulfate)	2 mg.
Iodine (from potassium iodide)	0.05 mg.
Potassium (from potassium sulfate)	1.66 mg.
Zinc (from zinc sulfate)	0.4 mg.
(2) **Hematopoietic Factors**	
Iron (from ferrous sulfate)	3.40 mg.
Vitamin B_{12} (cobalamin concentrate, N.F., as Stablets®)	1 mcg.
Vitamin C (ascorbic acid, U.S.P.)	50 mg.
(3) **Digestive Enzyme**	
Pancreatic substance*	50 mg.
(4) **Gonadal Hormones**	
Methyltestosterone, N.F.	1.0 mg.
Ethinyl Estradiol, U.S.P.	0.006 mg.
(5) **Amino Acids**	
L-lysine (monohydrochloride)	50 mg.
L-Glutamic acid	30 mg.

*Enzymatically active defatted material obtained from 250 mg. of whole fresh pancreas.

For older adults who require it, daily supplementation with Neobon can help overcome decreases in endogenous gonadal hormone production, as well as deficiencies of iron, vitamins and other nutritional factors. In a single convenient capsule, Neobon provides vitamins, minerals, gonadal hormones, hematopoietic factors, digestive enzymes, and amino acids—all selected for adjunctive therapeutic value in the geriatric syndrome. For example, one of the gonadal hormones in Neobon is ethinyl estradiol. It is more slowly metabolized in the body than natural estrogens or their esters.



Precautions: Contraindicated in patients in whom estrogen or androgen therapy should not be used, as in carcinoma of the breast or prostate.

Dosage: One capsule, t.i.d. with meals, or as directed by physician.

Supplied: Bottles of 60 capsules. Rx only.

V-Cillin K® Lilly 700636

Potassium Phenoxymethyl Penicillin

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Warnings: In rare instances, the use of penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin and in those with bronchial asthma or other allergies. Resuscitative drugs should be readily available for emergency administration. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for relief of immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with high parenteral dosage schedules, frequent evaluation of the renal and hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory studies (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrowth of penicillin-insensitive organisms. In such cases, its administration should be discontinued, and appropriate measures should be taken.

Adverse Reactions: Although serious allergic reactions are much less common with administration of oral penicillin than with intramuscular forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it does possess a significant index of sensitization. The following hypersensitivity reactions associated with the use of penicillin have been reported: skin rashes ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; and reactions resembling serum sickness, including chills, fever, edema, arthralgia, and prostration. Severe and often fatal anaphylaxis has occurred (see Warnings). Hemolytic anemia, leukopenia, thrombocytopenia, and nephropathy are rarely observed side-effects and are usually associated with high parenteral dosage.

Administration and Dosage: For Tablets V-Cillin K and for V-Cillin K Pediatric, the usual dosage ranges from 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants the daily dosage may be 50 mg. per Kg. of body weight divided into three doses.

Beta-hemolytic streptococcus infections without associated bacteremia may be treated with 200,000 to 400,0000 units three times a day. Therapy should be continued for a minimum of ten days to prevent development of rheumatic fever and/or other serious complications. Dosage for routine streptococcus prophylaxis in patients with a history of rheumatic fever or congenital heart disease may be 200,000 units once or twice daily. When such patients undergo tonsillectomy, tooth extraction, or other minor surgery, the prophylactic dose should be 500,000 units every six hours given two days prior to surgery and for two days postoperatively. If oral medication is not feasible on the day of surgery, parenteral therapy should be considered. Mild to moderately severe pneumococcus pneumonia has been treated effectively with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be given every six to eight hours in conjunction with indicated surgical procedures.

For gonorrhea in males, 500 mg. (800,000 units) every four hours for three doses may be employed; in females, 500 mg. every four hours for six doses are recommended. Patients with a suspected lesion of syphilis should have a dark-field examination before receiving penicillin and monthly serologic tests for a minimum of three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units) in bottles of 50 and 100; and 250 mg. (400,0000 units) and 500 mg. (800,000 units), in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,0000 units) per 5 cc. of solution, in 40, 80, and 150-cc.-size packages. [011867]

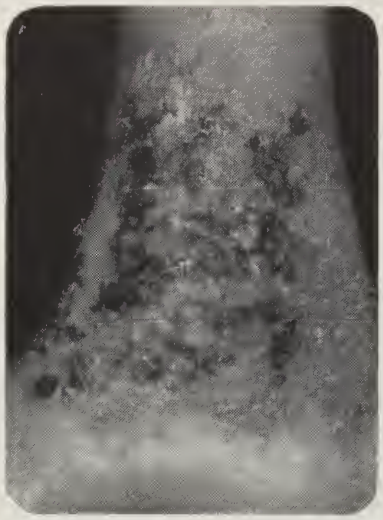
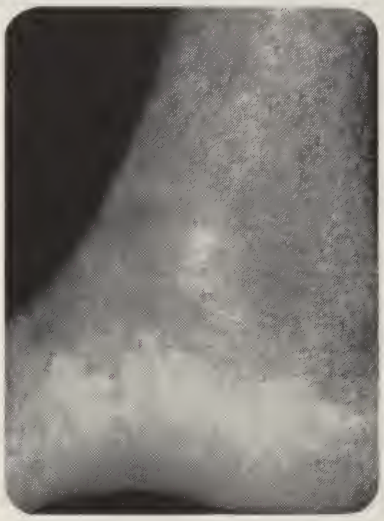
Medical Genetics

BERNICE SIGMAN, MD
Somatic Cell Genetics
Rosewood State Hospital
Assistant Professor of Pediatrics
University of Maryland School of Medicine



In recent years there has been an increasing interest in those diseases which are genetically and chromosomally transmitted. Both medical and lay publications have reflected this concern and patients are becoming more aware of the implication of the often heard statement, "It runs in the family." Another indication of this trend is the increasing number of training programs in medical genetics. The question arises then as to what is the role of the medical geneticist or, perhaps of more pragmatic interest, what does he or she have to offer to the practicing physician.

Medical genetics is populated by a group of people with a wide variety of training and research interests. They may be internists, pediatricians, hematologists or PhDs in human genetics. Research interests vary from population genetics to biochemical genetics to pharmacogenetics to cytogenetics, etc. The area of clinical concern is genetic prognosis and counseling.



Genetic prognosis deals with predicting the probability of recurrence of an hereditary disease in future offspring of relatives or parents of an affected child. The first step is obviously to ascertain the correct diagnosis. To do this, the medical geneticist requires a careful and detailed personal and family history and physical examination not only of the patient but also of other family members. He also may need certain routine laboratory studies and additional special studies such as buccal smears for sex chromatin, chromosomal studies, dermatoglyphics, urinary and/or serum amino acid determinations, urinary mucopolysaccharides, etc. Once the diagnosis is made, other problems arise. In those disorders which are caused by a single mutant gene, prognosis may be very exact and a definite numerical recurrence can be cited. In many developmental anomalies, such as cleft lip and/or palate, prognosis becomes much more empiric. Very rarely, this anomaly may be associated with a chromosomal error, ie the D1 trisomy. It may even be inherited as an autosomal dominant trait, but more usually this is not the case. Usually, the child is quite normal otherwise and may or may not have an affected relative. In this well-studied condition, empiric risk figures may range from 0.1% if neither parent nor any siblings are affected to 10%-15% when one parent and one sibling are affected. These percentages are based on results obtained in large studies of the incidence within families of this malformation. Moreover, even in some single gene disorders (especially in dominant diseases), a gene may not express itself until late in life or may never be expressed at all. This variety of gene expression must be taken into account in dealing with examples where a disease "skips" a generation.

It is not the purpose of this paper to describe genetic risks in detail or to list genetic syndromes. Several excellent texts on these subjects, and a

Eczema of many years... controlled in two weeks

Before treatment

After treatment —
with ARISTOCORT Topical
Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Available in 5 Gm. and 15 Gm. tubes and ½ lb. jars.

number of pertinent articles, will be listed at the end. It is the intention of this writer to point out that the burden of genetic counseling rests on the private practitioner. It is he who must recognize the disorder and that it is of genetic origin. In many instances, he will do his own counseling. This is obviously preferable for he knows the family, has rapport with them, and can best evaluate the impact that genetic counseling will have on them. In instances of obscure disorders which he refers to a medical geneticist, he must be the one who reinforces and, many times, explains the recurrence risks to the often bewildered parent.

Finally, we would like to emphasize that, where as we have the obligation to provide patients with true genetic prognosis to the best of our ability, we do not have the right to decide for them whether or not to have additional children. That is their decision to make. One-in-four risks mean different things to different people and the gambler reacts differently from the arch conservative.

Could it be
something
more than
growing
old that
"gets her
down"?

Mild mood depression, poor appetite, little interest in the present or future. Does this picture mean that she's giving in to functional fatigue?

When functional fatigue is part of her problem, Alertonic can help counteract accompanying apathy and inertia. It helps lift mood, stimulate appetite, and establish new interest in daily life.

Pleasant-tasting Alertonic combines pipradrol hydrochloride—a gentle cerebral stimulant—with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Especially in the aging patient, nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding, and encouragement. Between visits, however, your prescription for Alertonic can help keep your patient from giving in to functional fatigue.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals ...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

Available only on prescription

Alertonic®

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%, pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.

Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

Learn To Do Your Part In The Prevention Of Disease

Tuberculin Tests in Schools

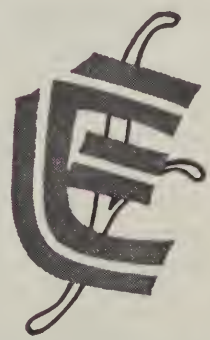
The City Health Department is currently tuberculin testing all kindergarten and first grade children who have this year entered public school for the first time. The testing, which is done with parental consent, will involve up to a total of 14,000 children and should be completed by the end of May.

The project now in progress covers all public schools in the City as contrasted with a previous program, conducted in 1964, that involved only first grade children in inner city public schools.

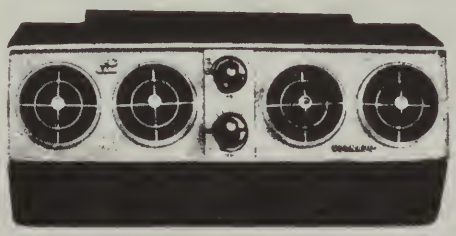
The program will enable the Department to accomplish three purposes: (1) to discover an occasional case of active tuberculosis in children, (2) to uncover the unknown active adult case responsible for the child's reaction, and (3) to establish an infection rate by age in children as a base for future comparison in evaluation of tuberculosis control.

PROGRESS REPORT ON NEW CHILD HEALTH CARE CENTERS

The Comprehensive Children and Youth Pediatric Care Centers in Baltimore City are off to a promising beginning according to Dr. J. L. Rhyne, Director of Child Health Services in the Baltimore City Health Department.



The Sinai-Druid Center at 1515 W. North Avenue registered its 4,352nd patient on March 31 after six months of operation. The Greater Baltimore Medical Center's Children and Youth Project located in the Presbyterian Outpatient Building at 1017 E. Baltimore Street reported a case load of 1,069 patients in its report dated April 1, 1967; the University of Maryland Hospital, 1,130. The Johns Hopkins Hospital Project funded under a separate U.S. Children's Bureau grant, has registered approximately 5,000 patients. A total of about 11,551 children have therefore, been registered for care in these centers in the City of Baltimore. The center at Baltimore City Hospitals will begin to see patients about July 1, 1967. An additional center is being planned at the Union Memorial Hospital.



A wide range of screening, diagnostic and treatment services are provided. These include medical, nursing, dental, psychological, nutritional, social, physical therapy and rehabilitation, as well as speech, hearing and vision services which are offered to those eligible children whose families cannot affort private care. These facilities are developing family-centered medical care services providing counseling to parents and direct services to children from birth through 18 years who reside in the designated service areas.

Patients are seen on each visit by the same medical and auxiliary personnel assuring continuity of care; however, the number of broken appointments is of major concern to the centers and steps are being taken to improve this situation. The Sinai-Druid and the Greater Baltimore Medical Center projects are doing an exceptional job in coordinating many existing community agencies which serve children and youth. Weekly case conferences are held, to which representatives of agencies involved in the care of a particular patient are invited. The City Department of Public Welfare, the Baltimore City Public Schools, and the Community Action Agency as well as other community agencies have been particularly

cooperative in the developmental stages of these new health centers.

We believe that one of the most decisive factors affecting the educational and economic status of a population relates to that population's level of health. Therefore, in addition to providing direct preventive, diagnostic and treatment services, the Comprehensive Health Centers are directing their efforts toward the modification of those community conditions which adversely affect health.

William J. Peeples, MD, MPH, Commissioner

HIGHLIGHTS

PAYMENTS TO PHYSICIANS UNDER MEDICAL ASSISTANCE PROGRAM

In September 1966, the Health Department committed itself to the principle of "usual" and "customary" fee payments to physicians for their services to patients certified eligible for Medical Assistance.

Item D5340 of the *Federal Handbook of Public Assistance Administration* (Medical Assistance Programs under Title 19 of the Social Security Act), states in part: "The requirement for fee structures permits a variety of means which may be used in determining payments to providers of services other than hospitals. An underlying assumption is that adequate financing is available to pay the costs of the medical and remedial care and services included in the plan."

To implement the revised fee structure, the Health Department requested in its budget for fiscal 1968 an increase of approximately $4,400,000 for payments to physicians for services performed in home, office, or nursing home. An additional $4,300,000 was requested to inaugurate payment to physicians for services to hospital inpatients and outpatients.

Cuts made by the Bureau of the Budget and the Governor reduced the home and office program increase to approximately $2,600,000, and the Governor's budget message specified fees of $5 for an office visit, $6 for a home day visit, and $7 for a home night visit. The funds requested to reimburse physicians for services in hospitals were slashed to $1,868,000.

Following discussions with the budget bureau, the Governor's staff, and the Medical and Chirurgical Faculty, the Department in its supplemental budget requested for payment to physicians an additional $510,925 for the home and office program and $2,168,000 for hospital inpatient and outpatient services. However, the Governor's supplemental budget omitted these requests.

It seems clear that the funds appropriated by the Legislature will not suffice for total payment of "usual" and "customary" fees during fiscal year 1968. The Advisory Committee on Medical Care has been asked to study the situation and make recommendations to the State Board of Health and Mental Hygiene.

HEW ALTERS CRITERIA FOR NURSING HOMES UNDER TITLE 19

The US Department of Health, Education, and Welfare has modified its previous requirement that by Jan 1, 1968, nursing homes under Title 19 meet the standards set for extended care facilities under Title 18 (Medicare) in order to qualify for Federal participation in payments.

A set of twelve general standards replace the more rigid Medicare criteria, and the deadline for compliance has been extended to Jan 1, 1969. However, beginning Jan 1, 1968, federal partici-

pation will continue only if the state has determined that the home has the potential to meet the new "skilled nursing home" standards by Jan 1, 1969. If the home fails to comply with the standards by that date, federal participation in payments will cease.

The new standards retain a requirement that a registered nurse supervise nursing services and that registered nurses or licensed practical nurses be on duty as charge nurses around the clock. With the nationwide shortage of qualified nurses, this requirement remains the greatest obstacle for the nursing home to hurdle. However, the requirement that a licensed practical nurse be graduated from a state-approved school has been relaxed to permit her employment as a charge nurse if she "was successfully discharging the responsibilities of a charge nurse on July 1, 1967, . . . [and] has completed training satisfactory to the appropriate state licensing authority."

TRAINING IN GERIATRIC NURSING GIVEN

A month-long- in-service educational program in geriatric nursing was given by the Divisions of Public Health Nursing and Occupational Therapy in cooperation with the Wicomico County Health Department, at the Wicomico Nursing Home in Salisbury.

Participants included several public health nurses from nearby health departments, plus twelve professional nurses and one licensed practical nurse from nursing homes in the area.

REHABILITATIVE NURSING PROCEDURES TAUGHT AT MONTEBELLO

A four-week course in rehabilitative procedure was recently completed at Montebello Hospital by three nursing supervisors from Sacred Heart Hospital. Instruction was given in initial care of the acutely injured to avoid later disabling contractures, as well as methods of caring for chronic disabilities. Methods which have proved highly successful at Montebello in prevention and cure of decubitus ulcers were demonstrated.

Each participant was assigned two patients for the course, and will use the skills learned to train nurses and other hospital staff. The instruction has engendered widespread interest, and it is hoped similar courses may be arranged for supervisory personnel from other Maryland hospitals.

MEDICAL "SELF-HELP" SAVES A LIFE

A free 16-hour course in Medical Self-Help, developed by the Public Health Service and administered in Maryland by the Department through local agencies to secondary schools and community groups, has been credited with saving a child's life. Designed to teach emergency procedures in the event of a major disaster when the services of a physician may not be available, the course was given last year to 38,081 Maryland residents, a three-fold increase over the previous year.

Subjects covered are Radioactive Fallout and Shelter, Healthful Living in Emergencies, Artificial Respiration, Bleeding and Bandaging, Fractures and Splinting, Transportation of the Injured, Burns, Shock, Nursing Care of the Sick and Injured, Infant and Child Care, and Emergency Childbirth. The reported rescue resulted from mouth-to-mouth resuscitation in cases of asphyxia.

She simply sits while the party goes on around her, already used to being the girl who is left out. She tries to lose weight—but her emotions won't let her. She becomes irritable and depressed when she doesn't eat, and anxious when she considers her future. So each time she gives up.

"What can I do?" she asks when she visits your office. "How can I ever stay on a diet and lose weight?"

A PARTICULAR COMBINATION OF ACTIONS

Ambar #2 Extentabs®

methamphetamine hydrochloride 15 mg., phenobarbital 64.8 mg. (1 gr.)
(Warning: may be habit forming).

FOR THE NEEDS OF THE DIETING WOMAN

A. H. Robins Co., Inc.
Richmond, Va. 23220

A·H·ROBINS

Ambar is formulated to specifically meet both the physical and emotional needs of the woman who is trying to lose weight. *Methamphetamine hydrochloride* has a powerful suppressant effect on the appetite and also provides a gentle psychic lift to improve mood and encourage activity. The *phenobarbital* component, through its classic calming action, helps control irritability and anxiety, and helps counteract excessive CNS stimulation.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY / *Indications:* Ambar suppresses appetite and helps offset emotional reactions to dieting. *Side Effects:* Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. *Precautions:* Administer with caution in the presence of cardiovascular disease or hypertension. *Contraindications:* Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. See package insert for further details.

MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

Medical Assistants Week Terminates With Annual Meeting of MAMA

Spiro T. Agnew, Governor of the State of Maryland, proclaimed April 16-21, 1967, as Medical Assistants Week. As was stated in the proclamation, "The Maryland Association of Medical Assistants is a non-profit organization composed of dedicated men and women who work for the betterment of humanity." The governor urged all citizens to recognize the outstanding work rendered by the association.

Medical Assistants Week was highlighted by the Seventh Annual Meeting of the Maryland Association of Medical Assistants held on April 22, at the Holiday Inn, Baltimore. The meeting commenced with registration at 10:45 AM, after which Miss Betty Fern, president of MAMA, welcomed the members of the Baltimore, Wicomico, and Cumberland chapters. The following new officers were elected at the meeting:

President: Nell Chaney, Baltimore chapter, President-elect: Gertrude Gillum, Cumberland chapter, Vice-president: Carol Davis, Baltimore chapter Secretary: Betty Porter, Wicomico chapter Treasurer: John Komber, Baltimore chapter.

Elected also were the delegates to the AAMA convention. They are as follows:

Mabel Young, Cumberland chapter, Dorothy Hartel, Baltimore chapter, Mary Winters, Baltimore chapter.

Nicholas J. Kohlerman, MD

The meeting was adjourned by Miss Fern at 12:30 PM.

After luncheon, the scientific seminar followed with the welcoming address by Harry J. Connolly, MD, president of the Baltimore City Medical Society. Dr. Connolly emphasized the importance of the medical assistant, and offered the assistance of the Medical Society to publicize the activities of the association.

Nicholas J. Kohlerman MD, chief of obstetrics

and gynecology at Church Home and Hospital, was the first speaker. Dr. Kohlerman, whose topic was "Sex," reviewed the many controversial aspects of his subject as they influence the normal life of man from birth until death. During his presentation, he gave a general account of the stages of sexual development and how to remedy and possibly prevent sexual insufficiency. A brief question and answer period following his talk.

Before the next speaker was introduced, there was a short coffee break at which time door prizes were distributed to the lucky winners.

At 3:30 PM, Harvey Felix, information specialist of the Baltimore City Health Department, was introduced to make his presentation on "Venereal Disease." Mr. Felix explained the startling increase in V.D. throughout the country, and the disturbing number of teenagers infected with the disease. Following his talk, a film, which is being incorporated into the sex educaton in many school systems around the country, stimulated many questions, which Mr. Felix answered during the discussion period.

The meeting was followed, at 6 PM, by a cocktail hour and, at 7 PM, by a banquet in the East Ballroom of the Holiday Inn. The banquet began with the invocation given by the Rev. Pope F. Brock, chaplain at Church Home and Hospital. Master of Ceremonies for the evening was J. Morris Reese, MD, outgoing president of the Medical and Chirurgical Faculty of Maryland. During the evening's festivities, Miss Dorothy Hartel, trustee of the American Association of Medical Assistants, installed the newly elected officers at a "candlelight ceremony."

E. T. LISANSKY, MD, SPEAKS TO MEMBERS OF B A M A

E. T. Lisansky, MD, was the guest speaker at the April meeting of the Baltimore Association of Medical Assistants. Dr. Lisansky's topic was Psychosomatic Medicine. The speaker emphasized the importance of psychosomatic treatment in conjunction with physical disease.

Dr. Lisansky is associate professor of medicine and clinical psychiatry at the University of Maryland School of Medicine, and also lectures at the University of Maryland School of Social Work, Dentistry, Nursing, and Law.

MEMBERS OF MAMA ATTENDED SCIENCE FAIR EXHIBIT

Members of MAMA joined the Washington Medical Assistants at the Science Fair Exhibit held on April 15 and 16 at the Coliseum on the University of Maryland campus. The American Association of Medical Assistants' display was exhibited, and members of the association were present to answer questions asked by students and visitors.

MEDICAL ASSISTANTS HELP AT THE HEALTH EVALUATION CENTER AND COFFEE BOOTH

Members of the Maryland Association of Medical Assistants volunteered their services at the annual meeting of the Medical and Chirurgical Faculty of Maryland. The volunteers helped with the health evaluation center and also served coffee to participants at the meeting.

Newly installed officers of M.A.M.A. 1967: (left to right) Carol Davis, vice president; Carolyn Ziolkowski, corresponding secretary; Gertrude Gillum, president elect; John Komber, treasurer; Nell Chaney, pesident.

Solutions to Business Problems in Daily Medical Practice

ALL ABOUT AIDES - PART I

WILBURN L. McCLURE, JR.

Not long ago a well-established physician walked into my office and introduced himself. He had a very definite problem. His secretary-receptionist had resigned.

His questions were, "How do you find a good aide, and how do you know a good one until she has worked in your office for several months? What kind of questions should he ask her? How could he keep her interested enough to stay with him?; and what did he do to make his last aide resign'"

All of these are good questions. This doctor is not the first to be confronted with such a problem.

The following sections answered his questions and will act as a guide toward analyzing the current rapport with your staff.

FINDING AN AIDE

The doctor in question remarked that several of his colleagues were well satisfied with their aides—mentioning how responsible they are, and that they have employed them for many years.

My suggestion was that his successful colleagues would be best able to provide some guidelines.

Each time I encounter an exceptional aide in a client's office, I attempt to find out how he located her, how long she has been with him, his complaints and, his praises.

The consensus seems to be that most physicians locate their aides through the following methods:

1. Colleges—It would certainly be advantageous to hire a college graduate, though few doctors have the foresight to do so. Few doctors want to pay a salary commensurate with what graduates want or deserve. This is unfortunate. With all aspects of medicine becoming more and more involved in administration, law, technical requirements and extensively trained physicians, it is time to upgrade the status of "aides."
2. Junior Colleges—Choose one which has an elective or a regular curriculum in subjects relating to administrative techniques employed in a doctors office. Here students generally are high caliber girls preparing for a career rather than just a job.
3. Professional Schools—Such as an accredited Nursing school attached to a hospital. If an R.N. is needed, the competition will be high and assistance from the administrator cursory. Such schools generally direct their graduates to the hospital or similar institutions connected with the hospital. Success in finding an aide in such a school depends on your personal contacts at the school and in the hospital.
4. Medical Secretarial Schools—Most states have several secretarial schools, training students for work in the field of medicine. Many

Inexpensive
Effective

CAMP

HEAD HALTER
TRACTOR KIT

Recommended for traction treatment of:

1. Syndromes caused by slipped cervical discs.
2. Certain fractures of cervical vertabrae.
3. Certain types of tuberculosis of the spine, in preparation for, instead of or after fusion of the spine.
4. Certain cases of neck-muscle spasm.
5. Temporary measure until a cervical brace is prepared.

such institutions offer comprehensive medical secretarial courses. A few are taught by practicing physicians who act as professional lecturers. When approaching the placement officer of such an institution, check to see if it is state accredited. Also asked for one of their brochures. This way you can review their curriculum, history, instructors, etc.

5. State, County, or City Medical Assistants Organizations—There is a national organization called the American Association of Medical Assistants. Most states have branch member organizations. Local organizations have some type of placement service or, at least a public relations officer who can assist a physician. The Maryland Association of Medical Assistants provides such a program. Such organizations are best contacted through local medical societies.
6. Professional Counselor—Most physicians have business advisors who should be in a position to provide recommendations concerning the hiring of an aide. If the business consultant is well enough versed with the doctor's requirements, he can assist in weeding out undesirable applicants by contacting schools and agencies and by conducting interviews.
7. Advertising in the newspapers—This is one of the most harassing methods of obtaining an aide. If the doctor advertizes, he is confronted with appointments and interviews. One advantage is a post office box number for replies. One can observe the caliber of typing or handwriting, the completeness of the résumé, the grammar, and the references.
8. Employment Agencies—Agencies specializing in areas such as medical secretaries generally provide adequate assistance to the physician. Very seldom do the agencies bother to interview applicants sufficiently or test them for typing and shorthand abilities. They are quite willing to call and claim the applicant is qualified.

Past experiences have probably dictated that it is not easy to find a good aide. A final resort are the placement officers, employment agencies and newspaper advertizing. Next month, Part II will be discussed which is entitled, "How to Interview a Prospective Aide."

In peptic ulcer... antacid therapy with a new benefit

CONTAINS A BALANCED COMBINATION OF THE MOST WIDELY USED ANTACIDS— FOR RAPID NEUTRALIZATION. PLUS SIMETHICONE— TO CONTROL THE FACTOR WHICH ANTACIDS ALONE CANNOT INFLUENCE.

Mylanta®

- In Mylanta, aluminum and magnesium hydroxides are balanced to minimize the chance of constipation or laxation and still achieve rapid acid neutralization and pain relief.
- The positive action of simethicone helps relieve the painful gas symptoms which often accompany the peptic ulcer syndrome.
- The nonfatiguing flavor and smooth, nongritty consistency of tablets and liquid encourage continued patient cooperation during long-term therapy.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) of liquid contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. **Dosage:** one or two tablets, well chewed or allowed to dissolve in the mouth, or one or two teaspoonfuls of liquid to be taken between meals and at bedtime.

Woman's Auxiliary Holds Annual Meeting

The 18th Annual Meeting of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland was held April 19 and 20 at the Sheraton-Belvedere Hotel in Baltimore.

Due to unfortunate illness, both Mrs. Archie Cohen and Mrs. Wallace Sadowsky, president and president-elect, respectively, were unable to attend. The presiding officer was first vice-president, Mrs. M. McKendree Boyer.

E. Roderick Shipley, MD, of the Faculty Public Relations Committee, speaking at the general session on April 20, thanked the members for their many services and philanthropic endeavors.

The business meeting was followed by a sherry hour and luncheon, at which J. Morris Reese, MD, president of the Medical and Chirurgical Faculty extended greetings. He was followed by John W. Walsh, MD, who presented an illustrated lecture on the SS HOPE in Colombia.

Honored guests presented were: Mrs. Thomas N. Carter, president of Woman's Auxiliary to the District of Columbia Medical Society, and Mrs. James H. Sculley, its president-elect; Mrs. Hu C. Myers, president, Woman's Auxiliary to the West Virginia Medical Society and Mrs. Rupert Powell, its president-elect; Mrs. Harold Laggoner, president-elect, Woman's Auxiliary to the Delaware Medical Society; and Mrs. Robert F. Beckley, Eastern Regional vice-president of the Woman's Auxiliary to the AMA.

Mrs. M. McKendree Boyer, presiding officer at the Womans' Auxiliary to the Medical and Chirurgical Faculty of Maryland luncheon, seen with J. Morris Reese, MD, president (1966-67)

The invocation was given by Rabbi Donald N. Gluckman.

NEW SLATE OF OFFICERS ELECTED

The following officers were elected for 1967-1968. Mrs. William S. Stone, president;

Dietary Violations are Diminished Profoundly with...

†STEDYTABS Delfeta-sed*

•**SEDAFAX** (brand of special micronized grade of AMOBARBITAL - Warning: may be habit forming.).....**120 mg.**

DELFETAMINE (brand of dl-N-METHYL-amphetamine HCl.).....**30 mg.**

Usual Adult Dosage: One tablet daily. To be taken in the morning.

Tablets Delfeta-sed*

•**SEDAFAX** (brand of special micronized grade of AMOBARBITAL - Warning: may be habit forming.).....**40 mg.**

DELFETAMINE (brand of dl-N-METHYL-amphetamine HCl.).....**10 mg.**

Usual Adult Dosage: In obesity, 1 tablet t. i. d. 30-60 minutes before meals. In all other conditions, take 1 tablet t. i. d. immediately after meals.

†**STEDYTABS DELFETA-SED** are so prepared that the active ingredients are released continuously to provide for prolonged therapeutic effects for a period of up to 8 to 10 hours.

The dieting obese sometime experience emotional problems as secondary symptoms resulting from restricted food intake: anxiety, depression, irritability and tension. Subjective relief is accomplished with Delfeta-sed •(Delfetamine, dl-N-Methylamphetamine HCl) balanced with the mild euphoric sedative action of Sedafax, brand of Amobarbital-Warning: may be habit forming). The mood is altered to promote optimism and impart a cheerful sense of energy and well-being.

IN DEPRESSION: A completely logical synergistic combination of wide application as a mood normalizer for the common depressed states encountered in everyday practice. Induces a serene outlook without excessive tranquillity. The patient is alert but composed, free from emotional peaks and troughs. Relieves anxiety which is a part of every illness.

CAUTION:

Contraindicated in the presence of marked hypertension and in cases of coronary or cardiovascular disease; also, in patients hypersensitive to barbiturates or ephedrine-like drugs.

(chlordiazepoxide HCl)

Also available as
LIBRITABS™ (chlordiazepoxide)
5-mg, 10-mg, 25-mg tablets

ROCHE

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral*—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 50. Libritabs™ (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

Whether the allergen is greenish or garish, unseen or unknown, your patient can get symptomatic relief with BENADRYL—the potent antihistamine with antispasmodic action. *INDICATIONS:* Antihistaminic, antispasmodic, antitussive, and antiemetic therapy. *PRECAUTIONS:* Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this product. Hypnotics, sedatives, or tranquilizers if used with diphenhydramine hydrochloride should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing diphenhydramine hydrochloride. *ADVERSE REACTIONS:* Side effects are generally mild and may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, blurring of vision, vertigo, headache, muscular aching, thickening of bronchial secretions, restlessness, and insomnia have been reported. Allergic reactions may occur.

BENADRYL is available in Kapseals® of 50 mg. and Capsules of 25 mg. 00867

The pink capsule with the white band is a trademark of Parke, Davis & Company.

PARKE-DAVIS

Brewer Diagnostic Kits

Complete Serological Screening Tests For Syphilis . . .

The RPR Card Tests make use of a specially prepared, carbon-containing RPR Card antigen. The particle size and other characteristics of the carbon is such that when a reactive specimen is encountered, flocculation occurs, and there is a coagglutination which is readily visible to the naked eye. Individual tests, including the collection of blood and separation of plasma can be performed in 7 to 8 minutes.

Confirming earlier findings with the RPR Card Test[1-10] Reed[11] in reporting on 63,800 specimens had an overall agreement of 98.5% in a recent comparative study with other routine screening procedures.

The RPR Card Tests, with their low cost, ease of performance, high sensitivity and specificity, are without peer in situations that demand rapid testing of patients, enabling the physician to initiate prompt treatment of early infectious syphilis.

Specify the RPR Card Test as the screening procedure on serum or plasma samples submitted to your State Approved Laboratory.

'Thorazine' is useful as a specific adjuvant in the above named conditions.

The following is a brief precautionary statement. Before prescribing, the physician should be familiar with the complete prescribing information in SK&F literature or *PDR*. *Contraindications:* Comatose states or the presence of large amounts of C.N.S. depressants. *Precautions:* Potentiation of C.N.S. depressants may occur (reduce dosage of C.N.S. depressants when used concomitantly). Antiemetic effect may mask other conditions. Possibility of drowsiness should be borne in mind for patients who drive cars, etc. In pregnancy, use only when necessary to the welfare of the patient. *Side Effects:* Occasionally transitory drowsiness; dry mouth; nasal congestion; constipation; amenorrhea; mild fever; hypotensive effects, sometimes severe with I.M. administration; epinephrine effects may be reversed; dermatological reactions; parkinsonism-like symptoms on high dosage (in rare instances, may persist); weight gain; miosis; lactation and moderate breast engorgement (in females on high dosages); and less frequently cholestatic jaundice. Side effects occurring rarely include: mydriasis; agranulocytosis; skin pigmentation, lenticular and corneal deposits (after prolonged substantial dosages).

For a comprehensive presentation of 'Thorazine' prescribing information and side effects reported with phenothiazine derivatives, please refer to SK&F literature or *PDR*.

Treat yourself and your investments to professional management...

WITH AN INVESTMENT MANAGEMENT ACCOUNT AT THE TRUST DEPARTMENT OF MARYLAND NATIONAL BANK

You will be relieved of all the cumbersome details of investment management and what's more important, you can stop worrying about what to buy and sell and when to do so.

Your securities will be under the careful supervision of our Investment Department with an Investment Officer assigned to your account. This Department, backed by our Investment Research and Administrative Departments, works under the direct supervision of our Trust Committee which is composed of senior officers and directors of our Bank.

Our annual fee for an Investment Management Account is based on the income and value of your account and is surprisingly low. As it relates to taxable income, the fee is tax deductible for Federal Income Tax purposes.

Why not discuss the advantages an Investment Management Account would have for you? There is no cost or obligation.

In Baltimore, telephone 685-3900 and ask for L. Dale Marvel.

WILLIAM TAYLOR IS BIG ON FAD DIETS.

Bill knows all the latest schemes for losing weight.

He's a big loser.

He loses time. And money. And maybe even his best chance to do something sensible about his size.

Because like most faddists, Bill isn't building new habits. He'll simply bounce back to his old routine —and with every rebound make real weight control more difficult.

That's what started Project Weight Watch.

That's what prompted preparation of research-tested scientific diets which are offered to you free. They're a realistic balance of the 4 food groups—meat, bread and cereals, fruits and vegetables and dairy foods. They're diets that you'd write yourself, if you had the time.

Send for them. Help stamp out big Bills.

Send me the Project Weight Watch kit of materials including diets.

PROJECT WEIGHT WATCH
FACTS, NOT FADS

DIURESIS

MERCUHYDRIN®
(meralluride injection)

LAKESIDE

Twenty years ago the publication of "A System for the Routine Treatment of the Failing Heart"[1] established a schedule of diuretic therapy as a primary factor in the treatment of acute congestive failure. With emphasis upon daily injections of Mercuhydrin (meralluride injection) until dry weight was obtained, Gold, et al. achieved a 40% increase in improvement, in ⅓ the time, over other methods then current. Today, most medical texts continue to recommend parenteral mercurials in acute congestive failure when prompt diuresis is indicated.

Recently Modell[2] has stated: "The mercurial diuretics are the injectable diuretics of choice since they are the most potent as well as the most dependable. Their toxicity is not an important consideration either by comparison with other potent diuretics or in relation to the seriousness of the conditions in which they provide such excellent relief."

IN BRIEF

Mercuhydrin is indicated in edema of cardiac or hepatic origin and in the nephrotic syndrome; it is contraindicated in acute nephritis and in anuric or oliguric states. *The usual adult dose is one to two cc. daily or every other day until "dry weight" is obtained.* Sensitivity is rare but small initial doses are advised to minimize potential reactions; vertigo, fever, and rash have occurred. Overdosage may produce electrolyte depletion, muscle cramps, and G. I. reactions. Supplied: 1 cc. and 2 cc. ampuls in boxes of 12, 25 and 100; 10 cc. rubber capped, multiple-dose vials (intramuscular or subcutaneous use only) in boxes of 6 and 100.

1. Gold, Harry, *et al.: A System for the Routine Treatment of the Failing Heart,* The American Journal of Medicine, Vol. III, No. 6:665-692 (Dec.) 1956.

2. Modell, Walter: *Drugs of Choice 1966-1967,* p. 97, 1966.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

DEPRESSION

NORPRAMIN®
(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) in depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

LAKESIDE

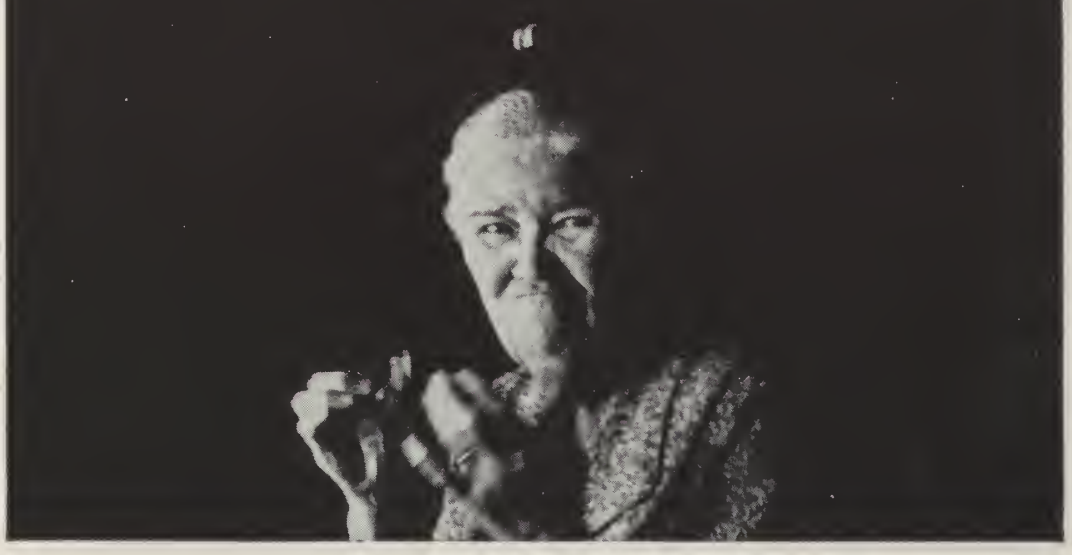
IN BRIEF:

INDICATIONS: In depression of any kind —neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.



ADVERSE EFFECTS: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, anxiety, agitation and stimulation, insomnia, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy, agranulocytosis, altered liver function, ataxia, and extrapyramidal signs.

DOSAGE: Optimal results are obtained at a dosage of 50 mg., t.i.d. (150 mg./day). **SUPPLIED:** NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1000; and tablets of 50 mg., in bottles of 30, 250 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

IRON DEFICIENCY

ANEMIA

Imferon®

(iron dextran injection)

There's as much iron . . . 250 mg. . . . in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron . . . or orally administered iron proves ineffective or impractical . . . or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves. Precise dosage is easily calculated.

LAKESIDE

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

There are 35,700* undetected diabetics in Maryland

Most of these are probably among patients over 40; the overweight; relatives of diabetics, and mothers of large babies. By the time polyphagia, polyuria, polydipsia, pruritus or other overt symptoms of diabetes appear, damage may have been done that could have been minimized. DEXTROSTIX® gives you a reliable blood-glucose estimate in 60 seconds.

Why Wait?

*Based on Statistical Report, U.S. Dept. Commerce, ed. 86, and Fisher, G. F., and Vavra, H. M.: Pub. Health Rep. 80:961 (Nov.) 1965.

Note: DEXTROSTIX is not meant to replace the more precise analytical laboratory procedures such as needed in glucose tolerance testing.

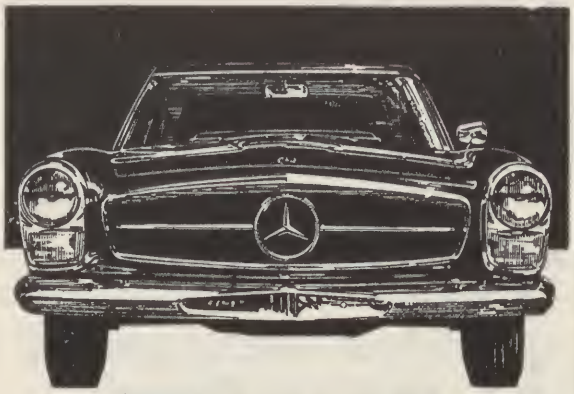
In peptic ulcer... antacid therapy with a new benefit

CONTAINS A BALANCED COMBINATION OF THE MOST WIDELY USED ANTACIDS— FOR RAPID NEUTRALIZATION. PLUS SIMETHICONE— TO CONTROL THE FACTOR WHICH ANTACIDS ALONE CANNOT INFLUENCE.



Mylanta®

- In Mylanta, aluminum and magnesium hydroxides are balanced to minimize the chance of constipation or laxation and still achieve rapid acid neutralization and pain relief.
- The positive action of simethicone helps relieve the painful gas symptoms which often accompany the peptic ulcer syndrome.
- The nonfatiguing flavor and smooth, nongritty consistency of tablets and liquid encourage continued patient cooperation during long-term therapy.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) of liquid contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. **Dosage:** one or two tablets, well chewed or allowed to dissolve in the mouth, or one or two teaspoonfuls of liquid to be taken between meals and at bedtime.

EXECUTIVE SECRETARY'S NEWSLETTER

June, 1967

1967 DIRECTORY

The 1967 Directory issue of the Maryland State Medical Journal soon goes to press. If you have not returned your listing for 1967 - or have not received one - check your current listing and advise of any changes that should be carried. Such advice should be in writing and sent to the Faculty office without delay.

1967 LEGISLATION

In the latest issue of The Assemblyman, reference is made to Work Permits for Minors. The effective date of this legislation is June 1, 1967.

In addition, comment was received regarding Senate Bill 189, dealing with the prohibition on "...dispensing...of amphetamines or barbiturates...to minors." Physicians are not affected by this legislation, inasmuch as a previous section of the law specifically covers this aspect when in the normal practice of their profession.

NEWS NOTES

J. Fred Hawkins, M.D., Annapolis, has moved his office to the Lyons Professional Building, 16 Murray Avenue.

George H. Yeager, M.D., Baltimore, has been named to the Council of the Southern Medical Association.

Gilbert D. Barkin, M.D., Silver Spring, has been elected to serve as Vice Chairman, Section on Allergy, Southern Medical Assn.

David Marine, M.D., has been chosen as the President of the Maryland Thoracic Society; while Mary Avery, M.D., will serve as Vice-President; C. Murray Wylie, M.D., will act as Secretary-Treasurer.

Others elected include Allan S. Moodie, M.D., and Milton B. Kress, M.D., as members of the Executive Committee; and John Miller, M.D., as the Councilor to the American Thoracic Society.

John Wiswell, M.D., has been named Professor of Medicine; and Drs. Harold C. Dix and Albert Steiner, Clinical Assistant Professors of Otolaryngology, at the University of Maryland School of Medicine.

Peter A. Santucci, M.D., was elected Vice-President of the Guild of Catholic Psychiatrists at their Annual Meeting on May 8.

DRUG SAMPLES

One of the many worth-while projects of the Faculty's Auxiliary is that of collecting unneeded drug samples and distributing, after sorting and collating, to various needy charitable projects. These include Operation Handclasp, as well as others. Over 1,400 pounds of such samples have been so disposed of during the past year.

PHYSICIAN — PHARMACIST CODE OF COOPERATION

The Faculty, together with the Maryland Pharmaceutical Assn., is developing a joint Code of Cooperation for the two professional groups.

Interested persons and those who have suggestions for incorporation in this Code should let the Faculty office know.

REFERENCE COMMITTEE MEETING

The Reference Committee is scheduled to meet on

Wednesday, August 23, at 8:00 p.m.

in the Faculty building.

CANCER RESEARCH

National Cancer Institute has established a Cancer Research Center at the USPHS Hospital in Baltimore, as a cooperative program in therapy and research. Of particular interest for study and treatment are patients with leukemia, malignant lymphomas and a few other malignancies. The purpose of the program is to evaluate conventional and newer approaches to therapy.

Interested physicians may write or telephone:

Arthur Serpick, M.D., Medical Service,
Baltimore Cancer Research Center
USPHS Hospital, Wyman Park Drive,
Baltimore, Md. 21211 Phone: 889-4429

"When I couldn't even smell corned beef and cabbage,
I decided it was time for you, Doc."

Maybe he doesn't know when he's well off. But you might want to prescribe long-acting Novahistine LP anyway.

Two tablets in the morning and two in the evening will usually provide day and night relief by helping to clear congested air passages for normal, free breathing. Novahistine LP is formulated to provide continuous therapeutic effect for 8 to 12 hours. The decongestant ingredients help restore normal mucus secretion and ciliary activity—physiologic defenses against infection of the respiratory tract.

Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

NOVAHISTINE® LP

DOW **PITMAN-MOORE** Division of The Dow Chemical Company, Indianapolis

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

ON MAY 11, THE EXECUTIVE COMMITTEE,

Took the following actions:

1. Authorized the use of the Faculty's mailing list for a solicitation letter in connection with Project HOPE.

2. Named a representative of the Faculty to act as liaison with the Appalachia Regional Medical Program. Chosen was Benedict Skitarelic, MD, of Cumberland.

3. Suggested the name of A. Murray Fisher, MD, Baltimore, to the State Board of Health and Mental Hygiene as a nominee for the list to be submitted by that group to the Governor for possible appointment to the Advisory Council on Air Pollution.

4. Selected Paul F. Richardson, MD, Baltimore, for the Governor's Award for Employment of the Physically Handicapped.

5. Rereferred to the MEDS Committee the question of a study to probe the possibility of (a) selecting specific hospitals for handling special medical and surgical emergency problems (b) evaluation from remote parts of Maryland and (c) discussing with the US Armed Forces the use of their transportation facilities, including helicopters.

6. Considered requests for provision of legal defense, even though dues had been paid after January 31 of 1967; and expressed concern over the number of such requests with a recommendation to the Council that in 1968 and subsequent years the Bylaws be interpreted more strictly on this point.

7. Recommended Donald Drinkard, MD, Baltimore, for appointment to the Baltimore Criminal Justice Commission as a Faculty representative.

8. Authorized Stuart Christhilf, MD, Annapolis, to discuss further the question of the Upton Scott, MD, House in Annapolis which is now for sale; and to contact Historical Annapolis Inc., in connection with its possible purchase. It is to be understood that this is not a commitment on the part of the Faculty.

9. Authorized expenditure of up to $150.00 for travel for the Public Relations Committee chairman to attend the annual AMA PR Institute in Chicago, in August.

10. Authorized an expenditure of up to $300.00 for a Seminar on the Medical Aspects of Sports to be sponsored by the Faculty and the Catonsville Community College. The College is providing $200.00, the program printing and the facilities for the seminar which is to be statewide.

11. Heard a briefing on the Title 19 program and the activities of the Fee Schedule Committee in this regard, and adopted a motion of "commendation" to this Committee for its activity and ardor in pursuit of solutions to the problems involved in this program.

12. Adopted "Emergency Procedures for Maryland Schools," at the request of the State Health Department.

13. Referred to the Council a proposed joint statement on The Role of the Registered Nurse in the Care of the Patient with Cardiovascular Disease, with the recommendation that it be adopted.

From Washington

The American Medical Association proposed that Congress set up a National Commission on Health Resources and Medical Manpower with broad powers to supervise the drafting of physicians for military service.

The AMA recommendation was presented by Albert H. Schwichtenberg, MD, chairman of the AMA Council on National Security, at a Senate Armed Services Committee hearing on S. 1432 which would provide for a four-year extension of the present draft law expiring June 30.

Other AMA recommendations for modification of the doctor draft program included:

Expansion of the physician draft pool to include women doctors.

Making subject to draft call foreign physicians under 35 years of age, with permanent visas or who have subsequently become citizens, and who may not be subject to call because they were not deferred from induction while under age 26.

Limiting credit for fulfillment of the draft obligation to only service performed in the armed services. (Under the old law, service in the Public Health Service could satisfy a physician's obligation for active military duty).

Routine transfer, upon completion of an internship, of the jurisdiction of physicians to the local draft board serving the area in which the physician is engaged in training or practice.

Changes in the pay and promotion policies for military physicians designed to increase the retention of career military physicians.

"Our primary recommendation . . . is the creation of a National Commission on Health Resources and Medical Manpower," Dr. Schwichtenberg said. "This Commission would replace and be responsible for the functions of the present National Advisory Committee and the Health Resources Advisory Committee. This new Commission, under the direction of the President, would have the responsibility of maintaining a proper balance of health personnel, within existing resources, among the Armed Forces, other Government agencies, and the civilian population. Requests of the Secretary of Defense for health manpower in the military would be reviewed and approved by the Commission. The Commission would establish for the Selective Service System criteria for classifying, reclassifying and determining the order of selection for health personnel. Under this proposal, the present State Advisory Committees would be redesignated as State Health Manpower Committees, whose activities would be coordinated by the National Commission. It is further recommended that the Commission should be constituted from among persons of outstanding national reputation in the health-care fields, and its composition should include substantial representation from physicians in private practice."

A monthly summary of Washington News prepared in the Washington, DC, office of the American Medical Association.

The National Highway Agency's Tentative Standards on Emergency Medical Services

The National Highway Agency announced tentative standards for emergency medical services provided for persons injured in traffic accidents.

The Federal Standards give the states broad authority in implementation and also are subject to comment by the states before they become final. The State programs must be in full operation before Jan. 1, 1969, or a state could lose up to 10 percent of its allotted federal highway construction funds.

Although the Federal Standards apply only to traffic accidents, they are expected to necessarily set a pattern for emergency medical services generally.

William Haddon, Jr. MD, head of the National Highway Safety Agency, said the emergency care regulations are designed to provide quick response to accidents, sustain and prolong life through

proper first aid measures, reduce the likelihood of permanent disability and prolonged hospitalization, and provide speedy transportation of accident victims to hospitals.

The Federal Standards would require states to:

Appoint a full-time medical emergency services coordinator to have primary responsibility for the program.

Prepare a comprehensive plan for emergency services throughout the state.

Establish training, licensing and related requirements for ambulance drivers, attendants, and dispatchers.

Coordinate ambulance and other emergency medical care systems, including requiring ambulances to carry two-way radios hooked up with the police and hospitals.

Provide first aid training and refresher courses for emergency service personnel and policemen and firemen, and encourage first aid instruction for the public.

Other draft regulations with medical aspects:

Make physical and eyesight examinations for driver licensing.

Do compulsory blood tests for alcohol on drivers in accidents.

Reconsider Length of Stay for Foreign Medical School Graduates

John C. Nunemaker, MD, chairman of the American Medical Association's Department of Graduate Medical Education, told a House Judiciary Subcommittee that the AMA's position continues to be that graduates of foreign medical schools who come to the United States for training "should be encouraged in every possible way to return to their home countries where their skills are so badly needed."

Dr. Nunemaker suggested that the five-year length of stay provision for physicians on exchange programs be reconsidered. Every year beyond two or three years "intensifies the desire of the visitor to stay longer," he noted.

* * * * *

Two new studies in clinical pharmacology have been undertaken at Public Health Service hospitals, according to John J. Walsh, MD, Director, Division of Direct Health Services.

The studies are being carried out at the Public Health Service hospitals in Baltimore, Maryland,

When eating fads of teens or tots Lead to a sudden case of "trots"

Parepectolin for quick relief of acute diarrhea

and San Francisco, California, two of 10 general hospitals operated by the Division. The studies are jointly sponsored by the Divisions of Direct Health Services and Medical Care Administration, both in the Bureau of Health Services.

The Baltimore hospital study, for which James R. Warbasse, MD, a cardiologist, serves as principal investigator, will seek to provide information on the efficacy of various quinidine preparations in the control of cardiac arrythmias.

The subjects of the study will be monitored by a portable electrocardiographic machine for periods of eight to 10 hours while they are engaged in their normal occupations at work and at home. Recordings will be repetitive, with patients on no dosage, a placebo, and quinidine preparations of identical strength but differing manufacture. Each subject will thus serve as his own control. The study began this month and will continue for at least a year. Subjects will be drawn from among Public Health Service hospital patients and from patients referred by community hospitals and private physicians in the area.

It has a number of objectives. The primary objectives are to study the physiologic availability of certain prefabricated medications and to study physiologic availability of certain drugs that are marketed in prolonged action formulations.

A consequent objective will arise if significant variations of such availability are encountered. In that event, the study will attempt to lay the groundwork for the development of physiologic availability standards, which do not now exist.

AAMA ANNOUNCES MEDICAL ASSISTANT SCHOLARSHIPS

Loans for medical assistant training are now available from the Maxine Williamse Scholarship Fund, sponsored by the American Association of Medical Assistants. Each loan is for $300. As AAMA assumes all administrat ive costs, there

From Oklahoma

National authorities in the field of sports medicine will be lecturers at a special postgraduate course of the American Academy of Orthopaedic Surgeons.

Invited to attend the three-day course of lectures and audio-visual demonstrations are orthopaedic surgeons, general physicians, high school and college team physicians, and others with a medical interest in the care of the athlete. It is to be sponsored by the Academy's Committee on Sports Medicine in cooperation with the United States Olympic Medical and Training Services Committee and the Department of Orthopaedic and Fracture Surgery, University of Oklahoma School of Medicine, Oklahoma City.

Chairman of the course is Don H. O'Donoghue, MD, Chairman of the Orthodpaedic and Fracture Surgery Department at the medical school. The faculty is composed of distinguished lecturers from 14 states and Canada as well as members of the University staff.

Lecturers will discuss in depth topics including altitude and other medical problems related to the 1968 Summer Olympic Games in Mexico City, the adolescent athlete, competitive swimming, the anthropology and physiology of endurance runners, mechanics of running, the use and misuse of drugs in athletics, and effects of vigorous athletic activity on women.

A symposium on the arm in such throwing sports as baseball, javelin, shot putt, and discus will feature talks on shoulder joint and muscle injuries, elbow injuries and the aging pitcher. A special day-long forum will be devoted to diagnosis and treatment of knee injuries.

Members of the American Academy of Orthopaedic Surgeons' Committee on Sports Medicine speaking at the course will be its Chairman, Jack C. Hughston, MD, Columbus, Georgia; or-

thopaedic surgeon and orthopaedic consultant to Auburn University, Auburn, Alabama; Don H. O'Donoghue, MD, Fred L. Allman, Jr., MD, orthopaedic consultant, University of Georgia, and President-elect, American College of Sports Medicine; Martin E. Blazina, MD, Los Angeles, Assistant Professor of Surgery, UCLA; Bruce J. Brewer, Associate Clinical Professor of Orthopaedic Surgery, Marquette University School of Medicine, Milwaukee, Wisconsin; Joe W. King, MD, head, Division of Orthopaetic Surgery, Baylor University College of Medicine, Houston, Texas; Edmond J. McDonnell, MD, Associate Professor, Department of Orthopaedic Surgery, Johns Hopkins University School of Medicine, Baltimore; James A. Nicholas, MD, Assistant Professor of Clinical Surgery, Cornell University Medical College, New York; Fred C. Reynolds, MD, Professor, Orthopaedic Surgery, Washington University School of Medicine, St. Louis; and Donald B. Slocum, MD, Eugene, Oregon, orthopaedic surgeon and chairman of the A.M.A. Committee on the Medical Aspects of Sports.

For application forms and further information, physicians are asked to write to Dr. Don H. O'Donoghue, 1111 North Lee Street, Oklahoma City, Oklahoma 73103, or to the American Academy of Orthopaedic Surgeons, 29 East Madison Street, Chicago, Illinois 60602.

FAMOUS BRITISH PHYSICIAN TO RECEIVE AWARD

Cicely D. Williams, MD, FRCP, London, is to be the 1967 recipient of the Joseph Goldberger Award in Clinical Nutrition. The Goldberger Award of $1,000 and a plaque is presented annually by the Council on Foods and Nutrition of the American Medical Association and the Nutrition Foundation, Inc., to a physician who has made significant contributions to the knowledge of nutrition. Reciepients are nominated by the Council and selected by the AMA Board of Trustees.

Dr. Williams will receive the award June 21 at the Scientific Awards Dinner to be held during the American Medical Association's Annual Convention in Atlantic City, NJ.

Perhaps more than any other person in the world, Dr. Williams is responsible for improvement of child and maternal health in developing nations. Her investigations in Africa during the

AMA Archive-Library

A young intern, hoping to practice medicine in East Africa after receiving his license, wants to correspond with medical people already practicing there and needs names and addresses. He writes to the American Medical Association Archive-Library for assistance.

A doctor, well established in a practice he has maintained for twenty years, finally gets the opportunity to take his wife on their dream tour of Europe. They will be in Switzerland in July. He wonders if there will be any medical meetings he can attend in Switzerland during their visit. He writes to the Archive-Library for information.

A general practitioner has a patient, a 17-year-old girl, who is planning to attend a year of school in Guatemala. She is a potential surgery patient. He is concerned about the type and quality of medical service available in the region. He writes to the Archive-Library for help.

You could be any one of these *AMA* members who benefit from the services of the *AMA* Archive-Library, just one dividend of your *AMA* membership. The Archive-Library services to members include conducting medical literature searches and compiling bibliographies free of charge. Another available aid of great value, the Library's photocopy service, is also free to you. Any article from any journal to which the Library has access can be copied and sent to you for your files.

The Library handles from 1,500 to 1,800 requests similar to those above for information and publications from physician members every month.

Questions and requests may range from the treatment of chlorine inhalation or statistics on human longevity to the latest treatment for Scleroderma or Raynaud's Disease to plans for the mass treatment of large numbers of burned patients.

The *AMA* Archive-Library upholds the traditional role of the medical library as an adjunct to the postgraduate education of the physician in practice, but it is even more than a library. It is a complete information center.

As a national medical society library, the Archive-Library is able to provide services not normally available on the local level. A more complete collection of materials allows the Library to supplement local library service. In addition, several special subject collections cover thoroughly such topics as international health, history and the sociology and economics of medicine. The *AMA*'s collection on the sociology and economics of medicine is the best in the world. It contains almost all the English language publications and includes opinions reflected in mass media as well as in scholarly works.

At the core of the Library is a collection of current medical publications. Today, 2,200 journals are received on a regular basis. This is twice the number contained in any average medical school library. These represent all the major publications in medicine and the allied sciences. In addition to the periodicals, the Library contains 40,000 books. This makes the Archive-Library one of the most complete current medical libraries you will find any place.

Of course your needs and requests determine the Library's content. The quantity and type of periodicals and reference books contained in the Library are guided by your requirements and those of the *AMA* staff.

Perhaps the one thing above all others which sets the *AMA* medical Library apart and makes it a true information center is the availability to the Library staff of a unique resource unavailable at many other medical libraries—the professional staff members of the AMA's 20 scientific departments. "The professional staff is here and we can

use them," Susan Crawford, director of the Archive-Library, says. "Few other libraries have this type of consultation available. When a doctor writes to us and wants medical opinion or judgment, his question is referred to a consultant on the *AMA* staff, or to one of many specialists in the country, through the Questions and Answers Department of *JAMA*."

Such referrals are made in numerous areas such as medical physics, cardiology, psychiatry and drug therapy. Physicians on the *AMA* staff evaluate information for you before it is ever delivered.

For example, a question on drugs which requires clinical and pharmacological judgment is routed to the *AMA*'s Department of Drugs. The staff in that department can research all available

material on the subject and isolate the exact information you need.

The 26 members of the Archive-Library staff will go to great lengths to give you the information you need, and they are fully qualified to do so. They are especially trained to communicate with physicians—they speak your language. Half of the staff have graduate degrees in various areas and many have two masters degrees, one in library science and another in a chosen field such as economics, history or the biological and social sciences.

If you are a history buff, one of the more interesting areas of the Library is the Archive Section which houses documents and artifacts on the history of American medicine and the *AMA*. If you are at all interested in the progress of organized medicine, in the *AMA* or in tracing your ancestry or doing other historical research, the Archives hold a wealth of information for you.

The Library is always improving and enlarging its facilities. The last addition to the services was the International Health Section which has made it possible for all of the Library services to follow you, as a member of the *AMA*, wherever you go, whether it be the remote mountain stretches of West Pakistan, the rain forests of Brazil or a center of civilization such as Paris.

If you are planning an overseas trip or sabbatical, to set up practice or to attend a meeting or congress, the Library can give you all the information you need on foreign medical organizations, hospital and medical facilities in various countries, living conditions, what you should bring and the locations of the nearest American physician in any country.

The staff can also furnish you with information on a comprehensive and up-to-date listing of medical meetings outside the United States. After you are situated abroad the Library will continue to provide you with research facilities and photocopy services on specific medical subjects just as they did when you were stateside.

Any of the services of the Archive-Library are available to you by mail.

Copies of a "Guide to Services of the Archive-Library Department," a 16-page pamphlet, will soon be available through the *AMA* for your further information on this *AMA* service.

Tandearil®
oxyphenbutazone

Therapeutic Effects: Tandearil is a nonhormonal compound which may rapidly resolve inflammation and help restore normal joint function. Its action does not affect pituitary-adrenal function or impair immune responses. Its value in osteoarthritis is especially noteworthy because this disorder responds inconsistently to steroids and is often resistant to salicylates. Further, indomethacin is limited only to osteoarthritis of the hip, whereas oxyphenbutazone is effective in all forms of the disease.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage. Make regular blood counts. Discontinue the drug and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, or a generalized allergic reaction may occur and require withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Osteoarthritis: The initial daily dosage in adults is 300-600 mg. in divided daily doses. When improvement occurs, dosage should be decreased to the minimum effective level; this should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. daily.

For complete details, please refer to full prescribing information. 6562-VI(B)R

Availability: Tablets of 100 mg.

TA-4919 PC

Why these 7 patients wit
moderate to severe anxiet
may respond better to Mellari

1. The agitated patient.
Anxiety—particularly that beyond
range of minor tranquilizers—f-
quently is expressed as gross mo
restlessness, fidgetiness and purpo-
less movements, and may erupt i
aggressive behavior. Mellaril is
most a specific for those patie
whose anxiety follows such a patte

The psychosomatic patient.

ıe family physician is rarely given e diagnostic luxury of a classic, xtbook "anxiety state." Most often must probe for anxiety masked by functional disorder—or which exacbates a somatic problem. Doubleind evaluations have demonstrated at Mellaril can be a significant adnct in the treatment of such patients.

. The patient under ituational stress.

Iellaril helps the patient deal with :resses of everyday life. Nonhabituting, it can be given for extended peiods of time. It does not "separate" ıe patient from practical problems nd pressures, does not induce euphoia or a fuzziness which can compromise the ability to cope with realities. Rather, it helps the patient move more competently in his daily world by eliminating useless tension, by allowing him to conserve emotional resources and energies, and to direct them against the problems really worth worrying about.

4. The menopausal patient.

The woman who sees change of life as the end of useful life requires support from both family and family physician. Whether the psychological impact of menopause is directly related to hormonal changes, or merely coincidental, is debatable, but estrogenic therapy is frequently inadequate. Mellaril is a useful aid for these patients and, alone, or in combination with reduced estrogen dosage, will help ease the menopausal misery.

5. The previously hospitalized psychiatric patient.

Such a patient may still require the type of medication he has been accustomed to, but because he is no longer in a controlled setting the acceptable level of adverse reactions must be lower. In such circumstances Mellaril is perhaps the drug of choice.

6. The agitated geriatric.

Tranquilizer therapy in the elderly patient always involves special (or at least accentuated) problems: the possibility of drug-induced ataxia, hypotension or depression, for example, assumes an additional significance. These reactions have rarely been observed in geriatric patients treated with Mellaril.

7. The constantly returning patient.

The anxiety patient who has not responded to a minor tranquilizer is not very likely to benefit from your minor tranquilizer of second choice. A major tranquilizer, such as Mellaril, may be indicated in such patients.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.
Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.
Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.
Before prescribing, see package insert for full product information.

Mellaril®
(thioridazine)

SANDOZ

Bartholin's gland
Periurethral glands
Cervical glands
Flagyl®
brand of
metronidazole
Seminal vesicles
Bladder
Prostate gland

estroys richomonads Wherever hey Are

Flagyl seeks out the sites where trichomonads hide. Only a systemic agent can. Flagyl does, selectively and effectively.

Flagyl destroys trichomonads in the inner crypts, glands and cavities of the genitourinary tract in both women and men. Consequently, Flagyl is capable not only of curing trichomoniasis in women but also of preventing reinfection.

Correctly used, with due attention to repeat courses of treatment for resistant, deep-seated invasion and to the presumption of reinfection from male consorts, Flagyl has repeatedly produced up to 100 per cent cure in large series of patients.

When the diagnosis of trichomoniasis is positive, Flagyl is positive.

Dosage and Administration — In *women:* one 250-mg. oral tablet three times daily for ten days. A vaginal insert of 500 mg. is available for local therapy when desired. When used, one vaginal insert should be placed high in the vaginal vault each day for ten days; concurrently two oral tablets should be taken daily.
In *men* in whom trichomonads have been demonstrated: one 250-mg. oral tablet twice daily for ten days.

Contraindications — Pregnancy; disease of the central nervous system; evidence or history of blood dyscrasia.

Precaution—Complete blood cell counts should be made before, during and after therapy, especially if a second course is necessary.

Side Effects—Infrequent and minor side effects include nausea, metallic taste, furry tongue and headache. Other effects, all reported in an incidence of less than 1 per cent, are diarrhea, dizziness, vaginal dryness and burning, dry mouth, rash, urticaria, gastritis, drowsiness, insomnia, pruritus, sore tongue, darkened urine, anorexia, vomiting, epigastric distress, dysuria, depression, vertigo, incoordination, ataxia, abdominal cramping, constipation, stomatitis, numbness of an extremity, joint pains, confusion, irritability, weakness, flushing, cystitis, pelvic pressure, dyspareunia, fever, polyuria, incontinence, decreased libido, nasal congestion, proctitis and pyuria. Elimination of trichomonads may aggravate candidiasis.

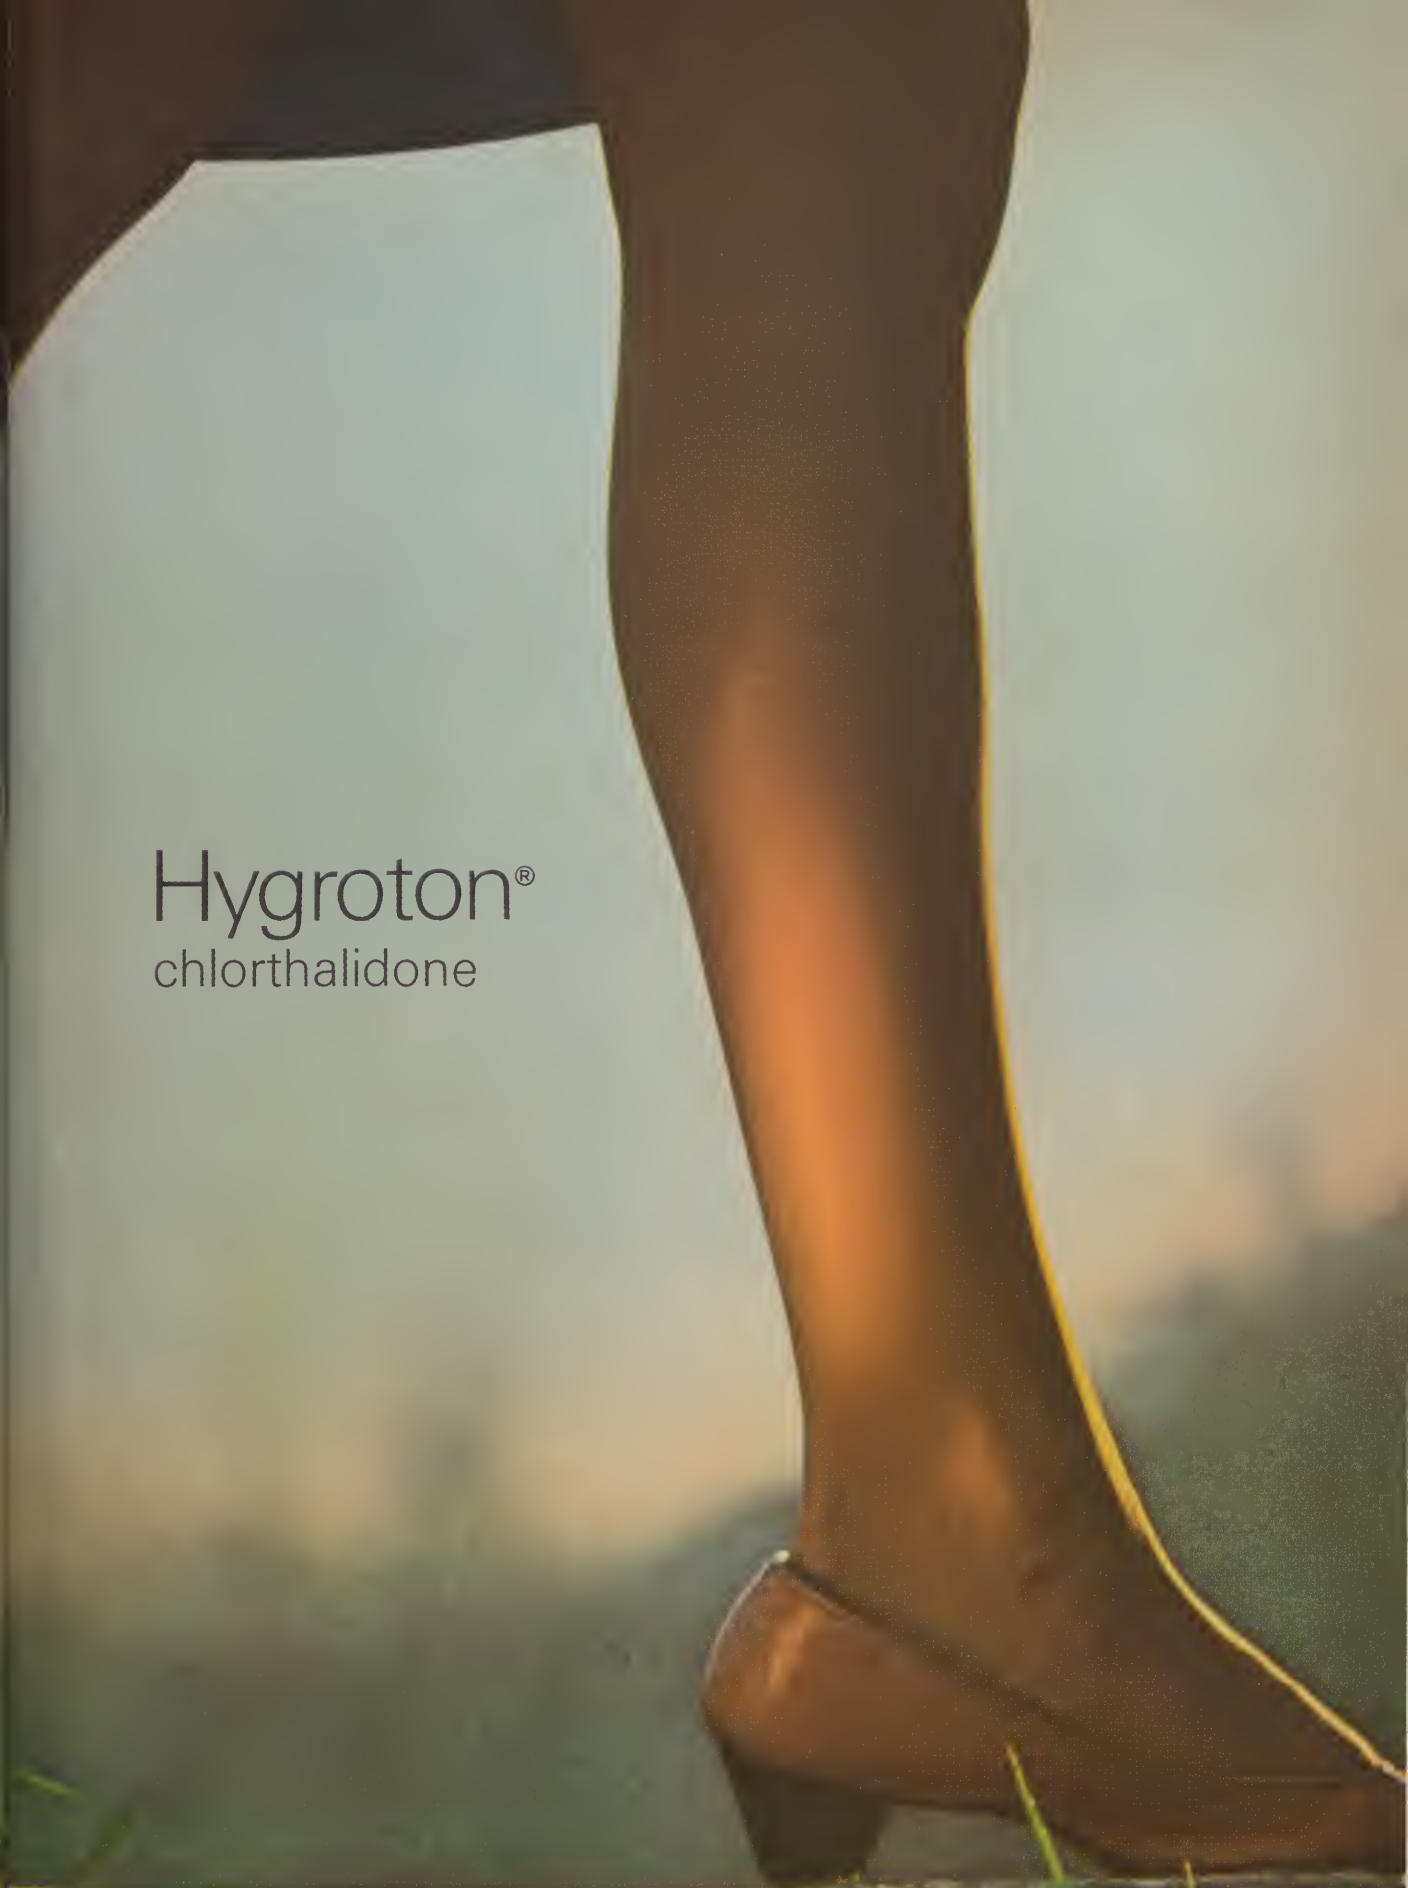
SEARLE *Research in the Service of Medicine*

Did Dorothy Larson show you her ankles in private? Now she shows them in public.

Your office examination would have confirmed that Mrs. Larson was up to her knees in edema. Her heart was beginning to fail. And her ankles had disappeared under an inch of salty water.

Along with digitalis, you might have prescribed Hygroton. To get rid of the edema. And to keep it from coming back. And you prescribe Hygroton the same way you usually prescribe digitalis: just once a day.

Tablet for tablet, Hygroton is just about the most effective diuretic going. And it costs a fraction of what Mrs. Larson would have to spend for equivalent therapy with short-acting diuretics.



In fact, Hygroton is an awfully nice way to treat the Mrs. Larsons in your practice. Just tell them you can get their ankles back at half price.

Indications: Hypertension and many types of edema involving retention of salt and water.
Contraindications: Hypersensitivity and most cases of severe renal or hepatic disease.

Warning: With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihyper-

tensive agents by at least one-half. Discont
BUN rises or liver dysfunction is aggravated
imbalance and potassium depletion may oc
special care in cirrhosis or severe ischemic

Hygroton®
chlorthalidone

...tients receiving corticosteroids, ACTH, or digi-
Salt restriction is not recommended.
Effects: Dizziness, weakness, nausea, vomiting,
...glycemia, hyperuricemia, headache, muscle cramps,
postural hypotension, constipation, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin reactions, including urticaria and purpura, epigastric pain, or G.I. symptoms after prolonged administration.

Average Dosage: One tablet (100 mg.) with breakfast daily or every other day.
Availability: Tablets of 100 mg. 6524-V(B)
For full details, see prescribing information.

. . .so you might say Hygroton is good public relations for Mrs. Larson

Because it gets her *out* in public in the first place. At 43, Mrs. Larson worries about appearances and swollen ankles don't help.

But Hygroton's cosmetic effect is only half the story. Hygroton and digitalis therapy helps her get back in the swing of things. Gives her a second wind. Gets rid of the extra pillow she needed for a good night's sleep. Now she even likes to take walks. Just for the fun of it!

When her troubles began, Mrs. Larson thought they were the signs of the change of life. It's a change all right, but one you can treat. And you can count on Hygroton to help keep her in public instead of in the hospital.

CONSOLIDATED . . . . .

solves your billing and collection problems

- Touch-tone card dialer transmits service and fee data quickly, easily
- Consolidated handles all billing and collection
- Physician receives payment in full within one week
- Moderate service charge

A complete billing service

Consolidated Services is a centralized billing and collection service which places the physician on an immediate cash basis. Using a touch-tone dialer and prepunched data cards (supplied by Consolidated) your record of patients, services, and fees is transmitted in seconds. Consolidated does the rest, and remits fees in full to the physician (less a modest discount) within one week from billing date.

How the physician benefits

The physician is relieved of all billing and collection, stationery, postage and clerical costs. AND accounts receivable are turned into immediate cash!

Optional payment plans

Five payment plans are available to physician and patient, including: Straight billing, 90-day payment at no extra charge to patient. . . .

You have a choice of Billing
On Your Personal Billheads
Or
On Group Billheads

Modest cost

Consolidated applies a basic service charge of only 5% to 7% dependent upon size and volume of practice. No cost for equipment, supplies, reports, etc.

For complete information, call for appointment. Phone 486-4984/8935

THE OUTPATIENT EXPLOSION

GILBERT A. SANFORD
Associate for Research and Planning
Hospital Council of Maryland, Inc.

Everyone knows it is happening but few know the extent to which the use of outpatient clinics and emergency rooms has increased in recent years. This article will describe what has happened in Maryland hospitals in the last several years and will suggest possible projections to 1970. It will also inquire into some of the causes for this tremendous increase.

As stated by Rudolf J. Pendall, executive director of the Hospital Council of Maryland, in a discussion of the situation in outpatient departments, "There is a paucity of everything except patients." The number of patients has increased rapidly in recent years, often beyond the capacity of hospitals to handle them adequately. Reimbursement has been inadequate, often below costs, although this is improving. The quality of care has been spotty, and too often the vertical patient has been considered a second-rate patient. This is not intended as an indictment of outpatient departments; frequently they have performed major or minor miracles, and usually they have offered dedicated service to mankind under very trying circumstances.

THE SITUATION IN MARYLAND

A list of hospitals having an emergency room and/or organized outpatient clinics is presented in Table 1. The Baltimore metropolitan area appears to be adequately supplied, with 17 emergency rooms and 18 hospitals having a variety of organized outpatient clinics. Eleven of these hospitals are planning to expand their outpatient departments. In the remainder of the State, outside of the Baltimore metropolitan area, there are 25 general hospitals all with emergency rooms. Seven of these general hospitals plus the Veterans Administration Hospital at Perry Point have organized outpatient clinics. Twelve expect to expand their outpatient departments. In this survey, no attempt was made to gauge the quality of care in the emergency rooms, but it seems obvious that in the smaller hospitals where the emergency rooms are staffed by physicians on call, the quality and immediacy of treatment in an emergency are not always of the same quality that might be expected in a hospital where there is full-time medical staff coverage.

The increase in outpatient and emergency room visits across the nation is now too well-known to be called a phenomenon. The national picture is portrayed this Table 2, which shows the number of outpatient and emergency room visits in short-term hospitals throughout the United States for the four years beginning with 1962. A similar picture is shown for Maryland in Table 3, in which the outpatient visits to Baltimore hospitals

and to non-Baltimore hospitals are shown for 1960 and 1965, and estimated for 1970. Also shown in the Table are the number of inpatient days for the same years in the same group of hospitals. It must be understood that inpatient days are not strictly comparable with out-patient visits, but presenting both sets of data does permit a comparison of trends. Figure 1 and 2 show the increase in outpatient visits to Baltimore hospitals in a more graphic manner. Figures 3 and 4 present the same type of information for hospitals outside of the Baltimore metropolitan area.

The increase in outpatient visits in the last 10 to 15 years is shown for a few selected hospitals in Baltimore in Table 4. The selection of these hospitals was made for the pragmatic reason that the data were available. It should be noted here that in most of the tables presented, the outpatient clinical visits have been combined with the emergency room visits. This has been done because the

Table 2
OUTPATIENT AND EMERGENCY ROOM VISITS IN U S SHORT-TERM GENERAL HOSPITALS AND OTHER SPECIAL HOSPITALS *

Year	Number of Visits
1962	70,727,474
1963	85,764,089

1965	92,631,497

* "Hospitals, JAHA," Guide Issue: 1963, 1964, 1965, 1966.

data are not entirely reliable when separated. In many instances a patient comes to an emergency room and is recorded as a visit, but is actually sent to an outpatient clinic. The practices vary enough from hospital to hospital to render these data not completely comparable. The total outpatient visits are considered reliable, however.

Why The Explosion?

With the situation in Maryland hospitals clarified, it becomes necessary to look at the "why." Someone is reported to have asked the notorious Willie Sutton why he robbed banks. He replied, "Because that's where the money is." This seems to have some application to the outpatient problem

in hospitals. People go where the medical services are.

Studies have been made to determine the cause of the outpatient explosion. To some extent, these studies merely state the obvious. The doctors themselves are one major reason why more and more people are going to outpatient clinics. In fact, many patients are referred by the physician. Physicians are unwilling to make home visits, and instead they refer patients to a hospital. There is also the undeniable fact that the outpatient department of the community hospital has much more equipment than the physician can have in his own office. The decrease in the actual number of general practitioners in most cities is another factor.

A survey of outpatient department usage was made in 22 hospitals in Michigan in 1965.[1] The researchers found that 46% of the patients who went to an outpatient department in a given period of time had first phoned a physician. Of this group, 35% had been instructed by the physician to go to the hospital or to meet him at the hospital. Traumatic injuries accounted for 57% of all the persons who went to an emergency room. Of the remaining non-traumatic cases certainly some could be considered emergencies. Of the traumatic cases, 34% tried to reach a physician before going to a hospital.

In the large urban areas, the increased mobility of the population has contributed to an increase in outpatient department usage. Large numbers of people in the economically disadvantaged areas of cities have no family physician, and people who have recently moved into a city, or who frequently move from place to place within a city, find it difficult to establish a relationship with a physician even if they so desire. For those patients with Blue Cross or other types of medical insurance, there is sometimes an incentive to obtain medical treatment at a hospital rather than in a physician's office because the third-party payer does not always include private physician office visits in the list of benefits.

What is an emergency? The lay person is apt to define a medical situation as an emergency when the doctor would not define it as such. To the person suffering from a sprained ankle, or a toothache, or a migraine headache, the situation may very well be an emergency, but the doctor in the emergency room will not so define his condition. On the telephone, the determination of what is an emergency becomes even more difficult. The person who phones his physician and complains of a pain in his chest may have indigestion or may be suffering from a coronary attack, and the safest procedure for the doctor is to tell the patient to go to the emergency room of the nearest hospital.

The outpatient department has been called the supermarket of modern medicine. It provides a variety of types of care to large numbers of patients. It is often impersonal, and has been referred to as casual medicine. It is, in contrast to the private "appointment and referral" type of medicine, practiced by many modern physicians.

What Of The Future?

Where are we going in our outpatient departments? There seems to be no doubt that more medical care will be given at the hospital. The charts in Figures 1 and 2 attempted to project the

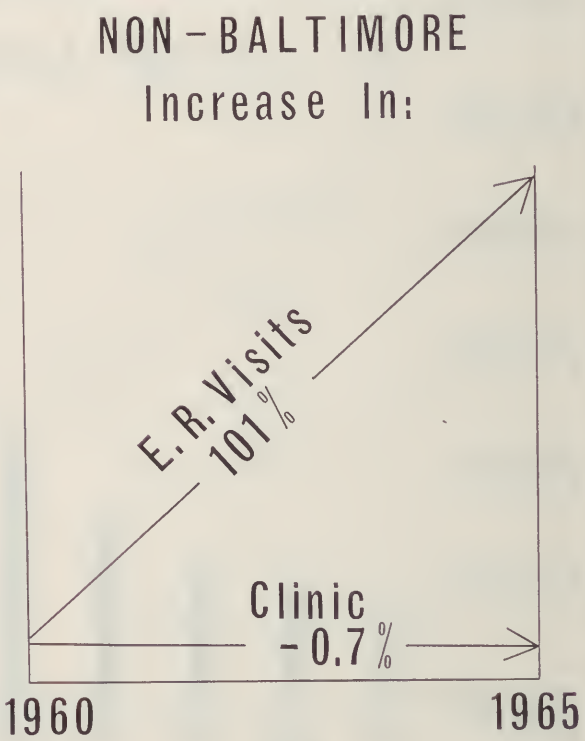

Fig 4
Increase in Clinic and Emergency Room Visits 1960-1965, Non-Baltimore Hospitals

Table 4

OUTPATIENT VISITS (INCLUDING EMERGENCY ROOM) TO SELECTED BALTIMORE HOSPITALS

Hospital	Year	Visits	Percent Increase in Last 10 Years
Baltimore City Hospitals	1952	59,347	
	1955	77,257	
	1960	86,515

Mercy Hospital, Inc.	1950	25,502	
	1955	29,097	
	1960	46,168	
	1965	49,404	69.8%
The Union Memorial Hospital	1946	21,143	
	1951	25,157	
	1956	38,042	
	1961	54,039	
	1966	66,601	75.1%
University Hospital	1950	128,764	
	1955	153,478	
	1960	177,005	
	1965	195,512	27.4%

number of outpatient visits in 1970 in Baltimore and non-Baltimore hospitals. The slope of the curve may be questioned but all indications seem to point to continued and possibly greater increases in utilization of outpatient facilities, including emergency rooms. There have been hospitals around the nation that have atempted to stem the tide by publicity in the newspapers and by brochures explaining the proper use of emergency rooms and outpatient departments. These attempts have been almost completely unsuccessful. The person who has what he considers an emergency condition is not going to heed the suggestion that he should seek medical treatment from his own physician first if the hospital is more convenient.

Doctors have divided opinions on this situation. There are those who think the emergency room should be used strictly for emergencies and that most of the remainder of medical practice should be performed in the doctors' offices. On the other hand, there are those who think that the hospitals are not performing the service they should be performing and that the outpatient departments should play a major role in the medical care of our people. The vertical patient, they say, should be considered as even more important than the horizontal patient: the better and more complete the treatment given to the vertical patient, the fewer horizontal patients there will be in hospital beds. The doctor's office, in or next door to the hospital, seems to make eminent good sense.

This article was not intended as promotion for a cause. It was presented to summarize what is happening in Maryland hospitals. We can only conclude, however, that the center of medical attention for most of the population is becoming the hospital. It seems apparent that more and more medical complexes will consist of inpatient centers, outpatient departments including emergency rooms, and doctors' offices. Other ancillary services may well be added to the principal services. It can be said, with considerable assurance, that this trend will continue.

MEDICAL CARE: THE NEXT DECADE IN THE PUBLIC-PRIVATE PARTNERSHIP

PHILIP R. LEE, MD
Assistant Secretary for Health and Scientific Affairs
US Department of Health, Education, and Welfare

Medical practice has changed greatly. Yet the judgment is widely expressed, in and out of medicine, that the changes have not been profound enough to keep pace with the growth of medical knowledge and the rise of society's expectations and demands. The current problems of medicine are in large measure problems created by its own success.

It is a pleasure to meet with you to discuss a subject that I believe is of mutual interest—the next decade in the public-private partnership in medicine.

In order to view the present and future relationships in context I think it is essential that we be aware of the many forces at work in our society which have an important influence on medicine.

The recent report of the Citizens Commission on Graduate Medical Education, commissioned by the American Medical Association, provides much food for thought on this subject. I would like to quote from the Introduction of the Report:

> Medical education and the practice for which it gives preparation face problems quite different in kind but nearly as profound as those which concerned Abraham Flexner half a century ago. When Flexner wrote, medical education and practice were suffering from the lack of a solid, scientific base. Now, the scientific base not only exists but has grown so explosively that it has outrun much of medical practice. Then, medical education suffered from the lack of effective standards. A problem of today is the complexity, the fragmentation, and the inflexibility of standards for graduate medical education. When Flexner conducted his inquiry into medical education, the public was little concerned. Now the public is deeply concerned.
>
> The informed public knows of the revolutionary development in medical knowledge, of dramatic advances in surgical skill, and of new vaccines and "miracle" drugs. Knowing all this, society expresses its grateful appreciation by spending much more on medical services and by generously supporting research that is confidently expected to lead to still greater medical achievements.
>
> The informed public also knows, however, that a wide gap exists between the best that medicine can offer and the lesser services actually available to many patients.

In reviewing the major trends in medical education and practice the Commission highlighted the following trends as of particular significance:

1. Increasing knowledge and the resulting increase of specialization;
2. Rising expectations and demands for medical and health care;
3. The changing geographic distribution of the population; and
4. The increasing institutionalization of medical practice.

I would modify this list only slightly, emphasizing:

1. Sustained economic growth and a rising per capita income;
2. Increasing expenditures for health and medicine, both in absolute terms and as a percentage of gross national product or disposable income;
3. The growth of private health insurance;
4. Federal support of biomedical research, health manpower development and health facilities construction; and
5. Federal programs to reduce or eliminate financial barriers to medical care.

It is against this backdrop of change that I

Delivered at the 169th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland, The Alcazar, Baltimore, April 20, 1967.

shall discuss the public-private partnerships that have developed in the past 30 years. I will emphasize the role of the federal government and the private sector, because it is this relationship that is exerting the major influence today.

The federal government's role in medical care actually pre-dates the Constitution. The US Army medical services trace their origin to the Revolutionary War. The United States Public Health Service, our major domestic health agency, had its origins in 1798 with the organization of medical care services for merchant seamen. The Civil War saw an expansion of medical care programs for veterans, and it was during this period that Saint Elizabeths Hospital, a federal mental hospital, opened its doors.

The present role of the federal government in domestic health programs did not really begin to take shape until 1935, with the passage of the Social Security Act. The Social Security Act, in addition to establishing the Old Age Survivors and Disability Insurance program, established federal grants to the states for maternal and child health services, crippled children's services, public health and public assistance programs. This pattern of federal-state grant-in-aid programs was followed for the next 30 years, with over 20 separate grants now in effect for the support of state and local public health programs.

The National Cancer Act, enacted in 1937, was perhaps the single most important health bill ever enacted by Congress. This law formed the basis of federal support for biomedical research in the United States, and it resulted in one of the most fruitful public-private partnerships now in existence. There is little question that the scientific and technological developments in medicine in the past 30 years are the single most important influence on medical education and medical services.

The National Cancer Act created a mechanism for the support of research by able investigators in non-federal institutions, and it also established an intramural program that was to grow and become the world famous National Institutes of Health. In these 30 years a strong partnership between the federal and non-federal institutions and scientists has been established.

The Public Health Service Act of 1944 extended the basic principles established in the National Cancer Act, and gave to the Surgeon General broad authority to support research related to health and disease.

The next step occurred in 1946 with the passage of the Hospital Survey and Construction (Hill-Burton) Act. In this legislation another unique public-private partnership was established. In this case federal funds were made available to state governments; these, in turn, made them available to non-profit, voluntary community hospitals, nursing homes and other health facilities. The results are known and appreciated in the more than 3,000 communities in this country where new or remodeled health facilities exist because of the program. In the 20 years of the Hill-Burton program almost 350,000 hospital and nursing home beds have been constructed. Like our program of biomedical research, the primary result of this program has been to strengthen the private sector and the non-federal partnership in our vast health industry.

The period from 1946 to 1960 saw little fundamental change in the federal role in medicine, although there was significant and rapid growth in federal support for biomedical research and research training.

The Kerr-Mills law of 1960 established the principle that a person did not have to be on public assistance in order to receive aid for the payment of medical services. This was a federal-state program, which built on previous public assistance medical care programs and which became the base for the 1965 Social Security Amendments that established a single category of medical assistance.

The federal role in consumer protection assumed a new dimension in 1962 with the enactment of the Food and Drug Amendments that year. The law required that a drug manufacturer demonstrate not only the safety but also the efficacy of a new drug. Safety had long been a requirement, but it had never been necessary to prove efficacy prior to that time.

It was not until 1963 that the federal government was authorized to provide funds in direct support of medical education. Since that time, passage of the Nurse Training Act of 1964 and the Allied Health Professions Personnel Training Act of 1966 extended this support to all the health professions. The federal government also provides support for all other levels of health occupations training through the Vocational Education Act, the Manpower Development and Training

Act, and the Economic Opportunity Act.

The federal role in financing medical care was dramatically altered in 1965 with the enactment of the Social Security Amendments. Medicare established a program of hospital and medical insurance for all those aged 65 and over, as a matter of right. The Medical Assistance Program established a single category of medical assistance, rather than the multiple categories for the aged, the disabled, the blind and families with dependent children that had previously existed. This program was aimed at providing the poor with the same quality and scope of medical services available for the bulk of the population. Again, we find the federal programs strengthening those of state and local governments as well as the private sector.

Both program planning and the strengthening of state and local initiative received special emphasis in the Heart Disease, Cancer and Stroke Amendments of 1965 and the Partnership for Health Amendments of 1966. The Partnership for Health Amendments provide funds for the creation of a state health planning agency and an advisory council to bring together the various private and public groups involved in health and medicine today, in order that better judgments can be made on the development and utilization of resources.

The Heart Disease, Cancer and Stroke Amendments provided a mechanism for the development of regional medical programs to speed the flow of knowledge and improve the services at the patient's bedside. Again, this legislation recognized the importance of decentralization and of cooperation between the various elements in the private sector—private physicians, medical schools and university hospitals, non-profit and community hospitals, and voluntary agencies—with those of state and local government.

I have traced the development of the federal role in health and medicine as it has been evolving over the past 30 years, and as it has been reflected in laws enacted by the US Congress.

The pace has quickened in recent years, particularly since 1963. In the short period of four years, 24 major new health laws have been enacted, and a number of other laws in civil rights, traffic safety, education, housing and urban development, and other fields have been enacted that will have a profound impact on medical research, medical education and medical care.

The federal role in health and medicine is now expressed through six broad areas:

1. Programs designed to advance research in the cause, prevention, treatment or care of diseases, defects and disabilities;
2. Programs to meet the manpower, facility and other resource requirements of the health industry;
3. Programs designed to stimulate local, regional and state initiative and improve the effectiveness of federal, state and local government efforts in public health;
4. Programs designed to remove the financial barriers to health care;
5. Programs to improve the quality, availability and effectiveness of health services; and
6. Programs designed to protect the consumer, and to reduce the hazards in, and improve the quality of, our environment.

The effectiveness of each of these approaches needs to be carefully, objectively and critically assessed. The role of the federal government in each of these areas has been growing. In some cases the results have been brilliantly successful. In other areas the results have yet to be assessed. In each case, however, we must ask ourselves why have the people—through laws enacted by Congress—taken this course. The growth in federal support for these programs is a reflection of the magnitude and rate of change of the federal role in health and medicine.

Support for biomedical research has increased from $8 million to $800 million in the last 20 years. Federal support for biomedical research has been thoroughly examined and evaluated. The most recent study was that completed under the direction of former Supreme Court Justice Whittaker. Perhaps the most comprehensive analysis was that done a few years ago under Dean Wooldridge. The programs have also been scrutinized by various Congressional committees. In general, the programs have received high praise—praise, in my opinion, which is well deserved. There is little question that our present biomedical research effort is exerting a profound influence for change in our system of medical education and in our system of delivering medical services.

Support for the development of manpower and facilities will exceed $1.3 billion in fiscal year 1968, if Congress appropriates the funds that

have been requested. This represents a $500 million increase in federal expenditures for health manpower and facilities in the past three years.

The federal role in health manpower now covers support for the full spectrum of the health team, from the highly trained medical specialist to the home health aide or auxiliary health worker. All have essential roles to play in providing the services needed.

Federal support for construction of facilities has been provided primarily through the Hill-Burton program. This highly successful public-private partnership has been largely responsible for the revitalization of our hospital system since World War II. In the 20-year period from 1947 to 1967 during which this program has been in effect, federal funds have contributed to the construction of almost 350,000 hospital and nursing home beds.

In spite of great progress in hospital construction, we face major problems: the urban hospitals require major modernization and renovation; new beds must be built; new types of facilities, particularly for ambulatory services, are urgently needed.

In addition to the Hill-Burton program, there are federal programs supporting the construction of university medical centers, community mental health centers and mental retardation treatment facilities, mortgage guarantees for group practice facilities, and a number of other related programs.

Support for state and community programs covers a wide range of activities. The President has requested new authorizations in this area that would permit expenditures of $170 million in 1968, an increase of almost $60 million over funds now available through categorical grant-in-aid programs. This proposal, termed the "Partnership for Health," was enacted last year by Congress and a four-year renewal is being requested.

Regional medical programs, established by the Heart Disease, Cancer and Stroke amendments, are now in the planning stage in over thirty regions. Programs are expected to be in operation this spring in four of these areas. The program is now being reviewed by a group of outside advisors and this June the Surgeon General will submit a report to the President and the Congress on the program. The program has, I believe, great promise because it is helping to break down some of the artificial barriers that have tended to divide physicians in private practice from those in academic medicine. It is also bringing a number of interested parties, including consumers, into the process.

Programs designed to remove the financial barriers to health care now take the lion's share of federal funds in health and medicine. Payments for medical and hospital services in non-federal facilities have risen more rapidly than any other health related expenditure—from $1.3 billion in fiscal year 1966 to an estimated $6.2 billion in fiscal year 1968. Medicare is, of course, the primary reason for this rapid rise.

Programs designed to improve the quality and availability of medical care have increased rapidly in recent years. They include neighborhood health centers, maternal and infant care projects, migrant health services, and projects to provide comprehensive medical care for preschool and school age children in low income areas. Expenditures in these programs will approach $300 million in 1968, a three-fold increase in less than five years.

A very important development in this regard will be the establishment, this year, of the National Center for Health Service Research and Development. The Center will be concerned with the definition and solution of practical problems related to the quality, availability, organization, financing and delivery of health services.

The final area that I described as an important one for the federal government, namely, consumer protection and environmental health, is assuming increasing importance for all of us. Federal expenditures in the Department of Health, Education, and Welfare will total more than $200 million this year. In addition, there are important programs in the Departments of Interior, Agriculture, Transportation, and Housing and Urban Development. The federal role in air and water pollution control has assumed increasing importance in recent years, as has its role in traffic safety.

Where do we go from here? It seems highly probable that in the next ten years we will continue to build on the public-private partnerships that I have described.

I believe a number of significant advances will be made in biomedical research. We should have

the means at hand to eradicate rubella and perhaps much more effectively control a number of upper respiratory infections. There may be a major breakthrough in the better understanding of the relationships of viruses to leukemia. Your meeting today gave some indications of the possibilities in research related to arteriosclerosis and coronary thrombosis.

Computers will play an increasingly important role in medicine. The computer, combined with the development of improved automated laboratory techniques, should provide the physician with more and better data about his patients. The developments in multiphasic screening may make it possible for the physician to markedly expand his productivity in terms of early diagnosis and prevention.

Bioengineering will be extended to a number of areas where programs are now just beginning: the artificial heart and the artificial kidney; postoperative care, intensive care and surgical monitoring; the development of patient simulators and other technological innovations that can improve and extend training programs.

New hospitals will be built and many of our existing hospitals will be rebuilt or renovated in the next ten years.

It seems highly probable that there will be further extension of hospital and medical insurance or prepayment among gainfully employed persons, among the unemployed, the disabled, the indigent and the medically indigent. This will take place, I believe, through the further growth of voluntary insurance—which provided in December 1965 some protection for hospital, surgical and or medical costs to over 156 million people (81% of the population); through an extension of Medicare to the 1.5 million disabled who now receive Social Security benefits; and through the full implementation of the Federal-State Medical Assistance (Medicaid) Program.

It is very likely that within five to ten years there will be no "free" or "charity" patients in our hospitals: virtually everyone will have his hospital and medical costs met, as a whole or in part, by some third party.

In the next ten years we will see a major research and development program in health services. This program may well reach the dimensions of the present programs of biomedical research. It will focus on such problems as the rising costs of medical care; the effective and efficient use of personnel; the application of computers, automated laboratories and other technological advances; and the design and construction of hospitals, nursing homes, group practice facilities and other health care facilities.

Finally, I visualize a more vigorous and important role for county, district and state medical societies in the definition of local problems and in the development and carrying out of programs to solve the problems. We are already seeing this in programs of health education, health manpower development and health services for the poor.

In closing, I would like to not that it is an understatement to say that ours is a period of transition or change. Some have described it as a revolution—in rising expectations, in science and technology, in medicine.

Certainly, as we view these turbulent times in medicine, and as we view the changing role of the public-private partnerships that have evolved in the last 30 years, we would do well to bear in mind a statement by Alfred Whitehead, He said, "The art of progress is to preserve order amid change and to preserve change amid order."

Certainly we are saying goodbye to an older era. Certainly we are greeting a new one, and a better one. This new encounter is accompanied by difficulties, by problems, and by the demand for energetic and earnest effort. To this I believe we must all apply ourselves with dedication, and not necessarily in a spirit of martyrdon. I prefer the philosophy of the late Winston Churchill—the cheerful and devoted philosophy which he displayed to a group of temperance ladies when they called on him to protest his inordinate consumption of brandy.

"Why, Mr. Churchill," said one, "if all the liquor you consume in a year were poured into this room, it would fill it to here."

She pointed to a spot midway between the floor and the ceiling.

The Prime Minister gravely regarded the lady, the floor, the ceiling, and the spot she indicated.

"So little done," he murmured, "and so much to do."

THE FORGOTTEN PHILANTHROPIST

MARGARET V. WILLIAMS
Mt. Wilson State Hospital Auxiliary
and Woman's Auxiliary
Medical and Chirurgical Faculty of the
State of Maryland
and
MARGARET GOHEEN SLEASMAN
Program Director
Baltimore County Tuberculosis and Health Assn.

Mount Wilson State Hospital is a tuberculosis hospital sitting on a hill two miles from Reisterstown Road in Baltimore County. The man for whom it was named, Thomas Wilson, was one of those merchant-philanthropists of the "stewardship" school to whom Baltimore owes much of its subsequent reputation as a cultural and medical center. Unlike George Peabody, Henry Walters, Johns Hopkins and Enoch Pratt, Mr. Wilson's name is shrouded in comparative obscurity. Indeed, there are few persons today who have even heard of him and there is very little recorded information about him; perhaps, because his estate benefited only the sick and the poor and not the ambitious. Although what we have uncovered is by no means complete, it is enough to show that Mr. Wilson was one of the great contributors to public health in Baltimore, a city that was for years, known for its lack of it.

He was born in Harford County in 1789, the son of John Wilson. The family moved to Baltimore in 1798. Although the Baltimore Society of Friends shows no record of the family before July 4, 1872, when Thomas Wilson joined the group by request, Mr. Wilson was apparently a Quaker all or most of his life. His father was listed as one and there are other references to Thomas Wilson's conduct being governed by Quaker beliefs.

When he was seventeen Wilson was apprenticed to a prominent Baltimore merchant, Thorndick Chase. He worked in Chase's counting rooms until shortly before his apprenticeship obligations

THOMAS WILSON

were fulfilled at age twenty-one. During those years with Chase he became chief clerk and was in charge of the company's books.

He left Chase in 1810 and with a Mr. Brown, who supplied the capital, founded the shipping firm of Brown and Wilson on Fells Point.

The next year Wilson went to the West Indies in a chartered ship to sell a cargo that was partly owned by his firm. The young firm made enough money from that venture to buy its own ship, the schooner, "Spencer." They concentrated on trade with the Venezuelan coastal city, La Guaira. However, their business was interrupted the next year when the War of 1812 began and they were forced to sell the schooner.

Shipping in Baltimore during that war was greatly hampered by the effective British naval blockade of the Chesapeake Bay. Privateering presented the only effective means of shipping goods from the city. Because of their Quaker beliefs, Brown and Wilson would not participate in privateering. Instead, Wilson organized a line of small ships that sailed between Boston and Folly Landing, Virginia, on the Atlantic Coast. There they were met by a string of small open boats that transported the goods between Folly Landing and Baltimore.

When the war ended, Brown and Wilson entered into an agreement with another Baltimore company to re-establish the Venezuelan trade. As part of the agreement Wilson was to live in Venezuela for at least a year to sell the cargos.

However, in the ensuing year, the situation had changed in Venezuela. With the overthrow of Napoleon in Europe, the Spanish were free to concentrate on re-establishing control of Venezuela after Simon Bolivar had severed it in 1811. When Wilson reached there in 1814 the country was caught up in the Spanish counter-revolution of 1814-15. Wilson was clapped in jail at one point for a brief time, when he protested the impounding and selling of the cargo from one of his ships by the city government in Puerto Cabello. Shortly after his release Wilson contracted yellow fever and was ill with that disease for several weeks. Those events and the internal dissension caused by the uncertain political situation that provided little security for his ships or cargos, caused Wilson to leave the country. He returned to Baltimore in 1816.

In 1819, Mr. Brown retired. Wilson found the company difficult to manage alone and took G. W. Peterkin as his partner, who remained in that capacity until his death in 1837.

Mr. Wilson's partners from 1837 until the depression of 1857 were W. S. Peterkin and R. W. Allen. During that depression the firm, then called Thomas Wilson and Company suffered heavy losses that Wilson covered with his personal assets.

A view of one of the original buildings of the Mount Wilson State Hospital. This building has, over the years been renovated and updated in its facilities.

Although that depression and the Civil War cost him heavily, Wilson managed to build another fortune of $2,000,000 between 1865, when he was seventy-six years old and the year of his death, 1879.

Besides his shipping activities, Wilson had interests in manufacturing in Maryland and the buying and selling of coal fields in Pennsylvania, Maryland and Virginia. He owned the Pioneer Cotton Factory in Georgetown, District of Columbia, and was a large stockholder in several Maryland cotton mills, the Baltimore Coal Company, the Maryland Colonization Society and the Susquehanna Canal Company.

In 1820, Wilson married Hannah Houlton in Baltimore. We were able to document the marriage at the Hall of Records in Annapolis, although the record there shows the bride's last

name as Houston. They had two children, a girl who died when she was five, and a boy who lived only eight months.

Shortly before his son died, Wilson was advised that a change of air might help the dying boy. Wilson took him for a ride a few miles outside the city. That evening the child was much brighter and livelier. Although the improvement lasted only a short time, the impression of the effects of the change of air remained in Wilson's mind throughout the rest of his life. And he left part of his fortune for the establishment of the Thomas Wilson Sanitarium for Children.

This trust established in his will was not the first evidence of his interest in child welfare. Thomas Wilson served as president of the Baltimore Association for Improving the Condition of the Poor and the Baltimore Manual Labor School for Indigent Boys.

His death certificate lists the date as September 2, 1879, and his age as 90 years, 6 months and 27 days. He is described as a widower and capitalist, and his residence was 127 McCulloh Street.

He is buried in Greenmount Cemetery not far from his friend, Enoch Pratt. The tombstone says that Wilson was the founder of the Sanitarium for Children and the Thomas Wilson Fuel Saving Society.

The Fuel Saving Society is still functioning and is listed in the Baltimore telephone directory. The Society was established to help soften the financial hardships the need for fuel each winter caused among the poor, by allowing them to make year 'round deposits with the Society and being assured of adequate fuel during the cold months.

Greenmount Cemetery contained one surprise, however. The woman buried next to Wilson is not the Hannah whom he had married in 1820, but a Julia Ann Wilson, who died in 1868 at age 79. The Baltimore City Court House has neither a record of Hannah's death nor one of Wilson's marriage to Julia Ann, but does have a record of Julia Ann's will drawn up in 1833, mentioning Wilson as her husband and an adopted daughter. Therefore, sometime between the birth of the second child and 1833, Wilson lost his first wife along with the two children.

Hannah and the two children are not buried in Greenmount Cemetery. A check at the Baltimore Cemetery, in which Wilson owned stock, turned up two Hannah Wilsons, but the dates on the head markers and the names of the other persons buried in the same plot do not correspond with Wilson's known family.

That Wilson has been largely forgotten is evidenced by the fact that there has been no record of any visitors to the gravesite in Greenmount Cemetery and there is no correspondence in the file.

In his will, Thomas Wilson provided for the Thomas Wilson Sanitarium for Children of Baltimore with the following remarks by way of introduction,

> "I have observed for many years with much concern the great and alarming mortality which occur each summer among young children deprived by misfortune of their parents, of all opportunity for removal from the heat and fatal atmosphere of the city. God, in his providence, did not spare to me my children to be the solace of my declining years, but my pity for the sufferings of little children and of their parents is none the less. And I do not think that I can make a better use of some of the means of which God has made me steward than in the alleviation of the pains and in the prolongation of the lives of those of whom our Savior said "Suffer the little children to come unto me for such is the Kingdom of Heaven."

In the Preface to the book, *Sanitary Care and Treatment of Children and Their Diseases,* prepared by request of the Trustees of the Thomas Wilson Sanitarium of Baltimore, Maryland, in 1881, it states,

> "The public may also be interested in knowing that the trustees have purchased a farm of 150 acres for the sanitarium, on the Western Maryland Railroad, nine miles northwest of Baltimore in a neighborhood long known for its salubrious air, highly cultivated land and intelligent population.
>
> It is probable that the trustees will begin their work in very simple and inexpensive houses and decide upon permanent buildings after they have had the experience of several years in the management of their trust."

The book just quoted contained a series of five essays and also a building plan proposed in one of the essays by J. Lewis Smith, MD and that was

prepared by Mr. John Beverly Robinson, architect, New York. This building was never constructed and the conservatism of the trustees in not having it constructed was rewarded when the sanitarium was no longer needed.

In establishing this institution it was not the intent of the trustees to establish a hospital, but rather a summer retreat "for sick children under the most hygienic and local conditions that the neighborhood of Baltimore may afford."

One part of the grounds was to be devoted to day excursions, and the other part for the care and treatment of children who must be kept a number of days for recovery from sickness. Since the abnormal death rate during the summer was primarily in children under two years of age, this was the group to be treated at the Sanitarium. Mothers were taken with their infants and when a mother had other children under six years of age who could not be left at home, they too were taken with the children.

A day excursion to the Sanitarium included these meals:

> Lunch at 9:00 A.M.—Bread, butter, crackers and tea
>
> Dinner at 12:30 P.M. — Soup, roast or boiled meat, vegetables, bread, butter, milk and tea
>
> Supper at 5:00 P.M.—Bread, butter, crackers, milk and tea

A branch track of the Western Maryland Railroad led directly into the center of the grounds. A train left Hillen Station for the Thomas Wilson Sanitarium of Baltimore at 7:20 A.M. A wagonette drawn by two horses met the train at Mt. Wilson and carried the children to the Sanitarium. After the 5:00 P.M. supper, the train took the children back to Baltimore.

Tickets for the train rides and the day's excursions were given to patients considered in need of treatment by physicians and nurses in Baltimore. Four days of the week, the Sanitarium was to be used by white persons and by Negroes the fifth.

The first superintendent and physician was James Hall Mason Knox, Jr., MD. The Sanitarium was managed by Colonel John A. Tompkins, who was also one of the trustees of the Sanitarium.

The Sanitarium was open from June until September. The number of children cared for ranged from fifty to one hundred at a time. The figures for 1911 show that 3,596 sick children were cared for, 1,799 mothers and 507 well children visited the Sanitarium. Out of 301 patients that stayed at the hospital for treatment that year, 13 stayed less than two days, 190 patients were there from two to fourteen days, 76 children stayed from fifteen to thirty days, and 22 were at the Sanitarium for longer than 31 days.

In 1892, the buildings designed for the Sanitarium were completed. There was an Administration Building, a kitchen and dining room building, a cottage for workers, a laundry, a bath house, an engine house, a boiler house, and three wards for patients. There were three small cottages, of two rooms each, for separate or isolated cases and a laboratory.

The wards were one-story, wooden buildings; two were 92 feet long by 55 feet wide and one was 115 feet long by 56 feet wide. The wards were well-ventilated and were steam heated.

The summer retreat for children was necessary because of the poor sanitary conditions in the city in the summer and the lack of social and welfare agencies to assist the children affected by what was generally termed "summer complaint." When the Sanitarium was closed in April, 1914, there was no longer a need for children to leave the city. Sanitation had improved, and there were public agencies to lend a hand to needy families.

In the April 29, 1914, issue of the Evening Sun the following item appeared: "The Thomas Wilson Sanitarium today dismissed the last of its small charges and the duty of caring for the babies in the coming months will fall on the nurses of the Babies Milk Fund Association."

When the Thomas Wilson Sanitarium for Children closed, some of the children who had no parents were placed with nearby families. The infant summer work was turned over to the Happy Hills Hospital; this later became a permanent all-year-around ward.

Thomas Wilson's name, continued to be associated with care for the children of Baltimore. On July 1, 1923, child health centers called Thomas Wilson Welfare Stations were organized in Highlandtown, Curtis Bay, Brooklyn and Fairfield. These were comparable to today's well-baby clinics and were later taken over by the City Health Department.

During the 1930's there was a Thomas Wilson

House which was essentially a child welfare station, rendering preventive health services. Three nurses were attached to the station and infant welfare sessions were held each afternoon except Saturday, and on Saturday mornings. In April of 1934, the Thomas Wilson House had under supervision some 1,700 infants and young children under six.

Today, there are still two child health areas giving recognition to the wishes of Thomas Wilson that his money be used for the children of Baltimore City. "Thomas Wilson Wards" are located at both Happy Hills Hospital and in the Pediatric Ward of Union Memorial Hospital.

The *Annual Reports of the Board of Managers of the Maryland Tuberculosis Sanitorium,* October 1, 1924, contains the following sentence:

> "The purchase of Mt. Wilson was made on advantageous terms, largely due to the desire of the Thomas Wilson Sanitarium Board to make perpetual the use of the property for humanitarian purposes, especially for the welfare of children."

The buildings, land, livestock and equipment at Mt. Wilson, Maryland, owned by the Thomas Wilson Sanitarium Board were sold to the State for $110,000 in 1924. Some alterations were made to the property; a modern sewerage system and heating system were added, and the railroad siding was rebuilt, but the buildings were found to be fairly adaptable for the treatment of tuberculosis.

In 1926, the hospital was called the *Preventorium for Children.* In 1927-1928, the name was the *Mt. Wilson Sanitarium for White Patients* and was open to white women and children over six years old suffering from pulmonary tuberculosis. There were no proper facilities for the care of bed patients, nor for men, and admissions were limited to women and children who were ambulatory cases. In 1929-1930, Mt. Wilson was opened to white men as well.

In 1939, the legislature made $55,000 available for Mt. Wilson for operating room facilities and beds for a maximum of 40 additional patients.

The large brick 300-bed structure that was the last addition to the Mt. Wilson Hospital was formally presented to the State Health Department February 26, 1953. This $3,000,000 addition, with the 115-bed original building, made Mt. Wilson the largest TB Hospital in Maryland.

This large modern hospital now stands on the grounds of the Thomas Wilson Sanitarium for Children. But, serving as a reminder of a by-gone era and need, there are still several of the original buildings on the grounds and the railroad tracks still pass the old, white Victorian house where the wagonette waited to pick up the children to carry them up on the hill for a day excursion in the country air.

THE EVOLUTION OF PUBLIC MEDICAL CARE IN BALTIMORE CITY

C. A. Alexander, MD, DrPH
Assistant Professor, Department of Public Health Administration
The Johns Hopkins School of Hygiene and Public Health

The Social Security Amendments of 1965 are bringing about significant changes in the organization of public medical care services in Baltimore City. The Medical Care Program for the Indigent which began in Baltimore in 1948 came to a close when Title XIX of the Social Security Amendments took effect on July 1, 1966. At this juncture, it is of interest to review the evolution of public medical care in Baltimore City.

Public Assistance

The Elizabethan statutes of England, which required local parishes to aid the poor, had their influence in the New World and often served as the pattern for the welfare laws enacted in the American colonies. In most instances the provisions adopted in this country in the late seventeenth century for the relief of the poor and the sick were akin to the measures contained in England's Poor Law Act of 1598. Some departures from the "Poor Law" occurred in America, the most important one being the vesting of public responsibility for aiding the poor in the hands of local government, rather than in the parish (the ecclesiastical unit).

The Elizabethan Poor Law provided "indoor" or institutional relief in the forms of "poor houses" for the "impotent and the aged," "work houses" for the able-bodied, employable poor, and "houses of correction" for the "rogues" and "beggars.[1]" However, the sparsely populated colonies could not afford the expense of maintaining separate institutions for the several groups of indigent. Usually the local government maintained an "almshouse" or "poor farm" to which all the indigent, the sick and the disabled were sent. This was still the common practice in the United States in the late 19th and early 20th centuries.

Subsequently institutional relief was supplemented by "outdoor relief" to needy persons who continued to reside in the community. It was sometimes provided through the efforts of local charitable or volunteer organizations.

All public welfare services were in the domain of local and state governments. Federal participation was limited to rare instances of aid to farm areas in need of relief because of natural catastrophes. The American Red Cross, established in 1888, assisted in the provision of such relief.

The federal government became actively involved in public welfare in 1912 with the establishment of the Children's Bureau. This was followed by the enactment of special laws by several states to provide *outdoor* relief to widows, needy children, the blind and the old. Thus the categorizaton of the poor and the needy began.

The Great Depression (1930-1935) brought radical changes in the administration and financing of relief in the United States. Because of

Excerpts from a chapter in the author's dissertation for the doctor of public health degree, The Johns Ropkins University, 1966.

large scale unemployment throughout the country, what had been a local responsibility became a national concern. Millions of people needed help. Interim relief was provided through the Emergency Relief Administration of the federal government. The idea of federal grants-in-aid to the states for assistance to the poor was developed during the depression years. The Social Security Act of 1935 incorporated the grants-in-aid mechanism and established it on a permanent basis.

The Social Security Act—Under the Social Security Act federal grants-in-aid were provided to assist designated categories of recipients—the aged, the blind, and mothers with dependent children. In order to be eligible for grants, the states were required to conform to certain federal regulations. As a result, the State of Maryland formally established the three federal categories of public assistance through the provision of Old Age Assistance for needy men and women 65 years of age or over (OAA), Aid to the Blind (AB), and Aid to Dependent Children below 18 years of age whose parents were dead, incapacitated or absent from home (ADC). Although the Social Security program does not provide federal grants-in-aid to help the General Public Assistance (GPA) category, Maryland has continued to assist persons in this category from its own funds. GPA generally includes individuals who are not eligible for assistance under the provisions of the Social Security Act. It also provides for the partially employable who are at a disadvantage in the labor market.

Since 1935, amendments to the Social Security Act have liberalized the public assistance program. A fourth federal category was covered in 1950 with the provision of Aid to the Permanently and Totally Disabled (APTD). In 1960 another category was created under the Kerr-Mills Act: with Medical Assistance for the Aged (MAA), it not only liberalized federal grants to the states for medical care to OAA recipients, but also provided the same benefits to individuals 65 years and over who are not financially eligible for OAA but require assistance in meeting the extraordinary costs of medical care. In Maryland the MAA program began operations on June 1, 1961.[2] Owing to the more liberal federal reimbursement provisions of MAA and to the increase in Social Security benefits, some OAA clients were transferred to MAA.

The ADC category has also undergone some changes. In 1950, the category of beneficiaries was expanded to include the parent or adult who cares for the dependent children. In 1961 and 1963 further amendments permitted the extension of assistance to families with children whose parents are at home but unemployed. Since 1963 the program has been known as Aid to Families with Dependent Children (AFDC).

Substantial federal involvement in the provision of medical care services to public assistance clients was effected through amendments to the Social Security Act in 1950, 1956, and 1958. The original act permitted very limited financial participation by the federal government in paying for medical care. The 1950 amendment allowed federal reimbursement for "vendor payments" (direct payments to providers of medical care services), as long as the sum of payments for medical care and for the individual's cash assistance did not exceed the federally matchable maximum. Federal sharing of vendor payments for medical care was increased by the amendments of 1956 and 1958.[3] As already noted, the amendments of 1960 and 1961 increased federal participation in the cost of medical care services to recipients of old-age assistance and created the additional MAA program.

In 1951, total expenditures on vendor payments for public medical care programs in the United States amounted to $48.1 million. By 1964, expenditures exceeded $1.0 billion,[4] largely as a result of the 1950 and subsequent Social Security Act Amendments.

The Social Security Amendments of 1965 envisaged major changes in the public medical care programs, in addition to creating Medicare for the Aged. Title XIX, which takes effect in stages over 10 years, provides for medical assistance to medically indigent persons under 65 years of age and insists on uniform treatment of all public assistance categories.

State of Maryland—The Charter of Maryland was granted by the English Crown to Cecil Calvert (Lord Baltimore) in 1632 and the first colonists arrived in 1633.[5] A law concerning public welfare in Maryland was enacted as early as 1650. The law required that "all maimed, lame or blind persons within the county of St. Mary's"[6] be provided with maintenance from

public funds. The principal means employed by local government to assist needy citizens was the public almshouse. Tax funds were also used to grant financial subsidies to charitable institutions that concerned themselves with assisting the sick poor, the disabled and the needy. The first such subsidy to a private institution in Maryland is said[7a] to have been given in 1798 to Frederick County College, which admitted needy students. Grants for aiding the sick poor were given to hospitals and dispensaries, but these were lump subsidies that were not directly related to the cost of care given to the poor. The State of Maryland continued this method of subsidizing private and social agencies for almost two centuries, because the State thought that "it was cheaper for the State to support organizations outside State control and management."[8]

In 1900 the Maryland legislature[9] created a Board of State Aid and Charities, the principal function of which was to supervise the disbursement of tax funds to local institutions aiding the poor. This Board was reorganized in 1935[7b] to conform to the Federal Social Security Act. Later the Board became the official agency charged with distributing emergency relief funds obtained from the federal Emergency Relief Administration. Between 1935 and June 1, 1939, all county welfare boards and the Department of Public Welfare of Baltimore City (which came into existence on January 10, 1935)[10a] were subject to supervision by the Board. On June 1, 1939, the Board of State Aid and Charities was abolished and replaced by the Maryland State Board of Public Welfare.[11]

Legislation for aiding the blind in Maryland was passed in 1860.[12] Beginning in 1916 indigent widows and their children were assisted.[13] The first old age pension was paid in 1927,[14] with the aged (65 years and over) poor receiving up to $1 a day.

Aside from unemployment compensation, there is no State law that requires the counties or Baltimore City to provide assistance to the unemployed or unemployable. However, the State provides some assistance through the General Public Assistance program (GPA). Public assistance programs contain three components, namely, a cash payment for food, clothing and shelter; provision for medical care; and social services.

The State of Maryland has always been a leader among the states in complying with federal legislation in order to improve its public assistance program.

Public Medical Care in Baltimore City

The events leading to the establishment of Baltimore City's Medical Care program for the Indigent (MCI) can be roughly grouped between two time periods—before 1935 and 1935-1948.

Prior to 1935—As noted, earlier, the State of Maryland has always provided some care for its poor at public expense. This is also true of Baltimore City. The first public infirmary in Baltimore City was opened in 1776 or 1777,[15] together with a large almshouse near the old Richmond Market. The sick poor received care at both places. In 1797, the State Legislature authorized another public hospital to care for the "indigent sick and lunatics," which was located at the present site of The Johns Hopkins Hospital. This hospital is known to have operated for 20 years. In 1865 a new "mixed almshouse with hospital features" specifically for the care of the indigent sick was built at a cost of $50,000 on a 300-acre farm at Bayview[16a] under the administrative responsibility of the "town overseers of the poor." This institution became known as the Baltimore City Hospital and is still in existence. In 1909, another institution, Sydenham Hospital, was opened by the city to take care of patients with infectious diseases. It was later converted to other uses as the Montebello State Hospital for Chronic Diseases.

The voluntary (non-profit) general hospitals in the Baltimore area have also cared for the indigent sick. In addition, University Hospital, staffed by the University of Maryland School of Medicine, has served them. The costs of such care were met either through endowment funds or charitable contributions, or from lump-sum grants of tax funds made by the Board of State Aid and Charities.

In 1927, the city had 50 dispensaries[16b] that cared for the poor—14 operated by the City Health Department, 16 by general hospitals and 20 by other philanthropic agencies. Although there is only scant evidence of any unified effort in the late 1920s to take care of the sick poor, there is ample evidence that both private institutions and the city government were alive to their medical needs.

1935- 1948—With the formation of Baltimore City's Department of Public Welfare in 1935, a shift occurred in responsibilty for medical care to the indigent. All but eight dispensaries closed. The Department operated six public clinics[10b] that were kept open two hours a day for six days a week. Two private dispensaries, subsidized through grants from the Department of Public Welfare, rendered similar services to the poor. In addition to the eight dispensaries, the Department also arranged for the handling of emergency calls from persons unable to travel to a dispensary or to a hospital. In the daytime, emergency calls were answered by physicians staffing the dispensaries, while at night the calls were linked with the telephone switchboard of the City Fire Department, which sought a physician from a list furnished by the Department of Public Welfare.[10c] Physicians were paid a fee per visit for house calls and "per session" for the time spent at a dispensary.

The Department also administered the Baltimore City Hospital to which most of the needy sick were directed. In addition, the Department entered into contracts with voluntary (non-profit) general hospitals in the area to care for the indigent who were seriously ill. The hospitals were reimbursed uniformly at a stated patient day rate, which was increased in several steps over the years and amounted to $10 per day in 1947.[17]

With the passage of the Social Security Act of 1935, the need for providing adequate medical care for all categories was keenly felt by the Department of Public Welfare. The Department became aware of the need to coordinate its medical care activities, and its annual report of 1935 asked for the creation of a position of "Assistant Director of Public Welfare to be filled by a physician,"[10c] and cited the need for a comprehensive survey to estimate the medical care needs of the indigent in Baltimore and the surrounding counties. These two requests recurred in every annual report of the Department for the next five years, with little or no effect. At that time there was widespread discussion of socialized medicine and national health insurance in Maryland and throughout the nation, as a result of President Roosevelt's interest in compulsory national health insurance and of the earlier report of the Committee on the Costs of Medical Care.[18] With the Wagner Health Bill (1939) pending before Congress, the professional and lay leaders in Baltimore were actively concerned with its implications.

Following discussions of the bill by a small professonal group, known as the "Saturday Night Club,"[19a] an "All-Maryland Health Conference" was convened, largely through the efforts of Dr. Henry E. Sigerist of The Johns Hopkins medical faculty. The conference was held at The Johns Hopkins School of Hygiene and Public Health on May 27 and 28, 1939. Approximately 100 organizations were represented. Although the primary purpose of the conference was to enlist support for the Wagner Bill, one of its by-products was the documentation of the medical care needs of the indigent and medically indigent by Dr. Maurice C. Pincoffs, chairman of the Department of Medicine of the University of Maryland School of Medicine.[19] Dr. Pincoffs proposed that a permanent subcommittee on medical care be established under the State Planning Commission to study the medical care needs of the people of the State and to suggest improvements as necessary. The conference endorsed Dr. Pincoff's suggestion and referred it to a committee for further study, where it was shelved.[20a] The strong views of a labor leader[20b] who participated in the conference are credited with awakening the Medical and Chirurgical Faculty of the State of Maryland to the desirability of concerning itself on a voluntary basis with the problems of the indigent sick. On August 23, 1939, the Medical and Chirurgical Faculty took action by requesting Dr. Abel Wolman, chairman of the Maryland State Planning Commission, to appoint a committee on medical care to survey the medical care needs of Baltimore and the surrounding counties of Maryland.[20a]

The appointed committee under the chairmanship of Dr. Pincoffs, held its first meeting on January 23, 1940. It gave priority of attention to the needs of the counties, where organized facilities for medical care were greatly lacking in comparison with those in Baltimore City. World War II intervened, and Dr. Pincoffs volunteered for military duty. Dr. Victor F. Cullen assumed chairmanship of the committee and a brief report, issued on April 15, 1944, recommended that an organized medical care program be established in each of the 23 counties of Maryland. The recommendation was endorsed by the Medical and Chirurgical Faculty. In 1945 the State Legislature

approved a medical care program for the indigent and medically indigent in the counties of Maryland under the aegis of the State Department of Health.[20a]

In Baltimore City, the Department of Public Welfare continued as the official agency responsible for the medical care of the indigent. With the launching of an organized medical care program for the indigent in the counties, the Department persuaded the Mayor of Baltimore City to accede to its repeated request to create the post of Assistant Director of Welfare for Medical Care. Dr. Ross Camerson, a physician, was appointed to the post on July 1, 1945.[21] He received the additional title of Deputy Commissioner of Health in the City Health Department for liaison purposes, ie, to facilitate a close working relationship between the Baltimore City Health Department and the City's Department of Public Welfare.

On August 5, 1944 the State Planning Commission had nominated Dr. Lowell J. Reed of The Johns Hopkins University to chair a committee to study the "medical care needs of Baltimore City"[22] and make recommendations to the city and state governments. The Reed Committee submitted its report in December 1946.[23a] It recommended the adoption of an "organized plan for meeting the medical care needs of the recipients of public assistance" and the establishment of a "Medical Care Section" in the City Health Department to discharge the functions specified by the plan.[23b] The committee also recommended that responsibility for administering the program be vested in the City Health Department.

The suggested plan[23c] for organizing a medical care program for public assistance recipients in the City was quite different from the plan in effect in the counties. The differences lay in the method of paying physicians and in the additional provision, for Baltimore City, of separate clinics in the City's hospitals as an additional source of medical care. The plan for the City prescribed a capitation method of payment whereas in the counties the physicians were paid on a fee-for-service basis.

Separate clinics, which had no counterpart in the counties, were recommended for Baltimore City in order to take advantage of the greater medical facilities available there and to ensure the provision of comprehensive care for the indigent through the "integration of the facilities of the hospital dispensary and the services of the physicians practicing in the area."[23d] The originators also had in mind the opportunities that such an *integration* would provide for the education of medical students and house staff, and for the continuing education of private practitioners.

The capitation method of paying physicians was proposed for the City program in the belief that "this plan will permit greater freedom in the referral of any individual to his personal physician by the 'Medical Center'," and vice versa.[23e] Administrative ease, reduction of paper work by the practitioner, and the desire to predict and control expenditures were the other considerations that prompted the Reed Committee to recommend the capitation method for paying physicians.

The State Legislature approved all the recommendations of the Reed Committee, and the new law, Chapter 714 of the Maryland State Laws of 1947, was signed on April 25, 1947. This law charged the Baltimore City Health Department with administering a medical care program for the indigent by establishing a Medical Care Section.

The text of the law reads as follows:

> Within the provisions of the budget for the program of medical care, monies for the care of the indigent persons in Baltimore City shall be transferred to the Mayor and City Council of Baltimore and the administration of the program in Baltimore City shall be administered under the Commission of Health of the City by a Medical Care Section in Baltimore City Health Department in accordance with plans that shall be prepared by the Baltimore City Health Department and submitted to and approved by the State Board of Health: and for these purposes the Commissioner of Health of Baltimore City is hereby authorized to contract with physicians, dentists, hospitals, or other accredited agencies for the medical, surgical, hospital or other medical or nursing care of eligible persons; and also to appoint such personnel as may be necessary within the provisions of the budget and in accordance with the provisions of the Baltimore City Charter.[24]

The new law became effective on June 1, 1947. As required by a recommendation in the Reed Committee Report, the Mayor announced the appointment of an advisory Committee on Medical Care when the Medical Care Section of the Baltimore City Health Department was inaugurated on September 4.[25] The Commissioner of Health appointed the members of the Committee and the Committee elected its own chairman with a tenure of three years.[26]

Unlike the State Council on Medical Care, which is a legally constituted advisory body serv-

ing the State Board of Health, the City's Advisory Committee had no legal standing. The Committee was established principally to afford representation to the professional and lay groups that have a direct interest in medical care for the indigent. The composition of the Committee was flexible and consisted of 10 to 15 members who represented the medical societies, hospitals, medical schools, pharmacists, nurses, dentists, State Health Department, State Board of Health, City Welfare Department and the City Health Department. The Director of the Medical Care Section served as the secretary of the committee, which met approximately three times a year. It performed the useful functions of eliciting a consensus of the several professional and lay groups on matters directly affecting the administration of the Medical Care program for the Indigent (MCI) and conveying it to the State Council on Medical Care and to the City Health Department for their guidance. From time to time the Committee also studied specific problems of the program and offered constructive solutions.

It took ten months of hard work by the new Medical Care Section of the City Health Department to launch the MCI program. With the formal signing of contracts with The Johns Hopkins and University Hospitals, the program began on June 15, 1948.[27] Newspapers and professional journals hailed the program as a shining example of a city's efforts to solve its health problems.[28,29]

Dr. Wendell R. Ames, who became the director of the Medical Care Section on Sept 10, 1947, held office briefly and was succeeded by Dr. J. Wilfred Davis on June 2, 1948.[30] Dr. Davis directed the program for 17 years until his retirement in October 1965.

Within two months after the signing of contracts with The Johns Hopkins and University Hospitals, a medical care clinic was established at each and five other hospital clinics were subsequently added to the program, in the following order:

1. The Johns Hopkins Hospital, Aug 2, 1948.[31]
2. University Hospital, Aug 9, 1948.[31]
3. South Baltimore General Hospital, April 1, 1949.[32]
4. Sinai Hospital of Baltimore, Inc., May 1, 1949.[32]
5. Provident Hospital, June 1, 1949.[32]
6. Mercy Hospital, Inc., Dec 1, 1949.[32]
7. Baltimore City Hospitals, Aug 31, 1953.[3]

The public dispensaries, hitherto operated by the Department of Public Welfare and private organizations, were closed one by one after the Medical Care program for the Indigent went into operation. All but two were closed by 1950. The Baltimore Eastern Dispensary, under voluntary auspices, closed in 1964. The Curtis Bay Dispensary is the only survivor. It renders first aid, and is operated by the Department of Public Welfare only because the area has no medical center nearby. This dispensary may be closed as soon as the South Baltimore General Hospital moves from its present location to the new one, close to the Curtis Bay area.

Hospital inpatient care could not become part of Baltimore City's MCI program because certain city health officials were at that time reluctant to assume too many responsibilities in providing "curative medical care." The result was that the State Health Department had to assume responsibility for the inpatient program. In the counties, too, the State Health Department assumed the responsibility for inpatient care, since many county clients had to go to hospitals in Baltimore City or in another county.

From its inception in 1947, Baltimore City's MCI program grew steadily in size. For many years, however, the method of operation remained essentially as envisaged in the plan proposed by the Reed Committee. In June 1961, the Medical Assistance for the Aged (MAA) program became the additional responsibility of the Medical Care Section and it provided for a fee-for-service method of reimbursing physicians. This was followed, on Jan 1, 1963, by the adoption of the same method for the MCI program.

Reasons for Change

Under both the capitation and fee-for-service methods the client has had the free choice of a personal physician. Under capitation, however, the client usually obtained all of his care from the same physician. If for any reason the client or the doctor wanted a change, it was possible to arrange it, but only with the knowledge and consent of the Medical Care Section of the City Health Depart-

ment. Under the fee-for-service method the client has complete freedom to visit any licensed physician in the community without notifying the Medical Care Section in advance.

As noted earlier, the Reed Committee proposed capitation in 1946 in the belief that under this method of payment both the physician and the medical care clinic would have greater freedom than under fee-for-service in referring clients to each other.[23c] The Committee believed that referrals for specialist care would enhance opportunities for educating the referring practicing physician, as well as the young physicians in training at the two teaching institutions (The Johns Hopkins and University Hospitals) where the first medical care clinics were established. The administrative ease of the capitation method, with the absence of detailed recording or billing procedures for services rendered, was another important consideration. The Committee also believed that the capitation method might be cheaper.

The minutes of the meetings of the Baltimore City Advisory Committee on Medical Care show that the representatives of the Medical and Chirurgical Faculty of Baltimore City frequently expressed dissatisfaction with the capitation method, although the medical society had unanimously approved it in 1947. The public acclaim following the inauguration of the MCI program facilitated its initial acceptance by the medical society. The strong endorsement of the program by the medical society is also credited to its sponsorship by Dr. Maurice C. Pincoffs, in whom the society had great confidence. However, since the county program in Maryland had been paying physicians on a fee-for-service basis since its inception in 1945, many physicians who had indigent clients from the counties as well as the city began to complain about the inconvenience of operating under two different methods of payment. In 1953, the Baltimore County Medical Association in conjunction with the Maryland Academy of General Practice criticized the capitation method in the MCI program and asked for the immediate institution of fee-for-service.[34]

Whenever complaints were aired at the meetings of the Advisory Committee, Dr. Pincoffs defended the capitation method. The issue was not joined for 12 years until Dr. Pincoffs withdrew from active participation in 1960. After his departure the idea of fee-for-service was revived with increased vigor and with strengthened support from the medical society. In the course of time the administration of the Medical Care Section also became more receptive to fee-for-service, for it was experiencing increasing difficulty in finding physicians willing to care for the growing number of new clients. Moreover, the legislators and the authorities controlling the budget of the city government had never really understood the capitation method. The result was that the capitation fee remained the same for 15 years. The repeated complaints of officials that the capitation method was "foreign" and "unfair" because the doctors "get paid whether they see a patient or not" gained momentum by the beginning of 1961. At that time the Medical Care Section was preparing to launch the Medical Assistance for the Aged (MAA) program. The Health Department was convinced that paying on the existing capitation basis would be inequitable toward physicians who care for a good many elderly clients, because the aged use more services, on the average, than younger clients. The Medical Care Section did not favor setting a higher capitation fee for MAA clients, because it regarded two rates of payment as impracticable. The administration, as well as some members of the Advisory Committee, preferred to launch the MAA program with fee-for-service.[35a] The MAA program would also provide an opportunity to test the feasibility of the fee-for-service method for the MCI program in Baltimore and to ascertain whether fee-for-service attracted large numbers of physicians to the program.

A resolution recommending the adoption of fee-for-service for the MAA program was adopted by the Advisory Committee on Jan 25, 1961.[35b] Much to the satisfaction of the physicians, the fee-for-service method made its debut in Baltimore City through the MAA program on June 1, 1961. The pressure from physicians urging that the same method be employed for the MCI program intensified. The experience gained by the Medical Care Section with fee-for-service persuaded the Health Department of its efficacy. A resolution recommending the fee-for-service method of paying physicians in the MCI program was passed by the Advisory Committee on Oct 24, 1962, to become effective on Jan 1, 1963.[36]

Physicians were paid per visit. The schedule of fees was as follows:

Office visit	$2.50
Home day visit (8 AM to 8 PM)	$3.50
Home night visit (8 PM to 8 AM)	$4.50

Since July 1, 1966, the MCI program has formally ceased to exist. In its place a new enlarged program has been established. The new program provides for medical care services to the medically indigent as well. A medically indigent person is defined as a person who is not receiving public assistance, but who is unable through his own resources, or resources available to him, to provide himself and his dependents with proper medical care. Single persons with a maximum family income of up to $1,800, a family of two with a maximum of $2,280, and a family of six with a maximum of $3,960, qualify for medical care services through the new program. It is estimated that nearly 120,000 medically indigent together with about 80,000 public assistance recipients will be covered by the new public medical care program in Baltimore City.

Under the new program there has been a 50¢ increase in the fee for an office visit to the physician. Judged by prevailing standards, these fees are low.

The seven medical care clinics that existed under the old program are no longer in operation. Public medical care recipients are now free to go to any hospital outpatient clinic or any private physician for medical care.

Summary

The Medical Care Program for the Indigent began in Baltimore City in 1948 and the program operated for nearly 15 years without major changes. The Medical Care Section launched the MAA program in June 1961 with a provision to reimburse physicians on a fee-for-service basis. This was soon followed by a change in the MCI program's method of paying physicians from capitation to fee-for-service. The passage of the Social Security Amendments of 1965 resulted in the cessation of the old MCI program and the establishment of a larger program to serve both the indigent and medically indigent in Baltimore City.

THE PHYSIOLOGY OF THE PLACENTA AS IT AFFECTS THE HEALTH OF THE FETUS

GORDON B. AVERY, MD, PhD
Director, Newborn Service, Children's Hospital of the District of Columbia
Assistant Professor of Pediatrics, Georgetown University School of Medicine

We have begun to think of the placenta as we think of the girl next door: We always knew that she was there, we have taken her for granted, sometimes we have thrown her aside unfeelingly, but now, as scientists, we are beginning to appreciate her in her maturity. And I might even add that hormones have played a role in our changed attitude.

Table 1

PLACENTAL FUNCTIONS

- Respiratory exchange
- Immunologic barrier
- Endocrine gland
- Alimentary organ
- Biosynthetic organ
- Excretory organ

The placenta functions as the main organ of homeostatis for the fetus. Table 1 lists many of these functions. The placenta is an organ of respiratory exchange: in effect, the fetal "lung." It is an immunologic barrier that prevents interactions between the mother and the fetus which would otherwise be detrimental. It is an endocrine gland, secreting gonadotropin, progesterone and estrogen, and perhaps a growth hormone-like substance and adrenal steroids. It is an alimentary organ: the fetal "gut." It is, a biosynthetic organ with ability to form a number of proteins and complex metabolites: the fetal "liver." And finally, the placenta is also an excretory organ: the fetal "kidney." Anyone who doubts this should give attention to the baby with bilateral renal agenesis, who is born with an essentially normal blood urea nitrogen (BUN) which then rises after the placenta is discarded.

The placenta has a definite evolution and lifespan. The primitive blastocyst is free floating until about seven days after ovulation, when it settles into the endometrium and begins nidation. At that stage it is a sphere of cells destined to become trophoblast, surrounding a much smaller disc of cells destined to become embryo. With nidation, the trophoblast cells proliferate rapidly and burrow into the endometrium. At this stage both trophoblast and embryo are nourished by diffusion. However, by 24 days there is formation of maternal blood lakes, and a primitive embryonic circulation develops. The trophoblast is by then differentiated into a cellular, dividing cytotrophoblast and a syncytial, nondividing syntrophoblast.

With time, recognizable villi develop. These are

Presented at a meeting of the Maryland Pediatric Society Jan. 10, 1967, at the Sheraton-Belvedere Hotel, Baltimore.

fingerlike projections of tissue of fetal origin, projecting down into maternal blood lakes. The outer layer of the villus is syntrophoblast, then cytotrophoblast, then connective tissue and finally fetal capillaries. As pregnancy proceeds, there is a progressive thinning out of the cytotrophoblast layer, and towards the end of pregnancy it is absent in places. There is always, however, a continuous layer of syntrophoblast between fetal and maternal tissues. The relative amount of connective tissue decreases towards the end of pregnancy while the density of fetal capillaries increases. This has the effect of decreasing the distance between the fetal and maternal blood streams and aids diffusion as the volume of the embryo increases.

Towards the end of pregnancy, senescent changes begin to take place in the placenta. Individual villi become hyalinized and nonfunctional. The increase of placental blood flow fails to keep pace with the increase of fetal size. In some cases small infarcts develop in the placenta. The pace of these changes varies greatly, and some placentas survive in good functional condition well beyond the normal 40 weeks of gestation. In other cases, the placenta is already declining in its function before the child is born. In the case of multiple pregnancy, the volume of fetal tissue is so great that even a normal placenta is unable to accommodate it towards the end of pregnancy. All these factors may contribute to placental insufficiency syndromes, to be described later.

Experimental evidence that the placenta has a finite lifespan, after which it is no longer ideal as an organ of support, is provided by transplantation experiments carried out by Simmons and Weintraub.[1] These investigators transplanted fragments of trophoblast or fertilized ova beneath the kidney capsule of the mouse. They found that placental fragments transplanted at progressively later stages of gestation survived for progressively shorter intervals of time. They all degenerated by about the same time that the pregnancy would normally have terminated: in particular, in the mouse, about 25 to 30 days after conception. The implication is that there is some sort of biological clock in the placenta which dictates its senescence whether or not it is related to an embryo and whether or not it is in its normal location. This may be a protective mechanism that prevents a highly invasive tissue such as trophoblast from becoming a tumor after the birth of a fetus. Histologically, in fact, the trophoblast looks highly neoplastic. Yet only about 1 in 15,000 pregnancies results in choriocarcinoma.

It seems very peculiar indeed that the fetus, although genetically foreign, is accepted as a homograft by the mother for a period of nine months, although she would reject a skin graft from her husband in about nine days. There must be some sort of insulation between the fetus and the mother to prevent her from recognizing and attacking the fetus as a foreign tissue. Recent evidence suggests that the trophoblast and the fetal membranes together form such a barrier. Grafts of mouse trophoblast into a number of sites, including under the kidney capsule and the capsule of the testis, have demonstrated inability to sensitize to subsequent skin grafts.[2] It seems to be a particular property of the trophoblast that it fails to express histocompatibility antigens in a normal fashion. Yet there is no doubt whatsoever that the trophoblast is derived from fetal tissues, and genetically it should be like the fetus rather than like the mother.

The extreme experiment in this respect was done by Lanman et al,[3] who mated Rabbit A with Rabbit B, and then took the ovum from this mating and implanted it in Rabbit C. Thus neither on the father's side nor on the mother's side was the ovum related to the adoptive mother. Rabbit C had been sensitized by skin grafts from rabbits A and B, which she rejected. In this situation there was completely normal differentiation of the embryos, and the offspring were born alive at term, in spite of the fact that the mother was further sensitized by skin grafts from both Rabbit A and Rabbit B during the gestation. The mother sloughed the skin grafts at the same time that she was tolerating the fetuses. Among the many remarkable feats which the placenta performs, not the least is this peculiar immunologic separation of the fetus and mother.

Table 2

SIMPLE DIFFUSION

Oxygen
Carbon Dioxide
Water
Urea

The placenta has been most thoroughly investi-

gated in terms of its selective permeability. It is by virtue of the highly selective nature of its transfer function that the placenta is able to regulate the internal environment of the fetus to so large an extent. Table 2 lists a group of substances which apparently pass the placenta by simple diffusion. The transfer of blood gases in many ways resembles that which occurs in the lung. The partial pressure of oxygen is, however, much lower in the embryo, and one of the changes occurring immediately after birth is a large increase in P_{O2} appreciated by the tissues of the infant. Of clinical significance is the fact that water crosses the placenta readily, and if a mother is overhydrated during labor by the use of intravenous fluids, it is quite possible to have a water-intoxicated fetus who is born with convulsions and edema secondary to rapid shift of water across the placenta.

Table 3

HIGHLY PERMEABLE, MECHANISM UNKNOWN

Na, K, Cl, Co, Cu, SO4, Ca
Sex Steroids, Thiouracil
Sulfa, Salicylates
Tetracycline
Chloramphenicol
Phenothiazine
Barbiturates
Streptomycin

Table 3 lists a group of substances to which the placenta is highly permeable, but for which the transfer mechanism, if any, is unknown. Included are many ions, and one could readily conclude that metabolic abnormalities present in the mother would also be reflected in the fetus. Sex steroids acquired passively from the mother are responsible for the familiar breast engorgement encountered in neonates. Salicylates given to the mother in high dosage can result in bleeding in the newborn. Prophylthiouracil can cause an airway obstructing goiter in the baby. Diuril has been known to result in thrombocytopenic purpura. Barbiturates given for obstetrical anesthesia frequently cause depression in the newborn. And many of the antibiotics which might be given during the last trimester have potentially adverse effects upon the fetus. These include sulfonamides which compete with albumin binding of bilirubin, tetracycline which causes temporary growth arrest and discoloration of the teeth, and streptomycin which can cause deafness in the neonate.

Table 4

ACTIVE TRANSPORT

Amino Acids
Glucose, Fructose
Fatty Acids
Vitamins
Glycerol
Certain Antibodies
Fe, Zn, Iodide

Table 4 illustrates a group of substances that cross the placenta by active transport. You will recognize here a number of fundamental building blocks for tissue: amino acids, glucose, fatty acids and vitamins. How do we know that these substances are actively transported? In most cases the evidence is based upon finding higher concentrations in the fetus than in the mother.[4] Another line of evidence is illustrated in the case of iron. It is a common occurrence to have a baby born with 18 grams of hemoglobin from an anemic mother. If the mother is sufficiently anemic I believe that levels of iron can be achieved at which the baby also becomes anemic. But the baby evidently has first choice on a limited iron supply. Clement Smith et al[5] observed a similar effect with respect to other nutrients after the hunger winter in Holland. As you perhaps know, the last winter of the Nazi occupation was a very difficult one in Holland, and starvation was common. Many women were pregnant during this era and actually lost as much as 20 to 40 pounds during pregnancy. Smith's finding was that the birth weight of their babies was normal. Again the indication was that, despite an acute shortage of tissue building blocks, the fetus had first claim and grew at the expense of the mother.

It is a little difficult to harmonize this last finding with the common experience that babies in the less nourished areas of the world are normally smaller. A friend of mine, visiting from Indonesia, said, "If a premie is defined as 5½ lbs or less, most of our babies are premies." My own feeling is that racial differences play a role in birth size, and that chronic starvation may be more damaging than acute starvation following a

lifetime of adequate nutrition.

Table 5

GRADIENT, MECHANISM UNKNOWN

Adrenal Steroids
Thyroxin
Bilirubin
Cholesterol
Reserpine

Table 5 lists a group of substances which pass the placenta, but in which a significant gradient occurs between maternal and fetal concentrations. In some cases the gradient has been demonstrated experimentally by giving radioactively labeled substances to the mother and measuring the levels in the cord blood. The question is frequently raised whether the mother who is on pharmacologic doses of steroids will give birth to a baby whose pituitary-adrenal axis is suppressed. Although this is theoretically possible, in practice these infants have usually been able to make adrenal steroids in response to stress, and apparently are protected by the placental gradient. The completely athyrotic cretin receives some transplacental thyroid from his mother, but frequently not enough to protect him against intrauterine damage. Perhaps the most significant difference between the cretin who is already badly damaged at birth and the one who can be salvaged by prompt thyroid treatment is the degree to which the placenta of each has been permeable to maternal thyroxin.

With respect to bilirubin, we know that the Rh baby with severe disease may die in utero from anemia, but does not get kernicterus until after birth. The sharp rise in bilirubin after birth simply represents the withdrawal of the placenta and the large excretory capacity of the maternal liver.

The transplacental passage of reserpine may be of significance in the toxemic mother who is treated for hypertension with reserpine. The drug may cause a syndrome in the baby characterized sometimes by drowsiness but more commonly by an intractable stuffy nose. This tenacious nasal mucous may be enough to cause respiratory embarrassment, since newborns are obligate nose breathers.

Table 6 lists a group of substances which do not ordinarily pass the placenta. The fetal pituitary is active, and the normal development of certain of the target organs may in fact depend on fetal pituitary function. Growth hormone is an important exception. Apparently embryonic growth is independent of the necessity of growth hormone stimulation. Jost,[6] in rabbits, has decapitated embryos and returned them to the uterus to allow their continued development. Despite being totally headless, these rabbit embryos went to term and were normal in size. Exactly what factors control the growth of embryos is not known, but growth hormone itself appears not to be indispensable until considerably later.

Table 6

NOT PERMEABLE

Most proteins
TSH, ACTH
Growth Hormones
(Exception Insulin,
Immune Globulins)
Nucleic Acids
Neutral Fats
Phospholipids

The gamma globulins are an important class of proteins towards which selective permeability is demonstrated. Gamma-G, making up the larger part of the immunoglobulins, passes the placenta and is found in fetal blood in nearly the same concentration as in maternal blood. However, gamma-A and the large gamma-M globulins are nearly totally excluded. As a result, babies are born without a preformed library of gamma-M antibodies against the common gram negative organisms in their environment. Many workers feel that the peculiar susceptibility of newborns to infection by gram negative organisms results from the lack of this preformed antibody library rather than from the inability to form new antibody in response to a specific stimulus. In certain animal species, the fetal concentration of gamma globulins is even higher than the maternal concentration, and active transport is suspected.[4]

This selective permeability has implications also for erythroblastosis. The ABO antigens are probably more powerfully antigenic than the Rh antigens. We would therefore expect ABO erythroblastosis to be more devastating than Rh disease. The opposite finding appears to be on the basis of

placental permeability. Rh antibodies are frequently of the 7-S variety and pass the placenta relatively early and well. The ABO antibodies are often 19-S macroglobulins, and 7-S antibodies in response to ABO antigens are formed in lower titer.

Table 7

TERATOGENS

- Thalidomide
- Antimetabolites
  - Aminopterin
- Androgenic Steroids
- Corticosteroids (?)
- Quinine
- Antithyroid Drugs
- Radiation

Table 7 lists a group of potentially teratogenic substances. Thalidomide is so familiar I hesitate to enlarge upon it. Almost all antimetabolites cross the placenta reasonably well and are injurious to the fetus. They are frequently used as abortifacients, and if they are used in inadequate dosage so that the fetus is not destroyed, a terribly damaged infant may result. Quinine has also been used as an abortifacient and also is teratogenic. Androgenic steroids cause masculinization of female fetuses and may result in pseudohermaphroditism. Even progesterone and other estrogenic substances given in attempt to prevent threatened abortion may cause masculinization because of close structural relationship and partial cross specificity with the adrogenic steroids.

Table 8

DRUGS AFFECTING NEWBORNS

- Dicumarol
- Reserpine
- Hexamethonium
- Narcotics and Sedatives
- Inhalation Anaesthetics
- Diuril
- Streptomycin
- Narcotic Addiction

In Table 8 there is a list of drugs which pass the placenta and can cause injurious effects to the newborn. Some of these I have mentioned already. Dicumarol, even in normal dosage, may cause bleeding in the fetus and may even cause fatal hemorrhage. Hexamethonium may be used to treat maternal hypertension from toxemia. There have been instances of prolonged paralytic ileus in the newborn resulting from this drug. Occasionally such babies have been erroneously operated upon with a diagnosis of intestinal obstruction. The fact that narcotics and sedatives given to the mother may depress the baby is, I am sure, familiar to you all. The infant of a mother addicted to narcotics may demonstrate withdrawal symptoms in the newborn period. The baby's irritability, convulsions, and other neurological signs may be attributed to cerebral hemorrhage unless narcotic withdrawal is considered. Observation of the mother for withdrawal symptoms is a good way of confirming this diagnosis. The baby can be treated by using paregoric or some other substitute agent and withdrawing it slowly.

Table 9

G6PD HEMOLYSIS

- Vitamin K
- Naphthalene
- Furadantin
- Sulfonamides
- Phenacetin
- Aspirin
- Acetanilid
- Probenecid

Table 9 is a list of drugs which will cause hemolysis in a child with a genetic defect in glucose-6-phosphate dehydrogenase. This is significant in that 10% of Negroes, a sizeable percentage of Mediterranean peoples, and Sephardic Jews carry this genetic trait.

Table 10

PLACENTAL PATHOLOGY

- Single umbilical artery
- Monochorionic twins
- Velamentous insertion of cord
- Fetomaternal hemorrhage
- Placental insufficiency syndrome
  - toxemia
  - multiple pregnancy
  - "postmature"

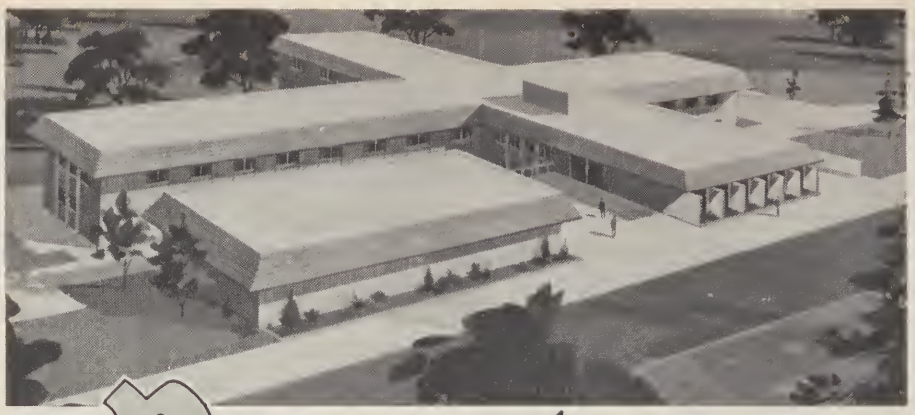
Table 10 lists certain pathologic occurrences in the placenta which have important implications for the fetus. A single unbilical artery is seen in about 1% of single births and about 3% to 7% of

twins. In various series, between 10% and 50% of infants with single umbilical artery will have associated, often major, congenital malformations. Many of these malformations are easily recognized, but an intravenous pyelogram in search of a urinary tract anomaly may be well advised in such babies.

Another newly recognized syndrome is cross transfusion in monochorionic twins. One in every 60 to 80 births is a twin birth, and about ⅓ of these twins are one egg or identical twins. Identical twins can immediately be ruled out if the twins are of unlike sex. Of the identical twins, about ⅔ will have a single chorion, and all such twins have some degree of vascular anastomosis between the two fetuses. The single chorion is recognized by examining the common wall between the two amnionic sacs. If these two layers can be peeled apart easily and are thin and glistening, coming apart down to the placental surface where bare blood vessels are revealed, the twins are monochorionic. If the amnions come apart with difficulty and appear to have an additional layer of tissue in between, this is the double layer of chorion which surrounds each individual amnion in dichorionic twins.

The importance of performing these maneuvers and establishing that one is dealing with monochorionic twins is two-fold. In the first place, the monochorionic twin is a guaranteed identical twin, and is a walking tissue donor for his other twin. Working out the proof of identity by blood typing and skin grafting is a much more tedious affair. The second and more immediate significance is that one twin may give a significant blood transfusion to the other. This occurs when the anastomoses are from artery to vein, so that blood is pumped from a high pressure into a low pressure vascular bed. The plethoric twin is cyanotic, with enlarged heart and kidneys, increased blood volume, may be in frank congestive failure and tends to have polyhydramnois. This twin may need an emergency phlebotomy. The anemic twin may be smaller, look malnourished, and typically has oligohydramnios. Of the two, the plethoric twin is often in greater difficulty.

Abnormal insertions of the umbilical vessels predispose to fetal bleeding. In addition to gross hemorrhage such as is caused by rupture of a vessel entering the surface of the placenta, more minute hemorrhages occur very frequently. Fetal hemorrhage into the placenta is important from a number of standpoints. It may be of major proportions and result in exsanguination of the fetus. It may allow substantial amounts of fetal blood to enter the maternal circulation and hence predispose to erythroblastosis in the next pregnancy. Hemorrhage may be chronic and sufficient in amount to result in hypochromic anemia in the newborn. Finally, the child may be normal in every respect except for normocytic anemia already present at birth. This may be the result of a moderate sized acute hemorrhage. In cases where feto-maternal hemorrhage is suspected, a search can be made for fetal cells on a maternal blood smear by the use of buffer solutions which hemolize adult cells but leave fetal cells intact. If repeated examinations are made at intervals during pregnancy, 40% to 50% of women will be found to have some fetal blood in their circulations.



Finally, we have instances in which the placenta is inadequate. The babies resulting from placental insufficiency have been variously termed dysmature, small for dates, or cases of intrauterine malnutrition or growth failure. These babies are recognizable because their birth weight is significantly less than that expected for their gestational age. Placental insufficiency syndromes are seen most commonly after toxemia and multiple pregnancies. In one study,[7] toxemia was shown to reduce placental blood flow from 600 cc per minute to 200 cc per minute, thus potentially limiting the supply of both nutrients and blood gases for the fetus. It has been demonstrated that twins frequently cease significant growth after the 35th week of gestation, because the larger combined mass of the twins outstrips the potential of the placenta. Triplets and quadruplets outgrow their placenta proportionately earlier.

Table 11

PATHOLOGY CONTRASTED

pre-term	small for dates

8100 Marlboro Pike, Forestville, Maryland

the true premature. The true premature is predisposed to respiratory distress syndrome, sepsis, organ immaturities such as poor kidney function, difficulty in taking adequate volumes of feeding, problems in temperature regulation, jaundice due to liver enzyme immaturity, and slow intitial weight gain. The small for dates baby has an increased incidence of stillbirth (apparently from outright placental failure), hypoglycemia, meconium aspiration syndrome and sudden unexpected death. The mortality of the small for dates baby is greater than that expected on the basis of gestational age, but less than that expected on the basis of birth weight. Many of the extremely small for dates babies are reduced in ultimate stature and in intelligence as well.

In summary, the placenta is the life support of the embryo and fetus. It insulates him from maternal immunologic rejection, secretes hormones necessary for the maintenance of pregnancy, allows for the removal of toxic metabolites, and supplies him with nutrients and blood gases needed for life and growth. The placenta itself goes through a definite development and senescence, and may become functionally inadequate before the child is born. In that case, varying degrees of wasting and injury to the fetus result. Many drugs adminstered to the mother will affect the fetus as well, often adversely. Certain pathologic conditions in the placenta itself may be correlated with conditions in the fetus. The placenta may, then, be an area where embryologist, obstetrician, and pediatrician may come together in the interest of better care for the baby.

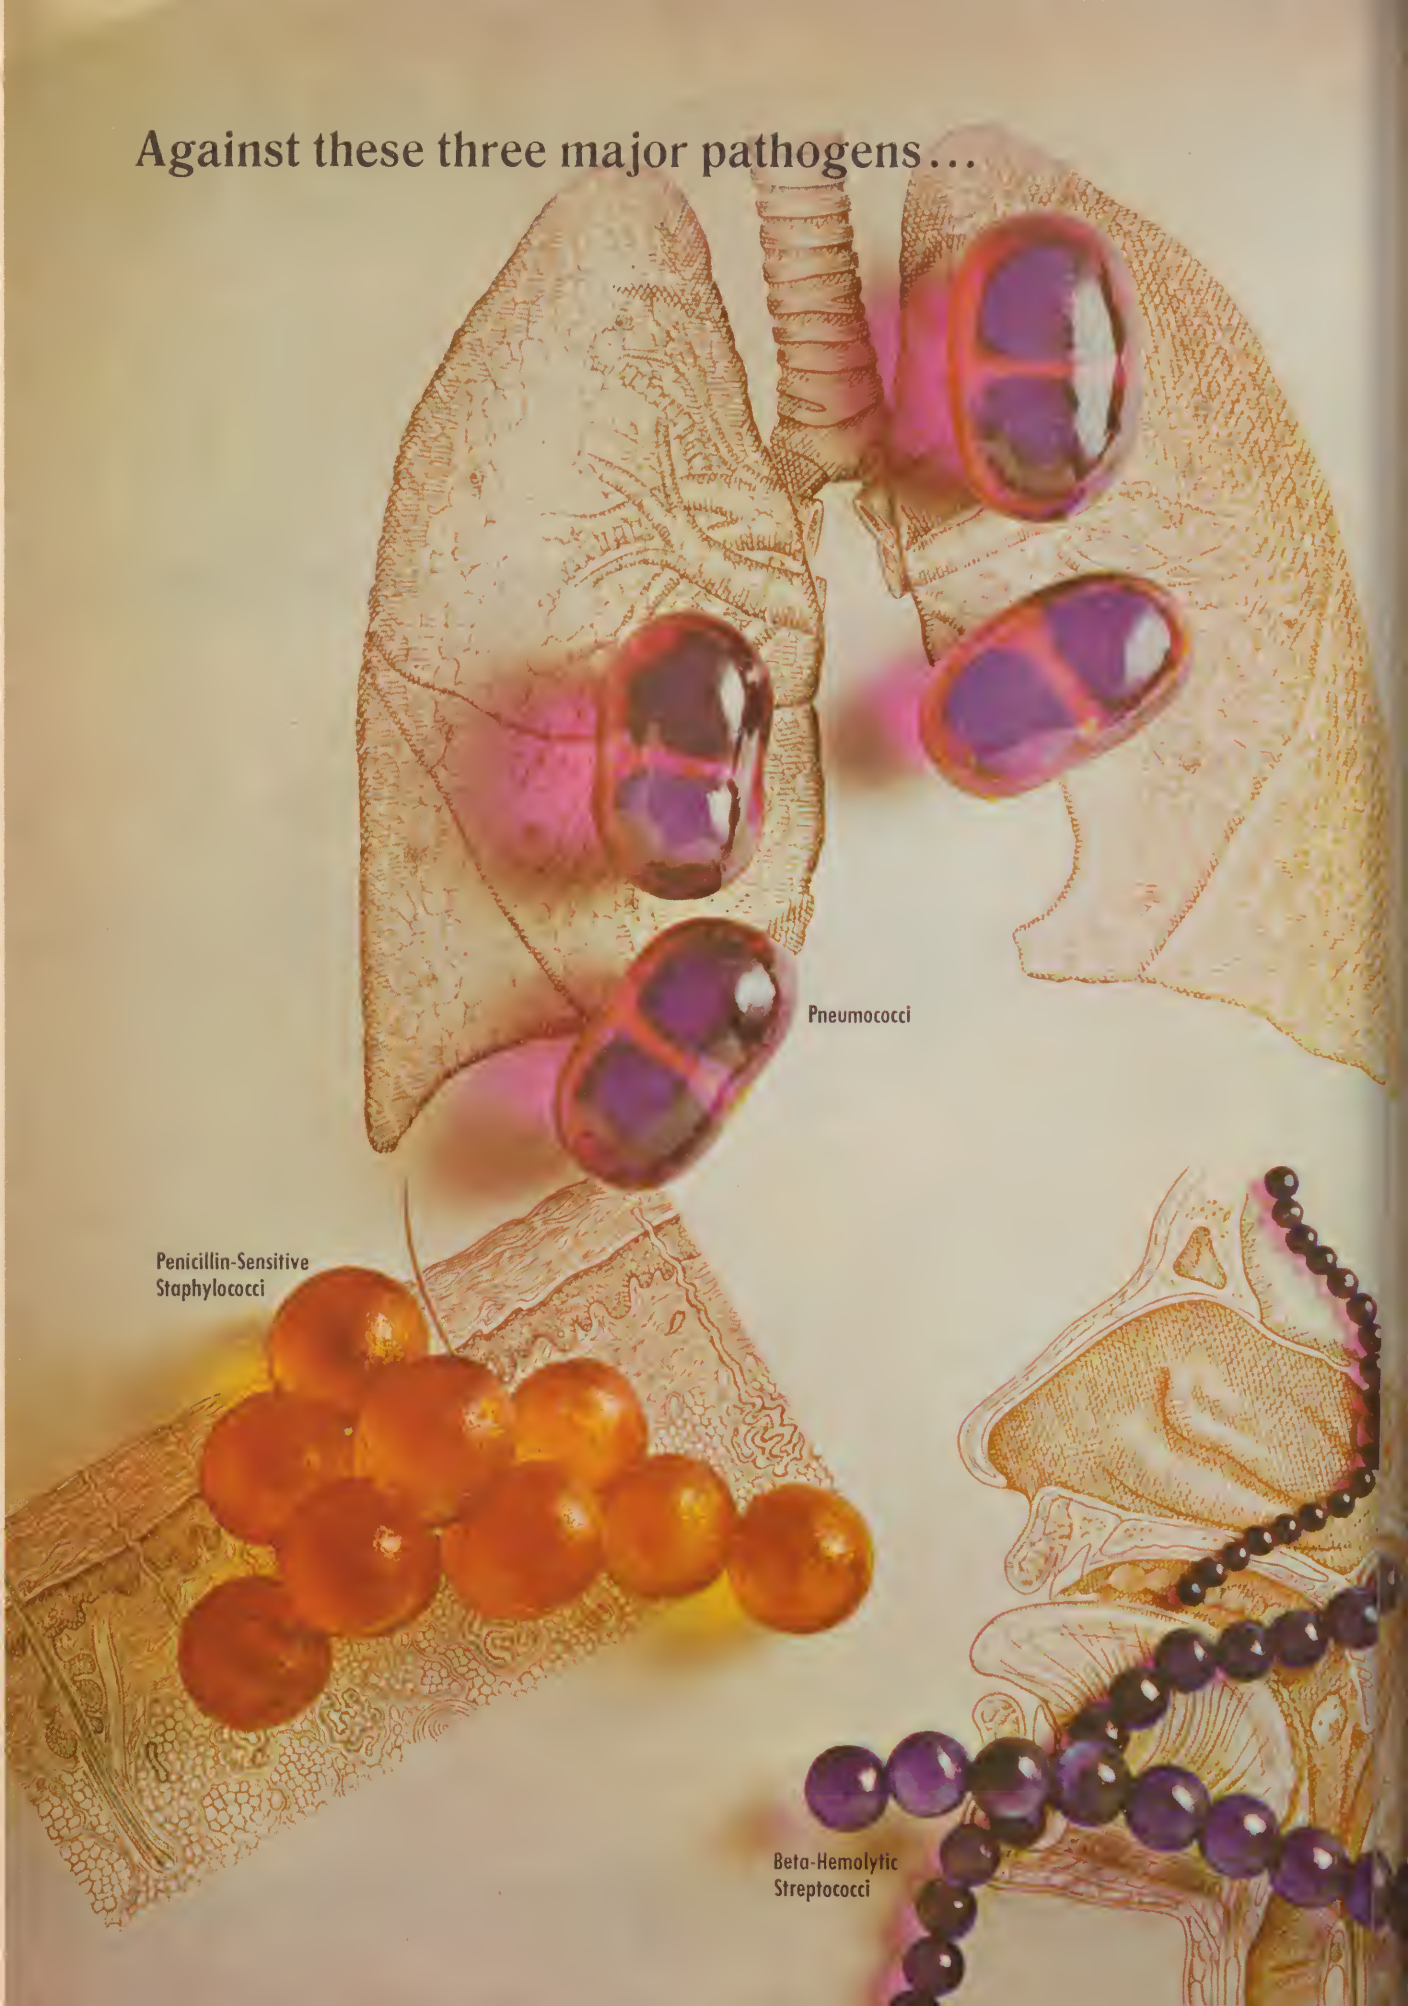
ONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).



ıe Ambar Extentab before breakfast can lp control most patients' appetite for up 12 hours. Methamphetamine, the appe- suppressant, gently elevates mood and lps overcome dieting frustrations. Pheno- rbital, the sedative in Ambar, controls irritability and xiety...helps maintain a state of mental calm and equa- nity. Both work together to ease the tensions that erode willpower during periods of dieting.

so available: Ambar #1 Extentabs®—methamphetamine drochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warn- : may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

V-Cillin K® Lilly 700636

Potassium Phenoxymethyl Penicillin

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Warnings: In rare instances, the use of penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin and in those with bronchial asthma or other allergies. Resuscitative drugs should be readily available for emergency administration. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for relief of immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with g parenteral dosage schedules, frequent evaluation of the rena hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory st (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrow pencillin-insensitive organisms. In such cases, its administration s be discontinued, and appropriate measures should be taken.

Adverse Reactions: Although serious allergic reactions are muc common with administration of oral penicillin than with intramu forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it does possess a s cant index of sensitization. The following hypersensitivity rea associated with the use of penicillin have been reported: skin r ranging from maculopapular eruptions to exfoliative dermatitis caria; and reactions resembling serum sickness, including chills, edema, arthralgia, and prostration. Severe and often fatal anapha has occurred (see Warnings). Hemolytic anemia, leukopenia, bocytopenia, and nephropathy are rarely observed side-effect are usually associated with high parenteral dosage.

Administration and Dosage: For Tablets V-Cillin K and for V-C Pediatric, the usual dosage ranges from 125 mg. (200,000 units) times a day to 500 mg. (800,000 units) every four hours. For i the daily dosage may be 50 mg. per Kg. of body weight divide three doses.

Beta-hemolytic streptococcus infections without associatec teremia may be treated with 200,000 to 400,0000 units three ti day. Therapy should be continued for a minimum of ten days to pr development of rheumatic fever and/or other serious complic Dosage for routine streptococcus prophylaxis in patients with a h of rheumatic fever or congenital heart disease may be 200,00 once or twice daily. When such patients undergo tonsillectomy extraction, or other minor surgery, the prophylactic dose sho 500,000 units every six hours given two days prior to surgery c two days postoperatively. If oral medication is not feasible on th of surgery, parenteral therapy should be considered. Mild to ate severe pneumococcus pneumonia has been treated effe with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be every six to eight hours in conjunction with indicated surgical dures.

For gonorrhea in males, 500 mg. (800,000 units) every four hrs f three doses may be employed; in females, 500 mg. every four for six doses are recommended. Refractory infections generally re to a second treatment three to four days following completion first. Treatment of gonorrhea with severe complications shou individualized, with prolonged and intensive treatment. Patients suspected lesion of syphilis should have a dark-field examinat fore receiving penicillin and monthly serologic tests for a minim three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 un bottles of 50 and 100; and 250 mg. (400,0000 units) and 5 mg (800,000 units), in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 uni 5 cc. of solution, in 40, 80, and 150-cc.-size packages.

The Hand in Rheumatoid Arthritis: Part II

GAYLORD LEE CLARK, Jr., MD
Instructor in Orthopedic Surgery
The Johns Hopkins University School of Medicine

DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

In a previous communication some selected deformities of the hands associated with rheumatoid arthritis were discussed and their surgical correction illustrated.

The following case report illustrates the use of reconstructive hand surgery in rheumatoid arthritis. The results of the Upper Extremity Function Test (UEFT) are included.

L.M. (BCH #385463)

Rheumatoid arthritis was diagnosed in this 53 year old white woman at age 8. Her life since has revolved around the progressive joint involvement and pain.

The first symptom, at age 5, was an inflamed swollen right knee. The arthritis migrated to the left knee, spine, hips, ankle, elbow and shoulder, but the symptoms were controlled with salicylates and no deformities resulted.

With the onset of her menstrual periods at 13, there was a reduction in all symptoms which continued until menopause at age 40. However, she was never entirely free of pain.

For the last 13 years she has become progressively worse with involvement of wrists, ankles, fingers and toes in addition to the aforementioned joints. Pain and morning stiffness, somewhat relieved as the day proceeds, has been constant. Weakness, fatigue, anorexia, malaise, and a low-grade fever have been intermittently present over the past 10 years. There has been recent pain and limitation in motion of the tempero-mandibular joint with difficulty in mastication.

She has visited numerous hospitals seeking relief. Seven years ago at the National Institute of Health a regimen of prednisone gave partial relief for several years. Two years ago she received triamcinolone for about 1 year. The steroid therapy caused her to gain weight to 128 lbs. with the typical Cushingoid facies, buffalo hump and protuberant abdomen. For the past 1½ years, she has received only Darvon and salicylates. Her weight has dropped to 90. Involvement of the hands and feet has progressed rapidly in the past 2 years. Ambulation is shuffling and difficult.

In 1959 she suffered a fracture of the left tibia and in August, 1963, a spiral fracture of the distal ⅓ of the left femur. Both of these accidents required prolonged bed rest.

In April 1963, a program for the surgical reconstruction of the patient's hands was begun and continued as listed in Figure 1.

Figures 2 to 5 show the appearance of hands in maximal finger extension before and after Vainio arthroplasty.

Figure 1. records serial studies of upper extremity function performed between 1959 and 1965 in relation to various surgical procedures. This upper extremity function test (UEFT) was developed in this department in an attempt to obtain a semiquantitative evaluation of hand function in a wide variety of hand impairments. Although the results are repeatable in stable traumatic and neurological impairments, they vary in patients with rheumatoid arthritis depending on the amount of pain present. If performed when the patient has no pain in the upper extremity, the scores are consistent. Figure 1 demonstrates that there has been no significant change in hand function with the various surgical procedures performed.

The cosmetic appearance of the hands has improved, and it is believed that the surgery will prevent or delay further deterioration of hand function.

Mortality Among Alcoholics

A total of 6,853 patients with a primary diagnosis of alcoholism were treated in Maryland's public and private inpatient and outpatient facilities in the three year period from July 1, 1961 to June 30, 1964. In addition, 1,969 individuals with other diagnoses were reported to have a drinking problem. Of these 6,853, 351 (or 5.1 percent) are known to have died while under care or after release by June 30, 1964. The following table, based on data from the Maryland Psychiatric Case Register, shows the distribution of these deaths by age at death and by cause.

		Age at Death (Years)				
Reported Cause of Death	Total	25-34	35-44	45-54	55-64	65 and Over
Heart Disease	101	2	7	33	29	30
Cirrhosis of Liver	46	5	18	14	7	2
Accidents	33	2	8	17	5	1
Cancer	30	—	4	9	12	5
Pneumonia & Bronchitis	29	2	7	10	5	5
Alcoholism	16	1	4	7	4	—
Vascular Lesions	12	—	2	5	1	4
Suicide	11	1	2	3	3	2
Tuberculosis	9	—	1	7	—	1
All Others	64	10	13	21	9	11
Total	351	23	66	126	75	61
Alcoholics Under Care During Period	6,853*	1,181	2,364	2,022	904	197
Percent Known to Have Died	5.1%	1.9%	2.8%	6.2%	8.3%	31.0%

*185 Alcoholics Were Less Than 25 Years of Age

As in the general population, heart disease was the most important cause of mortality, accounting for nearly 30 percent of all deaths. Thirteen percent were reported as due to cirrhosis of liver, the second most frequent cause. By comparison, 1.4 percent of all Maryland deaths during this time period were from this cause. Only four percent of all deaths from cirrhosis of the liver had been under treatment in a psychiatric facility during this three year period. Proportionally, accidents, pneumonia and bronchitis, alcoholism, suicide and tuberculosis were also more frequently reported as the cause of death among alcoholics

than in the general population while cancer and vascular lesions occurred less often. However, only 21 of the 165 Maryland deaths from alcoholism had been reported to the Case Register as under care in a reporting facility. Of these 21, 16 had been diagnosed as alcoholics.

Nearly one-third of the alcoholics, 65 years or older, were dead at the end of this observation period. High rates were also indicated in all other age groups. Although these can not be strictly considered age-specific mortality rates, since the time between admission and death was not computed, they are substantially higher than similar rates for the total Maryland population. They indicate that major physical illnesses are a frequent occurrence among these alcoholics.

TOWARD A NEW LIFE FOR OUR DISABLED

SHERMAN LAZARUS
Project Director, Comprehensive Statewide Planning for the Vocational Rehabilitation of Maryland's Handicapped Citizens

With the passage of the Vocational Rehabilitation Act of 1965, tremendous opportunities opened up for venturing beyond traditional rehabilitation lines in reaching and serving greater proportions of the physically and mentally handicapped citizens of our State. The restoration of increasing numbers of individuals to useful, productive living through gainful employment and/or participation in family and community activities requires that rehabiliation efforts be focused not only upon those with comparatively static disabling conditions but also upon those with progressive disabling conditions (eg, multiple sclerosis, muscular dystrophy) and other groups—including those disabled by cancer, stroke, and even the disabled law offender. Comprehensive Statewide Planning encompasses this objective of raising the scale of the State's rehabilitation program so that all of the State's disabled can be served as soon as possible but not later than 1975.

The achievement of this objective is dependent upon the availability of the necessary financing, facilities, and trained manpower. It is also dependent upon greater fusion of public and private rehabilitation efforts. In this connection, Mary E. Switzer, Commissioner of Vocational Rehabilitation, remarked that "One of the great tests of the next ten years will be to see whether, when the developmental state of rehabilitation in the United States gives way to a massive attack upon disability among our people, the rehabilitation movement can merge group interest into a truly cooperative national effort."

In order that we may serve increasing numbers of our handicapped population, we need to look at ways for improving the quality of services provided to our disabled. This means that we must continually search for and organize new patterns and organizational approaches for providing these services. For example, are we rehabilitating our disabled to their maximum level or potential? Are we involving the family of the disabled in the rehabilitation process? Are services organized so as to meet the needs of the disabled or are they organized along traditional agency lines?

What of the developing role of the workshop in vocational rehabilitation? During the Congressional hearings which accompanied the consideration of the 1965 Amendments, the need for achieving quality improvement of existing workshops as well as for constructing badly needed new workshops was underscored. Since workshops represent a valuable clinical tool—in terms of diagnosis, evaluation, and training—and also function as a transitional and long-term employment opportunity for many disabled persons, it is paramount that adequate workshop standards be developed. We also need to address ourselves to problems experienced by existing workshops in obtaining sub-contracts, in pricing proposals, etc. We might also want to consider the merits of establishing satellite workshops (eg, in nursing homes, sparsely populated areas).

How can we ensure the availability of sufficient numbers of trained manpower? We need to re-examine salary scales, recruitment practices, patterns of utilization of personnel, training practices, etc. Emphasis must, of course, be upon the maximum possible uses of our scarce human resources.

In summary, we have an opportunity through this Statewide planning effort to do something constructive about the needs of Maryland's handicapped citizenry. Although the task which lies before us is well within our grasp, it will take a coordinated and concentrated effort—on the part of all of us who care about providing our citizens with the prospect of a new life—if we are to succeed.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Provident Hospital's Acute Alcoholic Detoxification Unit

PROGRESS REPORT

Roland T. Smoot, MD, Addison W. Pope, MD, and John H. Weber

On April 17, 1967, Provident Hospital opened a five bed Alcoholic Detoxification Unit, the first of its kind in the Greater Baltimore area. The new service, limited and experimental, is in accordance with current medical and legal decisions that alcoholics are a medical rather than a correctional responsibility.

The Unit is under the supervision of the Hospital's Department of Medicine, of which Roland T. Smoot, MD, is chief. Consultation has been made available by Addison W. Pope, MD, Regional Mental Health Director for Baltimore City, and Charles R. Venter, MD, Director of the Crownsville State Hospital Alcoholic Rehabilitation Unit. John H. Weber is alcoholism counselor, and five recovering alcoholics serve as orderlies. Training programs for medical and nursing staff were provided by the Department of Mental Hygiene.

The statistical report on the Unit's first month of operation reveals that 20 patients were admitted and treated during that initial period: 16 male, 4 female; 12 Caucasian, 8 Negro; 10 covered by Medical Aid, 8 by Blue Cross-Blue Shield, and two by private means; 8 were referred by Alcoholics Anonymous, 6 by hospital staff physicians, two by the Baltimore City Health Department Alcoholism Clinic, two by other general hospitals, one by Baltimore Area Council on Alcoholism, and one by Provident Hospital Outpatient Clinic; 14 were referred to Alcoholics Anonymous for follow-up service, three to the Baltimore City Health Department Alcoholism Clinic, and three to Provident Hospital Outpatient Clinic.

The average length of stay for the 20 patients was 4½ days.

During the month, 19 additional alcoholic patients applied for treatment but were not admitted to the Unit: 8 could not be accommodated because of lack of beds, 4 were referred to more appropriate agencies, 3 changed their minds, and 4 had other problems which made admission inadvisable.

Dr. Smoot reports that problems anticipated in the management of acutely intoxicated alcoholic patients failed to develop. Because treatment was specific for acute alcoholism, complications generally experienced in withdrawal were avoided. Medical and nursing personnel now take for granted that these patients will present no more

problems than other sick people.

Henry J. Whyte, Provident Administrator, regards the Unit as evidence of the Hospital's determination to serve the needs of the community, and plans expansion of this particular service in the new hospital now under construction.

TREATMENT

Treatment in the Alcoholic Detoxification Unit is directed toward alleviating or minimizing agitation and mental confusion that usually ensue with cessation of alcohol intake, and aiding in restoration of the normal metabolic processes of the body by correcting the nutritional, fluid and electrolyte and vitamin deficiencies that have developed.

Routinely the patients in this Unit receive 25 mg. of Librium (chlordiazepoxide hydrochloride) four times a day, with supplements of 100 mg. of Librium IM q 3-4 H as the state of agitation warrants; in extreme cases the use of paraldehyde (paracetaldehyde) may be necessary. Thiamin (vitamin B_1) in dosage of 100 mg. three times a day, in addition to multi-vitamins are given, along with antacids to reduce the gastric upset that is usually present. Fluids per os, mainly fruit juices, are encouraged so that at least 2500-3000 cc are ingested daily. Initially the patient is given a soft diet which is changed to a regular diet as soon as he or she is able to tolerate it. All acute withdrawal symptoms have usually disappeared within 72 to 96 hours, and the average stay in this Unit has been 4 to 5 days.

A psychiatric evaluation is usually obtained after the patient's mental faculties have improved sufficiently. This is usually obtained on the 4th or 5th day of hospitalization. Many patients are referred to one of the alcoholic clinics upon discharge where psychotherapy, if deemed necessary, is initiated.

Upon admission to the Alcoholic Detoxification Unit, each patient receives a complete physical examination and laboratory tests, including chest x-ray and screening blood urine tests to rule out evidence of infection and to assess liver and kidney function. Should these examinations reveal any abnormalities further studies and treatment are rendered as is warranted.

after surgery

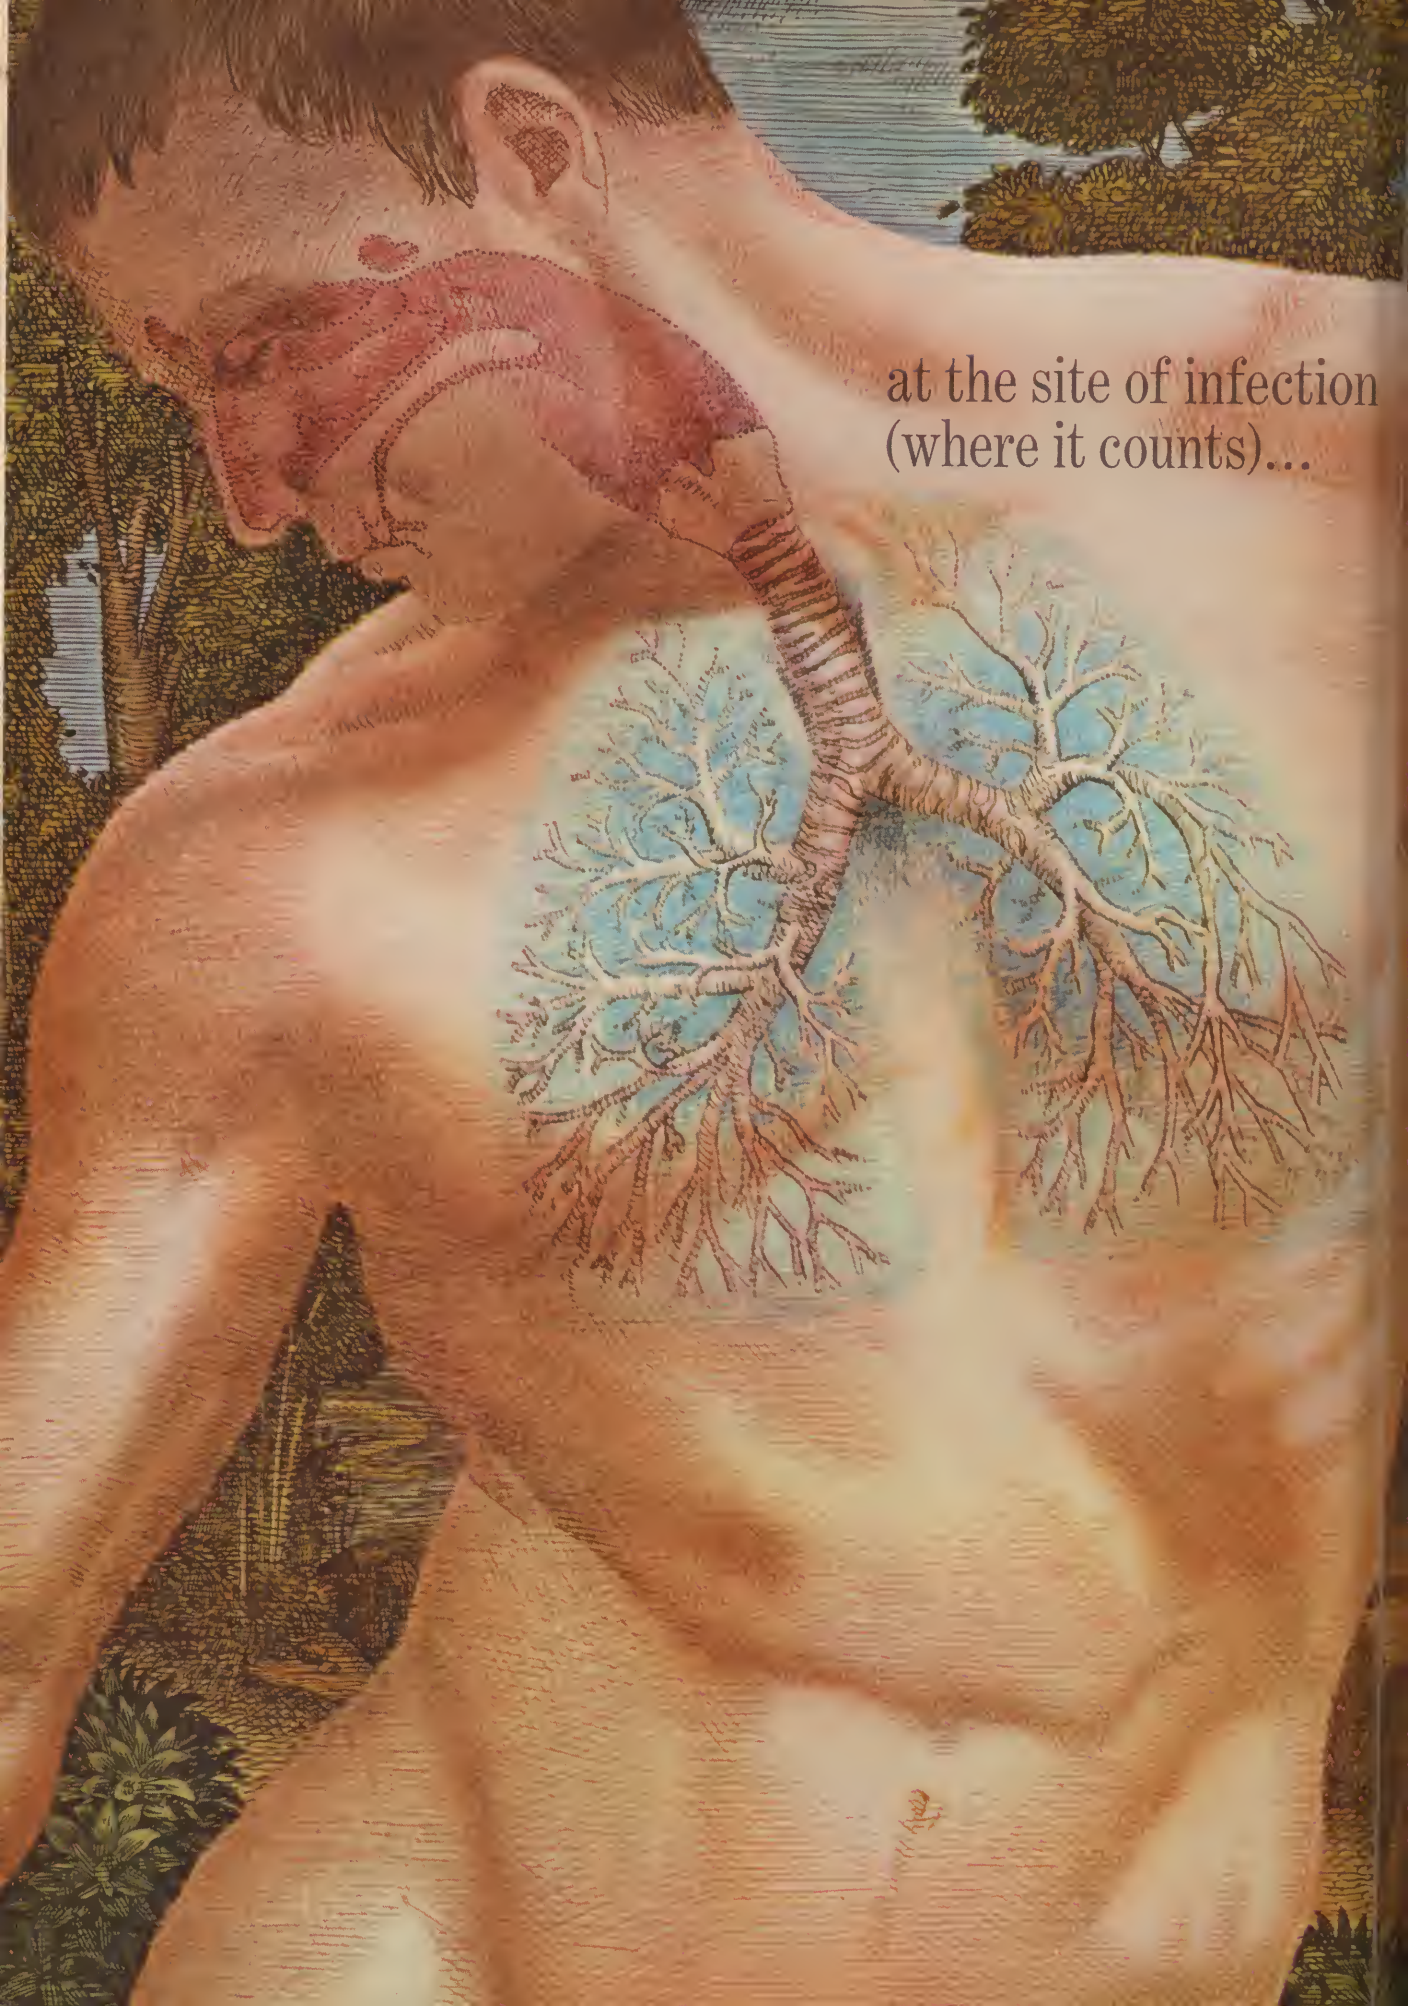
B and C vitamins are therapy: Therapeutic amounts of B and C in stress formula vitamins often are vital during periods of physiologic stress. STRESSCAPS capsules, designed to meet increased metabolic demands, aid in achieving a more comfortable convalescence, a more rapid recovery. After surgery, as in many stress conditions, STRESSCAPS vitamins are therapy.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY

Each capsule contains:



Vitamin B_1 (Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

700121

Ilosone®

Lilly

Erythromycin Estolate

(See next page for prescribing information.)

Ilosone®/the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with pre-existing liver disease or dysfunction.

Side-Effects: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have appeared in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly if the drug is readministered to sensitive patients, usually within forty-eight hours. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared to be definitely related to use of the drug, laboratory findings characterized by increased direct-reacting bilirubin, elevated alkaline phosphatase levels, negative or weakly positive cephalin flocculation and thymol turbidity tests, elevated serum glutamic oxalacetic transaminase levels, peripheral eosinophilia, and abnormal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has been reported in other patients taking prolonged courses of the medication. Patients with chronic infection have been given up to 2 Gm. of the drug daily for periods of two to six months, and patients with rheumatic fever have taken prophylactic doses of 0.5 Gm. daily for two years without difficulty. In one group of 144 patients who received the drug daily for two years, no jaundice was noted. It was of interest that members of six of these patients' families, who were not taking the drug, had episodes of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels were determined in a group of fifty-four adults and children who took 250 mg. of Ilosone daily for an average of sixteen months as rheumatic fever prophylaxis. The results were compared with those of a similar group of forty-four patients who received penicillin. There were no cases of jaundice in either group. Elevations of SGPT and serum alkaline phosphatase levels during the course of treatment was observed in one patient treated with Ilosone and in two patients treated with penicillin. Seven other patients in the group receiving Ilosone and four others in the penicillin group showed elevations in one of the tests at some time during administration of the drugs.

Very satisfactory therapeutic results, without toxicity, were reported in 102 pediatric patients who received short-term (ten day) courses of Ilosone in the treatment of streptococcus infections. Results of liver function tests in these patients were comparable to those in a similar control group who had received penicillin.

Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of individuals as a result of a local stimulating effect of the medication on the alimentary tract; however, the normal intestinal gram-negative bacterial flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with this type of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Pulvules®
Ilosone Chewable Tablets
Ilosone Drops
Ilosone, 125, for Oral Suspension

For infants and for children under twenty-five pounds of body weight, the usual dosage is 5 mg. per pound every six hours; for children twenty-five to fifty pounds, 125 mg. every six hrs. (Tablets Ilosone Chewable should be chewed or crushed and swallowed with water.)

For adults and for children over fifty pounds, the usual dosage of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythromycin therapy should be considered.

In the treatment of syphilis, the recommended total dose is 20 to 30 Gm. given in divided doses for a period of ten to fifteen days. Close follow-up of the patient is necessary since erythromycin drugs have not had adequate evaluation in all stages of syphilis. Examinations of spinal fluid are recommended as part of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days are recommended. In the treatment of gonorrhea, patients with a suspected lesion of syphilis should have a dark-field examination before receiving antibiotics, and monthly serologic tests should be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 250 mg. (equivalent to base), in bottles of 24 and 100.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to base), in bottles of 50.

Ilosone Drops, 5 mg. (equivalent to base) per drop, in cc.-size packages, with dropper calibrated at 25 and 50 mg.

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equivalent to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size packages.

MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

JUNE, 1967

Baltimore Chapter Holds Dinner

On Tuesday, May 9th, the BAMA held their annual "Bosses' Night." Approximately 75 persons attended the function. Special guests were: Drs. R. Atkins, L. Berger, E. Berstock, A. Cole, E. Cumerma, R. Fisher, A. Himelfarbe, D. Jovanovski, E. Lisansky, J. Littleton, M. Trail, H. Wollenweber, J. Willis, and T. Wilson. Also present were W. E. Tucker, Physical Therapist at Church Home and Hospital, and T. G. Whedbee, Director of Church Home and Hospital. Cocktails and dinner were served in the York Room of the Penn Hotel in Towson.

After dinner "Dolly Awards" were presented to each Doctor commending him for his special interest or talent. These awards consisted of a small doll sprayed gold, taped to a bottle of Jim Beam Bourbon covered in gold paper. To further augment their appreciation of their bosses, and his special talent or hobby, each physician was presented with a small gift.

This gala event closed with the presentation of "Disaster" or "How Dr. Egghead's Office Ceased to Function Without his Medical Assistant" by the BAMA Thespians. The cast members were:

Miss Bacon: Elva Edmondston, Dr. Egghead: Dorothy Hartel, The Penguin: John Komber, Batman: William Leiby, Robin: Peggy Bury.
As requested, the audience participated in the production by applauding and hissing on cue.

During the evening certificates were presented to those who had attended the Anatomy and Physiology Course. Melvin Trail, MD, of Church Home and Hospital presented these in behalf of Jack Zimmerman, MD, who was unable to attend.

A special thanks for "Bosses' Night" goes to Dolly Stuck, Chairman of Arrangement Committee; the BAMA Thespians; and the "Bosses" and Medical Assistants who attended.

ALLEGANY COUNTY

On Wednesday, April 26, 1967 the Allegany County Medical Assistants Association held their monthly dinner meeting at the Ali Ghan Country Club. Following the dinner, Gina Glick, MD, head of the Anesthesiology Department at Sacred Heart Hospital, Cumberland, gave a very informative and interesting talk on Anesthesiology. Other highlights of the meeting were the distribution of *AAMA* pins and a report on the State Meeting by Mrs. Gertrude Gillum, President-Elect, *MAMA*. Election of officers will be held at the May meeting.

WICOMICO COUNTY

The May meeting of the Wicomico Association of Medical Assistants was held on May 10th at the Peninsula General Hospital School of Nursing Auditorium. Speaker of the month was Rolf Emberland, MD, a Biochemist, from Peninsula General Hospital, whose topic was entitled "Hormonal Balance in the Pregnant and Non-Pregnant Female." Dr. Emberland was born and raised in Norway, and educated at the University of Copenhagen. He came to the United States in 1960, where he worked at the Worcester Foundation for

Experimental Biology, in Massachusetts, in research on hormones. It is interesting to note that he worked under Gregory Pincus, MD, a famous figure at the institute, who was the first founder of the birth control pill. Dr. Emberland joined Peninsula General Hospital in 1962.

The Wicomico chapter is at work on the Seminar, which is to be held in Salisbury this year. The theme will be Mental Health.

AAMA ANNOUNCES MEDICAL ASSISTANT SCHOLARSHIPS

The following news release has been received from the AAMA:

Chicago: Loans for medical assistant training are now available from the *Maxine Williams Scholarship Fund*, sponsored by the American Association of Medical Assistants.

Each loan is for $300. As AAMA assumes all administrative costs, there is no interest rate. Repayment may be made after the student is employed.

Anyone who is a high school graduate, and wishes to take formal training is eligible to apply for a loan. Application blanks are available from AAMA headquarters, 510 N. Dearborn St., Chicago, 60610.

The fund, named in honor of AAMA's first president, is supported entirely by private contributions. It was established to encourage those wishing to become medical assistants to take formal training, preferably at a school which offers a two-year course."

COMMITTEE CHAIRMEN APPOINTED FOR APRIL 1967-1968

The following Committee Chairmen have been appointed: Arrangements, Catherine Kousouris, Budget and Finance, John Komber; Civil Defense, Dorothy Walker, Constitution and By-Laws, William Leiby; Convention, Dorothy Hartel, Education, John Komber; Historian, Peggy Bury; Legislative, Dorothy Hartel; Membership, Frances Fairley; Membership Extension, Dorothy Hartel; Parliamentarian, Mary Rachuba; Program, Carol Davis; Program Printing, Ann Schultz; Publicity and Public Relations, Arlene Whalen; Registration, Margaret Krize.

These chairmen will pick their own committee members and will be contacting members throughout the state for assistance.

HOSPITAL EXPENSES INCREASE

Higher wages and more personnel have resulted in an increase of $5.31 in total hospital expense per patient day in January 1967 as compared to the same month in 1966, according to figures in Hospital Indicators released on April 16 by the American Hospital Association.

In January 1966 a hospital's cost of caring for a patient for one day was $45.55; a year later this cost increased to $50.86.

Hospital Indicators, published monthly by *HOSPITALS*, Journal of the American Hospital Association, is based on data from a sample of 628 community hospitals taken from a universe of 5,736 hospitals registered by the AHA.

Payroll expenses account for about two-thirds of the hospital's operating costs. In January 1966 hospital payroll expense per patient day totaled $28.01; in January 1967 this expense category totaled $31.54.

The AHA survey also showed an increase of more than 80,000 full-time hospital personnel in the 12-month period. Hospitals reported 1,251,453 employed in January 1966 and 1,332,328 in January of this year. Part-time personnel increased from 296,995 in 1966 to 334,772 in January 1967.

the HEART PAGE

Elijah Saunders, MD—*Editor*

Transient Ischemic Attacks of the Brain: Part II—Management

On the Heart Page in the previous issue, certain diagnostic features of *transient ischemic attacks* were briefly noted, the importance of historical features emphasized and some of the conditions commonly confused with TIAs were mentioned. Once the diagnosis of TIA has been established, largely on historical grounds, attention is appropriately directed toward determining the cause of the ischemic episodes and prescribing therapy.

Blood studies to rule out either polycythemia or anemia are in order, since either can produce cerebral ischemia which may be transient. A normal chest x-ray and EKG help to vindicate the heart as being of etiologic significance. Particularly if symptoms follow head turning, cervical spine x-rays should be done since spondylosis or anomalies can diminish vertebral blood flow. A pulse lag and a 20 mm. systolic pressure difference in the two arms indicate obstruction in the innominate or subclavian vessels producing a "subclavian steal syndrome." Repeated pressure determinations in different positions may corroborate postural hypotension. Carotid sinus massage should not be done routinely because of the danger of embolization from a plaque at the bifurcation. An EEG, while not diagnostic, often if valuable in cases where epilepsy is a possibility and clear localization is not apparent from the history; further, the EEG, like the brain scan is a useful and harmless procedure in atypical cases where a mass lesion remains in the differential diagnosis. A lumbar puncture is appropriate in atypical cases especially when the possibility of meningovascular lues exists and, in any case, is required before anticoagulant therapy can be initiated. In a minority of cases, clinical examination or laboratory studies will provide a specific etiology and dictate a specific therapy, eg, elastic stockings for the patient with postural hypotension; a collar for the patient with spondylosis and ischemia on head turning; phlebotomy for the patient with polycythemia, etc. More often, the specific basis for the TIA is less obvious and is considered to be on the basis of degenerative vascular disease with the cerebral symptoms related to thrombosis or embolism. If the patient is experiencing TIAs and is hypertensive, gradual lowering of the blood pressure toward a diastolic pressure of 100 mm. is advisable, although the possibility of iatrogenic strokes keeps one cautious. Should a surgically correctable lesion that correlates with the patient's symptoms be found and if the patient's general condition allows for consideration of surgery, angiography is appropriate. Because of the possibility of dislodging embolic material from a plaque and the usefulness of knowing the condition of all vessels preoperatively, direct carotid

puncture is being supplanted by four-vessel angiography via brachial or femoral catherterization.

When symptomatic "subclavian steal syndrome" is present, surgical intervention is in order. Similarly, a unilateral obstruction in the right internal carotid at the bifurcation producing transient right eye blindness and hemiparesis needs surgery. Unfortunately, such cases are infrequent; more often angiography is negative or inconclusive. In such cases, anticoagulation therapy should be considered, provided: (1) there is no history of hemorrhagic diasthesis, ulcer, or G.I. bleeding, (2) the patient is reliable, (3) the physician is acquainted with this type of therapy and a good laboratory is available for regular prothrombin determinations, (4) there is no evidence of bleeding into the subarachnoid space. Hypertension is, at least, a relative contraindication to anticoagulation. There is no unanimity of opinion as to the optimum time to continue anticoagulation; however, there is increasing evidence to support long range therapy lasting months to years.

Available evidence shows that prognosis is significantly better for posterior than anterior system insufficiency.

Stellate ganglion blocks and fibrinolytic agents have not proven of value. While 5% CO_2 in O_2 is a potent stimulus to increase blood flow, it is uncertain whether it is of practical value in TIA therapy. Determination of the usefulness of intravenous vasodilators and low molecular weight "Dextran" is currently under investigation.

In summary, the diagnosis of *transient ischemic attacks* of the brain can be made in most cases on the basis of the history alone; some cases can be further studied with simple office and laboratory procedures and the specific cause elucidated; others require special investigations including angiography before the most appropriate management can be instituted. TIAs are a treatable condition.

DEPARTMENT OF HEALTH

STATE OF MARYLAND

William J. Peeples, MD, MPH, *Commissioner*

HIGHLIGHTS

PROMOTION OF ADEQUATE IMMUNIZATION

A follow-up program designed to encourage complete immunizations for all infants born in Maryland counties began in April. Following the routine birth registration notice, parents of newborns will receive communications from the Health Department urging that the baby be taken to a physician or health clinic for the recommended series.

Each letter contains a postage-paid card on which the parents are to indicate the baby's age and the date when the series was begun. The card is then to be mailed back to the Health Department. When the parents report that the basic immunization series has been completed, a permanent immunization record card will be issued. A similar program is in operation in many other states and in Baltimore City.

In addition to serving as a reminder to parents of the importance of early immunizations and boosters, the reply cards will help physicians and, State and local health departments to plan improved immunization services for the children in Maryland.

The birth certificate follow-up program is a phase of the Maryland Immunization Project being conducted by the Division of Communicable Diseases.

MARYLAND CHOSEN FOR FDA DRUG ABUSE CONTROL PROGRAM

Active negotiations by the Division of Drug Control have been instrumental in Maryland's selection by the Food and Drug Administration as one of eighteen states to join a cooperative Federal-State program to control the illegal distribution of prescription drugs. The Health Department has been designated as the enforcement agency for the State, dealing with violations on the drug store level, while the FDA concentrates on large scale operations. Selection was made on the basis of the State's potential, capability, and willingness to participate.

Personnel from other selected states in the region will join Department staff members in a three-day training course in Baltimore in June. In addition to enforcement procedures, the course will cover provisions of the 1965 Drug Abuse Control amendments, which apply to amphetamines, barbiturates, and other drugs found to have a potential for abuse because of their stimulant, depressant, or hallucinogenic effects.

PKU PROGRAM BEING EVALUATED

Procedures relating to the PKU program are being examined and evaluated by six subcommittees of the Advisory Committee on Hereditary and Metabolic Diseases, which serves in an advisory capacity to the Division of Community Services for the Mentally Retarded. Subcommittee findings on psychological follow-up, laboratory procedures, public health nursing, diagnosis, nutrition, and legislation and regulations will provide bases for Advisory Committee recommen-

dations to hospitals, aimed at clarifying current legislation and suggesting ways of simplifying implementation of the law. Physicians or hospitals may refer questions or specific problems to the Committee for study.

MARYLAND'S PUBLIC HEALTH PROGRAMS IN ACTION

A graduate course, *Maryland's Public Health Programs in Action,* jointly sponsored by Towson State College and the State Health Department, is scheduled from June 19 through July 10, 1967, in Osler Hall, Medical and Chirurgical Faculty Building.

ROSEWOOD PRE-ADMISSION PILOT PROGRAM

Starting May 1, a pilot program will be initiated through the Health Departments in five counties, designed to provide coordinated, cooperative, comprehensive community services to Rosewood State Hospital patients and their families, beginning when request for admission is made and continuing through pre-discharge and post-discharge phases. Administrative, medical, nursing, and social service staffs of the hospital and the Health Department's Divisions of Community Services for the Mentally Retarded and Public Health Nursing have developed guidelines and pre-admission forms. The program will be followed for six months before being recommended for statewide use.

IN-SERVICE TRAINING INSTITUTE HELD

Instructors from Maryland day care centers for the mentally retarded recently attended the Tenth Semi-Annual In-Service Training Institute held by the Health Department's Division of Community Services for the Mentally Retarded, at which basic principles and training techniques were taught. The formal two-week training course emphasizing problems of severe retardation was followed by a third week devoted solely to practical teaching experience.

Broadening of the day care concept since the first Institute in 1962 is reflected in the growth of the faculty from 8 to its present staff of 22 instructors and lecturers from the field of pediatrics, psychology, public health nursing, nutrition, speech pathology, occupational therapy, physical therapy, social work, and health education.

NEW ANIMAL CARE LAWS OUTGROWTH OF STUDY

A study of existing animal care laws, requested by Senate Resolution No. 22 of 1966, was performed by representatives of humane organizations and bio-medical research institutions, under chairmanship of the Chief of the Department's Division of Veterinary Medicine. As a result of its cooperative study, the committee drafted six bills, of which three were enacted by the 1967 General Assembly.

SALMONELLOSIS IN BABY CHICKS SUBJECT OF STUDY

In a two-week period during the Easter season, eighteen groups of chicks and ducks were collected by five county health departments and tested by the Bureau of Laboratories' Enteric Infection Section for the presence of salmonella organisms. Approximately 66 per cent were found to be infected with one or more of the five serotypes of salmonella. Following the study, the General Assembly enacted legislation prohibiting the sale of bady chicks and ducks as household pets.

PUBLIC INTEREST IN HEALTH EDUCATION LITERATURE

A recent evaluation of the State Health Department's service to public and school librarians revealed greatly increased interest in air pollution, water pollution, venereal disease, drug abuse, family planning, sex education, and cigarette smoking. The special service to librarians was inaugurated in 1966, in cooperation with the State Department of Education, in order to help make health educational materials more available generally. The collection now includes approximately 3000 volumes on medical, health, and related topics.

Learn To Do Your Part In The Prevention Of Disease

Alcoholic Detoxification Unit at Provident Hospital

Baltimore physicians will be interested in learning that an Acute Alcoholic Detoxification Unit has been established at Provident Hospital, 1514 Division Street, Baltimore, Maryland 21217. The Unit, consisting of five beds, provides appropriate medical treatment for patients who are acutely intoxicated or those who are chronic alcoholics desiring treatment. In establishing this Unit, Provident Hospital has recognized the need of the modern hospital to provide care and facilities for the "whole patient" and not just segments of his illness. The unit will also serve not only as a place where interns, residents, nurses, attendants and orderlies can learn the signs and symptoms of acute alcoholic intoxification and the proper medical and nursing treatment techniques, but will also serve for research into the various treatment methods.

Procedures established by the Detoxification Unit are as follows:

1. Initially, patients will be admitted to the Detoxification Unit on an "Elective Basis" only.
2. Referral For Admission:
   a. Patients with the proper hospitalization insurance may be referred for admission as follows:
      1. By Physician Referral
      2. By Alcoholics Anonymous.
      3. By Members of the Clergy through the Alcoholism Unit Counselor.
      4. By Public Health Nurses through the Alcoholism Unit Counselor.
      5. Patients may be referred to the Detoxification Unit from any "In House" Service by the Attending Physician with the endorsement of the Chief, Department of Medicine. Such patients must meet all other qualifications required of patients admitted to the Unit.
   b. Patients referred for admission by a Private Physician may be managed by the Private Physician with a consultation by the Psychiatrist-on-call or the patient may be admitted as a patient of the Psychiatrist or attending physician and the Private Physican as referring physician.
   c. Patients on the Medical Assistance Program may be referred by any of the above methods, however, they will be cleared for such admission by the Chief of the Department of Medicine and assigned to the Medical Attendant on Service.
   d. Patients who do not have financial resources will be admitted, only after referral, by an Alcoholics Anonymous sponsor who is to demonstrate the ability and the willingness to assume financial responsibility for this person.
3. The patient and/or responsible relative, upon admission, is required to sign an authorization for the Hospital to commit the patient to the appropriate State Mental Hospital if it should become necessary, as well as to be financially accountable for any expenses incurred in the

Louis Krause, MD, Chairman
Library and History Committee

Elizabeth Sanford
Librarian

Meeting of the Curators of Osler Library, Montreal, Canada

The privilege to attend the Meeting of the Curators of the Library at McGill University is accorded the chairman of the Library Committee of the Medical & Chirurgical Faculty. It probably was the first time the faculty was represented at such a meeting. The impressive factor about the meeting was the atmosphere of the love of books. It was a surprise to me to learn about the extent of the McGill University Library, more particularly the size of the Osler Library. Part of the library is dedicated to the preservation and the use of rare books, particularly the rarissimi. These books have to be cared for not only in the proper filing position, but also for their preservation; air conditioned cases and maintenance of a constant temperature. Because of the increased amount of attention these books deserve, and need, special curators are in charge of the various divisions of the library, such as a curator of the Osler Section. It was refreshing to listen to the discussions that took place exhibiting the familiarity with medical literature, more particularly relating to the history of medicine and the development of medical ideas. Many of the things that we accept as new today are the concepts of the ancients come to fruition. How true the saying is *"the farther back you can look, the farther in the future you see,"* or as Patrick Henry said, *"I see no way to judge the future but by the past."*

The agenda were varied with no ridigity maintained, so there was a free discussion in every direction.

There is a need for a place in our library for all Members of the medical profession to have easy access to any medical literature, and for displaying the very latest medical information. It would be a shortsighted policy to maintain books in our library of only practical utility. Our book shelves should contain any volume that is being used by medical scholars. It is true that the medical practitioner's first concern is with the living literature, thus we must meet their needs by subscribing to a great number of periodicals in our own and other languages. Our Library must offer the greatest hospitality to a variety of subjects. Some of our books contain written words of the framework of the time in which they were written, but today, have ceased to be oracles.

One can envision the future of our Library with its 86,000 volumes as one of the most important parts of our faculty. Incidentally this is just a little smaller than the Library at McGill University. It could serve 3 functions—1. Pertaining to current medicine. 2. The history of medicine going back 100 years more or less, and 3. Rare books division—those not ordinarily

found in the average library, which would include a special section for the "rarissimi" books, the latter occupying a niche comparable to that accorded an ancient scroll of hallowed worth. This all would be under the control of a chief librarian, in addition there would be a curator for the various subdivisions. I am aware that this means a lot of time and work, nor am I unmindful of the expression of Ecclesiastes in which he states, *"of making many books, there is no end and much study is a weariness of the flesh."*

JUNE, 1967

Woman's Auxiliary Elects First Honorary Member

The unanimous vote to elect Mrs. Albert E. Goldstein the FIRST HONORARY MEMBER of the Auxiliaries to the Baltimore City Medical Society and the Medical and Chirurgical Faculty of the State of Maryland was of noteworthy interest. Elsie Goldstein has more than earned this honorary membership for her fine leadership, her charm and devotion to Auxiliary work. A Charter member of the State and Baltimore City Auxiliaries she has served as president of both, always helping wherever and whenever needed on committees.

Her leadership ability was recognized by the Woman's Auxiliary to the American Medical Association, where she held the office of Director for two years and served as Chairman of the Resolutions Committee and member of the Nominating Committee. For the past year she has been Liaison Officer to the Woman's Auxiliary of the Student American Medical Association and has opened her home and heart to these outstanding young women.

Elsie's thirst for knowledge drew her to Johns Hopkins University for various courses, including some on Shakespeare. She is a member of the Daughters of the American Revolution. Sharing her late husband's interest in parliamentary procedure, she became a charter member of the *Margaret W. Wheelock* unit of the National Association of Parliamentarians. She is also an enthusiastic gardener. Always interested in her husband's career, she accompanied him to numerous medical meetings in many lands. She is the mother of four sons (two business men, an attorney and a physician) and has five grandchildren. Her fiftieth wedding anniversary was celebrated in 1962, five years before the demise of Dr. Albert Goldstein in February, 1967.

© JOBST, 1966

JOBST offers a complete range of custom-made support garments for the treatment of venous insufficiency and management of lymphedema.

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

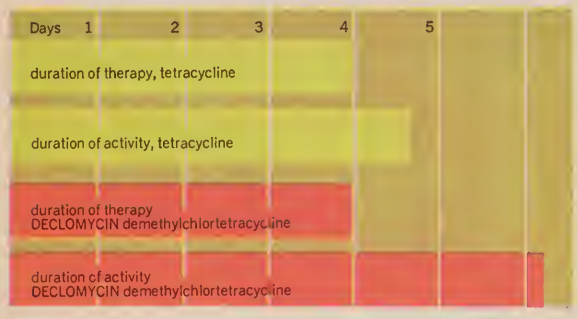
Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

'NEOSPORIN'®

brand

POLYMYXIN B-BACITRACIN-NEOMYCIN OINTMENT



BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

why wonder about a drug

when you know

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

produces 1-2 "extra" days' activity

1-2 "extra" days' activity
after the last dose to protect against relapse

one 300 mg tablet b.i.d.
or
one 150 mg capsule q.i.d

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort.

Precautions and Side Effects—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measu should be taken. Use of demethylchlortetracycline dur tooth development (last trimester of pregnancy, neona period and early childhood) may cause discoloration the teeth (yellow-grey-brownish). This effect occurs mos during long-term use but has also been observed in sh treatment courses. In infants, increased intracranial pr sure with bulging fontanels has been observed. All sig and symptoms have disappeared rapidly upon cessat of treatment. Side reactions include glossitis, stomati proctitis, nausea, diarrhea, vaginitis and dermatitis adverse reaction or idiosyncrasy occurs, discontinue m ication and institute appropriate therapy. Anaphylact reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b. Should be given 1 hour before or 2 hours after mea since absorption is impaired by the concomitant adm istration of high calcium content drugs, foods and so dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 and 75 mg of demethylchlortetracycline HCl.

LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York

Lederle

For he's a jolly good fellow

But what does he think?

Many overweight patients can benefit from the appetite control provided by the sustained anorexigenic-tranquilizing action of BAMADEX SEQUELS: anorexigenic action of amphetamine; tranquilizing action of meprobamate; prolonged action through sustained release of active ingredients.

Bamadex® Sequels®

DEXTRO-AMPHETAMINE SULFATE (15 mg.) WITH MEPROBAMATE (300 mg.) SUSTAINED RELEASE CAPSULES

to help establish a new dietary pattern

Contraindications: Dextro-amphetamine sulfate: in hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

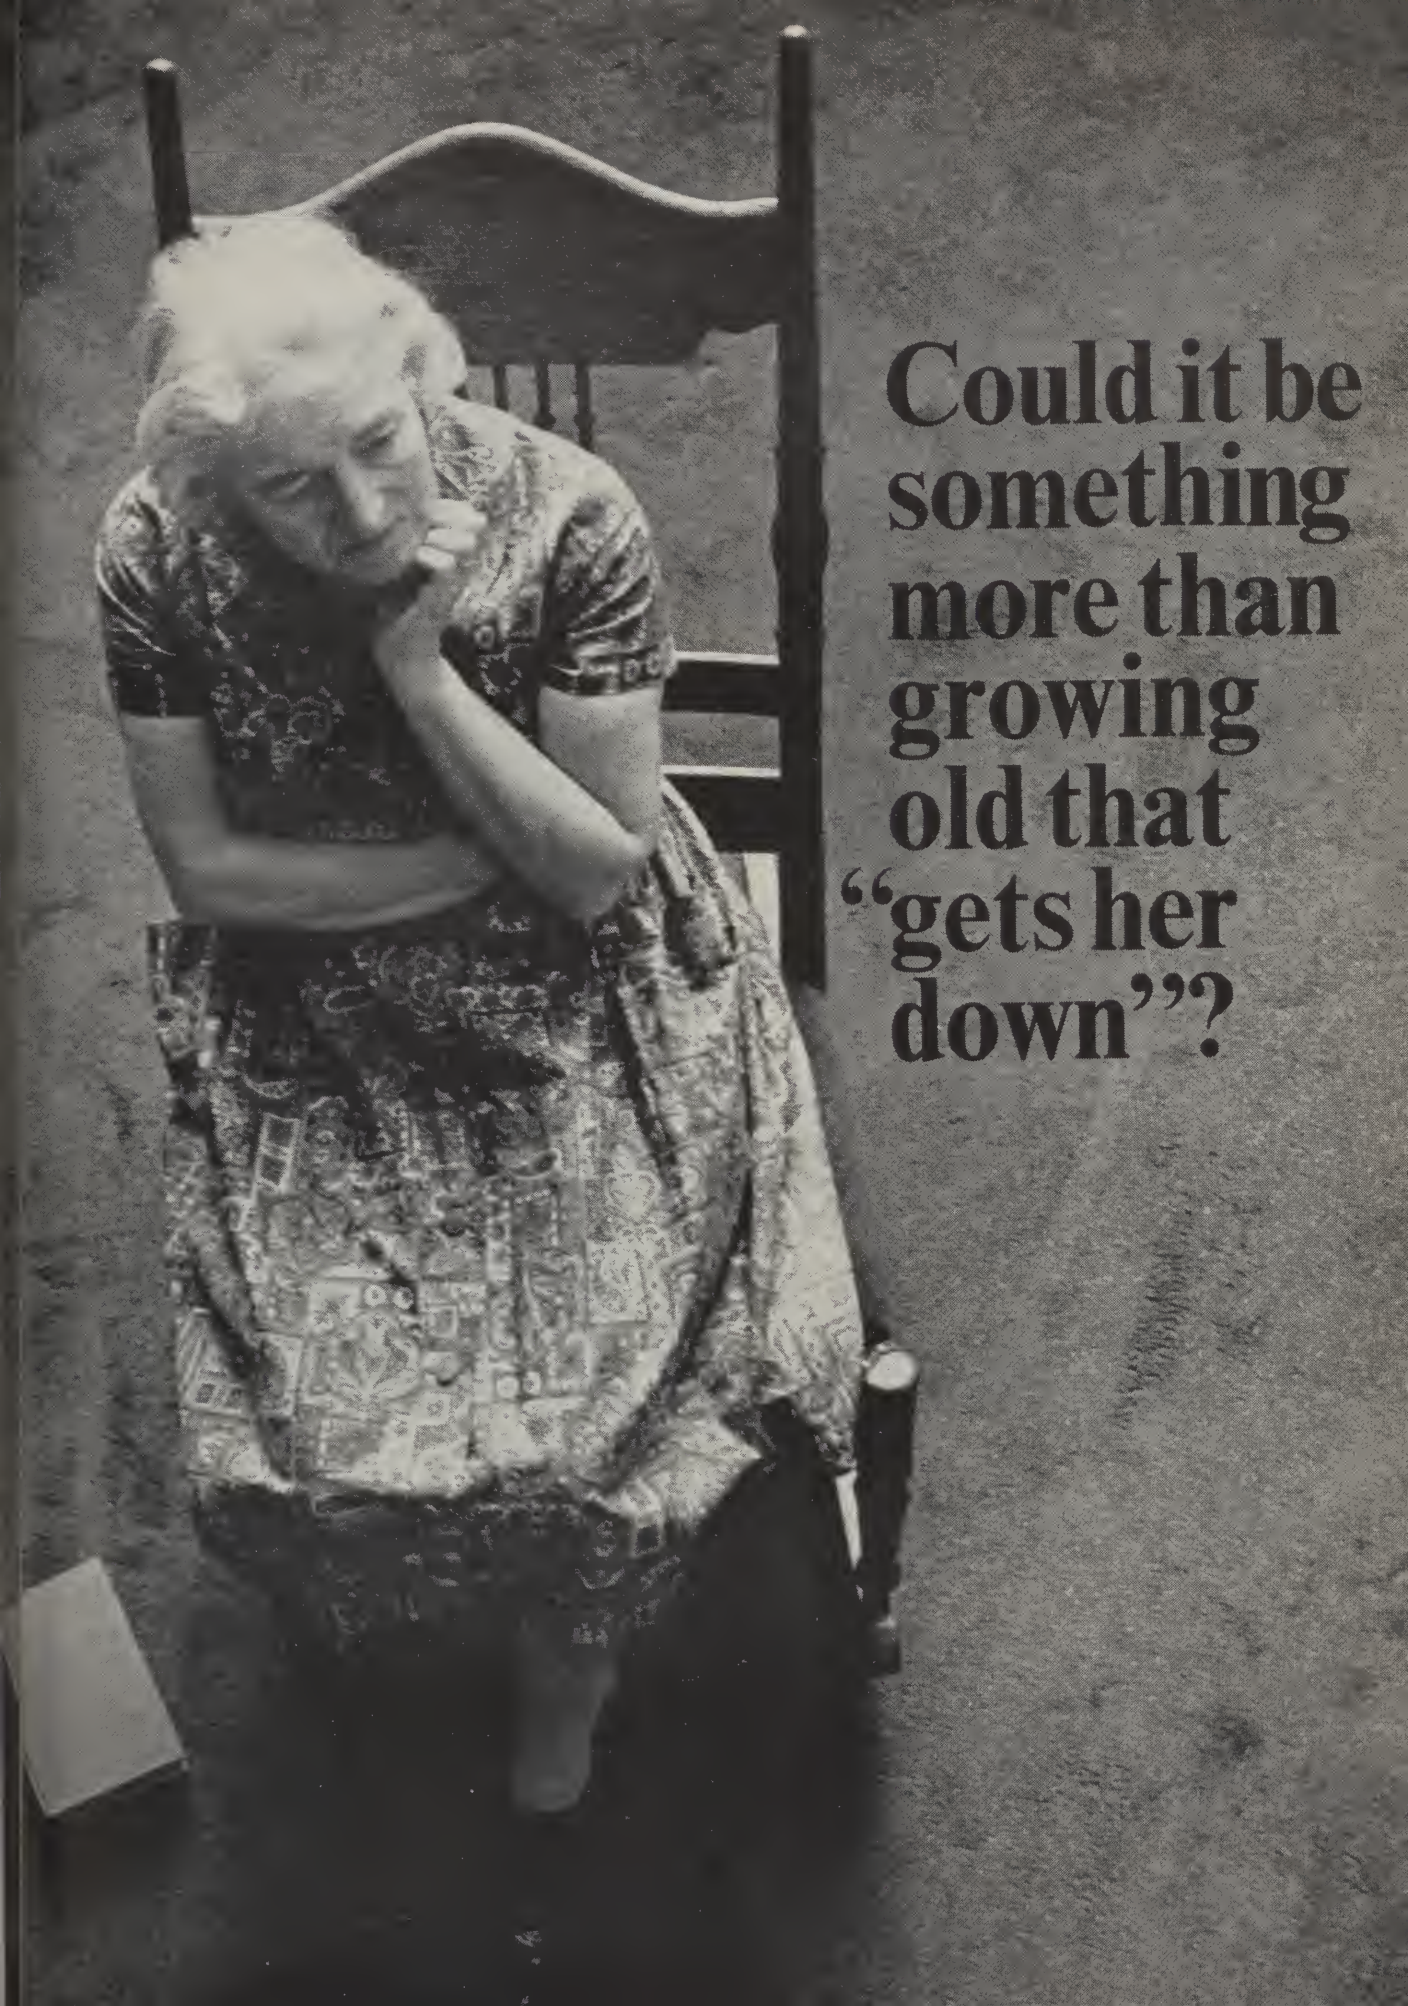
DIARRHEA

CANTIL®
(mepenzolate bromide)

Diarrhea, one of the most vexing symptoms of common G.I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.



LAKESIDE

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth, blurring of vision, constipation, nausea, vomiting, bloating and dizziness may occur but are usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy — withhold in glaucoma. Contraindicated in patients sensitive to phenobarbital and/or Cantil (mepenzolate bromide); in toxic megacolon, obstruction of G.I. or G.U. tract.

SUPPLIED: CANTIL (mepenzolate bromide) — 25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL — containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

Could it be something more than growing old that "gets her down"?

Mild mood depression, poor appetite, little interest in the present or future. Does this picture mean that she's giving in to functional fatigue?

When functional fatigue is part of her problem, Alertonic can help counteract accompanying apathy and inertia. It helps lift mood, stimulate appetite, and establish new interest in daily life.

Pleasant-tasting Alertonic combines pipradrol hydrochloride—a gentle cerebral stimulant—with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Especially in the aging patient, nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding, and encouragement. Between visits, however, your prescription for Alertonic can help keep your patient from giving in to functional fatigue.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals ...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

Available only on prescription

Alertonic®

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%, pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.

Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

LOOK TO THE ULTIMATE IN NURSING HOMES

What makes Community Health Facilities *different and better* than other nursing homes in Maryland? The main reason they stand out from all the other homes is that these nine health institutions are made up of skilled people whose entire lives are devoted to the profession of helping others. These people are interested, concerned and thoroughly conscientious regarding every guest they have. At a Community Health Facility, each and every guest receives personalized individual care that guarantees them a pleasant stay whether they are convalescing or receiving restorative long term rehabilitative care.

COMMUNITY HEALTH FACILITIES FEATURE:

- Registered Nurses—24 hour nursing care
- Open medical staff—your doctor continues to care for you
- Special diets under the supervision of an Accredited Dietician
- Modern hospital equipment—Oxygen, Intravenous, Suction Therapy
- Physical Therapy Available
- Air Conditioning Available
- Religious Services
- Recreational Areas
- Separate Units provide separation of convalescent from sicker patient
- True convalescent section—Intensive Care Unit
- And *best of all . . . attractive and sensible rates*

Solutions to Business Problems in Daily Medical Practice

ALL ABOUT AIDES - PART II

INTERVIEWING PROSPECTIVE AIDES

WILBURN L. McCLURE, JR.

Prior to sitting down with an applicant, the doctor should have the following:

1. An application form.
2. A written description of the position to be filled.
3. A private area and an unhurried hour.
4. A few well-chosen words describing the doctor's personality and idiosyncrasies.

When possible, mail an application form prior to the interview. Ask that it be completed and returned; and state that if your review of the form is favorable, an interview will be arranged.

In this way, you can observe the applicant's handwriting ability or typing skills. Also, you can review her qualifications, work experience, salary requirements and references. If the references prove favorable, you are ready to conduct a professional interview.

Should the applicant come directly to your office, provide a private place in which the form can be completed. Take time to review the application prior to admitting the applicant to your consultation room. If possible, make one quick phone call to check a reference; otherwise, make sure that you complete this task after the interview.

Interviews that are conducted in the privacy of a consultation room should be unhurried. Try not to take phone calls. After all, these few minutes must provide you and the applicant with information that you need regarding each other, or it might as well not have been conducted.

Without an outline of the position to be filled, the doctor cannot relate to the applicant the full scope of the intended responsibility. The written description of the position should be two-fold—something like the following:

ROUTINE DUTIES: Open the office by 8:45 A.M.; make sure the entire office is in a tidy condition; review pre-pulled medical history files; call the answering service for messages; answer the phone; greet patients; prepare charge slips; accept payments; make appointments; advise patients about preparations for special tests; prepare patients for examination; assist the doctor during examinations, when required; open and sort mail; post daily log; prepare daily deposits; schedule surgery; type letters, reports and insurance forms; prepare patients' monthly financial billing; keep filing current; order the doctor's lunch, etc., etc., etc.

SPECIAL DUTIES: Take deposits to the bank; inventory and order drugs and supplies;

Mr. McClure is director of the Baltimore office of Professional Business Management, Inc. This monthly column is prepared as a complimentary service to the *Maryland State Medical Journal.*

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We knaw the difference between edema and enema; syndrome and symptam; sewage and sewerage. And when and why we should use 12 paint Caslan Bold instead af 10 Stymie.

If yau, taa, need a gaad printer, let's cammunicate!

supervise cleaning personnel; sterilize equipment; check the doctor's bag; remind the doctor of special meetings and events; maintain professional and administrative equipment, etc., etc., etc.

Far too often the doctor is unable to describe adequately the position to be filled. This leads to mass confusion later when the aide finally learns that she has much more to do than answer the phone and greet the patients. This shock leads to a resignation or to an apathetic condition where she does as much as she can get done.

If you decide to hire the applicant immediately, the salary, the hours, vacations, sick leave and overtime must be fully discussed and understood. Also, let her know whether she is to wear a uniform, and if so, who bears the purchase and maintenance cost.

The thoroughly planned interview can be a very rewarding experience even if you decide not to hire the applicant. If you gave the applicant a fair chance and she did not pass, at least you will be able to say that you rendered a judgment based upon fact and not upon pure conversation.

Next month Part III will discuss "Ways to Keep a Valued Aide."

Book Reviews

THE PAPERS OF ALFRED BLALOCK, Vols. I and II. Johns Hopkins Press.

These collected papers edited by Mark Ravitch, MD, trace the life of Dr. Blalock from his early, formative years at Vanderbilt, until his death shortly after his retirement in 1965. It consists of a compendium of all his various articles published in this country, as well as others. Adequately indexed and referenced it is an outstanding work. Because of Dr. Blalock's interest in the Faculty and it activities, as well as Dr. Ravitch's connection with Baltimore and The Johns Hopkins Medical Institutions, this would be an excellent work that would add much to the library of any person who receives it.

THE OCULAR FUNDUS IN NEUROLOGIC DISEASE; William Fletcher Hoyt, MD and Diane Beeston, AB; The C V Mosby Company, St. Louis.

This manual and atlas is designed for medical specialists responsible for the evaluation, counsel and treatment of patients with diseases of the Central Nervous System. The illustrations of the ocular fundus were taken from the extensive stereophotographic records collected during recent years at the University of California School of Medicine. It is a well illustrated book and one that has been needed in this field.

AN ATLAS OF FIGURE DRAWINGS, Caroline Bedell Thomas, MD; The Johns Hopkins Press, Baltimore.

This is the third volume in a series devoted to various indices dealing with psychological testing and is devoted to an analysis of drawings made by medical students of the Johns Hopkins Medical School. It evaluates the drawings using a scale so that the individuals can be rated according to their parental histories in relation to coronary disease, hypertension, stroke, diabetes anl obesity.

STEREOSCOPIC ATLAS OF MASTOIDOTYMPANOPLASTIC SURGERY; Harold F. Schuknecht, MD; Werner D. Chasin, MD; and John M. Kurkjian, MD; The C V Mosby Company, St. Louis.

The purpose of this atlas is to show the important histopathologic changes in chronic suppurative middle ear and mastoid disease, to describe the technique of mastoidotympanoplasty, and to present our method for teaching temporal bone surgery to house officers. It accomplishes this purpose remarkably well.

SYNOPSIS OF NEUROLOGY, Francis M. Forster, BS, MD; The C V Mosby Company, St. Louis.

This is the second edition of this publication and has been prepared with the same concept as the first, that of maintaining simplicity and essentiality in the presentation of clinical neurology. It is a book primarily for medical students, but it can be widely used by those in the paramedical field. It is a valuable book for use in libraries and for reference purposes.

CURRENT CONCEPTS IN OPHTHALMOLOGY, Bernrd Becker, MD, and Robert C. Drews, MD; The C V Mosby Company, St. Louis.

This book represents a compilation of selected topics representing current clinical work and interests of the staff of the Department of Ophthalmology, Washington University School of Medicine, St. Louis, Missouri. It is meant to be read at leisure and provides the reader with useful and provocative material.

US ARMY IN WORLD WAR II, Charles M. Wiltse, US Government Printing Office.

This publication is one of many in a series and is devoted to The Technical Services, and in particular, The Medical Department: Medical Service in the Mediterranean and Minor Theaters.

As always, these publications constituting a rerord of the US Army in World War II, are well written, albeit somewhat dull to read. In any event, it provides for the historian, a valuabe reference to what happened and just how well and much improved the medical services in World War II were.

ALLEGANY COUNTY

Officers of the Allegany County Medical Society for the current year are:

President: **L. Michael Glick, MD**
Vice-President: **Lester Kiefer, MD**
Secretary: **Robert F. Miller, MD**
Treasurer: **Albert P. Marsh, MD**

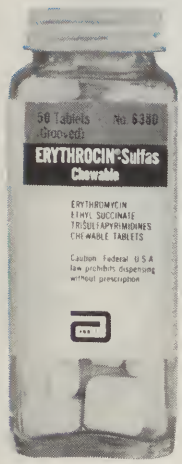
On Sunday, May 7, 1967, the Allegany County Medical Society, in conjunction with the Medical and Chirurgical Faculty of the State of Maryland, State Health Department and County Health Department, carried out a mass vaccination program against measles for children age 1-9. **Robert Brodell, MD** and **Elmer L. Hill, MD** were co-chairmen of the program and in spite of inclement weather, 2,104 children were successfully inoculated, using the hypospray type injection. The attendance exceeded expectations and included children from neighboring counties of Mineral (West Virginia) and Garrett (Maryland).

On Wednesday, May 10, 1967, our Society toured the Allegany Ballistics Laboratory of the Hercules Powder Company in nearby Rocket City, West Virginia. Following a social hour and dinner in the plant cafeteria, the doctors, escorted by scientists in charge of various departments, were shown all the operations that are not classified, including the actual production of various stages of the Sprint Anti-missile Missile which is assembled and tested at the local subsidiary.

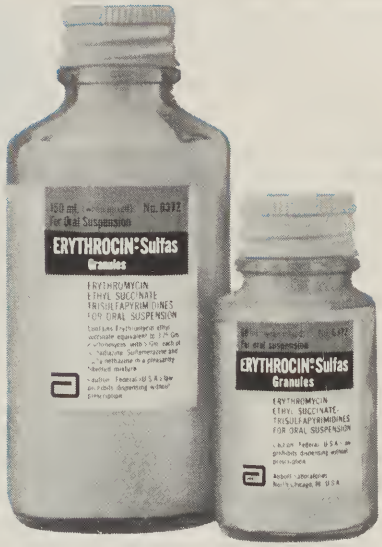
The new Sacred Heart Hospital on Haystack Mountain started receiving patients on March 28th. The modern, 250 bed, $8,000,000 facility fills a void which had become quite acute in the Cumberland area. The new hospital has also opened three new departments, mainly: psychiatry, intensive care and maternity. The dedication of the new institution will be June 11, 1967.

Plans for one and possibly two nursing homes in the area are in the process of being put into the building phase. These institutions are expected to ease the burden of the hospitals in the care of the chronically ill.

On May 10, 1967, in observance of National Hospital Week, Society members, and all heads of departments in both hospitals met at a luncheon with the administrative, nursing and lay people of both hospitals. The meeting was held at the local Ali Ghan Shrine Country Club with Rudolph J. Pendall, executive director of the Hospital Council of Maryland, Inc., as the principal speaker.



Recent additions to the Society membership have been: **Andrew Stasko, MD,** general surgery; **C. Herschel King, MD,** anesthesiology; **Frank Fagan, MD,** psychiatry; **Ingeborg C. Dross, MD,** internal medicine; **Drs. William Newman, Robert F. Miller** and **John P. Light,** radiology; and **Elmer L. Hill, MD,** County Health Officer. **Drs. John A. Topper, Vasilios P. Dross** and **William Francis** provide round the clock coverage in Memorial Hospital Dispensary while **Drs. Nelson C. Estruch** and **Leo H. Ley, Jr.** provide dispensary coverage at Sacred Heart. These physicians in both institutions



Continued on page 128

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

701358

ABBOTT

fill a void brought about by the lack of house staff.

Calvin Y. Hadidian, MD, plans to return to practice in Cumberland in the near future. He has been on a one year leave of absence for further study and research in thoracic and cardiac surgery, six months of which was spent training in the veteran's facility in Chicago.

Mrs. Nancy Spiggle, R.N. assumed the position of Director of Nursing Service at Memorial Hospital on May 1st. Mrs. Spiggle is the wife of **Wayne C. Spiggle, Jr., MD,** a local internist.

We are anticipating having our new Center ready for occupancy by mid-summer. This Center will have 60 additional rooms, each with private bath, that will augment our present 100-bed psychiatric facility.

All accepted modern therapies are employed, and not a day is wasted in placing a new patient on active treatment. Despite our increase in size, we will maintain the concentrated professional individual attention for each patient.

When the realization of this project is completed, we hope that the added staff and environment will create one of the finest centers for psychiatric treatment, not only in the East but in the country.

Edith L. Taylor

Valium®
(diazepam)
Roche®

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, hallucinations); changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage—Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

some allergens are green

whatever their color, shape, or size...

Benadryl®

(diphenhydramine hydrochloride)

PARKE-DAVIS

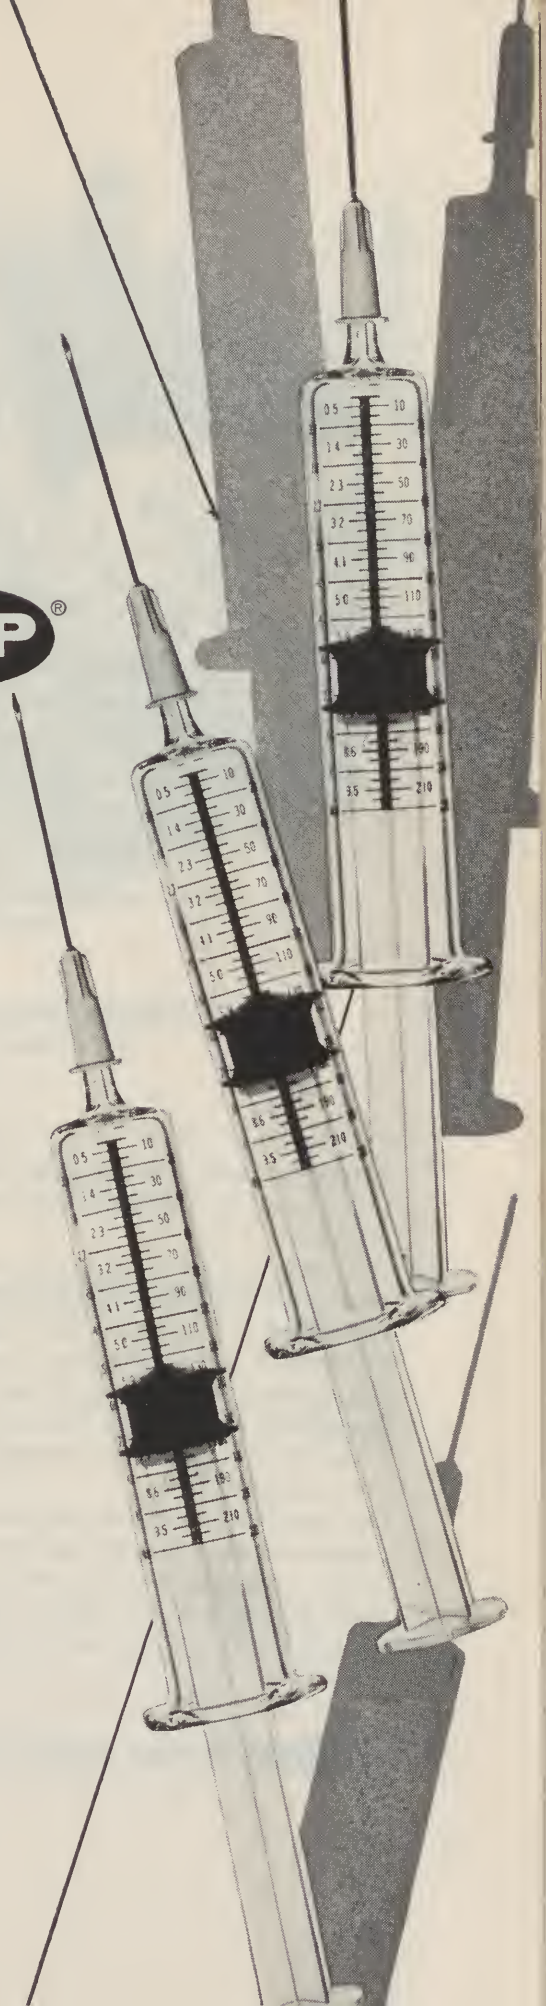
for control of allergic symptoms

Whether the allergen is greenish or garish, unseen or unknown, your patient can get symptomatic relief with BENADRYL—the potent antihistamine with antispasmodic action. *INDICATIONS:* Antihistaminic, antispasmodic, antitussive, and antiemetic therapy. *PRECAUTIONS:* Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this product. Hypnotics, sedatives, or tranquilizers if used with diphenhydramine hydrochloride should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing diphenhydramine hydrochloride. *ADVERSE REACTIONS:* Side effects are generally mild and may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, blurring of vision, vertigo, headache, muscular aching, thickening of bronchial secretions, restlessness, and insomnia have been reported. Allergic reactions may occur.

BENADRYL is available in Kapseals® of 50 mg. and Capsules of 25 mg.

00867

The pink capsule with the white band is a trademark of Parke, Davis & Company.



PARKE-DAVIS

BSP® DISPOSABLE UNIT

BALTIMORE, MARYLAND 21201

"When I couldn't even smell corned beef and cabbage, I decided it was time for you, Doc."

Maybe he doesn't know when he's well off. But you might want to prescribe long-acting Novahistine LP anyway.

Two tablets in the morning and two in the evening will usually provide day and night relief by helping to clear congested air passages for normal, free breathing. Novahistine LP is formulated to provide continuous therapeutic effect for 8 to 12 hours. The decongestant ingredients help restore normal mucus secretion and ciliary activity—physiologic defenses against infection of the respiratory tract.

Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

In peptic ulcer... antacid therapy with a new benefit

CONTAINS A BALANCED COMBINATION OF THE MOST WIDELY USED ANTACIDS— FOR RAPID NEUTRALIZATION. PLUS SIMETHICONE— TO CONTROL THE FACTOR WHICH ANTACIDS ALONE CANNOT INFLUENCE.

Mylanta®

- In Mylanta, aluminum and magnesium hydroxides are balanced to minimize the chance of constipation or laxation and still achieve rapid acid neutralization and pain relief.
- The positive action of simethicone helps relieve the painful gas symptoms which often accompany the peptic ulcer syndrome.
- The nonfatiguing flavor and smooth, nongritty consistency of tablets and liquid encourage continued patient cooperation during long-term therapy.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) of liquid contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. **Dosage:** one or two tablets, well chewed or allowed to dissolve in the mouth, or one or two teaspoonfuls of liquid to be taken between meals and at bedtime.

From Washington

The Department of Health, Education and Welfare is making a broad study of prescription drugs which will be the basis of a recommendation on whether their costs should be covered by medicare when they are used outside a hospital.

HEW Secretary John W. Gardner appointed a task force of *HEW* officials to evaluate the study and make the recommendation.

"Prescription drugs are an essential element of modern medical care," Gardner said. "In the last twenty-five years we have witnessed greater advances in the use of drugs than in the whole previous history of medicine. Today drugs and biologicals make possible the prevention and successful treatment of illnesses that were serious and frequently fatal.

"Yet for many older Americans the cost of needed drugs prescribed by a physician is a heavy burden, representing 15 to 20 per cent of their medical care costs. Many older Americans find themselves with limited financial resources at the very time that age brings an increasing incidence of chronic disease and greater needs for medical care, including prescription drugs."

President Johnson directed last January that Gardner "undertake immediately a comprehensive study of the problems of including the cost of prescription drugs under medicare." Studies on some aspects of the question were started then and are near completion. Other specific studies are in various stages of progress.

But Congress may decide the issue before the full study is completed. The Senate Finance Committee will hold hearings this summer on such a medicare extension.

Philip R. Lee, MD, Assistant *HEW* Secretary and Chairman of the task force, said that even if the study is incomplete, *HEW* will take a stand anyway when the Senate Finance Committee takes up the legislation.

One bill would finance medicare coverage of drugs by increasing from $3 to $4 the cost of monthly premiums for the voluntary doctor bills insurance program (Plan B) for persons 65 and over. Sponsored by Sen. Joseph M. Montoya (D., N.M.) the bill would provide that generic drugs rather than trade name products be used whenever possible.

Another bill is sponsored by Chairman Russell B. Long, (D., La.), the Senate's leading critic of the drug industry. It would spur generic purchasing for all federally-connected welfare programs.

"The task force will examine a number of factors which are closely involved with the use of prescription drugs and with present and proposed methods of purchasing them," Lee said. "Many of these factors concern not only drug costs—and who pays them—but also the quality of medicare care."

Among the major areas listed for task force study:

1. Present patterns of drug prescription by physicians.
2. Present patterns of prescription drug use and expense by patients.
3. Present resources used to meet drug costs (including personal resources, aid from relatives, insurance, government assistance).
4. Present drug cost coverage programs (including federal, state, commercial insurance, union, and foreign programs).
5. Distribution systems (including independent pharmacies, central pharmacies, mail-order distribution, physician dispensing, and hospital dispensing).
6. Reimbursement factors (including determination of costs; co-insurance; deductibles; and limitations on dollar costs, drug quantities, and drug types).
7. Accounting methods (including nomenclature, coding, data processing).
8. Pharmacological aspects (including generic equivalents vs. clinical equivalents).

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide . . . . . 195 mg.
Aminophylline . . . . . 130 mg.
Phenobarbital, Caution: May be habit forming . . . 21 mg.
Ephedrine HCl . . . . . 16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

9. Clinical aspects (including formulatory systems).
10. Legal and fiscal aspects.
11. Impact of proposed methods of purchasing prescription drugs on costs and quality of patient care, on medical profession, on pharmacy profession, on drug industry, on government.

* * * * *

Surgeon General William H. Stewart says that measles (Rubella) should be eradicated this year but other cripplers and killers like venereal disease and cancer still baffle researchers.

"This year, 1967, may well go down in history as the year of measles eradication in the United States," Stewart told a House Appropriations Subcommittee, in testimony recently published.

Stewart said the measles vaccine, licensed four years ago, is "bringing the disease to the vanishing point." The Public Health Service researchers now are working with an "experimental vaccine" trying to conquer German measles, he said.

Other health problems, such as cancer, heart disease and gonorrhea, continue, however, to pose numerous research problems, Stewart reported.

Stewart told the Appropriations Subcommittee that the "fastest rising causes of death and disability" in this nation are emphysema and other chronic respiratory diseases. He said deaths from emphysema and chronic bronchitis have increased about nine times in the last 20 years, causing more than 60,000 deaths a year.

* * * * *

The federal health official, who estimated that some 300,000 people die each year indirectly from smoking, also reported that a new less dangerous cigarette may be developed.

"There is reason to believe that the development of a less hazardous cigarette is potentially within reach," he said. But he put no timetable on development of this type of cigarette.

* * * * *

The *AMA* supports all except one provision of legislation (S. 780) that would expand the federal government's role in the federal-state program to curb air pollution.

In a letter to the Senate Subcommittee on Air and Water Pollution, F. J. L. Blasingame, MD, executive vice president of the *AMA*, pointed out

that the *AMA* has been directing the attention of physicians and other health workers to the problems of air pollution through a series of meetings and its publications. He also noted that the *AMA* has supported such legislation in past years.

"In spite of past legislation and on-going federal, state and local programs which are carried on in cooperation with private industry, the *AMA* recognizes that air pollution continues as a major environmental problem," Dr. Blasingame said. "Increased program emphasis on research and development in techniques of air pollution control and abatement is worthy of the support of the medical profession.

"The bill before you contains one provision which we cannot support. Section 107 of S. 780 would require the Secretary of *HEW* to establish emission standards for certain industries. On the basis of present information and understanding of the relationship between emissions and the effect it has on surrounding air, such a requirement is unrealistic and would not accomplish its intended purpose."

* * * * *

Applications Now Being Accepted for Fellowships in Medical Education

The American Heart Association is now accepting applications for Fellowships in Medical Education for the 1968-69 academic year.

The program is designed to stimulate careers in the field of research in medical education. Fellows receive training in a medical school's department of Research in Medical Education, where they are taught to analyze learning processes and modern teaching methods in preclinical and clinical fields. In addition, they study behavioral psychology and participate in pilot projects in continuing education.

US citizens or those intending to become citizens, who hold either an MD, PhD, ScD or its equivalent, are eligible to apply. To meet the needs of candidates with varied backgrounds and experience, the stipend is based on qualifications and will be at least on the senior postdoctoral level.

Application forms may be obtained from the Director of Medical Education, American Heart Association, 44 East 23rd St., New York, N.Y. 10010. Sept. 15, 1967 is the deadline for receipt of applications

From Baltimore

The University Hospital, University of Maryland, Baltimore, Maryland, has become the first hospital to be awarded the United States Air Force Air Reserve Forces Outstanding Support Award. In recent Washington, D. C., ceremonies, the hospital became the first medical facility to be singled out by Air Force Secretary Harold Brown.

The citation is awarded on behalf of the Secretary of the Air Force to businesses and industries who lend outstanding, active support to Air Reservists and the Air Reserve Forces. Companies so honored have normally established policies or programs which not only permit Reservists to engage in AF Reserve activities, but actually encourage qualified employees to continue to assist in the national security by becoming productive members of the AF Reserve and Air National Guard.

In addition to cooperative policies regarding individual AF Reservists and their military activities, the University Hospital was specifically recognized for its open-handed donation of its medical facilities to enable reservists to update and maintain professional skills.

For the past several years, the hospital has permitted Medical Reservists, both as individuals and as units, to maintain their proficiency by working side by side with staff members in the hospital's wards, clinics, and laboratories. The skills of the reservists have been maintained to such a fine degree that they now devote the considerable portion of their activities to the

George Yaeger, MD (right) Director University Hospital, University of Maryland, Baltimore, is presented the Air Reserve Forces Outstanding Support Award by Theodore C. Marrs, MD, Deputy for Reserve and ROTC Affairs, Office of Special Assistant for Manpower and Reserves, Office of the Secretary of the Air Force. The University Hospital was selected for the citation, presented on behalf of the Secretary of the Air Force because of its outstanding support of Air Force Medical Reservists in the Baltimore area. Doctor Marrs presented the award during the Medical Reserve Symposium held in conjunction with the Aerospace Medical Association Convention in Washington, D. C., April 10-13.

actual care of Aeromedical evacuation patients from Vietnam.

The hospital had opened its facilities to Baltimore reservists of the Continental Air Command's 22nd Medical Service Squadron and 403rd Medical Service Flight by allowing them the use of hospital facilities for training.

Doctor Theodore C. Marrs, Deputy for Reserve and ROTC Affairs, Office of Special Assistant for Manpower and Reserves, Secretary of the Air Force, represented Secretary Brown in presenting the Air Force Citation to Doctor George Yaeger, University Hospital Chief of Staff, on April 13.

The presentation was made during the 4th Annual Medical Reserve Symposium held in conjunction with the 38th Annual Scientific Meeting of the Aerospace Medical Association in Washington, D. C.

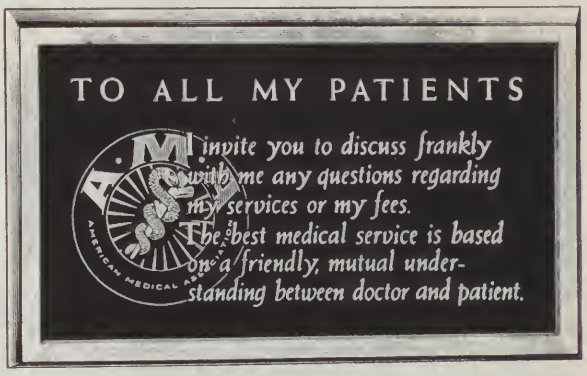
During the Annual Meeting at the Alcazar, the Library circulated books from the collection on exhibit there. One book, however, strayed away without being charged, so should anyone find the following title (with the Med-Chi ownership stamp, of course) among his own library, we would appreciate his sending it back to us:

Shindell, Sidney, Statistics, Science and Sense (RA 407 S4 1964)

Doctor, Do Your Patients Understand Your Fees?

Patients hesitate to ask about fees. But they want to know. They naturally worry about what their medical costs will be. And if they don't feel free to talk about it, serious problems—misunderstanding, resentment and even deep hostility can arise, threatening the all-important rapport between you and your patients.



Open discussion *before* treatment prevents such embarrassing problems. It paves the way for mutual understanding and good will.

An *AMA* Fee Plaque, prominently displayed in your waiting room, serves as an open invitation for your patients to discuss medical costs and financial problems with you. It shows that you care. Just seeing the message can give many financially worried patients peace of mind.

The *AMA* Fee Plaque works hard to prevent doctor-patient misunderstandings. And it works well.

How do you obtain one?

Just mail the coupon below and your check, or money order.

EXECUTIVE SECRETARY'S NEWSLETTER

July, 1967

REFERENCE COMMITTEE MEETING

The Reference Committee will meet on

WEDNESDAY, AUGUST 23, at 8:00 p.m.

in the Faculty Building to discuss whatever resolutions have been received before the July 15 deadline for receipt of such resolutions.

At the time of this writing the only resolution received for consideration is:

1S/67 - Authorizing the seeking of enabling legislation to require compulsory membership in a component medical society of the Faculty in order to maintain high professional and ethical standards incident to the right and privilege of practicing medicine in Maryland.

SEMIANNUAL SESSION

The Semiannual Session will be held on Friday and Saturday, September 8 and 9, at the Diplomat Motel, Ocean City. Concurrent sessions of various specialty groups will be held at the same time. Full details will be in the mail to all members shortly.

ELECTIONS

The recently formed Maryland Urological Society has elected the following officers: John N. Robinson, M.D., Easton, President; Martin Robins, M.D., Baltimore, Vice President; Raymond Yow, M.D., Salisbury, Secretary-Treasurer.

The Maryland Association of Private Practicing Psychiatrists elected new officers at its annual session, as follows: Michael J. Bisco, President; R. Taylor King, Vice-President; Elihu E. Allison, Secretary-Treasurer; and Carl B. Schleifer, Program Chairman.

1968 CRUISE CONVENTION

Representatives will be on hand at the Semi-annual Session to take reservations for the 1968 Cruise Convention to the Caribbean. Dates of the cruise, held as part of the Faculty's 1968 Annual Meeting, are April 21 through April 28.

NEWS NOTES

Henry N. Wagner, Baltimore, has become the 27th President of the American Federation for Clinical Research. Dr. Wagner will serve through 1968.

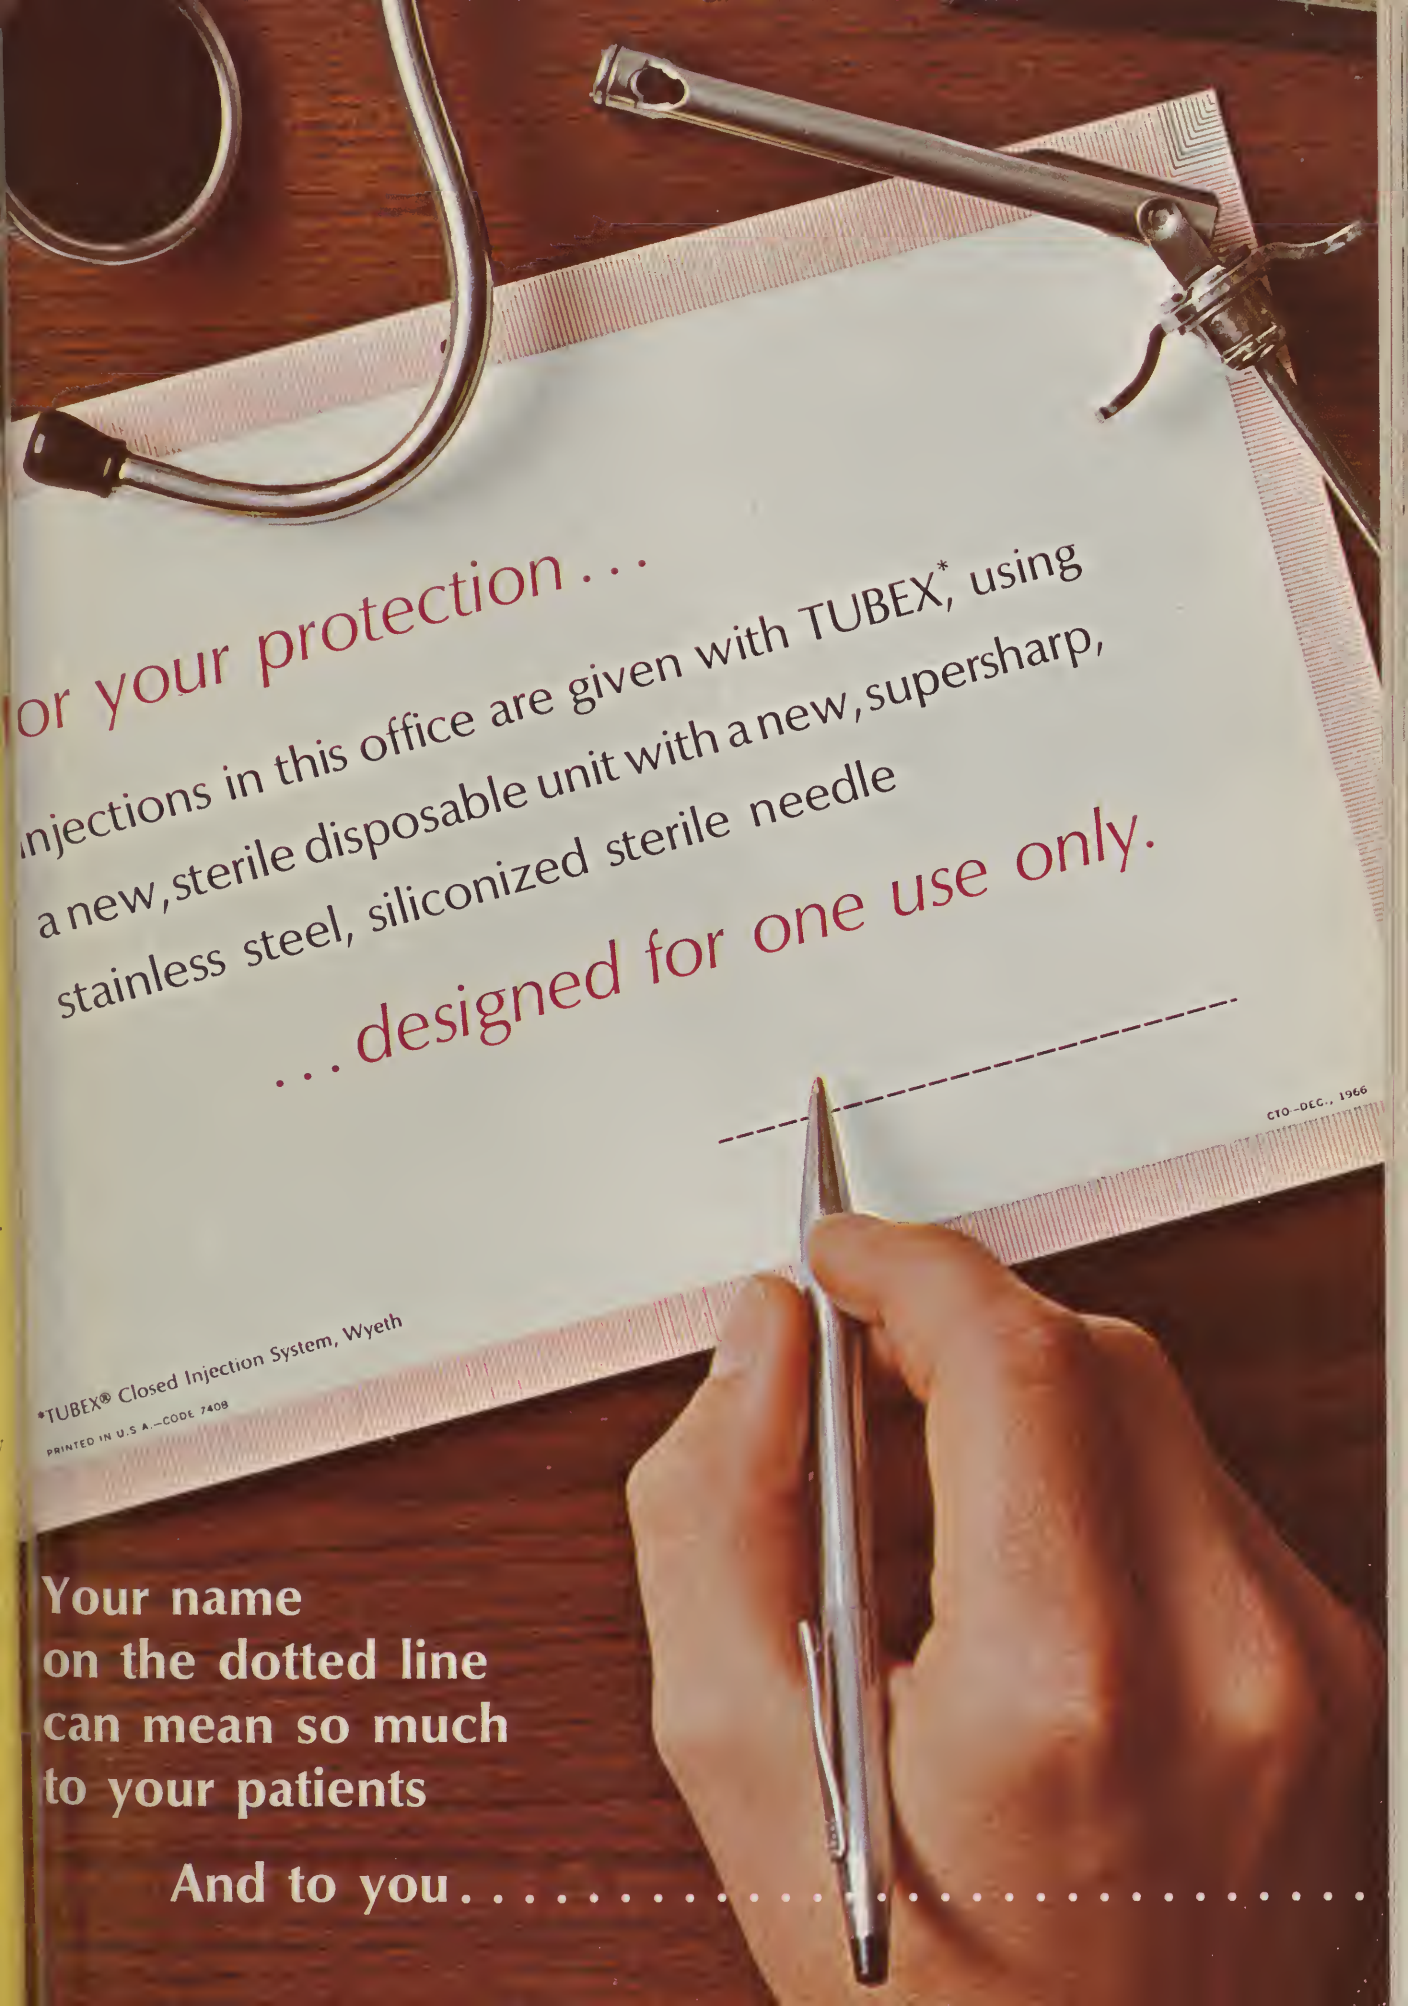
James E. Carson, Baltimore, has been named Deputy Commissioner of the Department of Mental Hygiene.

New members of the American Dermatological Association include Raymond C. V. Robinson, Baltimore. This group is dedicated to the development of knowledge concerning skin diseases and its application to patient care.

Harold Rosen, Baltimore, recently conducted a seminar on The Frigid Patient and her Nymphomanic Sister at the Connecticut Valley State Hospital.

VOLUNTEER PHYSICIANS FOR VIET NAM

Louis Padovano, of Woodstock, has left for a 60-day stint as a volunteer physician to serve in Viet Nam. This period of voluntary service provides care to the civilian population and is sponsored by the American Medical Association in cooperation with the U S Government.



The AMA is also cooperating in establishing a qualified medical school in Viet Nam and has provided faculty, as well as financial and administrative help to accomplish this purpose.

VETERANS ADMINISTRATION FEES

Commencing July 1, 1967, the Veterans Administration will dispense with form-filling and make payments on the basis of Usual, Customary and Reasonable Fees to physicians who treat veterans under the Home Town Medical Care Program. Physicians should submit bills on their own billhead and it is no longer necessary to complete VA forms, the procedure required previously.

to your patients
And to you . . . . . .

. . . . . The TUBEX® Closed-Injection System means

Efficiency and convenience

TUBEX injectables are ready for immediate use. No measuring of doses; no filling of syringes. Saves professional time. Easy to store in the office, easy to carry on house calls.

Precision and protection from cross contamination

TUBEX injectables are premeasured, accurately and clearly identified as to name, dose, control number and expiration date (if any). Used once, then discarded, TUBEX prefilled sterile cartridge-needle units cannot cause cross contamination.

Coverage of virtually all injection needs

The wide range of drugs available in TUBEX sterile cartridge-needle units can meet over 70% of common private practice injectable needs. For drugs not yet in TUBEX form, empty sterile cartridge-needle units can usually be employed—and retain most advantages of the system.

TUBEX® Closed Injection System

Wyeth® SERVICE TO MEDICINE

If you are already using TUBEX in your office and don't have a waiting-room placard, Wyeth will be happy to send you one. A postcard will do.

Wounds, abscess, cellulitis

...and the complications of staph.

From time of birth, the child is exposed to a whole range of potential staph infections: wounds; secondarily infected dermatoses; primary lesions, such as deep impetigo (ecthyma), boils and felons; and more serious conditions such as osteomyelitis, staph pneumonia and staph meningitis.

Bactericidal

Hardly a staph organism can resist the bactericidal action of Prostaphlin® (sodium oxacillin), as shown by a 34-month *in vitro* study. Of all staph isolates tested, 99.5% were sensitive to oxacillin.[1]

Clinically Proven

There is a high correlation between these *in vitro* findings and clinical results. Of 610 patients treated with Prostaphlin (sodium oxacillin), 89.8% were reported cured or improved, including those with staph infections resistant to penicillin G.[2] And since resistance does not appear to develop *in vivo,* therapy with oxacillin can be extended when necessary.

Outstanding Safety Record

Besides being staph-specific and rapidly absorbed—Prostaphlin (sodium oxacillin) has established an outstanding record of safety during five years of widespread clinical use. Continuous high blood levels of oxacillin have not produced toxic effects on kidney function, assuring a significant margin of safety. However, as with all penicillins, the possibility of allergic response should be considered.

Capsules, Oral Suspension and Injectable

Prostaphlin (sodium oxacillin) is available in three flexible dosage forms to suit the age of the patient and severity of infection—an oral solution for pediatric use, capsules, and multi-dose vials for injection.

PRESCRIBING INFORMATION: For complete information, consult Official Package Circular. *Indications:* Infections caused by Staphylococci, particularly those due to penicillin G-resistant Staphylococci. *Contraindications:* A history of severe allergic reactions to penicillin. *Precautions:* Typical penicillin-allergic reactions may occur. Safety for use in pregnancy and premature infants is not established. Because of limited experience, use cautiously and evaluate organ system function frequently in neonates. Mycotic or bacterial superinfections may occur. Assess renal, hematopoietic and hepatic function intermittently during long-term therapy. *Adverse Reactions:* Skin rashes, pruritus, urticaria, eosinophilia, nausea, vomiting, diarrhea, fever and occasional anaphylaxis. Rare cases of reversible hepatocellular dysfunction have occurred. Moderate SGOT elevations have been noted. Thrombophlebitis has occurred occasionally during intravenous therapy and leukopenia was noted in two cases. *Usual Oral Dosage:* Adults: 500 mg. *q.* 4 or *q.* 6 *h.* Children: 50 mg./Kg./day. *Usual Parenteral Dosage:* Adults: 250-500 mg. *q.* 4 or *q.* 6 *h.* Children: 50 mg./Kg./day. Treat beta-hemolytic streptococcal infections for at least 10 days. Give oral drug 1 to 2 hours before meals. *Supplied:* Capsules—250 and 500 mg. in bottles of 48. Injectable—250 mg., 500 mg., and 1 Gm. dry filled vial for I.M./I.V. use. For Oral Solution—100 ml. bottle, 250 mg./5 ml. when reconstituted. **A.H.F.S. CATEGORY 8:12.16**

We are anticipating having our new Center ready for occupancy by mid-summer. This Center will have 60 additional rooms, each with private bath, that will augment our present 100-bed psychiatric facility.

All accepted modern therapies are employed, and not a day is wasted in placing a new patient on active treatment. Despite our increase in size, we will maintain the concentrated professional individual attention for each patient.

When the realization of this project is completed, we hope that the added staff and environment will create one of the finest centers for psychiatric treatment, not only in the East but in the country.

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

On Thursday, June 8, 1967, the Council took the following actions:

1. Adopted Council and Executive Committee minutes.

2. Ratified legal defense for seven physicians requesting it.

3. Considered a request for legal defense for a physician who had been late in paying his dues; but denied it, offering the services of a "medical panel" only.

4. Declined to provide legal defense, in the event of a suit, for two physicians who had been late in paying 1967 dues.

5. Authorized the Treasurer to adequately inform members when 1968 dues are payable they are not entitled to this provision of membership if dues are not paid before January 31. Notices will be carried in the November, December and January issues of the Journal and other educational measures will be used.

6. Heard of the settlement of two cases, both in favor of the defendant, and authorized payment of legal fees in this connection.

7. Remitted 1967 dues for a member because of illness and at the request of the component society.

8. Adopted the Financial Statement through April 30; and the Dedicated Fund Statement through April 30.

9. Instructed the Secretary to mail to all Delegates and Components the proposed Medical Practice Act change dealing with the establishment of a Commission on Medical Discipline so that it can be discussed adequately on a local level before final action at the Semi-annual Session in September.

10. Declined to mail to Components the comments of the Board of Medical Examiners on this proposed change, stating that the Board could do so itself.

11. Heard that the Crisfield Hospital administration has been turned back to the Board of Trustees by the Arbitration Committee set up for purposes of discussing this matter in detail.

12. Rejected a proposal from the MEDS Committee that would have established a special committee to look into the use of hospital emergency rooms as a substitute for the family doctor. It pointed out that many studies in this area had already been done; and that this was a local problem.

13. Approved advising the Maryland Pharmaceutical Association that it is the responsibility of the physician to write and refill Rx orders; and that its suggestion for individual physicians to delegate this authority to his office aide was not clear as to procedure and authority.

14. Approved the report of the PL 89-97 Subcommittee with respect to payment mechanisms for Third Party Payments under this program. (See separate item in this connection).

15. Approved a Joint Statement (with the Maryland Nurses Association) on the Role of the Registered Nurse in Care of the Patient with Cardiovascular Diseases. (to be published as a supplement to the Nurses' Protocol approved in June, 1965).

16. Adopted a report dealing with Appalachia Regional Medical Needs, a copy of which appears at the end of this summary.

17. Deferred action on a proposed Membership Retirement Program at the request of the Med-Chi Insurance Trust.

18. Approved a recommendation to the Mediation Committee as follows:

"That association with properly licensed Osteopaths (in accordance with appropriate statutes) is considered ethical in light of the law now permitting Maryland Osteopaths to practice Allopathic medicine."

19. Adopted the following in connection with the Title 19 program in Maryland:

"The medical profession wishes to go on record as supporting the concept of Title 19 but is unwilling in receiving state payments to continue its practice of subsidizing this program as in the past and will provide to the public the promised medical care only on a Usual, Customary and Reasonable fee basis."

"It was understood in adopting this motion, that authority is granted to appropriate Faculty representatives to meet with State officials to convey this information to them; and that the Executive Committee is authorized to contact the Federal Government in this connection to express its concern or unwillingness to participate in the program because of the manner in which it is being operated."

20. Heard that the Vocational Rehabilitation Program, operated through the State Department of Education is paying for care under this program on the basis of Usual, Customary and Reasonable Fees.

21. Adopted the following recommendations in connection with Alcoholism: (a) That the Faculty endorses a three day workshop on Alcoholism Programming for Public Health Professionals to be held on November 27, 28, and 29, 1967, and that Doctor Conrad Acton be appointed to serve as the Faculty representative to the program planning committee. (b) That the Medical and Chirurgical Faculty support the Alcoholism Control Bill proposed by Senators Javits and Moss, now under discussion in the Labor and Public Welfare Committee of the United States Senate.

22. Adopted the following recommendations in connection with the Aging: (a) That the Faculty support, where need is demonstrated, community sponsored nursing home facilities in all communities in Maryland for extended care, nursing home care, and custodial or

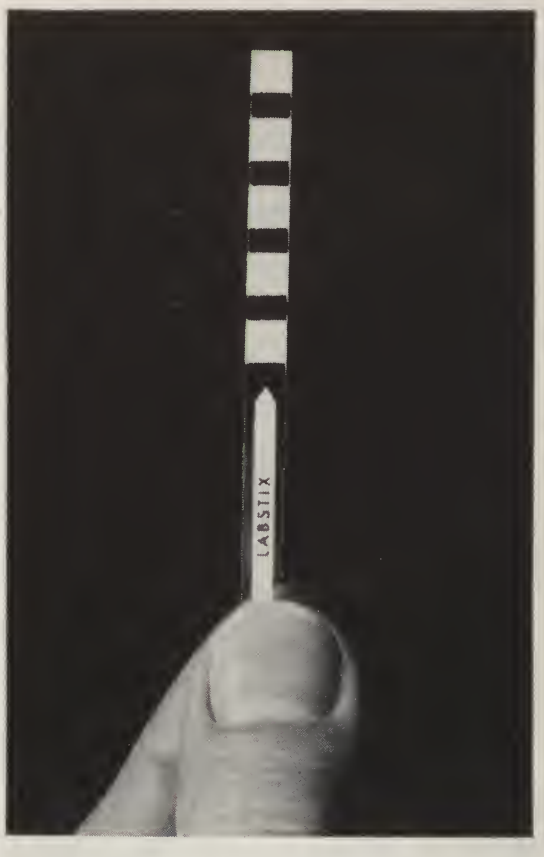
domiciliary care. (b) That each local Commission on Aging stimulate activity in programing community sponsored nursing homes.

23. Adopted the following recommendation in connection with MEDIC: That the Committee on Postgraduate Education, Preventive Medicine, and Public Health strongly recommends that the present system of financing the MEDIC network on a local level as it now exists be continued.

24. Appropriated $3,000 from the Educational Fund, to be matched by a $3,000 sum raised by the Ophthalmologists, for the purposes of an educational program on eye care. It is understood that the program will be statewide and that funds will not be used for legislative purposes.



25. Adopted the following recommendation in connection with the Handicapped Children's Program in Maryland: The Medical and Chirurgical Faculty of Maryland reiterates its support of the high standards of care offered through the State Crippled Children's Program, which stands ready to accept handicapped children particularly where special facilities are needed and are available for treatment. It also reiterates the concept that the Crippled Children's Program continue to maintain contact with the referring family physician and that encouragement be given to him for his participation in the follow-up and after-care of such patients. The Medical and Chirurgical Faculty also goes on record as endorsing the continuance of the high standards that have been adopted and used in the operation of the State Crippled Children's Program.

26. Voted to recommend to the House of Delegates Emeritus Membership for Napolean B. Steward, MD, Laurel; at the request of the Prince George's County Medical Society.

27. Heard that the Executive Committees of the Prince George's County and Montgomery County Medical Societies had gone on record as urging the Faculty to proceed with its application for a Construction Grant under the Medical Library Assistance Act.

Report of the PL 89-97 Liaison Subcommittee to the Council adopted, June 8, 1967

The PL 89-97 Liaison Subcommittee was

Take five...

LABSTIX® provides 5 important urinary findings*—on a single reagent strip! That's *more* information than you can get from any other single reagent strip. You know the results in just 30 seconds—while the patient is still in your office—and readings are reliable and reproducible. LABSTIX is easy to handle, too. Never goes limp, even when wet, because it's made with clear, firm plastic. And results with LABSTIX are easy to read—color contrast between the test areas and the transparent plastic is clearly defined. An unexpected "positive" from testing with LABSTIX may help in detecting hidden pathology before marked symptoms are manifest.

*Blood; ketones; glucose; protein, and pH.

...Plus one

You can extend your testing scope by including ICTOTEST® Reagent Tablets, the 30-second determination for bilirubinuria—which can be an early sign of obstruction of the common bile duct, infectious hepatitis, or other liver disease. This test is also useful for detecting liver damage from carbon tetrachloride and other halogenated hydrocarbons used as industrial and household solvents. Positive findings with the urine-testing team of LABSTIX and ICTOTEST can represent significant guides to patient management in many clinical situations. "Negatives" may help rule out suspected abnormalities over a broad clinical range and are important for the patient's record.

charged with the following by the Council on January 19, 1967.

"It is the consensus of the Council that this question be referred to the PL 89-97 Subcommittee and act as a basis of its discussion with the State Health Department and others involved with the following understandings:

1. Physicians must be reimbursed for care of so-called "service" patients;
2. The type of reimbursement can be based on a fee for service concept or a per diem concept, as outlined in the presentation by Dr. Nelson;
3. That some arrangements should be made for payment of the physician on a direct basis rather than channeling funds for payment through a third-party person, such as a hospital.

"The PL 89-97 Subcommittee, after study, will make its report with recommendations, preferably to the next Council meeting; but in any event prior to July 1, 1967."

The Liaison Subcommittee met on the evening of February 20, 1967 and after considerable discussion of this resolution adopted the following recommendation for submission to the Council:

1. More than one acceptable arrangement can be made between a hospital and a physician for payment of the physician for his activities in relation to "service" patients.
   These activities may fall into any of the following categories: (a) the direct supervision of residents or interns in the provision of services to Title 18 and 19 program patients (b) the direct provision of services to such patients (c) the direct or indirect responsibility of the physician for the care that is provided to such patients (d) the attendance, in person, of the physician as a teacher along with the resident who actually performs the service. Such activities, however, are not limited to these categories.
2. The physician and the hospital involved may work out arrangements suitable to them and approved by the medical staff.
   Such arrangements may include, but are not limited to: (a) a fee for service arrangement that provides for payment directly to the physician by the third party involved (b) a fee for service arrangement that

provides for payment to an association of physicians by the third party involved.

3. All arrangements should cover services whether rendered as an inpatient or an outpatient at the hospital concerned.
4. In all cases, arrangements should be those that will stand the test of "audit," by any party involved.

Report on Appalachia Regional Medical Needs

1. The extension of medical and paramedical educational facilities in all parts of Appalachia shall be actively encouraged, with improvement of local facilities now in operation, whenever feasible.
2. Rather than expend large sums of money for the construction of larger demonstration health centers, adequate funds should be made available for the addition to and enhancement of local county facilities already in operation. These facilities may be single or multi-county in operation.
3. The boundary lines between any of the Appalachian states shall not bar any citizen from seeking health care from a health center near his place of residence.
4. We strongly recommend additional funds under the Hill-Burton Act or other acts for increased construction of health facilities under Section 214 of the Appalachia Development Act.
5. Approval by organized medicine at national, state, or local level for the construction and operation of regional or community health centers shall be contingent upon acceptance and maintenance of the following conditions:
   (a) The operation of any regional or county health service center shall not infringe upon the private practice of medicine.
   (b) There shall be adequate medical representation on all national, state or local bodies having supervision or jurisdiction in the development and operation of these health service projects.
   (c) These projects shall in no way be developed, operated or influenced in a manner which could lead to a government-controlled system of medical practice.
6. The American Medical Association, through its cognizant Councils or Committees, shall be kept advised of all matters associated with the projects under discussion, and further, we request the American Medical Association to take all steps necessary for setting policies pertaining to these projects, as they may be concerned at the national level.

Editorial

Much has been said, both pro and con, with respect to Generic Equivalents in the drug field. For some reason, the term "generic" has become associated with the word "cheaper," in its connotation to the public. The U. S. Congress is presently conducting hearings on this particular subject and has heard reports and arguments from proponents of the "generic" prescribing philosophy. This philosophy would establish a regulation that all drugs paid for in whole or in part by the Federal government must be prescribed under "generic" terminology.

One of the main reasons for such a regulation, argue the proponents, is that the Federal government purchases drugs by generic names and such drugs are used in treatment given at the major military installations of the country, such as the Walter Reed Army Hospital, Bethesda Naval Hospital, and others.

In actual fact, however, this is not so. The Department of Defense, which buys drugs for all the armed services, buys them according to rigid, quality-oriented specifications. It conducts a most rigid inspection and testing program. It rejects many of the companies that ask to do business with it.

What then, does it buy? It buys from the same quality-oriented firms, large and small, that are relied upon by the private practitioner.

In addition, Defense requires potential contractors to submit samples of their products before the contract is awarded and again there is a substantial rejection rate because of high standards. However, the manufacturer who fails a defense department inspection is still free to continue producing goods for the civilian market.

The new commissioner of the Food and Drug Administration, James L. Goddard, MD, has several times exploded this myth, also. In an interview conducted by the *Pharmacist's Management Journal,* this past March, he had the following to say:

> "I think it's going to require very careful study before anyone could assume that there is such a thing as generic equivalency on a broad scale in our drug field today. There will have to be better methods of determination of equivalency than we now have, and more attention to the entire problem. It's not a simple issue. We appreciate this."

In the same testimony given before a Senate Subcommittee the following examples of Department of Defense experiences with drugs of supposed generic equivalency were presented. It is important to note that these are some of the "bargains" that are frequently mentioned as being "saviors of the consumer's pocketbook."

- On 15 September 1961, the commanding officer of the U. S. Naval Hospital, San Diego, California, reported that his neurology department had received "many valid complaints of toxicity and lack of potency regarding this drug—*Diphenylhydantoin Sodium Capsules,* made by company A, and sold by company B. Complaints included increase in seizure (the drug is used primarily for the control of epilepsy), dizziness and drowsiness. The patients were mostly children.

- March 20, 1962, the Fitzsimmons General Hospital, Denver, Colo., reported that "recently several patients at Fitzsimmons General Hospital who have convulsive disorders have had onset of break-through of their seizures, and each individual stated that they wondered whether the medication was not involved, since they had been seizure-free for several years with Parke-Davis *Dilantin* capsules with the red band, but recently had obtained medication without the red band. Medication was given of Parke-Davis *Dilantin* and no seizures have re-

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

curred." The report went on to say, "It is recommended that standardized Parke-Davis *Dilantin* be obtained in order to eliminate the disorders." The generic product had been supplied by Company B, and Company C.

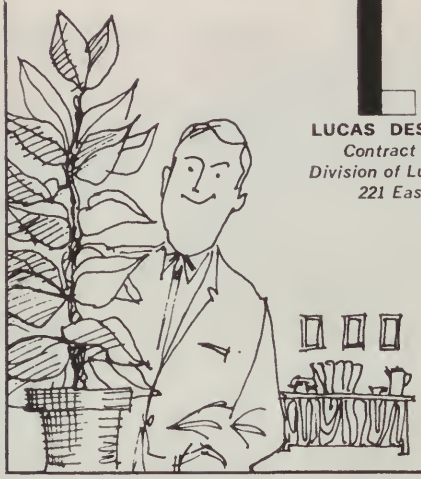
• August 7, 1963, the U. S. Naval Hospital, Oakland, California reported that *Diphenylhydantoin Sodium Capsules* produced by Company D caused "the controlled seizure patient to unnecessarily become non-controlled, which is both physiologically and psychologically contraindicated; absorption from the gastro-intestinal tracts of patients has been spotty when this product is used."

• November 30, 1965, the Naval Hospital at St. Albans, New York reported still another series of unsatisfactory experiences with this drug, again from Company D. The neurologist "has had seven adult patients with increased epileptic seizures. . . . This drug is intended to be an anticonvulsant and is not producing the effect needed," the report added.

Interestingly, the lot of this product had passed tests in the military laboratory; samples sent to the *FDA* also seemed to be satisfactory.

• June 9, 1966, Dow Air Force Base, Maine, physicians submitted a complaint about a new lot of *Diphenylhydantoin* from Company D. "Patients on this drug are experiencing seizures more frequently than on previously available products," they said.

One firm supplied an antibiotic used in urinary tract infections (*Methanamine Mandelate Enteric*-Coated Tablets), but the product would *NOT* disintegrate. Laboratory tests and x-rays showed the tablets would not dissolve, and hence could not release the medication. When the defense department informed the firm, its response was that the patient be told to bite them in half and swallow the pieces.



In 1964, the military submitted a number of versions of supposedly equivalent *Tetracycline* tablets for clinical testing to determine if the various firms' products actually got into the bloodstream. August 24, 1964, the laboratory reported that tablets supplied by Company E "gave no measurable blood levels in 7 of the 10 (human) subjects" who were given the product.

One additional example. *Nitrofurantoin* is a

widely-used agent against infections of the urinary tract. Often, patients with chronic infections require this drug over extended periods of time. Defense department doctors and hospitals use it in substantial quantities, as do their civilian counterparts. A series of complaints came in on a supposedly generic equivalent to *Nitrofurantoin* supplied by an Italian firm, Zambon, S.P.A., beginning in 1961 and running through April 1963.

From military hospitals all over the country the word was the same: This *Nitrofurantoin* is unsatisfactory. From Walter Reed, evidence that it "almost invariably" caused nausea and vomiting. From Sheppard Air Force Base, Texas, reports of severe rash. Other reports came from military institutions in Virginia, California, Texas, Florida, Washington, Massachusetts, South Carolina, Maryland.

From the Naval Hospital at San Diego, there were detailed reports on a 15 year old female patient whose condition worsened to near death using this product.

Regarding the last case cited, the hospital's commanding officer made a comment of particular import to the point we are examining. He said, "It is felt that this (young dependent child's) life was jeopardized by *SUBSTITUTING AN UNKNOWN PRODUCT* for one which for several years had controlled her infection exceptionally well. The cost of two hospitalizations, plus the expensive *Coly-Mycin* (an antibiotic used against severe infections) and the transfusions, made the substitution in her case of *Zambon Nitrofurantoin* a very expensive maneuver."

I should add that the product that had helped this young girl well in the past, and which helped her recover her health when she was given it again, was a brand of *Nitrofurantoin* made by a small but highly-reputed firm, Eaton Laboratories.

These examples are why the Department of Defense in the future is going to require "evidence of effectiveness in human beings," before a company can qualify to supply it with a given drug. It is well that our physicians note this and continue to place their reliance on prescribing drugs they know, personally, will effectively treat the condition for which they are prescribed.

Tandearil®
oxyphenbutazone

Therapeutic Effects: Tandearil is a nonhormonal compound which may rapidly resolve inflammation and help restore normal joint function. Its action does not affect pituitary-adrenal function or impair immune responses. Its value in osteoarthritis is especially noteworthy because this disorder responds inconsistently to steroids and is often resistant to salicylates. Further, indomethacin is limited only to osteoarthritis of the hip, whereas oxyphenbutazone is effective in all forms of the disease.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage. Make regular blood counts. Discontinue the drug and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, or a generalized allergic reaction may occur and require withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Osteoarthritis: The initial daily dosage in adults is 300-600 mg. in divided daily doses. When improvement occurs, dosage should be decreased to the minimum effective level; this should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. daily.

For complete details, please refer to full prescribing information. 6562-VI(B)R

Availability: Tablets of 100 mg.

V-Cillin K® Lilly 700636

Potassium Phenoxymethyl Penicillin

(See next page for prescribing information)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Warnings: In rare instances, the use of penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin and in those with bronchial asthma or other allergies. Resuscitative drugs should be readily available for emergency administration. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for relief of immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly wit parenteral dosage schedules, frequent evaluation of the ren hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgr pencillin-insensitive organisms. In such cases, its administration be discontinued, and appropriate measures should be taken.

Adverse Reactions: Although serious allergic reactions are m common with administration of oral penicillin than with intran forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it does possess c cant index of sensitization. The following hypersensitivity r associated with the use of penicillin have been reported: ski ranging from maculopapular eruptions to exfoliative dermat caria; and reactions resembling serum sickness, including chil edema, arthralgia, and prostration. Severe and often fatal anc has occurred (see Warnings). Hemolytic anemia, leukopenic bocytopenia, and nephropathy are rarely observed side-eff are usually associated with high parenteral dosage.

Administration and Dosage: For Tablets V-Cillin K and for V Pediatric, the usual dosage ranges from 125 mg. (200,000 uni times a day to 500 mg. (800,000 units) every four hours. Fo the daily dosage may be 50 mg. per Kg. of body weight div three doses.

Beta-hemolytic streptococcus infections without associa teremia may be treated with 200,000 to 400,0000 units thre day. Therapy should be continued for a minimum of ten days t development of rheumatic fever and/or other serious comp Dosage for routine streptococcus prophylaxis in patients with of rheumatic fever or congenital heart disease may be 200 once or twice daily. When such patients undergo tonsillecto extraction, or other minor surgery, the prophylactic dose s 500,000 units every six hours given two days prior to surger two days postoperatively. If oral medication is not feasible c of surgery, parenteral therapy should be considered. Mild ately severe pneumococcus pneumonia has been treated with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more shoul every six to eight hours in conjunction with indicated surgi dures.

For gonorrhea in males, 500 mg. (800,000 units) every fou three doses may be employed; in females, 500 mg. every for six doses are recommended. Refractory infections general to a second treatment three to four days following comple first. Treatment of gonorrhea with severe complications individualized, with prolonged and intensive treatment. Pati suspected lesion of syphilis should have a dark-field exam fore receiving penicillin and monthly serologic tests for a r three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,00 bottles of 50 and 100; and 250 mg. (400,0000 units) ar (800,000 units), in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,00 5 cc. of solution, in 40, 80, and 150-cc.-size packages.

THE ADOLESCENT GOES TO A GYNECOLOGIST

ALLAN C. BARNES, MD
Department of Gynecology and Obstetrics
The Johns Hopkins University School of Medicine

My assignment is to speak in very broad, general and, indeed, almost philosophic terms about the adolescent visiting a gynecologist.

The thesis that there is no such thing as adolescent gynecology could be defended from the point of view of our contemporary gynecologic practice. Certain it is that the organic complaints of the adolescent period are but a small fraction of our daily practice. That enchanting time of experimentally inserting foreign bodies into the vagina has already passed (there are few things that will strike terror into the heart of a mother more than the sight of a melting red crayon emerging from a four-year-old vulva), and that period which contains the bulk of the adult gynecologic complaints has not yet arrived. Statistically our own figures would indicate that the most frequent complaints brought to our attention during these years are, in order of their frequency, pregnancy and the need for contraceptive advice, vaginal discharge, menstrual irregularity or dysmenorrhea, and trauma.

Now it would also perhaps be feasible to defend the thesis of the relative nonexistence of adolescent gynecology on the grounds that there is no such thing as adolescence. I have no intention of flying in the face of the topic of this evening's session, and I recognize full well the dictionary definition of adolescence as the period between puberty and adulthood. But there is eternally a danger of setting aside any position in life as being a unique portion, the danger lying in the fact that we might mistake its uniqueness for isolation and that we might forget the continuing spectrum of life in which no time can be isolated as being uninfluenced by what came before or what is to come after.

It's not just that the woman becomes what the adolescent has made her. It is also that the adolescent is what the child has made her. We so often hear that adolescence is the period when the girl adjusts to her sexual role, but this narrow view accentuates the tubular vision that I am at the moment protesting. Adolescence is a period of relatively rapid acquisition of the physical characteristics of the gender role. But whether these physical characteristics are accepted as badges to be worn proudly or stigmata to be endured has already been cast into the personality rather long before these years arrive.

If a gynecologist should become strictly a gynecologist for adolescents he would have difficulty in influencing these reactions whose pattern has been established so much earlier. I would not deny the existence of the adolescent period as much as to restress the continuum of our behavioral de-

Presented at a meeting of the Baltimore City Medical Society, 1211 Cathedral Street, Baltimore, Nov. 4, 1966; previously published in part in the *University of Michigan Medical Center Journal* **32**: 131-134, 1966, and printed here with the editor's permission.

velopment. The gynecologist is concerned with preparation for adolescence. When an adolescent is brought to him as a patient he is not infrequently the victim of that preparation for adolescence which the child has already received.

Let me start with a phrase that I have just used and explore with you its meaning and its management: when an adolescent is brought to him as a patient.

May we for a moment, without diagnosing or prescribing specific complaints, discuss this medical episode and its attendant obligations. Three questions have preceded this visit, and three reactions ensue.

The first question is whether or not the girl will share with her parents the difficulties which form her chief complaint. This question is tied directly to the rebellion which constitutes one of the most conspicuous features of adolescence. If she does share her problem with her mother, the girl must give ground in her fight for separateness and return to a dependent relationship that she is struggling to terminate. On the other hand if she makes the decision not to discuss this problem with her mother, she is perhaps for the first time in her life attending a physician's office without the protection of an adult presence and she is trusting the physician to guard her secret. Either answer to this question is difficult for her to accept and prejudices her against this visit.

The second question revolves around whether or not the problem is worthy of a physician's visit or if it can be temporized with. In most instances, despite, for example, quite heavy menstrual bleeding, the initial reaction is to "wait and see." And this initial solution represents a departure from the medical practice of the preceding fifteen years, and is perhaps related to the third question which is whether or not the problem is primarily pediatric or gynecologic.

For most girls the visit to a gynecologist during adolescence is the first time that they have seen a doctor other than the familiar pediatrician who has "raised them," so to speak, and this perhaps contributes to the decision for temporization. The child who cries in the evening has in the past been reported exceedingly promptly to her pediatrician. But she is now replaced by the girl who has dysmenorrhea and is often managed with home remedies for a year before reporting to her doctor.

In addition there is a heightened reaction to her body and especially to its sexual areas, and not infrequently an overreaction to a genital dysfunction. And while we all accept the fact that no one likes to go to a gynecologist and that the examination involved is an unpleasant one, this reaction is particularly true when the patient is an adolescent.

The visit itself initially calls forth dual reactions: those of the patient towards her illness, and we are rather used to these; and those of the parents about the girl and her illness and the mythology of gynecologic diseases.

Let us take Dr. Hornick's view seriously and recognize the reactions of the doctor about his teen-age patient. No one of us regards disease in our reproductive tracts as we regard disease elsewhere. No woman considers her uterus and her gallbladder as being equivalent. And this special feeling is accentuated in the teen-age girl. Doubts about her physical development as a woman, a guilt about masturbation and her sexual phantasies, real or imagined fears about how much of her private life the examination will reveal: all of these contribute to her embarrassment and her confusion.

Then there is the reaction of the parents. Adolescence is difficult for everybody: the adolescent herself, her teachers, her sidlings, here parents—all have trouble coping with this process. This is often especially true for the parents, all of whose strength and sense of responsibility and tact are called into play when confronted with the emergence of a teen-age daughter. Adolescence in a daughter is the first obvious step towards departure from the home, towards marriage and a job. With the acquisition of what the mother may consider to be an adult-type disease, with going to a physician who is associated with adult complaints, a visible step is made towards this disruption of the intact family.

In addition to a general apprehension about the nature of the illness, mother may experience the sense of her role and her maternal usefulness being terminated. The maternal reaction as we see it in the office may cover a spectrum from something apparently akin to "I told you so," to the perhaps related, "You see being an adult isn't easy and now you're getting a taste of what I have been suffering all these years."

Finally there is the gynecologist's reaction. Nei-

ther the patient nor the doctor exists in a vacuum. This is a two-person relationship and each is reacting to the other. This is always true of course but with the teen-age patient it also represents three special problems.

First, the doctor gets the sensation of being caught between the girl and her family. And this is especially true if the issue concerns a request for contraceptive information or the revelation of a possible pregnancy.

Secondly, the doctor may feel himself caught between the girl and society, especially with respect to a pregnancy or abortion.

And, thirdly, the doctor may be caught by himself, either the memory of behavior during the same period of his life or his concept of himself currently and his community position and his own parenthood. Thus the gynecologist-obstetrician may be triply compromised in this position.

Now the therapeutic weapons which are customarily the armamentarium of gynecology and obstetrics are more subject to legal pronouncement and social taboo than are the therapeutic weapons of any other discipline in medicine. Legislators who would never dream of considering a law that specified which patients might receive insulin or in what doses will solemnly debate and even pass laws which prescribe what patients may or may not have the therapies which are familiarly employed by the gynecologist. And in addition to these laws there are strong feelings in the community about such things as venereal disease, virginity, extramarital pregnancy, and these feelings are often incorporated into professional ethics or customs. That these laws and these customs have little to do with the reality of contemporary life is an observation that is familiar to all of us. Nevertheless, the obstetrician-gynecologist often finds himself in the position of uncomfortable middleman.

No single set of procedures will unwind this situation and its many diverse elements. Some principles however emerge from a careful reevaluation of our own teen-age patients, their problems and their medical contacts concerning these problems.

The first of such principles is that the adolescent should be treated as an adult. Initially the girl should be conducted alone into the office for history taking. There are those obviously who would prefer to have the mother present, but this fact should be communicated to the doctor in the mother's absence. We have found that the majority of girls are perfectly competent to give a good history without the eternal coaching of a parent and there is no confusion as to who represents the physician's concern.

This admonition that the patient should be treated as an adult and that the history should be taken in confidence is not meant to imply that the personal management throughout should be the same as with an adult. The girl will need more reassurance and some indication that her own dislike for this session is shared by many including obviously the physician himself when he has to seek medical consultation. Nor is the momentary exclusion of the mother meant to imply that the history should in any way differ in its extent or in its coverage. Unduly intimate questions should be kept at a necessary minimum. Confidences should be shared much later when the youngster is more at home with this situation. And it should be remembered in this connection that silence is not simply a phenomenon designed to exasperate the doctor. Silence is a symptom which covers so many feelings that it should not evoke our annoyance but a careful exploration after more confidence has been obtained.

The history and the examination are carried out in other words with the same degree of privacy that would be accorded to an adult patient. Mother can join in a discussion of diagnosis or therapy, again with the permission of the patient, but this should not include a detailed recapitulation of the history in front of the historian. It is imperative to remember in this connection that the married teen-age patient should never have a mother substituted for the husband. He is the one with whom discussions should be held. The parents need general reassurance perhaps but he needs a recognition of his current responsibility.

The second principle is that the subject matter to be discussed should be taken casually. The physician is at all times a teacher and as such he should convey the fact that the perineum is just another part of the body. The reluctance of the adolescent to inspect her own perineum can be combatted by a matter-of-fact acceptance of her genital anatomy and this can be achieved best by the routineness of the office ritual.

The third principle which seems self-evident in

the extreme: examine the patient.

This obvious comment must be made because patients have been found with reasonably serious lesions the diagnosis of which has been delayed because the family physician was curiously reluctant to perform a pelvic examination. In a recent series of mixed mesodermal tumors reported from the Mayo Clinic, the patients under twenty-one years of age had a worse prognosis than the patients over twenty-one partially at least because all the cases of physician delay were in establishing the diagnosis in the younger age group.

This reluctance to examine the girl is often based on a fear of psychologic trauma, a concern that he would create a vaginal fixation. Hornick and Astradt have pointed to this fear and suggest that psychiatrists and analysts have been responsible for it. The psychologic aspect should not take precedence over the need for actual physical care. And most of these youngsters are smart enough to recognize either the obvious omission of an examination or an incomplete examination. If the mother thinks enough of the complaint to bring her daughter in, then the physician should think enough of it to examine the girl. Actually, a gynecologist's office is fundamentally for carrying out pelvic examinations. If any woman, whatever her age, gets inside that office she should have a thorough examination—and this even applies I might say to the lady who comes to collect for the Red Cross.

Finally, let us remember to examine ourselves. Being in a profession does not keep a physician from being human. In the midst of an afternoon of menopausal complaints and cancer detection comes a bright young thing who is obviously becoming a sexually alive person and is not infrequently sexually provocative. And perhaps the best admonition is that the physician not become self-conscious about having personal reactions. One finds on such self-examination that the tendency to retreat to parental roles and poses swings between being over-permissive and being overstrict, and perhaps in a positive sense the best suggestion is that one be reasonably consistent and always, always make clear to these girls the basis for your decision. If they can not be aborted or they can not receive contraceptive prescriptions, make sure that they know that this is because of a true and immutable law or because of the physician's cowardice or because of the physician's religious bias. Whatever the reason the girl has the right to know the basis for the decision. As we examine ourselves the results of this examination should where pertinent be shared with our patients.

Adolescence in the continuum of human development is a transition phase. Attitudes have to a great extent already been established but uncertainty is still there and apprehension about the adult role to be played lurks just underneath the surface. Dealing as we must with the biology of sex and reproduction, let nothing happen in this office visit to dampen the girl's enthusiasm for the adult feminine role.

I am not discussing the youngsters who emerge into adulthood accepting the feminine role. I am pleading for those who emerge with a positive pride in it. It is a wonderful thing to be a woman. And let's make sure our adolescent patients know this.

QUARTERLY ON CEREBROVASCULAR DISEASE PUBLISHED BY AMERICAN HEART ASSOCIATION

The Winter-Spring 1967 issue of STROKE—CURRENT CONCEPTS OF CEREBROVASCULAR DISEASE is now available to physicians, hospitals and medical schools without charge from local Heart Associations.

This is the first issue of the publications sponsored directly by the American Heart Association. The quarterly publication was established in 1966 and previously issued by the New York State Heart Assembly.

The publication, intended to offer interesting and practical information to the medical practitioner, will continue to carry one or two short, pertinent articles on the subject of stroke in each of its four issues a year. Walter J. Friedlander, M.D. of Omaha, remains as editor.

ENDOCRINE PROBLEMS OF THE ADOLESCENT

GEORGEANNA SEEGAR JONES, MD
Associate Professor of Gynecology and Obstetrics to Woman's Clinic
The Johns Hopkins Hospital

In order to assess the endocrinological problems of the adolescent, some five years of histories were reviewed and the complaints of patients between the ages of twelve and twenty-one were analyzed.

Of 509 patients, 356 were thought to have complaints of an endocrinologic nature and these complaints could be categorized in five classes.

There were 188 patients seen because of amenorrhea or oligomenorrhea; 71 patients had irregularities or abnormalities of the menstrual flow; 57 had dysmenorrhea; 35 had hirsutism or acne; and 6 had problems of breast development, either hyper- or hypotrophic.

As the problems of ovulation and amenorrhea will be discussed by Dr. Howard Jones, I am going to devote the rest of the discussion to the diagnostic procedures used in order to make an etiologic diagnosis and a specific treatment regime in patients with menstrual irregularities.

Seventeen of the children who were seen had irregularities of such minor nature that only an examination and reassurance was required. It was believed that these patients presented themselves because of either parental overconcern or adolescent over-concern. Fifty-five however had excessive menstrual flow and required diagnostic procedures.

The first necessity is a careful history and physical examination, as has been previously emphasized. Ordinarily, except in those rare instances where the flow is not of such severity or has been present for such a short time—usually three months—a dilatation and curettage is advisable even in the adolescent patient. This procedure is itself not only diagnostic but frequently curative. In addition this is the first step towards separating dysfunctional bleeding due to anovulatory causes from that due to ovulatory causes.

If the bleeding is of such character that the patient can postpone a curettage for six weeks, it is frequently helpful to ask her to keep a basal temperature record. This is the simplest way to differentiate ovulatory from anovulatory bleeding.

A routine hematologic study should be a prerequisite. This includes a hematocrit, white count, differential, platelet count and sedimentation rate.

If the individual has not had a thorough physi-

Presented at a meeting of the Baltimore City Medical Society, 1211 Cathedral Street, Baltimore, Nov. 4, 1966.

cal examination recently, this is also recommended. Ordinarily unless there are symptoms which warrant it, we do not feel it necessary to do an X-ray of the chest or tuberculin test. A protein bound iodine or a Column **T 4** test for thyroid function is usually indicated. A fasting blood sugar and if there is any evidence of excessive hair, a urinary 17-ketosteroid assay is requested. If there are any signs or symptoms suggestive of intracranial lesion, of course an X-ray of the sella turcica is necessary.

As far as the history is concerned, it is often extremely valuable, and if well taken can give one a clue to the etiology immediately. I try to take a history which gives the setting in which the menstrual irregularity has begun. Thus it is important to know if the menstrual irregularity has been present from the onset of menses. If it has a sudden onset it is extremely important to know if there has been an illness prior to the onset of the menstrual irregularities, if there has been an emotionally traumatic experience, if there has been a weight gain or loss. In my experience some of the most important findings from a psychological point of view has been a history of alcoholic parents, broken families, or love affairs.

As far as the history of weight gain or loss is concerned, a nutritional history is important. I take this by simply asking the patient's present weight, the average weight, the most she has ever weighed and the least she has weighed. If from this weight history in comparison to her height I believe that there may be a nutritional problem, I then ask the patient to keep a record of what she has had to eat and drink during the week before she comes in for her next visit.

The next thing of importance is the physical examination and this of course begins with the hymenal ring which can cause irregular intermenstrual bleeding. In addition to this one occasionally finds severe vaginitis responsible for a bloody type of discharge. Less common are cervical and endometrial polyps but these also can be present even in adolescent children; sarcoma botryoides, carcinoma of the fundus, most unusual, and finally tumors of the ovary which are associated with anovulatory dysfunctional bleeding. If the examination is unsatisfactory, it is wise to schedule the patient for an examination under anesthesia.

Having finished the history and physical examination, one must decide according to the severity of the bleeding whether or not one should start the patient on a basal temperature chart and decide on a curettage within the next four to six weeks. If in the month or six weeks the patient's menstrual bleeding continues in an irregular fashion, if the hematocrit is low to begin with or rapidly dropping, a curettage should be advised.

Among the 71 patients seen, 23 were thought to have mild menstrual dysfunctional bleeding due to psychogenic factors. Six had metabolic disease. These wese hypothyroidism in 2 patients, diabetes in 4. Four had nutritional disturbances which were probably on a psychogenic basis. Three had extreme weight loss: two because of their interest in various careers which required excessively thin individuals, ballerina and television; one was unusually stout, had been overweight her entire life but upon reaching adolescence had decided this was a social problem and that weight loss would be advantageous.

One patient had a tetralogy of Fallot and it has been our experience that this medical condition is often associated with abnormalities of steroidogenesis. Six patients had neurological disturbances, most being due to birth injuries which had apparently left scars in the central nervous system interfering with the hypothalamic-pituitary pathways. These patients have continued to have menstrual irregularities throughout treatment in the follow-up period. It is thought that continuous replacement therapy will be necessary to control these patients throughout their lives.

Six patients had primary ovarian problems. Two had ovarian tumors and four had polycystic ovaries associated with the Stein-Leventhal syndrome.

Six patients had mid-cycle bleeding which following a curettage was diagnosed as ovulatory bleeding. And two patients had severe Trichomonas vaginitis.

Thus it can be seen that the majority of the dysfunctional bleeding was associated with the anovulatory type, only 8 classifying as having ovulatory bleeding.

The classification of dysfunctional bleeding into anovulatory and ovulatory is of clinical value as, by and large, differentiates the functional endocrinologic types from the anatomical types. Patients who are bleeding with secretory endome-

trium are much more apt to have anatomical problems and should be considered in this category until proved otherwise. Although none of the patients in this group happened to show endometrial polyps, cervical polyps or blood dyscrasias, these do occur in adolescents and must be ruled out.

The importance of separating the ovulatory from the anovulatory types is also seen in the selection of therapy. The anovulatory or the endocrine dysfunctional bleeding will respond to substitution progestational therapy and the ovulatory will not respond to this form of endocrine substitution. Twenty-one of our 22 patients who were treated with progestational therapy responded with control of their abnormal menstrual bleeding. One patient did not respond and she was found to have a Stein-Leventhal syndrome and has been improved following wedge-resection operation.

While attempting to make an etiologic diagnosis for the anovulatory dysfunctional bleeding, we found it can be controlled satisfactorily with progestational therapy, and for many years we have used Ethisterone, 30 milligrams daily for five days given every twenty-eight days for three cycles. Therapy is then interrupted in order to allow the patient to revert to a normal cycle as this occurs spontaneously in about 60 percent of the cases. It is often helpful to keep the patient on a basal temperature chart, it is then easier to tell immediately whether or not ovulation has occurred. Provera, 10 mg a day for five days, given in a twenty-eight-day cyclic fashion is probably as satisfactory and if there is some doubt as to whether or not the patient will take oral medication 50 mg of Progesterone in oil intramuscularly every twenty-eight days usually will induce a regular bleeding period. It is always well to remember however that this is substitution therapy, not curative. It does not produce ovulation and one must continue to look for some specific cause of the anovulation which will respond to a specific therapy.

In addition to this type of substitution therapy we now have available Clomithene Citrate which will initiate ovulation in an anovulatory patient. This is particularly efficient in the group of patients who have dysfunctional bleeding with evidence of excessive estrogen. I would however believe that it might be best to reserve this therapy for those individuals who are interested in pregnancy and not to give it to adolescent patients unless it is given as a single therapeutic trial. Although the drug is a very interesting and important one, it has not been as satisfactory as we had hoped when it was first introduced, as it apparently does not actually cure the anovulation but must be taken repeatedly, also apparently as substitution therapy.

Experience with the use of estrogens in the control of menstrual anovulatory bleeding has been relatively poor and the same is true of the oral contraceptive pills which also contain estrogens. It is not well understood why a dysfunctional bleeding cycle can not be as readily controlled using these agents as it can be with Progesterone alone but this has been the clinical experience. If, however, one gives a high enough dosage of any of the progestational agents such as Norlutin, 10 mg daily over a period of twenty or twenty-five days, then it is possible sometimes to completely inhibit the hypothalamic-pituitary secretions and also to produce an atrophic type of endometrium so that bleeding may be inhibited. This form of therapy has been used by several investigators for the control of bleeding with blood dyscrasias. In other words, the patient can be started on medication and continued indefinitely so that the menstrual period never occurs.

Dysmenorrhea occurred in 57 patients in this series, and there is little new to be said as to the cause of dysmenorrhea. Most adolescents fall into the idiopathic category and this was true in the present series. Fifty-four were idiopathic. Only 3 showed anatomical problems. These 3 however were interesting. The oldest was nineteen, who had had severe dysmenorrhea since the age of fifteen and was found to have extensive endometriosis.

Another patient at the age of fourteen had just begun with her menstrual periods and in the past six months had had four periods, each one progressively more painful. The last one had been apparently extremely difficult. She came in with her mother who was very loath to let her come into the office by herself and because of this parent-child relationship I immediately thought that the problem was psychogenic due to an overanxious mother and a suggestive dysmenorrhea pattern. As she went into the examining

room I allowed the mother to come in to talk to me and she gave me exactly the history which I expected, that she had always had a terrible time with periods herself and that she had anticipated that her daughter would have this same problem and that she couldn't feel sorrier for her. I then went into the examining room expecting to do a rather cursory physical examination which would be completely normal and was startled to find a cyst the size of a grapefruit in the vaginal vault. Under anesthesia she was found to have a bicornute uterus with a blind horn and at operation this was corrected and the patient has had no more dysmenorrhea.

The third patient was a child brought in with a history again very suggestive of psychogenic amenorrhea in that she was an adopted child. Following her adoption the parents had three children of their own in rapid succession. In addition to this at the age of fourteen she had attained the height of six feet so she was obviously almost a foot taller than all of her peer group. In spite of this she seemed to be a very well adjusted child and in talking to the mother and the pediatrician they both informed me that they thought also that she had no psychogenic problems.

Under the circumstances because the dysmenorrhea was incapacitating, necessitating missing two days from school, it seemed important to immediately rule out a psychogenic factor and it was decided to stop the patient's ovulation. As demonstrated by Sturgis in 1940, if ovulation is interrupted no dysmenorrhea occurs. We therefore attempted to block ovulation in this patient by giving 10 mg of Enovid for twenty days in each cycle. Much to my surprise the patient continued to complain of dysmenorrhea in the withdrawal bleeding cycle which ensued. I was therefore again forced to consider psychogenic amenorrhea but because the mother seemed so sure that this could not be the case, we decided to schedule her for an examination under anesthesia and curettage. Much to my surprise a large endometrial polyp was present. Since the removal of this polyp there has been no more dysmenorrhea.

The obvious moral is that although most cases of dysmenorrhea in the adolescent are of idiopathic type with normal anatomical findings there is an occasional anatomical cause and each patient must be examined.

The medical treatment for dysmenorrhea is well known. Edrisal, Trasentine, Equagesic all have their place as well as aspirin and hot water bottles. When the condition is severe enough to warrant it, Duphaston, 15 mg daily for twenty days beginning on the fifth cycle day, has been an extremely satisfactory drug. It is the most conservative type of progestational agent as it usually can be given in amounts which are small enough not to interfere with ovulation but nevertheless will give relief from the dysmenorrhea. Occasionally one can reduce the dosage to 10 mg daily over a fifteen-day period. There were 23 patients in the present series with severe incapacitating dysmenorrhea who were treated with this medication satisfactorily. However the problem with it as with all other types of medication for dysmenorrhea is that once the medication is discontinued the dysmenorrhea is apt to return.

It seems well to begin the treatment of dysmenorrhea in the adolescent as rapidly as possible. If one can interrupt a habit pattern of this type sometimes one can cure the condition, but if it has gone on for any length of time it seems to have established a pattern which is very difficult to interrupt. Once the individual has been reassured that the pain be controlled and completely eliminated her pain with Duphaston, then she is often willing to endure with this if she does not have a specific obligation at the time of her menstrual periods. I therefore usually tell her to discontinue the medication unless looking, forward, find, that she has some important thing such as an examination, a piano or dance recital, or a prom to attend at the time of the menstruation. If this is the case then she takes her Duphaston in the period prior to this expected engagement.

It should be unnecessary to state that narcotics or any type of habit-forming drug such as alcohol should not be used in a chronic recurring medical condition such as dysmenorrhea.

GENERIC AND TRADE NAMES OF DRUGS

1 ENOVID: norethynodrel with mestranol
2 EDRISAL: amphetamine sulfate with aspirin
3 EQUAGESIC: meprobamate and elhoheplazine citrate with aspirin
4 NORLUTIN: norethindrone
5 PROVERA: medroxyprogesterone acetate
6 TRASENTINE: adiphenine

CONGENITAL ANOMALIES AS A CAUSE OF PRIMARY AMENORRHEA

HOWARD W. JONES, JR., MD
Professor of Gynecology and Obstetrics
to The Johns Hopkins University School of Medicine

Congenital defects may be defined in a variety of ways. Most of us are apt to think of a congenital defect as a rather gross, easily diagnosable condition. However, a broader view would include more subtle problems, such as a single enzyme deficiency located in a critical area, the net effect of which is primary amenorrhea. A single enzymatic defect in the adrenal gland causing virilizing adrenal hyperplasia is an example of such a lesion. Viewed in this broader light almost all, but not all, cases of primary amenorrhea are indeed due to a congenital defect.

I have chosen to adopt the broader concept, for no other reason than when the patient presents herself with primary amenorrhea we do not have the advantage of knowing whether it is explainable by a gross anatomical abnormality and, therefore, the patient must be studied with the entire problem of primary amenorrhea in mind.

First, a word about when a work-up might be advised for a patient with primary amenorrhea. At what age is this to be undertaken? In my opinion, at least a careful history should be taken and a careful examination should be done when either the patient or her parents are sufficiently interested in this problem to seek medical advise.

If the history does not reveal similar symptoms in other members of the family and if the examination reveals that a vagina and uterus are present, the problem then arises as to how much additional work-up should be undertaken.

Presented at the Meeting of the Baltimore City Medical Society, 1211 Cathedral Street, Baltimore, Maryland 21201, on Friday, November 4, 1966.

Puberty is a complex phenomenon of maturation which involves many more things than the onset of menstruation, which is only the most obvious sign. If there are no signs of the initiation of puberty, such as the presence of axillary or pubic hair, or of breast development, there is certainly more urgency to the work-up and even at a rather early age; for example, fourteen—a work-up of considerable detail might be initiated. On the other hand, if the other signs of puberty are indeed present but menstruation has not started, some delay might be entertained with a working diagnosis of delayed puberty (a late bloomer). If, however, menstruation has not appeared by the age of 18, a very thorough work-up is then indicated regardless of how good the other signs of puberty may be.

A CLASSIFICATION OF AMENORRHEA

Amenorrhea may be discussed under four main headings—lesions of central origin, lesions of intermediate origin, lesions of gonadal origin and lesions of end organ origin (Table 1).

The diagnosis of 46 recent consecutive patients with primary amenorrhea according to the classification of Table 1 is shown in Table 2 (Table 2). An example of a patient from each main category will be discussed.

Table 1

CLASSIFICATION OF PRIMARY AMENORRHEA

I. Lesions of Central Origin
  A. Neurogenic
    1. Organic destructive lesion
    2. Idiopathic hypothalamic dysfunction (Stein-Leventhal Syndrome)
    3. Inhibition of the prolactin inhibition factor (Ahumada-del Castillio Syndrome)
    4. Idiopathic hypogonadotrophic eunuchoidism
  B. Pituitary Disturbances
    1. Tumors
      a. Chromophobe adenoma (Ahumada-del Castillio Syndrome)
  C. Psychogenic Amenorrhea
    1. Major and minor psychosis
    2. Emotional shock
    3. Anorexia nervosa
II. Lesions of Intermediate Origin
  A. Chronic Illness
  B. Metabolic Diseases
    1. Thyroid
      a. Hyperthyroidism and hypothyroidism
    2. Pancreas
      a. Diabetes mellitus
    3. Adrenal
      a. Congenital virilizing adrenal hyperplasia and related disturbances
      b. Cushing's disease and "stress obesity"
      c. Adrenal tumor
  C. Nutritional Disturbances
    1. Malnutrition
    2. Exogenous obesity
III. Lesions of Gonadal Origin
  A. Congenital Developmental Defects—Hermaphroditism and Related Conditions
    1. Gonadal agenesis (Turner's Syndrome and related conditions)
    2. Virilizing male hermaphroditism
    3. Feminizing male hermaphroditism (testicular feminization syndrome)
  B. Destructive Lesions—Infections, Neoplasms, Irradiations, Surgical Trauma, etc.
  C. Tumors
    1. Virilizing
    2. Feminizing
IV. End Organ
  A. Congenital Defects
    1. Imperforate hymen (cryptomenorrhea)
    2. Transverse vaginal septum (cryptomenorrhea)
    3. Absence of vagina and/or uterus
  B. Acquired
    1. Atresia of the vagina
    2. Atresia of the cervix
    3. Destruction of uterine cavity due to infection

Table 2

PRIMARY AMENORRHEA

I. Lesions of Central Origin	
Stein-Leventhal Syndrome	1
Pan Hypopituitarism	1
Ahumada-del Castillio Syndrome	2
Hypogonadotrophic Eunuchoidism	12
II. Lesions of Intermediate Origin	
Malnutrition	5
Adrenal Hyperplasia	2
Adrenal Tumor	1
Hypothyroidism	1
III. Lesions of Gonadal Origin	
Gonadal Agenesis	3
Male Hermaphroditism, feminizing	3
Male Hermaphroditism, masculinizing	2
Arrhenoblastoma	1
Hilus Cell Tumor	1
IV. End Organ	
Congenital Absence of the Uterus and Vagina	10
Infection (tuberculosis)	1
TOTAL	46

LESIONS OF CENTRAL ORIGIN

A 22 year old patient with primary amenorrhea who was referred with the comment that she had no ovaries. There was no history of breast development, but pubic and axillary hair in a scant amount had appeared at about the age of 12.

Physical examination showed that she weighed 120 pounds and was 5 feet 4 inches tall. There was no breast development, but rather sparse axillary and pubic hair. The external genitalia were normal but undeveloped. There was a small undeveloped vagina and on rectal examination a very small uterus could be felt (Fig. 1).

Laboratory studies showed that the buccal smear was 30% positive for sex chromatin. Chromosomes on the peripheral blood revealed 2 $\times$ sex chromosomes. The gonadotrophins were negative at less than 6.6 mouse units per 24 hrs. on 4 occasions. The PBI was 6.0 ug/100 ml. The 17-ketosteroids were 3.5 mg/24 hrs.; 17-hydroxycorticoids 5.2 mg/24 hrs. The maturation index was 95-5-0. Total estrogens were 7 ug/24 hrs.

These diagnostic findings ruled out ovarian agenesis and were consistent with the diagnosis of hypogonadotrophic eunuchoidism. This diagnosis was confirmed by the administration of human pituitary gonadotrophin 2 mg/day for 4 days followed by 3,000 units of HCG for 3 consecutive days. Following this a biphasic temperature chart

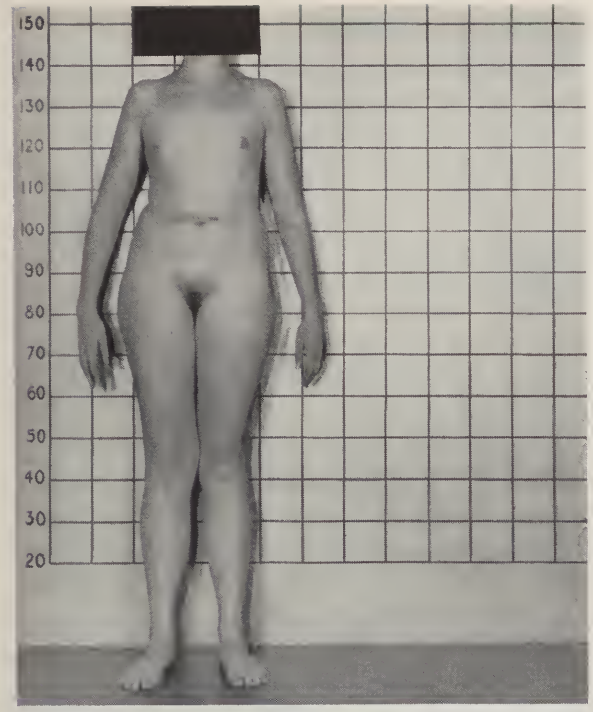

Figure 1

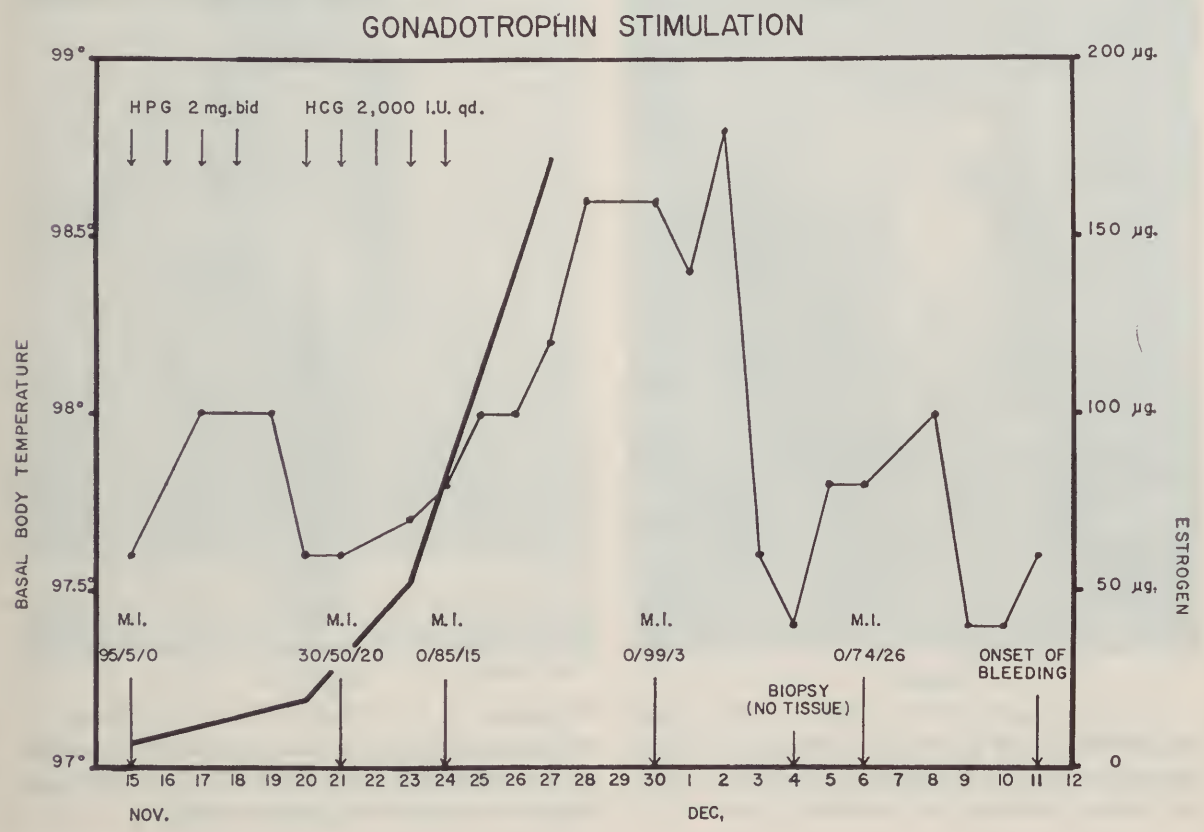
Photograph of 22 year old patient with primary amenorrhea. The only evidence of secondary sex development is pubic and axillary hair.



indicated that ovulation had taken place and the measure of the urinary estrogen excretion indicated substantial response. The maturation index furthermore shifted to the right and menstruation occurred after a luteal phase of about 14 days (Fig. 2).

LESIONS OF INTERMEDIATE ORIGIN

A 17 year old patient complained of primary amenorrhea. Her breast development, although never very great, had nevertheless appeared at about 10½ years and axillary hair and pubic hair in rather normal amounts soon thereafter. Her growth and development were otherwise normal. Physical examination revealed a healthy appearing girl 5′ 9″ tall. There was very modest hirsutism over the face, but there was no excess body hair and the axillary and pubic hair was entirely

Figure 2

A chart showing the effect on basal body temperature, estrogen excretion and maturation index of the injection of human pituitary gonadotrophin followed by human chorionic gonadotrophin in the patient shown in Figure 1.

normally developed for a female. The general physical examination was otherwise normal. The breasts, although small, were considered within normal limits. Pelvic examination revealed normal external genitalia without any enlargement of the clitoris. It was necessary to examine internal genitalia by rectal examination. This revealed a normal uterus in good anterior position and no adnexal enlargement.

The urinary 17-ketosteroid excretion was 13.7, 15.0, 15.2 and 23.7 mg/24 hrs. on four independent examinations. An intravenous pyelogram revealed a large calcified mass over the left kidney which was considered to be a calcified adrenal tumor (Fig. 3). This was removed through a transperitoneal incision. Following removal of the tumor, the patient's periods started and were regular. She subsequently married and has had two children.

LESIONS OF GONADAL ORIGIN

A 19 year old girl complained of primary amenorrhea. There was no history of breast development. Hair had appeared under the arms and in the pubic area at the usual time, but had never been very great in amount. There was no excess body hair elsewhere. She was normally intelligent and was doing well in college.

Physical examination revealed a patient who was 5 feet 6 inches tall and weighed 110 pounds (Fig. 4). She had always been thin. There was no breast development, no acne, no hirsutism, but she had scanty pubic and axillary hair. A very careful general physical examination failed to reveal any somatic congenital abnormalities. The external genitalia were normally formed but appeared undeveloped. The vaginal mucosa was quite atrophic. The rectal examination revealed a small infantile uterus and the ovaries were not palpable.

Figure 3

An intravenous pyelogram in a patient with primary amenorrhea. There is a large calcified mass above the left kidney. On exploration this proved to be the virilizing adenoma of the adrenal gland.

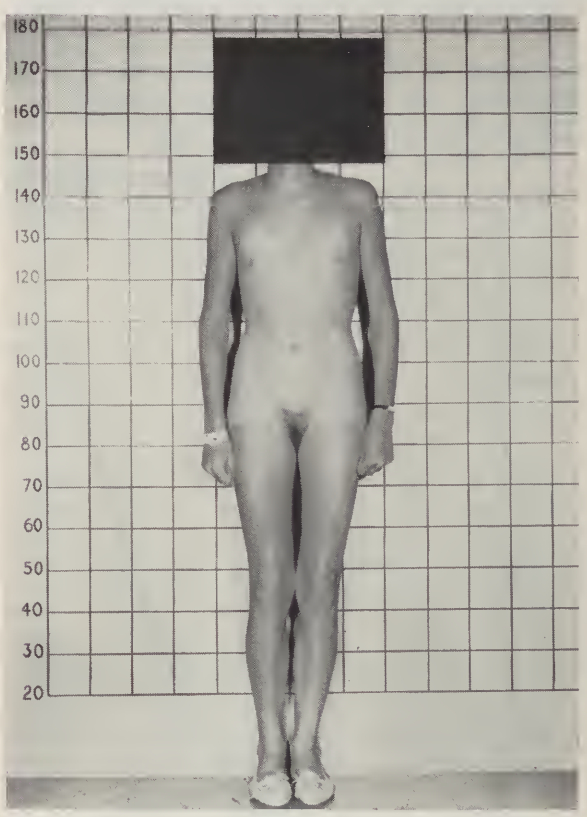


Figure 4

Photograph of a 19 year old girl complaining of primary amenorrhea. The only evidence of secondary sex development is pubic and axillary hair. The final diagnosis proved to be gonadal aplasia.

The vaginal smear had a maturation index of 78-17-5. The urinary gonadotrophin excretion was positive to 52.8 and 103.6 mouse units per 24 hrs. The urinary 17-ketosteroid excretion was 2.7 mg/24 hrs. and the 17-hydroxycorticoid excretion 8.6 mg/24 hrs. A buccal smear was negative.

The diagnosis was considered to be gonadal aplasia without evidence of Turner's stigmata. The patient was treated by cyclic estrogen therapy.

LESIONS OF PERIPHERAL ORIGIN

A 17 year old girl complained of primary amenorrhea. Breast development was noted at about the age of 11 and soon thereafter pubic and axillary hair appeared in normal amounts. The patient was normally intelligent and was doing well in high school. Her growth and development had been otherwise normal although she came from a family of short individuals.

Figure 5

Photograph of a 17 year old patient with primary amenorrhea and with excellent secondary sex development. Diagnosis proved to be congenital absence of the vagina and uterus.

Physical examination revealed a patient who was 5 feet 1 inch tall and weighed 95 pounds (Fig. 5). The general physical examination was entirely negative. Pelvic examination revealed pubic hair normal in amount with female distribution. The clitoris was normal. On separating the labia, the urethral orifice was found to be normal but there was no vaginal orifice (Fig. 6). On rectal examination no internal genitalia could be palpated. The buccal smear was positive—32%.

The diagnosis of congenital absence of the uterus and vagina was made and the patient advised that she could have an artificial vagina made when she was contemplating marriage.

Figure 6

Photograph of the external genitalia of the patient shown in Figure 5.

SUMMARY

1. The majority of patients with primary amenorrhea have some congenital defect.

2. A careful history and physical examination is indicated in any patient suspected of having primary amenorrhea regardless of her age.

3. If by the age of 14 the menstrual periods have not appeared and the other signs of puberty are also absent (breast development, axillary and pubic hair, growth spurt, etc.), a complete laboratory investigation is urgently indicated.

4. If by the age of 18 menstruation has not appeared, a complete laboratory investigation is indicated whether or not other signs of puberty have appeared.

5. A classification of primary amenorrhea is given with examples from each of the major subdivisions.

GUILLIAN—BARRÉ DISEASE COMPLICATING PREGNANCY

H. MELVIN RADMAN, MD
Attendant Gyneologist Obstetrician
to Sinai Hospital, Baltimore Maryland

A neurologic symptom complex described in 1856[7] by Landry and subsequently amplified by Guillian and Barré[4] in 1916, is a disorder chiefly confined to the peripheral nervous system. Recent consideration,[8] however, reveals that Landry's paralysis is a descriptive term applied to any ascending paralysis while the Guillian—Barré syndrome is a specific disease. This polyradiculoencephalomenopathy is characterized by an ascending paralysis that begins in the extremities and progresses to involve the facial muscles. Albuminocytologic dissociation of the spinal fluid and accentuation of motor weakness rather than sensory disturbances are integral facets of the disease process. While it may occur at any age it has a propensity for those in the 20 to 50 year group. It is found infrequently associated with pregnancy, and because few instances appear in the literature,[1, 6, 10, 11, 12] the report of an additional case would be warranted.

Since the first description of the disease, neurologists have debated the prerequisites for diagnosis. The questions of specific clinical findings, laboratory data and prognosis are factors that have received attention.[2, 3] Present concepts state that it is a specific entity, its origin being unknown.[5] Large numbers occur without demonstrable cause; however, many are found to follow or be associated with non-specific viral or bacterial infections. Some follow allergic disorders, inoculation with vaccines, collagen diseases or metabolic abnormalities such as pregnancy and diabetes.[8] The need for exact diagnostic criteria was advanced by Osler and Sidell.[9] They presented several valuable yardsticks, the most important of which are (1) the disease begins 1 to 3 weeks after an infection; (2) all sexes and ages are involved; (3) dysethesia of hands and feet precede paralysis; (4) rapid symmetrical loss of power; (5) objective sensory loss is minimal; (6) bladder disturbance is rare; (7) tendon reflexes are lost or diminished; (8) cranial nerves, usually the seventh, become involved; (9) the cerebrospinal fluid shows a rise in protein and a marked increase in cells; (10) complete recovery without residual paralysis occurs within six weeks.

The disease affects the spinal nerves in the region of the fusion of the anterior and posterior roots with proximal and distal extension of the process. However, rather than a mere inflammation of nerves and roots, the syndrome can be viewed as a manifestation of the entire nervous system to injury.[8] Elevation of spinal fluid protein, thought to be frequent, is but an incidental finding according to Guillian.

Case Report

Mrs. L. B., a 34 year old white woman entered the hospital on March 15, 1966 because of weakness of the entire body and inability to close her eyes. One week prior to admittance she had a severe upper respiratory tract infection with fever and malaise. Although she seemed to improve, she continued to complain of numbness and tingling of the fingers, toes and buttocks. Soon the weakness of both lower extremities became so pronounced that she had difficulty in walking. The symptoms gradually progressed so that they included the entire body, and she was forced to remain in bed. In addition, there was dimness of vision and inability to open or close her eyes. Dyspnea or dysphasia was not present. Although urinary incontinence developed, she was able to control bowel movement. There was no fever, chills, nausea, vomiting, headache or stiffness of the neck. The speech became slurred and saliva dripped from the sides of her mouth. She was para 66006 whose menstrual cycles had always been regular. The last regular period occurred on July 30, 1965. She was obviously pregnant (33 weeks) and the estimated date of confinement was May 6, 1966. The family, past and systemic histories were non-contributory. At physical examination the patient was a well developed, thin white woman, obviously pregnant; emotionally disturbed because of her illness. The secondary sex characteristics were well developed. The most notable finding was that she was unable to change her facial expression or close her eyes. There was obvious lacrimation and salivation. The blood pressure was 130 systolic and 90 diastolic; the pulse was 92; rectal temperature 99°F. Examination of the soma was not remarkable. She was 30-32 weeks pregnant, with the fetus in a cephalic presentation. The fetal heart tones were of good quality and located in the left lower quadrant of the abdomen. Of prime interest was the neurologic examination. There was bilateral, peripheral, seventh nerve paralysis; there was no nystagmus. The tongue moved loosely and a good pharyngeal reflex was present. The neck was not stiff or limited in motion. Deep tendon reflexes were exaggerated but equal. Babinski and Hoffman reflexes were absent. The position sense was intact as was pin-prick sensation. Muscle weakness of mastication and the hand was slight. She was unable to ambulate. Laboratory data revealed a 20 mg. per cent spinal fluid protein (upon admittance) with one leucocyte per high powered field. One week later the spinal fluid protein had risen to 36 mg. per cent, and no cells were found. Further tests which included hemophile, hematocrit, erythrocyte count, blood culture, serologic tests for syphilis, agglutination tests and urine examination gave no additional information. Supportive and symptomatic treatments were given and gradual improvement was noticed. The muscular weakness disappeared and within three weeks from the onset she was again ambulatory. On April 2, 1966 she was discharged from the hospital. When the patient was approximately 37 weeks pregnant she fell into labor spontaneously. Within two hours she was delivered of a live male child that weighed 5 pounds 9 ounces. The post partum course was uneventful. At the 6 week period her general condition was excellent. Despite continuous physiotherapy, slight weakness of the facial muscles continued for 3 months. At the four month period she was entirely well, with no residual paralysis.

DISCUSSION

Pregnancy has often been associated with vague tingling sensations of the hands, feet, upper and lower extremities and buttocks. While the exact cause of these complaints is difficult to determine, their etiology has been ascribed to pressure of the heavy uterus or fetus upon nerves, postural deviations, anemia, circulatory disturbances and the ingestion of medication. Although toxemia of pregnancy must be considered, some conditions such as aphasia, hemoplegia, convulsions and syncopal episodes should also receive attention from another standpoint. While serious neurologic disorders are not often seen in conjunction with pregnancy, investigative procedures are imperative so that a pathologic neurologic entity is not overlooked. One of the unusual ones is Guillian—Barré disease. Its appearance is cause for concern until a diagnosis is established because such complications as bulbar paralysis or cardio-respiratory involvement offer problems of fetal oxygenation—as well as the obvious ones to the mother. Since the etiology of Guillian—Barré disease is unknown, treatment is directed to symptomatic relief and general supportive measures.

(*Continued on page* 56)

SNEAKY SPIDER'S BITE IS SERIOUS

More Americans are having unpleasant experiences with the "brown recluse," a sneaky spider with a bite probably more toxic than that of the "black widow." Now seen in a dozen midwestern and southern states, the shy brown spider (Loxosceles reclusa) seems to be expanding its territory. Tourists probably will contribute to its spread this summer when they carry it home in their personal belongings.

The brown recluse tries to stay away from humans, but it hides in places where it can hardly avoid them—shoes, blankets, rolled-up newspapers, the dark corners of man-made structures, etc. The result often is a bite that the person is not aware he is getting, but which becomes painful and swollen later. A few deaths have been attributed to brown spider bites.

The brown spider's venom is now being studied for possible medical uses. Investigators at Little Rock (Ark) Veterans Administration Hospital and the University of Arkansas Medical Center have developed techniques for "milking" the spiders of their venom by giving them mild electric shocks.

"Our data indicate a bilogical poison much more potent than known snake venoms, and probably more toxic than venom from the black widow spider," said Paul N. Morgan, PhD, a research micro-biologist at Little Rock VA Hospital.

The Brown Recluse is being seen in an increasing number of states, say the Arkansas investigators, and physicians should consider its bite a a cause when examining certain types of lesions. The spider has been reported in southern Colorado, Kansas, Missouri, southern Illinois, North and South Carolina, Georgia, Alabama, Mississippi, Arkansas, Louisiana, Texas, and Oklahoma.

It was only ten years ago that University of Missouri investigators discovered the poisonous qualities of the brown recluse. Until then, the black widow (Latrodectus mactans) was believed to be the only North American spider capable of inflicting serious injury on man. So little is known about spider venom that it's impossible to estimate what might constitute a regularly fatal dose, Dr. Morgan said. It is known that the female brown spider ejects approximately twice as much venom as the male. (Only the female black widow is venomous.)

Preliminary studies indicate that the venom can be chemically separated into toxic and nontoxic components. It may be possible to use the nontoxic fractions as a poison antidote, Dr. Morgan said.

HYPERCALCEMIA WITH SPECIAL REFERENCE TO HYPERPARATHYROIDISM

W. LESTER HENRY, Jr., MD.
Professor of Medicine and Head of Department of Medicine, Howard University College of Medicine, Washington, D.C.

The diagnosis of hypercalcemic states requires a knowledge of the symptoms produced by hypercalcemia and an accurate laboratory whose calcium values are reproducible. This latter point is important since an increase of as little as 0.1 mg. above the laboratory's established upper limit of normal is an indication for detailed study of the patient.

The symptoms of hypercalcemia fall into three main groups: gastrointestinal, neuromuscular and urinary.

The gastrointestinal symptoms may include anorexia, nausea, vomiting, hematemesis, constipation and indigestion. Neuromuscular symptoms include headache, irritability, apathy, ataxia, odd behavior, insomnia and coma. Urinary tract symptoms are polyuria, thirst, renal colic and hematuria (these last two symptoms being related to the passage of urinary tract stones). The most important physical finding in hypercalcemia is band keratopathy: a greyish white deposit on the lateral borders of the paralimbic areas of the cornea.

Hypercalcemia is not a disease, but a sign of disease and the states in which it is most commonly found in adult life are as follows: Boeck's Sarcoid, Vitamin D intoxication; milk-alkali syndrome; multiple myeloma; carcinoma metastatic to bone; carcinoma without bone metastases; and hyperparathyroidism. Addison's disease, hyperthyroidism and immobilization are additional, not very common, causes of hypercalcemia.

William Royal Slókes Memorial Fund Lectue. Delivered at the 169th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland. The Alcazar, Baltimore, April 20, 1967.

Boeck's sarcoid may present as an asymptomatic disease. In such cases, the chest x-ray may show bilateral hilar adenopathy or the appearance of miliary tuberculosis. However, the disease may be more fulminating and present as the uveoparotid syndrome. Arthritis, renal stone, or unexplained pancreatitis are other modes of appearance of sarcoidosis. The hypercalcemic patient with Boeck's Sarcoid is practically always symptomatic. The diagnosis can be suspected from the clinical picture and confirmed by the Kveim test, node biopsy, response of the hypercalcemia to cortisone, and the serum protein electrophoretic pattern.

Vitamin D intoxication in adults in the United States is usually the result of treatment of arthritis with large doses of Vitamin D or food fadism. The history is frequently diagnostic and the response to removal of Vitamin D from the patient's program will settle this problem. The hypercalcemia in these patients usually responds well to administration of cortisone.

The milk-alkali syndrome is more complicated. These patients have a history of peptic ulcer treated with absorbable alkali and large doses of milk. Most patients with ulcer disease are no longer treated with absorbable alkalis. However, any cause for alkalosis associated with ingestion

of large amounts of milk may be causative of the same syndrome. Abstention from milk and absorbable alkali will cure this syndrome, but some of these patients actually have hyperparathyroidism and eventually require operation for cure.

Multiple myeloma is characteristically a disease of middle or late life characterized by anemia, bone pain, pathologic fractures, azotemia, proteinuria, and hypercalcemia. The diagnosis is easily confirmed by the characteristic bone marrow picture, electrophoresis of serum and urine, presence of Bence-Jones protein, and x-rays of the skeleton. In this disease there are numerous punched-out areas in the skull, pelvis, ribs and long bones. The absence of reaction around these punched-out areas is typical. Sometimes, however, the bones show only coarsening of the trabecular pattern and loss of density, a picture which is too non-specific to aid in diagnosis.

The patient with carcinoma metastatic to bone is not usually a diagnostic problem, inasmuch as, the carcinoma is usually evident or readily detectable. Such lesions may superficially resemble the bone lesions of multiple myeloma but usually present reaction around the areas of metastasis and often completely destroy portions of bone rather than creating punched-out defects.

One of the most difficult problems centers around the hypercalcemic patient who has carcinoma without bone metastases. These patients are in most instances secreting a parathormone-like substance which produced a syndrome identical with primary hyperparathyroidism. The underlying carcinoma is most frequently bronchogenic carcinoma, but may be renal, pancreatic, ovarian, or uterine.[1] The unpleasant part about this group of diseases is that the carcinoma may be occult and detectable for a long time despite the production of the hypercalcemic syndrome. This situation will be most commonly confused with true hyperparathyroidism and should be suspected when the patient in question is a middle-aged male smoker, inasmuch as, most of the patients with primary hyperparathyroidism are females.

At this point, we should consider the patient with primary hyperparathyroidism. These patients do not have a typical mode of presentation through any of the symptoms previously noted for hypercalcemia may be found. It should be noted, however, that 70% of patients diagnosed in the United States as having hyperparathyroidism, have urinary tract complaints. In addition, one should screen carefully all patients with peptic ulcer and pancreatitis since the patient with primary hyperparathyroidism has an increased incidence of these diseases.[2-3] Band keratopathy and a nodule in the neck are important physical findings if present, but are lacking more often than not.

When the serum calcium is obtained, simultaneously the serum phosphorus, serum protein, alkaline phosphatase and *BUN* are measured. If the serum calcium is elevated all measurements are repeated twice. The patient is then placed on a diet containing 150 mg. calcium. After three days of this diet, a 24 hour urine calcium is obtained. In most instances, the hyperparathyroid excretes 200 mg. or more of calcium on this diet. At this time a 350 mg. phosphorus diet (phosphorus deprivation test) is instituted for three days and serum calcium, phosphorus and protein measured daily. In the hyperparathyroid, this test usually accentuates the electrolyte abnormalities so that the calcium becomes definitely elevated and the phosphorus definitely lowered by the end of the test.

At this stage we usually determine the tubular reabsorption of phosphorus *(TRP)*. We are aware that the test is mis-named, in that active secretion of phosphorus occurs in the renal tubule so that the phosphorus appearing in the urine is the result of glomerular filtration of phosphorus minus the reabsorbed phosphorus plus the secreted phosphorus. We are also aware that creatinine clearance is not a good measure of glomerular filtration in the face of changing urine flows. The *TRP* is a poor test in the patient with renal damage since glomerular filtration rates below 50 ml/min. are associated with low *TRP's* irrespective of the parathyroid status. Despite these limitations, the *TRP* is useful. In our hands this involves two successive twenty minute clearances of phosphorus and creatinine (usually at 8:00 am). The normal value is 87 ± 5. In the hyperparathyroid patient, this figure is decreased.

If the serum calcium is less than 12 mg. we next test the autonomy of the parathyroid glands by evaluating the effect of a calcium load on the *TRP*. It is agreed that the secretion of parathormone is normally inhibited by hypercalcemia and stimulated by hypocalcemia. Normally then, the effect of hypercalcemia would be to shut off

parathormone secretion. However, if parathormone is being secreted by an adenoma, an autonomous structure, as it is in 90% of cases of hyperparathyroidism, increasing hypercalcemia would fail to halt secretion of parathormone. In this test, the patient's tubular reabsorption of phosphorus is measured on one morning, then that evening from 9:00 p.m. until 12:00 midnight, an infusion of 15 mg. of calcium/kg. body weight is given, and the next morning the tubular reabsorption of phosphorus is measured again. If there is no change, we assume the underlying lesion is an adenoma, and this has proved to be the case in our hands.

Cortisone suppression tests are most useful in cases of Boeck's sarcoid or hypervitaminosis D. Cortisone rarely suppresses hypercalcemia in hyperparathyroidism and only irregularly in multiple myeloma and metastatic cancer. It is contraindicated in the milk-alkali syndrome. Cortisone is administered for four days in a dose of 300 mg./day, and its effect on the serum calcium noted. Despite its frequent failure to aid in diagnosis, we usually run this test in the suspected hyperparathyroid patient unless ulcer disease is known or suspected to be present.

The administration of parathormone to a patient already secreting parathormone in large amounts should produce no significant change. This is the basis for the test designed by Kenneth Becker, MD. In this test, one measures the effect of an infusion of parathormone on the tubular reabsorption of phosphorus. As originally described by Becker,[4] the twelve hour tubular reabsorption of phosphorus was measured and compared with a twelve hour tubular reabsorption of phosphorus obtained during a twelve hour infusion of parathormone. This test has been modified by Gershberg[5] to measure the one hour response of tubular reabsorption of phosphorus after the I. V. injection of 200 mg. of parathyroid extract. Normal patients decrease their *TRP* 14% by this procedure; most hyperparathyroid patients do not.

Dr. Becker states that in patients with tumors causing hypercalcemia without osseous metastases administration of parathyroid extract fails to influence the *TRP*, suggesting that these tumors are secreting a parathormone-like substance.[6]

In recent months, there has been increasing interest in the role of glucagon in calcium metabolism. In pancreatitis, it is possible that in at least some cases the hypocalcemia is related to release of glucagon.[7] In measuring the response of a variety of diseases to the hypocalcemic effect of glucagon, it is reported that patients with primary hyperparathyroidism are unusually sensitive to glucagon.[8] This may become the basis of an additional test for hyperparathyroidism in the future.

As radio-calcium and radiostrontium turnover studies become more available, they will add an additional parameter, since bone turnover in hyperparathyroidism is invariably increased.

Likewise, when immuno-assay of parathormone is perfected further, it will be a marvelous tool for clarification of parathyroid disease. However, parathormone is a relatively poor antigen and a reproducible simple assay is not yet available.[9]

The x-ray is extremely helpful in all patients suspected of hyperparathyroidism. Most of the changes are not pathognomonic, but taken in a group they are extremely useful. These patients may show coarsening of trabecular pattern and generalized increased radiolucency of bone, but more specific are sub-periosteal resorption of bone, disappearance of the lamina dura, increased radiolucency of the distal ends of the clavicles, bone cysts, ground glass appearance of the skull and loss of definition of the inner table of the skull.

Nephrocalcinosis and renal stones are readily demonstrated by x-ray. The oesophagram has revealed an adenoma in one instance in my experience.

It should be emphasized that the entire routine is not followed in every case. The x-ray studies, though discussed last, are done quite early in the study of patients with suspected hyperparathyroidism and may settle the diagnosis before the other listed studies are done.

The diagnosis of primary hyperparathyroidism is time consuming and often difficult. The reward lies in the opportunity to cure a disabling and sometimes lethal disease.

Put your practice on a FULL CASH BASIS

with Consolidated Services centralized billing and collection

Solve your billing and collection problems once and for all and put your practice on an immediate cash basis. Sound too good to be true? Call Consolidated Medical and Dental Services, owned and operated by doctors and business men who know your problems and offer a simple, inexpensive solution. Centralized billing and collection through Consolidated Services will save you time, worry, and financial losses.

HERE'S ALL YOU DO . . .

- Touch-tone card dialer transmits service and fee data quickly, easily
- Consolidated handles all billing and collection
- Physician receives payment in full within one week
- Moderate service charge

Realize BIG benefits . . .

Transmit billing information in seconds—and save hours of secretarial and bookkeeping time, save stationery and postage, and eliminate all overdue accounts.

at small cost

Consolidated furnishes the card-dialing equipment and supplies. Your only cost is a modest discount on remittances. Optional 90-day, 6-month and 12-month payment plans available to your patients.

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Senator Tydings Supports Comprehensive Alcoholism Programs

In Maryland, during the 18-month period extending from Jan. 1, 1964 through July 1, 1965, 12,785 individuals were convicted of public intoxication, and 3,533 of these people had more than one conviction for this so-called offense within a 12-month period during that time. Think of the incredible waste of our police force, and the degrading effect upon the judges who must daily pretend to dispense justice to these unfortunate individuals. I am informed that the Baltimore Sun papers have reported some 27 deaths of persons arrested for drunkenness, while waiting for a court hearing, in the past five years alone. It is incredible that a civilized society could perpetuate as barbaric a custom as this one.

What of the rehabilitative treatment available for derelict inebriates in Maryland? A recent report of the Department of Mental Hygiene tells the whole story:

"The State hospitals have no treatment program for habitual drunkenness offenders, although the State Department of Mental Health has proposed, and requested financing for, a rehabilitation facility for long-term re-education of these individuals." *

(The above statement is excerpted from a paper presented by Maryland's junior U. S. Senator, Joseph D. Tydings, at the annual meeting of the Washington Council on Alcoholism May 23, 1967. The whole address was published in the Congressional Record for the same day.)

The new facilities which are available for intensive treatment are overcrowded and understaffed. Although State department mental health officials are aware of the need to develop new facilities, no funds have been appropriated for this purpose. Thus, it is clear that the State of Maryland, and indeed the rest of the country, has hardly begun to face up to the problems in this area.

I was startled to read in a newspaper several months ago that judges in Rockville, Maryland, had issued a report stating that although the "Easter" decision is not applicable to them, the problem of the chronic inebriate offender should be studied and dealt with because, at some time in the near future, the Maryland courts might also adopt this approach. These judges either did not understand, or were totally unaware of, or simply were refusing to apply, the "Joe Driver" decision handed down by the Fourth Circuit Court of Appeals in January, 1966. In that case, the court held that the eighth amendment to the United States Constitution prohibits conviction of a chronic alcoholic for public intoxication.

I cannot overemphasize the fact that the Driver decision, which adopts the identical rule as the Easter decision, is binding upon every judge in every court in the State of Maryland today. The Maryland judiciary is therefore obligated, just

like the District of Columbia judiciary, to inquire into the possible applicability of the defense of alcoholism for every inebriate who appears before the courts. Thus, my own State is facing the same problem that the District of Columbia has been facing for the past year.

The U.S. Crime Commission, like the D.C. Crime Commission, has pointed the way out of this archaic use of the criminal law to punish inebriates.

Our communities in Maryland and throughout the country undoubtedly have not had sufficient time to react to it, and to begin to make new plans. They must be given the incentive to do so.

I have co-sponsored with 35 other Senators the Javits-Moss bill, S. 1508, which would provide Federal incentives to assist the States in meeting their responsibilities in this area. As the U.S. Crime Commission has recognized, the Federal Government has a large stake in assisting States in removing the problem of public intoxication from the criminal system and handling it through public health, welfare and rehabilitation procedures.

The bill that has been introduced can, I am certain, be strengthened. I would like to suggest four points which I believe should appear in any final legislation.

First, S. 1508 presently contemplates that detoxification facilities would be provided through law enforcement agencies. It is now evident that the entire problem of public intoxication should be handled outside the sphere of law enforcement, and S. 1508 should therefore be revised in that respect.

Second, it is clear that the problem of public intoxication can be removed from the criminal system only through the coordinated efforts of all interested public and private agencies and institutions. The requirement for a broad community-wide plan for the control of intoxication and alcoholism, to be coordinated with other comprehensive health planning already provided for in Federal legislation, should be included in S. 1508.

Third, it is apparent that the problem of alcoholism has been sadly neglected by the Federal Government for the last twenty years during which significant health and welfare legislation has been enacted covering other serious problems. S. 1508 should include a congressional mandate that all other Federal legislation in the field of health, welfare, and rehabilitation must be utilized in the fight against alcoholism, and the specific statutes pertinent to this problem should be listed.

Fourth, as I have already noted, it is shocking to learn that the problem of alcoholism among Federal employees is handled by firing them, not rehabilitating them. S. 1508 should contain a specific statement of Federal policy abolishing this inhumane practice.

Finally, the Federal efforts in the area of alcoholism are presently split up among a number of departments and agencies. Provision should be made in S. 1508 for an intra-governmental committee that will coordinate these efforts, reduce duplication of work and insure a more efficient and effective treatment program.

The problems that I have discussed today are just really beginning to appear around the country. Courts in other States are beginning to study these problems, and soon will force local communities throughout the country to change their ways if these changes do not come voluntarily. The Federal Government must make certain that our local communities have the resources to meet these problems, and to resolve them, before they overwhelm us.

New view of an oral contraceptive at work

Although suppression of ovulation remains the primary mode of action of oral contraceptives, newer knowledge indicates that products like Norinyl-1—a combination of both low-dosage progestogen and estrogen for the full treatment cycle—may provide multiple action that helps explain their unexcelled record of contraceptive effectiveness. This report explores the possible secondary protective mechanisms offered by combined hormonal administration.

Accumulating evidence has indicated that sparse, highly viscous cervical mucus has a possible adverse effect on the motility and survival of spermatozoa.

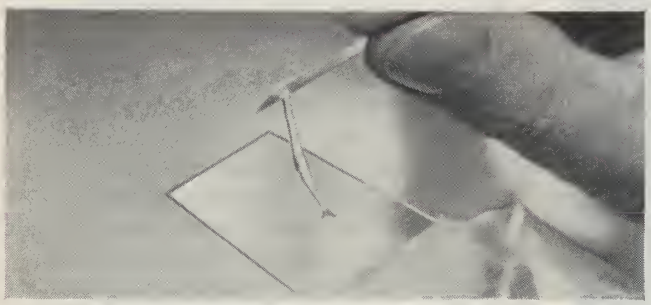
The estrogen-opposing progestational ingredient of Norinyl-1 (norethindrone 1 mg. with mestranol 0.05 mg.) changes the usual mid-cycle picture of a thin, watery cervical mucus. The result—a built-in barrier that appears to inhibit sperm from reaching the ovum should one be released. The inset in the adjoining photograph shows immobile spermatozoa as they appear in cervical mucus taken from a patient treated with Norinyl-1.

See last page for contraindications, precautions, side effects and dosage.

How the estrogen-opposing action of Norinyl-1 creates cervical mucus that may be hostile to sperm penetration

Normally, estrogen activity during the fertile midcycle stimulates the production of a profuse and watery cervical mucus that permits maximum sperm motility and promotes penetration.

But what happens when Norinyl-1 is administered? Its potent progestogen, norethindrone, opposes estrogen stimulation of cervical mucus. Consequently, the amount of mucus decreases and its viscosity increases. This results in a sparse but thick mucus barrier that appears to diminish the vitality of the sperm and to impair its powers of penetration.

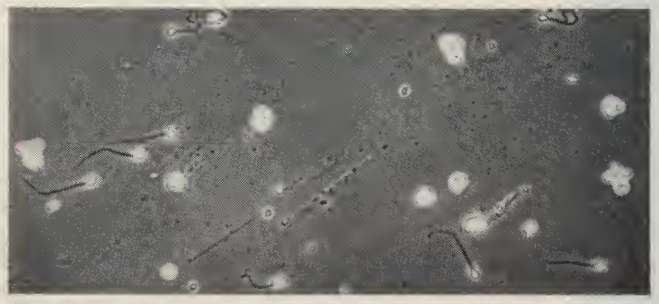


The role of viscous cervical mucus as a secondary action of Norinyl-1

In a report on 89 patients taking this medication,* cervical mucus obtained from cycle day 5 to cycle day 29 appeared scant and thick and exhibited little or no Spinnbarkeit.

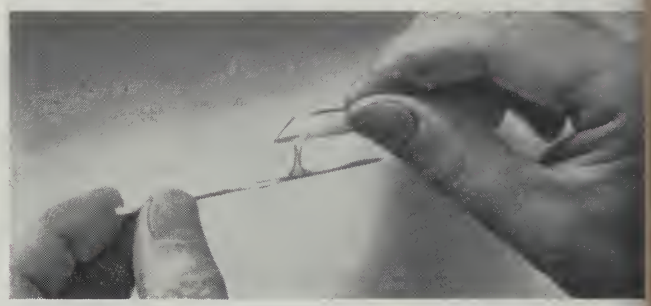
In the opinion of this investigator, the effect on cervical mucus may be sufficient to prevent conception.

*Cohen, M. R.: Symposium: Mechanisms of Action of Low Dosage Oral Contraceptive, Yale University Medical Center, New Haven, Conn., April 6, 1967.

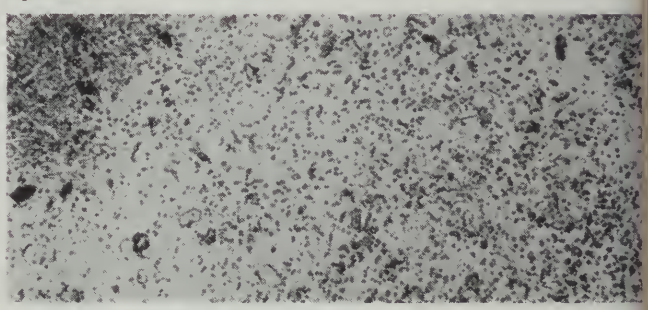


Normal cervical mucus at midcycle in untreated patient is known to permit sperm motility... promote sperm penetration.

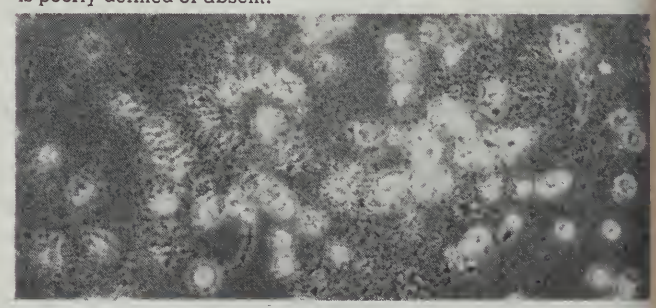
Cervical mucus is thin and watery with a stretchability (Spinnbarkeit) of 15 to 20 cm.



Thin, watery mucus crystallizes into this well-defined, fernlike pattern within a minute.



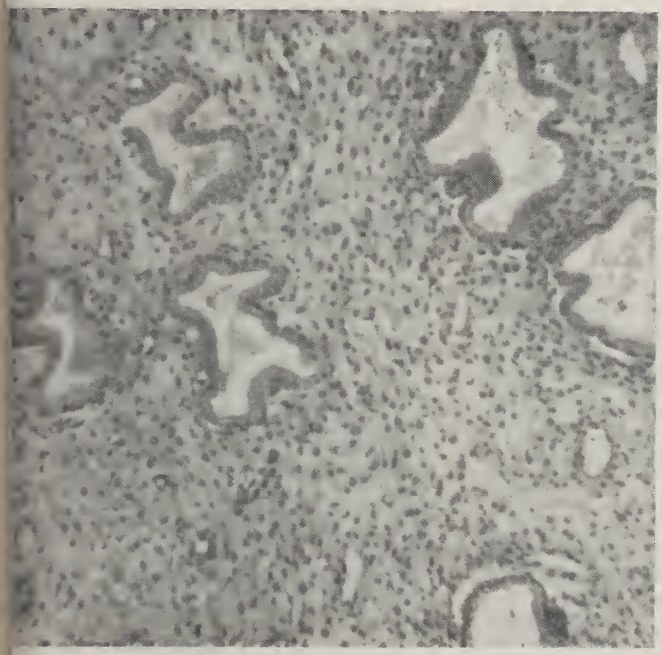
Spermatozoa appear healthy, are active and freemoving.



Viscous cervical mucus at midcycle produced by Norinyl-1 appears to impair sperm vitality... inhibit penetration.

Cervical mucus is scanty, thick and viscous. Spinnbarkeit is 1 cm. or less.

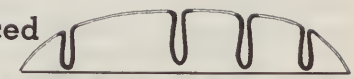
In thick, viscous cervical mucus the fern pattern is poorly defined or absent.



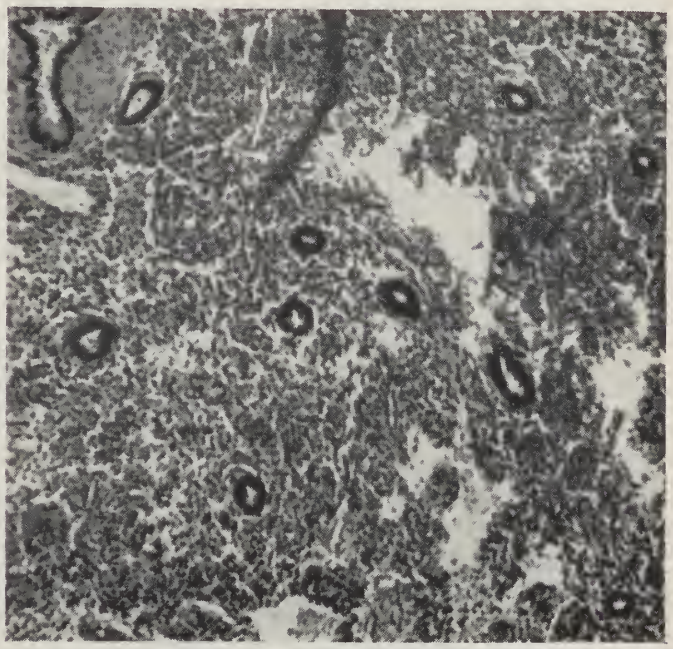
Immobile spermatozoa as they appear in cervical mucus taken from a patient treated with Norinyl-1.

How Norinyl-1 alters normal endometrial responses—another possible protective mechanism

Let us suppose that an ovum is released—as occurs in an occasional, rare case—and somehow a sperm succeeds in penetrating the cervical mucus barrier. Should this come about, one additional action of Norinyl-1 may protect the patient from unwanted pregnancy. The theory is that progestogen intake makes endometrial tissue unreceptive to implantation.



Endometrium of untreated patient



Normally, the endometrium progresses through a proliferative phase stimulated by estrogen and a secretory phase stimulated by progesterone. During the secretory phase the endometrium is receptive to the fertilized ovum.

Endometrium produced by Norinyl-1

When Norinyl-1 is administered its progestogen component—norethindrone—accelerates the secretory phase and suppresses glandular and vascular development.

See last page for contraindications, precautions, side effects and dosage.

new Norinyl-1® tablets

for multiple contraceptive action

effective fertility control on half the previous dosage

maintains ratio of the established norethindrone/mestranol combination

lower cost

new Norinyl-1®

(norethindrone 1mg. c̄ mestranol 0.05mg.) **tablets**

Reduction of oral contraceptive dosage to lowest effective levels has become a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now available in a new strength in which *both* norethindrone and mestranol are reduced 50 percent. Studies show that Norinyl-1 achieves fertility control with only 1.05 mg. of combined progestogen and estrogen per tablet.

Norethindrone was first reported for use as a progestational agent in human beings in 1955. Norethindrone 2 mg. with mestranol 0.1 mg., as an oral contraceptive, is currently in use by over 2,000,000 women. Clinical experience now establishes that Norinyl-1 also amply meets the criteria of reliability and safety.*

*Symposium on Low-Dosage Oral Contraception, Palo Alto, Calif., July 15, 1965.

PRESCRIBING INFORMATION

Contraindications: 1. Patients with thrombophlebitis or with a history of thrombophlebitis or pulmonary embolism. 2. Liver dysfunction or disease. 3. Patients with known or suspected carcinoma of the breast or genital organs. 4. Undiagnosed vaginal bleeding.

Warnings: 1. Discontinue medication pending examination if there is sudden partial or complete loss of vision or if there is a sudden onset of proptosis, diplopia, or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. 2. Since the safety of Norinyl-1 in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. 3. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this dose to the infant has not been determined.

Precautions: 1. The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. 2. Endocrine and possibly liver function tests may be affected by treatment with Norinyl-1. Therefore, if such tests are abnormal in a patient taking Norinyl-1, it is recommended that they be repeated after the drug has been withdrawn for 2 months. 3. Under the influence of estrogen-progestogen preparations, preexisting uterine fibroids may increase in size. 4. Because these agents may cause some degree of fluid retention, conditions that may be influenced by this factor, such as epilepsy, migraine, asthma, cardiac, or renal dysfunction, require careful observation. 5. Although a cause and effect relationship has not been established, Norinyl-1 should be used with caution in patients with a history of cerebrovascular accident. 6. In relation to breakthrough bleeding, as in all cases of irregular bleeding *per vaginam*, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. 7. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. 8. Any possible influence of prolonged Norinyl-1 therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. 9. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Norinyl-1 therapy. 10. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. A cause and effect relationship has not been demonstrated. 11. Because of the effects of estrogens on epiphyseal closure, Norinyl-1 should be used judiciously in young patients in whom bone growth is not complete. 12. The age of the patient constitutes no absolute limiting factor, although treatment with Norinyl-1 may mask the onset of the climacteric. 13. The pathologist should be advised of Norinyl-1 therapy when relevant specimens are submitted.

Side Effects: The following adverse reactions have been observed with varying incidence in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms, breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma, breast changes (tenderness, enlargement and secretion), loss of scalp hair, change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately postpartum, cholestatic jaundice, erythema multiforme, erythema nodosum, hemorrhagic eruption, migraine, rash (allergic), itching, rise in blood pressure in susceptible individuals, mental depression.

The following occurrences have been observed in users of oral contraceptives. A cause and effect relationship has not been established: thrombophlebitis, pulmonary embolism, neurooocular lesions.

The following laboratory results may be altered by the use of oral contraceptives: increased bromsulphalein retention and other hepatic function tests, coagulation tests (increase in prothrombin, factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metapyrone test, pregnanediol determination.

Other side effects reported to have occurred in association with use of this drug are dizziness, hirsutism, pains in legs, back, chest and abdomen, dysuria, drowsiness, vaginal discharge, libido increased and decreased, eruptions, hypermenorrhea, hypomenorrhea, increased appetite, G.U. infections, varicose veins, abdominal fullness, acne, headache, nervousness, allergies, blurred vision, pain in eyes, and itching in eyes. *For complete clinical data, see package insert.*

Dosage and Administration: 1. One tablet of Norinyl-1 is administered orally for 20 days beginning on day 5 of the menstrual cycle. (Count day 1 of the cycle as the first day of menstrual bleeding.) Repeat this dosage schedule for each cycle. 2. If no menstrual period occurs after a cycle of treatment (20 tablets) in which patient adhered to the schedule, the patient must be instructed to resume taking the Norinyl-1 tablets 7 days after the previous 20 day course was completed. For example, if the last pill of a previous cycle had been taken on a Sunday, then a new cycle of treatment should begin on the following Sunday. 3. In the postpartum woman, it is recommended that the first cycle of treatment should begin on day 5 of the first menstrual cycle. However, Norinyl-1 should not be administered during lactation.

Availability: Norinyl-1 (norethindrone 1 mg with mestranol 0.05 mg.)—Dispensers of 20 and 60 and bottles of 250 tablets.

SYNTEX LABORATORIES INC., PALO ALTO, CALIF.

The Maryland Academy of General Practice

The Inevitable Cry

G. OVERTON HIMMELWRIGHT, MD
Past-President, Maryland Academy of General Practice

Go into any church, Beauty Shop or PTA, and what conversation does one hear the most? It is the *cry,* "I can't get a doctor." This *cry* is directed more to the family physician and general practitioner than any other physician. It is now felt in the specialist's office as well. The patient is saying, "I want a doctor that will accept me as a total patient, see me for first contact, and then give me comprehensive and continuing health care."

One only has to go a short time back into history to realize why this *cry* is so great today. In 1931, no less than 84% of U.S. Physicians called themselves General Practitioners, today this number has shrunk to between 35% to 38%. Approximately only 16% to 18% of this year's medical graduates expect to go into general practice. Yes, the General Practice has lost it's image to the fast growing number of specialists; however, the specialist is fast losing his image to the general public as they can't quite understand when they need a *doctor,* a large proportion of the specialists are unable to care for them. For example the following chart will show the breakdown of number and types of physicians in my home county, Allegany: This might be broken down even further as to the physician ratio to population as to specialist, part-time specialist, and the non-specialist, to give you some idea as to why in Allegany County one keeps hearing this continuous *cry.* This is not unique only for Allegany County, it is found in most counties in Maryland as well as all over the U.S. To quote from the Baltimore City Health Department's 1964 statement of Problem and Background data on the Overloading of Outpatient Facilities of hospitals in Baltimore City, "the figures show that in 14 years the number of doctors per 100,000 population in Maryland has presented an about-face in type of practice. In 1949, there were 97 doctors per 100,000 population. Of these, 56 were in general practice and part-time specialization, 41 were in full time specialization. In 1963, there were 87 doctors for 100,000 population figure; but 31 were in general practice and 56 were specialists, which represents a state-wide as well as a national trend."

Of course, we do know that this is not a true comparison. More non-specialists see patients for

TOTAL PHYSICIANS VS. SPECIALTY OR PART SPECIALTY VS. NON-SPECIALTY

Date	Total Physicians Allegany County	Specialty or Part Specialty	Non-Specialty
1940	69	39	30
1966	73	63	10

PHYSICIAN RATIO TO POPULATION IN ALLEGANY COUNTY

Date	Total Population	Specialists and Part-time Specialists	Non-Specialists
1940	86,973	1:2230	1:2899
1966	84,169	1:1336	1:8416

the first contact, and give them comprehensive and continued care. But, by statistics, this is a true figure, just as much as we need 150 physicians born by 1975 to take care of a total population of 100,000 people. Somewhere, and somehow, medical education will have to be geared for the production of physicians who will have first contact with patients, giving them comprehensive and total health care.

With our ever more complex American Society, the increasing demands of the public for more and better medical personnel and facilities, medicine must act now to fill the gap. If not, Government will assume the responsibility for doing so.

It is hoped that organized medicine has "rushed to the scene of the emergency in time to save the patient."

Proposals for educating the physician of the future are detailed in the AMA's *Council on Medical Education.* Reports of (a) *Citizens Commission on Graduate Medical Education*—the *Millis Report;* and (b) the *Ad Hoc Committee on Education for Family Practice* as well as the *Core Content of Family Medicine* prepared by the AAGP *Committee on Requirements for Certification.*

Our own State also has been interested. As a result of the passage of Senate Joint Resolution No. 9, introduced by Senator Harry Hughes in the 1964 session of the Maryland Legislature, a Commission was appointed by former Governor Millard J. Tawes "to study and report on the acute problem resulting from a shortage throughout many parts of Maryland of general practitioners in medicine." This Commission reported its findings and recommendation to the Governor and to the Legislators in the 1965 Session of the General Assembly.

Although the *Ad Hoc Committee* and the *Citizens Commission* necessarily overlap in some areas, many recommendations of the two bodies are consistent and reinforcing.

The *Ad Hoc Committee* was also aware of the patient's *cry,* in that the report states, ". . . the American public needs and wants a large number of well-qualified family physicians to provide comprehensive personal health care. These physicians should be specialists prepared through new types of educational programs to meet the medical care needs of the future. As specialists, they should be entitled to appropriate specialty board certification."

The AAGP's *Core Content of Family Medicine* concludes, as does the Millis Report, that the *family physician* or *primary physician* should be proficient in preventive medicine, as clinical medicine, such as psychiatry, pediatrics, office gynecology and internal medicine. He should also be proficient in rehabilitation, studies of family and community, the use of community resources and allied para medical personnel, practice management, and practice evaluation.

"But more importantly, as stated in Senator Hughes' Resolution and again in the *Governor's Report,* 'capable and well-trained general practitioners in adequate numbers are an essential ingredient in our system of medical care, the importance of their role in American medicine having been decreed by our social system in which the family is basic and in the common concept of preventive medicine in which comprehensiveness is the objective. . .' It is, in short, just plain good medicine to do everything possible to preserve general practice for if general practice dies, it is the public as well as the medical profession who will be the losers.

MANAGEMENT IN THE COMPLETED STROKE

B. STANLEY COHEN, MD
Dept. of Rehabilitation Medicine
Sinai Hospital of Baltimore

Proper management of the patient with the *completed* stroke requires early and aggressive measures. The acute medical management includes careful attention to the problems of ventilation, blood pressure and cardiovascular status, feeding and urinary tract drainage. In the unconscious and confused patient, airway maintenance, intravenous feeding, and avoidance of bladder distention with catheterization are often necessary during the early hours. Frequent turning is required to prevent decubiti and respiratory problems.

Concurrent with attention to life threatening problems, planning for long term management should begin. In more than 75% of patients with stroke, the basic process is infarction, rather than hemorrhage, and in most of these, active rehabilitation measures can be instituted within 48 to 72 hours. Proper bed positioning and passive range of motion prevent troublesome and disabling contractures. Pillows, sandbags, towel rolls, and foot boards may be employed. The physical therapist, nurse, family, and the patient himself may perform passive movement of the extremities through full range at least twice each day. Spasticity may develop early and in the absence of such treatment, tightness develops within days. Morbidity incident to handling should be prevented. Prolonged positioning on the involved side may produce peripheral neuropathies, and traction on the paretic arm, in moving the patient, may result in shoulder subluxation or brachial plexus stretch.

Deconditioning should be avoided. Exercises for maintenance of strength on the uninvolved side are begun and the patient is taught to turn himself in bed. Such a simple measure as a knotted rope attached to the foot of the bed enables turning and sitting. As soon as the vital signs are stable, and often by 48 hours, preparation for ambulation should begin. Sitting balance and tolerance are established and the patient is taught to participate in transfer activities. It is not sufficient for nursing personnel to lift the patient from his bed and secure him in a wheelchair. Hip and knee flexion contractures develop even more easily following prolonged sitting than at bed rest. A bedside commode requires less energy expenditure than the use of a bedpan. With sitting and standing, voluntary voiding is usually accomplished. External collection apparatus may be used where needed. Prolonged catheterization is

THE Regent

Nursing & Rehabilitative Treatment Center

Offering full treatment to the adult physically handicapped, specialized care to the senior citizen, and convalescent care to post-stroke and post-operative cases. Separate area for cancer patients. *All facilities available to private physician.*

Professionally staffed and equipped Physical Therapy gymnasium, under the direct supervision of a specialist in physical medicine. There is also an organized program of recreation.

Everything at The Regent is designed to be used by wheel chair patients.

Adjacent to the Penn-Mar Shopping Center on Marlboro Pike Beltway Exit 34

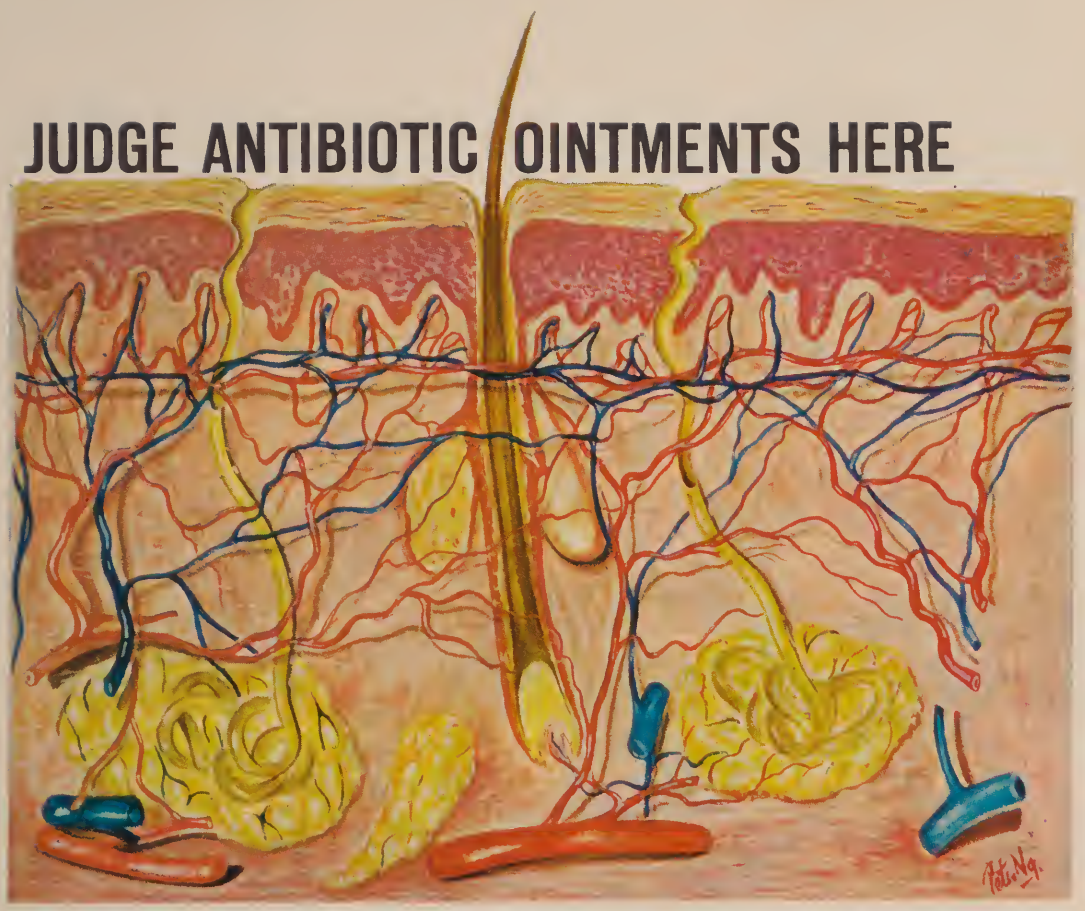
8100 Marlboro Pike, Forestville, Maryland

usually unnecessary and results in infection and a spastic contracted bladder with low capacity.

The average patient who can lift the heel of the involved lower extremity about three to six inches from the mattress, while lying on his back, is ready to begin standing. He may begin in the parallel bars and progress to walking with walker or cane, or to independent walking. Initially a temporary foot drop support and posterior splint for the knee may be required. The shoulder of a flaccid arm should be supported with a sling, and persistent foot drop requires a short leg brace. Gait training and the use of the brace reduce considerably the energy requirements of ambulation.



Where prompt return of upper extremity function does not occur, one-handed activities may be taught. Where necessary, change in dominance is accomplished.

When speech is affected, techniques for nonverbal communication may be employed early. As general motor improvement occurs, therapy by a speech clinician will be helpful.

Prognosis for rehabilitation depends, in part, on age, blood pressure, including the presence of hypertensive encephalopathy, visuospacial perceptual problems, and other complicating illness. In the elderly patient, lower extremity function may be expected to approach maximal in several months, and gait training beyond two to three months is usually not productive. Absence of significant upper extremity function, after one or two months, is a poor prognostic sign and usually calls for establishment of limited goals for the upper extremity.

Many of the rehabilitation procedures are best accomplished with the help of trained physical and occupational therapists, but where such personnel are unavailable, acceptable results can be obtained in many patients if the physician is rehabilitation conscious and is willing to assume an active management role. The most favorable outcome may be expected where the goals of treatment are not limited to physical restoration, but are concerned with maximum function of the individual, within his environment, despite residual disability.

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

POLYMYXIN B-BACITRACIN-NEOMYCIN OINTMENT

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

Why these 7 patients wit
moderate to severe anxiet
may respond better to Mellari

1. The agitated patient.
Anxiety—particularly that beyond t
range of minor tranquilizers—f
quently is expressed as gross mo
restlessness, fidgetiness and purpo
less movements, and may erupt i
aggressive behavior. Mellaril is
most a specific for those patie
whose anxiety follows such a patte

2. The psychosomatic patient.

family physician is rarely given diagnostic luxury of a classic, book "anxiety state." Most often ust probe for anxiety masked by nctional disorder—or which exac-tes a somatic problem. Double-d evaluations have demonstrated Mellaril can be a significant ad-t in the treatment of such patients.

3. The patient under ational stress.

aril helps the patient deal with ses of everyday life. Nonhabitu-g, it can be given for extended pe-s of time. It does not "separate" patient from practical problems pressures, does not induce eupho-a fuzziness which can compro-se the ability to cope with reali-es. Rather, it helps the patient move more competently in his daily world by eliminating use-less tension, by allowing him to conserve emotional resources and energies, and to direct them against the problems really worth worrying about.

4. The menopausal patient.

The woman who sees change of life as the end of useful life requires support from both family and family physician. Whether the psychological impact of menopause is directly related to hormonal changes, or merely coincidental, is debatable, but estrogenic therapy is frequently inadequate. Mellaril is a useful aid for these patients and, alone, or in combination with reduced estrogen dosage, will help ease the menopausal misery.

5. The previously hospitalized psychiatric patient.

Such a patient may still require the type of medication he has been accustomed to, but because he is no longer in a controlled setting the acceptable level of adverse reactions must be lower. In such circumstances Mellaril is perhaps the drug of choice.

6. The agitated geriatric.

Tranquilizer therapy in the elderly patient always involves special (or at least accentuated) problems: the possibility of drug-induced ataxia, hypotension or depression, for example, assumes an additional significance. These reactions have rarely been observed in geriatric patients treated with Mellaril.

7. The constantly returning patient.

The anxiety patient who has not responded to a minor tranquilizer is not very likely to benefit from your minor tranquilizer of second choice. A major tranquilizer, such as Mellaril, may be indicated in such patients.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.
Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.
Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.
Before prescribing, see package insert for full product information.

Bladder
Prostate gland

Destroys Trichomonads Wherever They Are

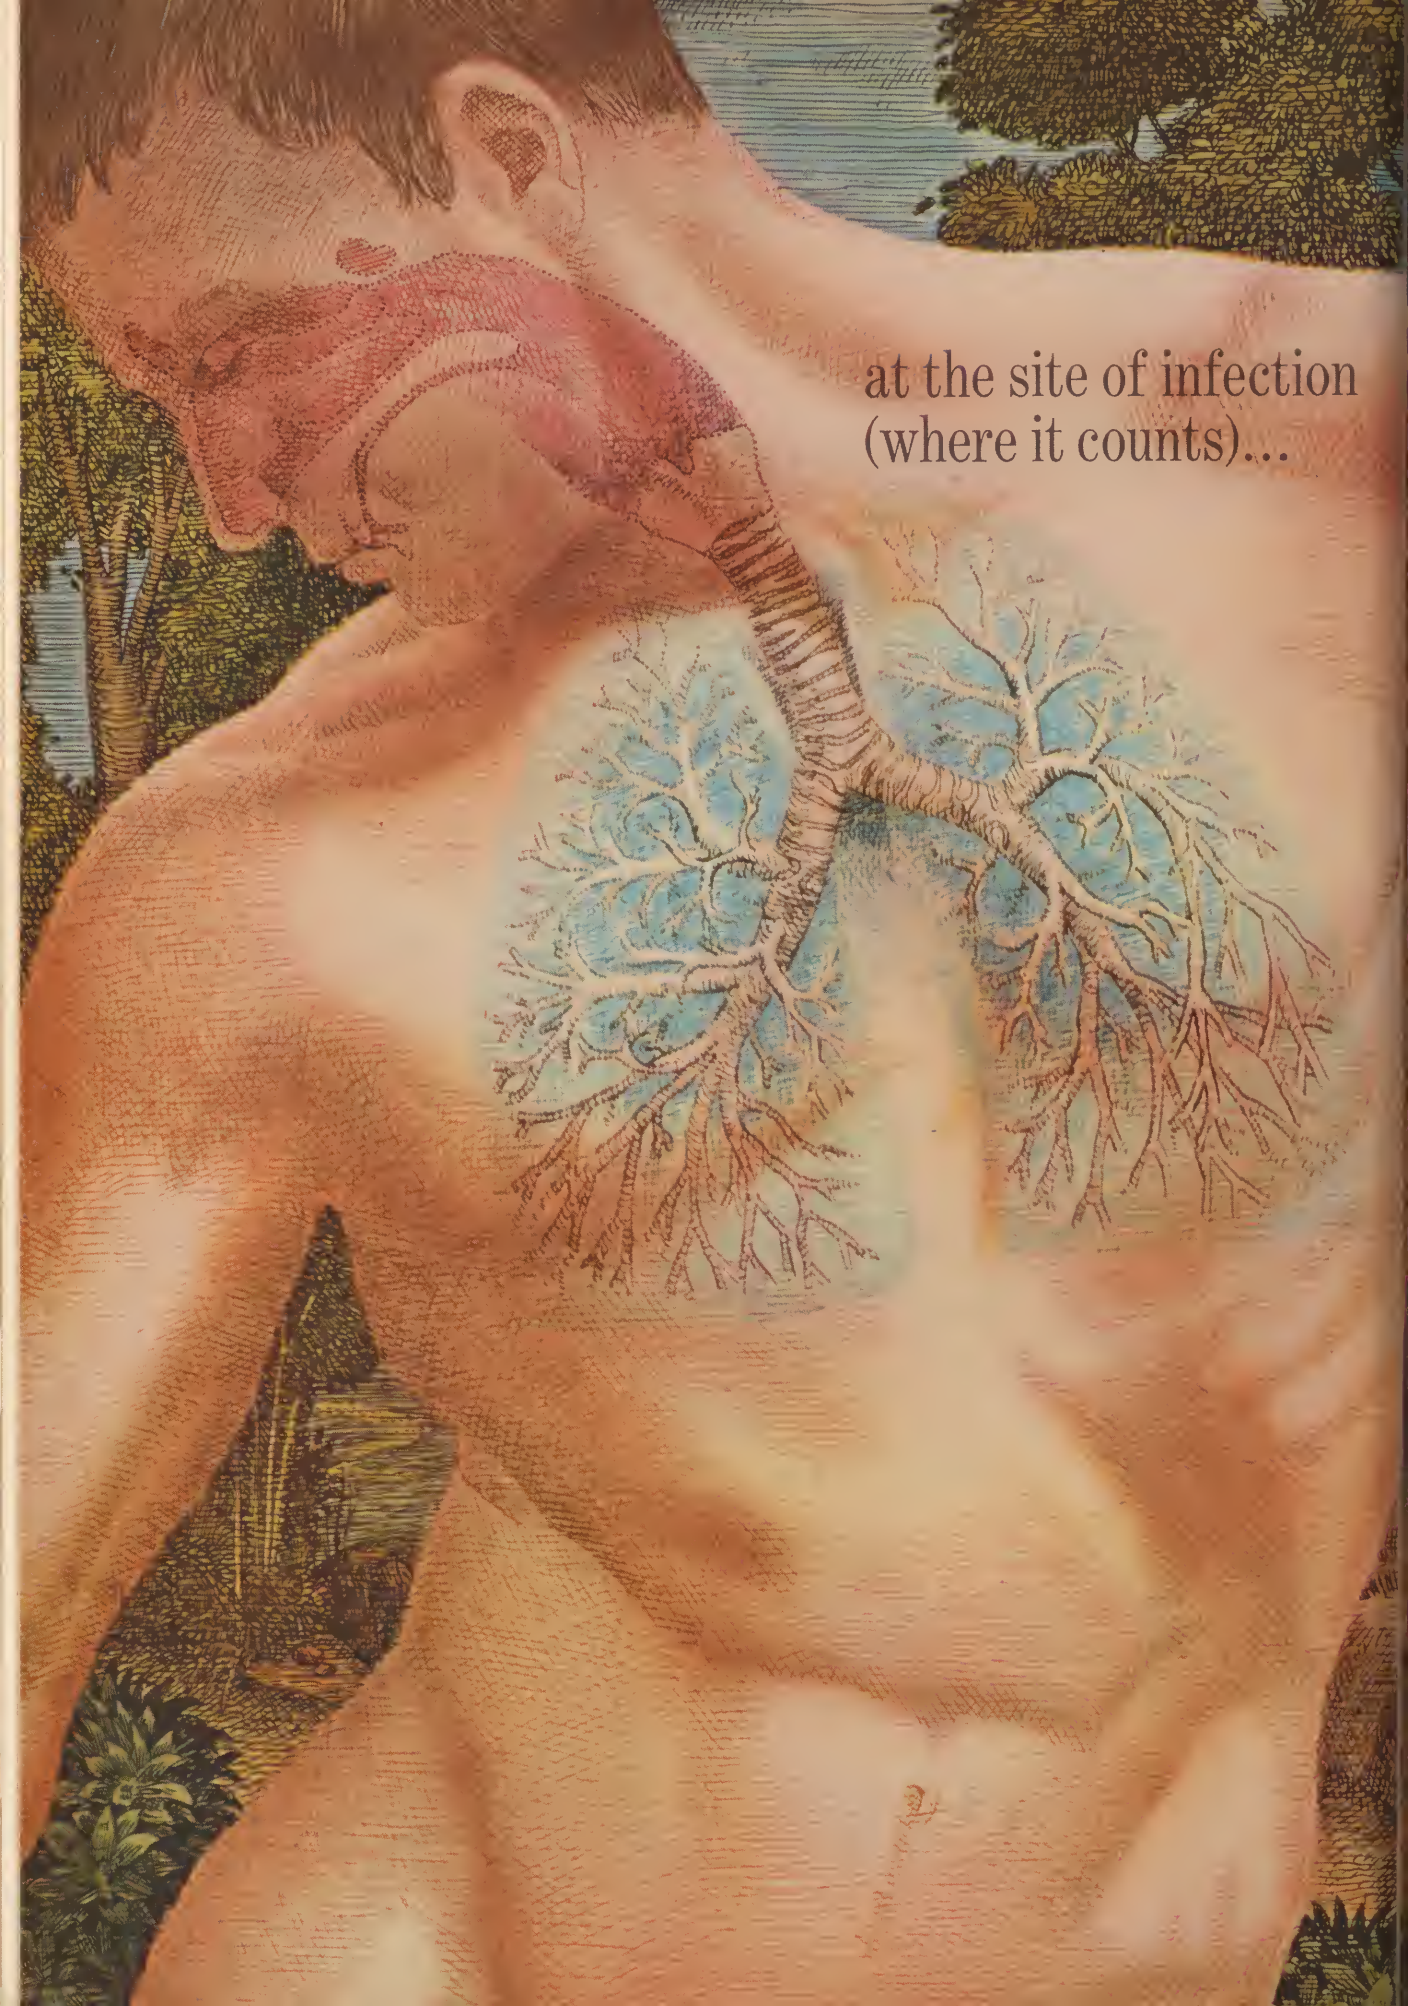
Flagyl seeks out the sites where trichomonads hide. Only a systemic agent can. Flagyl does, selectively and effectively.

Flagyl destroys trichomonads in the inner crypts, glands and cavities of the genitourinary tract in both women and men. Consequently, Flagyl is capable not only of curing trichomoniasis in women but also of preventing reinfection.

Correctly used, with due attention to repeat courses of treatment for resistant, deep-seated invasion and to the presumption of reinfection from male consorts, Flagyl has repeatedly produced up to 100 per cent cure in large series of patients.

When the diagnosis of trichomoniasis is positive, Flagyl is positive.

Dosage and Administration — In *women:* one 250-mg. oral tablet three times daily for ten days. A vaginal insert of 500 mg. is available for local therapy when desired. When used, one vaginal insert should be placed high in the vaginal vault each day for ten days; concurrently two oral tablets should be taken daily.



In *men* in whom trichomonads have been demonstrated: one 250-mg. oral tablet twice daily for ten days.

Contraindications — Pregnancy; disease of the central nervous system; evidence or history of blood dyscrasia.

Precaution—Complete blood cell counts should be made before, during and after therapy, especially if a second course is necessary.

Side Effects—Infrequent and minor side effects include nausea, metallic taste, furry tongue and headache. Other effects, all reported in an incidence of less than 1 per cent, are diarrhea, dizziness, vaginal dryness and burning, dry mouth, rash, urticaria, gastritis, drowsiness, insomnia, pruritus, sore tongue, darkened urine, anorexia, vomiting, epigastric distress, dysuria, depression, vertigo, incoordination, ataxia, abdominal cramping, constipation, stomatitis, numbness of an extremity, joint pains, confusion, irritability, weakness, flushing, cystitis, pelvic pressure, dyspareunia, fever, polyuria, incontinence, decreased libido, nasal congestion, proctitis and pyuria. Elimination of trichomonads may aggravate candidiasis.

SEARLE *Research in the Service of Medicine*

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

Now available:
New! Ready-mixed Ilosone Liquid 125! (Contains erythromycin estolate equivalent to 125 mg. erythromycin base per 5-cc. teaspoonful.)

700970

Ilosone® Lilly
Erythromycin Estolate

(See next page for prescribing information.)

Ilosone®/the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have also been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Adverse Reactions: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have developed in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly, usually within forty-eight hours, if the drug is readministered to sensitive patients. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared t be definitely related to use of the drug, laboratory findings wer characterized by increased direct-reacting bilirubin, elevate alkaline phosphatase levels, negative or weakly positive cephali flocculation and thymol turbidity tests, elevated serum glutam oxalacetic transaminase levels, peripheral eosinophilia, and no mal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has n been reported in other patients taking prolonged courses of t medication. Patients with chronic infection have been given 1 to 2 Gm. of the drug daily for periods of two to six months, ar patients with rheumatic fever have taken prophylactic doses 0.5 Gm. daily for two years without difficulty. In one group 144 patients who received the drug daily for two years, no jau dice was noted. It was of interest that members of six of the patients' families, who were not taking the drug, had episod of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels we determined in a group of fifty-four adults and children who to 250 mg. of Ilosone daily for an average of sixteen months rheumatic fever prophylaxis. The results were compared wi those of a similar group of forty-four patients who received pe icillin. There were no cases of jaundice in either group. Elevati of SGPT and serum alkaline phosphatase levels during the cour of treatment was observed in one patient treated with Iloso and in two patients treated with penicillin. Seven other patie in the group receiving Ilosone and four others in the penicill group showed elevations in one of the tests at some time duri administration of the drugs.

Very satisfactory therapeutic results, without toxicity, we reported in 102 pediatric patients who received short-term (te day) courses of Ilosone in the treatment of streptococcus inf tions. Results of liver function tests in these patients we comparable to those in a similar control group who had receiv penicillin.

Gastro-intestinal disturbances not associated with hepatic fects are observed in a small proportion of individuals as a res of a local stimulating effect of the medication on the alimenta tract; however, the normal intestinal gram-negative bacter flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with the u of erythromycin, there have been occasional reports of urticar skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Pulvules®, Ilosone Liquid 125, Ilosone, 125, for O Suspension, Ilosone Drops, Ilosone Chewable Tablets.

For infants and for children under twenty-five pounds of bo weight, the usual dosage is 5 mg. per pound every six hours; children twenty-five to fifty pounds, 125 mg. every six hou (Tablets Ilosone Chewable should be chewed or crushed a swallowed with water.)

For adults and for children over fifty pounds, the usual dos of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythromy therapy should be considered.

In the treatment of syphilis, the recommended total dosag 20 to 30 Gm. given in divided doses for a period of ten to fift days. Close follow-up of the patient is necessary since eryth mycin drugs have not had adequate evaluation in all stages syphilis. Examinations of spinal fluid are recommended as p of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days recommended. In the treatment of gonorrhea, patients witl suspected lesion of syphilis should have a dark-field examinat before receiving antibiotics, and monthly serologic tests sho be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 250 (equivalent to base), in bottles of 24 and 100.

Ilosone Liquid 125, Oral Suspension, U.S.P., 125 mg. (equival to base) per 5-cc. teaspoonful, in 60-cc. and pint-size packa

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

Highlights

Crippled Children Under Title 19

To safeguard the high standards of care which have always characterized the thirty year old State Crippled Children's program, the Health Department recently appointed a subcommittee on Standards of Care of Handicapped Children under the Medical Assistance Program (Title 19), to assist the Department by reviewing and advising on hospital and professional services to handicapped children eligible for Medical Assistance. Proposals developed would be referred for review by the Medical and Chirurgical Faculty which has appointed a group for this purpose.

The subcommittee, chaired by Edward McDonnell, MD, developed the following resolution which was approved by the Council of the Medical and Chirurgical Faculty at its June meeting:

Resolution of the Subcommittee on Standards of Care of Handicapped Children Under the Medical Assistance Program (Title 19)

The Subcommittee on Standards of Care of Handicapped Children recommends to the Medical and Chirurgical Faculty of Maryland and the Medical Assistance Advisory Committee that it reiterates its support of the high standards of care offered through the State Crippled Children's Program, which stands ready to accept the handicapped children particularly where special facilities are needed and are available for treatment also reiterates the concept that the Crippled Children's Program continue to maintain contact with the referring family physician and that encouragement be given to him for his participation in the follow-up and after-care of such patients. The Subcommittee also wishes to have both the Medical and Chirurgical Faculty and Medical Assistance Advisory Committee go on record as endorsing the continuance of the high standards that have been adopted and used in the operation of the State Crippled Children's Program.

The resolution will be presented to the Medical Assistance Advisory Committee for its recommendation to the State Board of Health and Mental Hygiene.

Measles Surveillance Program Instituted

The campaign to end measles during May 1967 resulted in the vaccination of 64,340 children. The next step is to institute a measles surveillance program. This is essential to pinpoint pockets of unprotected children and permit immediate measures to control localized outbreaks of measles.

Prompt reporting and investigation of measles

cases will facilitate this surveillance and provide a continuing evaluation of the effectiveness of the "end measles" program.

The burden of this reporting will fall largely on the private practicing physician. Physicians are therefore requested to report to the local health department all measles cases, giving name, address, date of onset, and any other pertinent data. The yellow communicable disease report form (card) may be used.

Syphilis in Migrant Workers Part of VD Control Study

Case finding and treatment of syphilis and gonorrhea among migrant workers was recently initiated on the Eastern Shore as part of a three-year Venereal Disease Control Demonstration Project being conducted by the section of Venereal Disease Control of the Division of Communicable Diseases.

Blood samples will be taken from each of the estimated 5,000 workers and screened for syphilis by means of the *RPR* card test. Sero-positive specimens will then be given *VDRL* and possibly fluorescent antibody tests to confirm or rule out presence of the disease. Those requiring treatment will be referred to private physicians or local health departments for care.

The study is expected to yield valuable data regarding the influence of migrant workers on Maryland's venereal disease rate, and be a means of early case finding as well. The services will be coordinated with the migrant health programs of other states.

Mosquito-Borne Encephalitis Surveillance Continues

The Department's Division of Communicable Diseases has requested the cooperation of physicians and hospital laboratories in a surveillance program for the detection of cases of mosquito-borne encephalitis on the Eastern Shore. Surveys show the viruses of Eastern and St. Louis encephalitis are constantly present in birds and mosquitoes.

The Division urges routine collection of blood specimens from suspected cases of encephalitis and aseptic meningitis, and shipment to the Bureau of Laboratories in Baltimore, where they will be examined for antibody titres of four types of encephalitis. Specimens may be tested for Echo and Coxsackie viruses or other serology if requested. Attempts will also be made to isolate the virus.

Paired sera are needed to determine a rise in antibody titre, requiring collection of one specimen during the early febrile stage of the illness, and a second 14 to 21 days after onset. If a spinal tap is done, a spinal fluid specimen should also be collected.

Instructions for collecting and handling specimens may be obtained from local hospitals, from the Division of Communicable Diseases, or from the Central Laboratory.

Montgomery County

Hugh B. McNally, MD formerly obstetrical consultant, Division of Maternal and Child Health, is now employed on a full-time basis by the Montgomery County Health Department to be in charge of a maternity program.

New Legislation Permits Treatment of Minors

Senate Bill 315, recently enacted by the General Assembly, permits physicians to render diagnosis and care to minors for pregnancy or venereal disease, without parental consent. Confidentiality is left to the judgment of the physician, except that he is not permitted to reveal any information to the spouse, parent, custodian, or guardian of the minor regarding any appointment, examination, test, or other medical procedure, if his examination shows the condition is not present.

Rubella Registry to be Undertaken

Possibly as many as 1500 Baltimore children born to mothers who fell victim to rubella in the epidemics of 1963 and 1964 may have suffered serious birth defects, a study by Janet Hardy, MD, of the Johns Hopkins Hospital indicates. Statewide, the figure may double this estimate. Anticipating a severe strain on the state's medical, rehabilitative, and educational facilities when these children reach school age, the Departments of Health and Education plan to enlist the cooperation of Maryland physicians in a massive joint effort to find and identify handicaps, so that plans may be made to meet the problem.

New Nursing Home Reimbursement Procedures Issued

Beginning July 1, nursing homes will be reimbursed for the care of Medical Assistance patients on the basis of audited costs plus a percentage

(up to $12 per day total), providing they have: (1) been licensed by the Health Department as a "skilled nursing home" (certification as an extended care facility is automatic qualification); (2) submitted cost figures for the period Jan 1 to Dec 31, 1966, to the Hospital Cost Analysis Service, Inc.; (3) signed an agreement for the audit; and (4) signed the Nursing Home Compliance Report (civil rights agreement).

Nursing homes which have not complied with these requirements will be reimbursed at the old rate, not to exceed $7 per day. If they have still not complied by Sept 1, reimbursement will continue at the old rate for the entire 1968 fiscal year, whether or not the compliance requirements (a cost statement is filed) are met within the year.

Health Departments to Assist Hospitals in PKU Testing

Legislation enacted by the 1967 General Assembly changed the mechanism for phenylketonuria screening of newborn infants, making hospitals the agency solely responsible for ensuring that a satisfactory test is completed. On the infrequent occasion when technical problems result in an unsatisfactory test, the hospital rarely learns of this until the infant has been discharged home. The Commissioner has requested local health departments to assume responsibility for follow-up testing, upon request from the hospital involved.

Course in Salmonellosis Control Given

A course on the control and epidemiology of salmonellosis was recently conducted in Salisbury for public health and agricultural specialists from Maryland, four other states, Puerto Rico, and the District of Columbia. Jointly sponsored by the Health Department, the National Communicable Disease Center, and Region 3 office of the US Public Health Service, the training program was part of a nationwide effort to reduce the incidence of food poisoning.

Attended by sanitarians, engineers, epidemiologists, veterinarians, supervisors of food hygiene programs, and other related specialists, the course was designed to enable participants to lend advice and support to industries and businesses engaged in the processing of foods subject to contamination with salmonella organisms, such as meat and poultry.

It has been estimated that as many as 2 million

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

TWO GOOD REASONS FOR STARTING A KEOGH RETIREMENT PLAN NOW

1. Immediate Tax Savings

A self-employed individual can set up a plan for his retirement and deduct 50 per cent of his contribution from taxable income up to a maximum of $1,250 as well as receive a 100% deduction for contributions for his employees. The tax savings a self-employed in a 48% tax bracket can NOW enjoy with a qualified Keogh Plan are illustrated below.

TAX SAVINGS NOW AVAILABLE

	Without a Keogh Plan	With a Keogh Plan
Self-employed's Contribution	$2,500	$2,500
Taxable Amount	2,500	1,250
Tax	1,200	600
Tax Savings	0	$ 600

By starting a Keogh Plan now, a self-employed can realize a 50% tax savings on his contributions this year—and in 1968, his contributions will be 100% DEDUCTIBLE!

2. Greater return at retirement

Call or write for the arithmetic of your age.

Learn To Do Your Part In The Prevention Of Disease

Lead Paint Poisoning Alert

Baltimore physicians are urged to be alert to the *child lead paint poisoning danger* during the coming summer months. Already in 1967, Jan 1 through May 31, a total of 7 children have been made ill and one case has terminated fatally. During this five month period due to the alertness of physicians or parents an additional 19 children have been found with elevated blood leads and placed under care or treatment.

Lead paint poisoning in Baltimore is no longer a disease of inner city children—cases have been found wherever there are unsupervised young children and homes painted with lead paint. For this reason every child with vague and nebulous symptoms seen by a physician should receive a blood test for lead.

The characteristic initial symptoms are anorexia, apathy, hyperirritability, incoordination and loss of recently acquired skills. The symptoms wax and wane and each episode may readily be attributed to both parent and physician to some intercurrent illness. They may also suggest emotional disorder. If lead ingestion continues the episodes may recur each summer. In this chronic form of the disease without overt encephalopathy a convulsive disorder refractory to therapy and/or signs and symptoms suggestive of cerebral degenerative disease may ultimately appear.

On the other hand, once the early symptoms listed have been present for three to six weeks, acute encephalopathy may occur at any time. In such cases the symptoms intensify gross ataxia appears together with the classic signs of increased intracranial pressure; namely intractable and usually projectile vomiting, lethargy, stupor, coma and convulsions. The risk of encephalopathy is especially great during summer months. A further detailed description of symptoms and diagnostic procedures is described in *Childhood Lead Intoxication: A Preventable Summertime Disease,* by J. Julian Chisolm, Jr., MD, in the July 1964 issue of *Pediatrics Digest,* available from the City Health Department.

It is our hope that physicians will develop a high index of suspicion for lead paint poisoning if a young child is seen with vague symptoms, and a blood test taken. Also it should be noted that cases of lead paint poisoning have ranged from under one year (5 cases) to ten years (2 cases); however most cases occur in the preschool child.

Physicians are advised that blood lead kits are available from the Bureau of Laboratories, Municipal Office Building, Lexington and Holliday Streets. Information regarding blood determinations may be obtained by calling extension 614.

OPENS ASTHMATIC AIRWAYS—

AND KEEPS THEM OPEN

NUMA® DURA-TABS®

for *prolonged* aid to ventilation

Each Numa Dura-Tab provides:

theophylline	225 mg.
ephedrine HCl	50 mg.
butabarbital	25 mg.

(Warning: butabarbital may be habit-forming.)

Numa Dura-Tabs provide *prolonged* three-way action to ease breathing. Theophylline, a potent bronchodilator with minimal effect on the CNS, opens air passages and reduces bronchial spasm. Ephedrine HCl improves breathing capacity through its decongestant action. Butabarbital, a mild sedative, allays fear and apprehension.

Dosage: One Numa Dura-Tab every 8 to 12 hours helps keep the asthmatic patient symptom-free all day/all night.

Precautions: Use with caution in cardiovascular or hyperthyroid disease, severe hypertension, circulatory collapse, prostatic hypertrophy, or glaucoma.

Physical Therapeutic Methods in Rheumatoid Arthritis of the Upper Extremity

DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

Heat and exercise are the two basic physical methods helpful in the treatment of rheumatoid arthritis of the upper extremities.

Heat:

Heat does not help the very acute swollen joint of rheumatoid arthritis. Heat is indicated prior to exercise therapy in the subacute and chronic stages. In a preventive exercise program to maintain range of motion, heat is indicated to relax muscle spasm.

Various types of heat are available. There is little clear evidence that one type of heat is more effective than another, although many clinicians feel that wet heat is more effective than dry heat in rheumatoid arthritis. Hot packs are particularly helpful in painful shoulder and elbow disease. The arm whirlpool has the advantage of supplying gentle massage and movement of the extremity in addition to heat. The paraffin bath is widely used because a high temperature may be maintained for a prolonged period.

Exercise:

Two important points should be emphasized. First, for exercises to be effective they must be carried out over long periods of time by the patient in his home. This will require good motivation and understanding. Secondly, use of exercise in rheumatoid arthritis is always based on a balance between too little exercise and too much exercise. If the joints are not taken through range of motion sufficiently often, contractures will develop. If the joint is exercised too much, there will be pain and accelerated joint destruction. Isometric exercises (where the muscle is tensed without moving the extremity) is indicated as a measure to maintain muscle strength around joints which are too painful to move.

A routine set of exercises follows. Exercises of lower extremities and neck are included for completeness. These exercises should be modified for the individual patient. As a general rule, application of heat to involved joints prior to exercising is helpful.

It should be emphasized further that it is not enough to hand the patient a sheet of directions for exercises and expect him to carry on. The reasons for exercises must be explained; the patient must be instructed in how to perform them; he must demonstrate that he understands them by performing them; he must be followed at frequent intervals to encourage him to continue them.

EXERCISES FOR RHEUMATOID ARTHRITIS

General Instructions for Exercises:

Conscientious performance of a prescribed exercise routine is of utmost importance in reducing and preventing the crippling effects of arthritis. All exercises must be performed *slowly,* smoothly and very *deliberately.* Attempt to attain as much motion as possible in all directions. Slight pain during exercise is to be expected. Any exercise producing pain later the same day, or persisting the following day, should be reduced. Watch also for increased swelling. Attempt to do the exercises as fully as possible without assistance. Assistance is recommended, however, where active motions are limited. Initially, do each exercise 2 or 3 times each and work up to 5 or 6 times each. Exercise routine should be done at least twice daily.

Fingers:

1. Keeping palm flat on table, raise fingers and lower. Do one at a time, then all together.
2. Make a tight fist; straighten fingers wide.
3. Make an "O" by touching the thumb to all finger tips one by one.
4. Spread fingers as wide as possible; close.
5. Same as 4, except with rubber band entwined around the fingers.
6. Squeeze a rubber ball, sponge, or similar object.
7. Place palms together in front of chest; push against opposite fingers individually one by one.
8. Stretch the fingers as straight as possible. If fingers remain bent, rest hand, palm down, on table. Hold other hand firmly on top of it and raise the forearm of affected hand in an effort to flatten bent fingers.

Wrist:

1. Forearms and hands on table; raise hands, keeping forearms on table. Do with palms up and palms down.
2. Forearms and hands on table approximately 8″ apart with palms flat; without moving forearms attempt to touch index fingers and thumbs of the two hands.
3. Turn palms up, turn palms down.
4. Keeping forearm stationary; turn wrist in circular motion as in stirring a mixture.

Elbow and Shoulder:

1. Touch hands to shoulders, raise elbows.
2. Facing wall; walk fingers up wall.
3. Hands behind neck; move elbows backwards

4. Raise hands to the side and overhead, touching palms; repeat touching back of hands.
5. Lying on stomach arms at sides and palms up, lift hands and arms directly upwards from the bed, keeping elbows straight.
6. Lying on stomach; pinch shoulder blades together.
7. Elbows bent 90° and tucked firmly against sides; touch hand to opposite arm. Return in opposite direction.

Foot and Ankle:

1. Bend ankle up, down and around in a circular motion. Do clockwise and counter clockwise.
2. Curl toes down; straighten.
3. Standing; go up on toes. Walk on toes.
4. Standing; go up on heels. Walk on heels.

Hip and Knee:

1. Lying on the back; raise feet directly upward, keeping knees straight. Do alternately, one leg at a time.
2. Lying on back; pull knee up to chest, bending knee. Do alternately.
3. Lying on back; spread legs, close and cross ankles.
4. Lying on back; knees straight, roll kneecap inward then outward.
5. Lying on stomach; raise each foot upwards keeping knee straight.

Head, Neck, Spine and Thorax:

1. Bend head forward, backward.
2. Rotate head to sides.
3. Bend head to sides, keeping face forward.
4. Standing, bend body forward, backward and to the sides.
5. Standing without moving feet attempt to turn (rotate) shoulder to side.
6. Breathe deeply attempting to expand the ribs as much as possible. Hold 5 seconds, exhale as far as possible.

Sick, and worried sick

Professionally posed

Anxiety and tension stemming from organic illness may undermine your patient's cooperation and possibly retard success of primary therapy.

If his emotional symptoms persist in the face of your counsel and reassurance, you may want to consider adjunctive use of SERAX (oxazepam). It is indicated in anxiety, tension, agitation, irritability, and anxiety associated with depression. May be used in a broad range of patients, usually with considerable dosage flexibility.

When prescribing, carefully observe dosage recommendations and appropriate precautions, especially as pertaining to the elderly and when complications could ensue from a fall in blood pressure. (See Wyeth literature or PDR as well as "IN BRIEF" below.)

IN BRIEF.

Contraindications: History of previous hypersensitivity to oxazepam. Oxazepam is not indicated in psychoses.

Precautions: Hypotensive reactions are rare, but use with caution where complications could ensue from a fall in blood pressure, especially in the elderly. Withdrawal symptoms upon discontinuation have been noted in some patients exhibiting drug dependence through chronic overdose. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose; excessive, prolonged use in susceptible patients (alcoholics, ex-addicts, etc.) may result in dependence or habituation. Reduce dosage gradually after prolonged excessive dosage to avoid possible epileptiform seizures. Withdrawal symptoms following abrupt discontinuance are similar to those seen with barbiturates. Caution patients against driving or operating machinery until absence of drowsiness or dizziness is ascertained. Warn patients of possible reduction in alcohol tolerance. Safety for use in pregnancy has not been established.

Not indicated in children under 6 years; absolute dosage for 6- to 12-year-olds not established.

Side Effects: Therapy-interrupting side effects are rare. Transient mild drowsiness is common initially; if persistent, reduce dosage. Dizziness, vertigo and headache have also occurred infrequently; syncope, rarely. Mild paradoxical reactions (excitement, stimulation of affect) are reported in psychiatric patients. Minor diffuse rashes (morbilliform, urticarial and maculopapular) are rare. Nausea, lethargy, edema, slurred speech, tremor and altered libido are rare and generally controllable by dosage reduction. Although rare, leucopenia and hepatic dysfunction including jaundice have been reported during therapy. Periodic blood counts and liver function tests are advised. Ataxia, reported rarely, does not appear related to dose or age. These side reactions, noted with related compounds, are not yet reported: paradoxical excitation with severe rage reactions, hallucinations, menstrual irregularities, change in EEG pattern, blood dyscrasias (including agranulocytosis), blurred vision, diplopia, incontinence, stupor, disorientation, fever and euphoria.

Availability: Capsules of 10,15 and 30 mg. oxazepam.

To help you relieve anxiety and tension

"Take a laxative" is a harsh sentence

Although there are more than 60 ethical laxatives available for the constipated patient, many, unfortunately, do not really produce an effect much like a normal bowel movement. Instead they whip the bowel, torment it and leave it irritated, inflamed and exhausted.
On the other hand, Dulcolax provides a nearly normal movement. Through its unique contact action, it induces the kind of natural contraction waves of the colon necessary for gentle, complete, comfortable bowel movements.
For your next constipated patient, try Dulcolax–the laxative with the gentle touch.

when he just can't sleep

Tuinal

One-Half Sodium Amobarbital an
One-Half Sodium Secobarbita
supplied in ¾, 1½, and 3-grain Pulvule

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal is indicated for prompt and moderately long-acting hypnosis. It is not suitable for continuous daytime sedation.

Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Overdosage: C.N.S. depression. Symptoms—Depression of respiration and of superficial and deep reflexes, slight constriction of the pupils (in severe poisoning, dilation), decreased urine formation, lowered body temperature, coma. Treatment—Symptomatic and supportive (gastric lavage; intravenous fluids; maintenance of blood pressure, body temperature, and adequate respiration). Dialysis may speed removal of barbiturates from body fluids.

Dosage: 50-200 mg. (¾-3 grains) at bedtime.

Kurt Gorwitz, ScD, Statistics Director

The Child's Physician And School Mental Health

The acquisition of mental health is not an activity limited to a clinic, hospital or professional office. Mental health should be seen as a potential contribution of all human institutions including the family, the church, community agencies and the school.

Many schools are rapidly increasing their awareness, with programs and an emphasis on their role and techniques in meeting the emotional and social needs of the children enrolled. Educators have recognized the value and relatedness of the child's mental health and personality growth to the total school experience.

Clinical mental health services for adults might be thought of as a *second chance to grow up,* while mental health fostered by the school and family, might be regarded as a better *first* chance to grow up.

Mental health of children is enriched by any experience in which they feel comfortable, accepted and successful. If the school offers the child a sense of challenge, stimulation and achievement, this positive feeling is incorporated into the child's developing personality structure. Much more is learned in school than mere numbers and letters. Personality traits and patterns of appraising and adapting to reality requirements are forming just as surely as are their skills in reading and arithmetic. Unfortunately, far more effort and attention has been given to the latter than to the former. Yet, without the child's subjective sense of purpose, confidence and values, all of the learning tools and contributions of the school may be lost to him and his society.

It is likely that more children with social and emotional problems are referred to mental health specialists by school staff members than by physicians. One reason for this, of course, is that school personnel have the advantage in being able to observe a child over a much longer period of time, both in the course of a day and over a span of months, even years. The school presents what might be considered a *standard stress* situation for all children in requirements for attendance, self-control, achievement, etc. It can be the first place where independent functioning and performance are expected without the presence or support of the parents. The physician, in contrast, only sees the child for a brief period of time and at wide intervals and must rely more on the perception and report of one or both parents. The parents may or may not share with the physician their concerns, if any, about their child's present or anticipated school adjustment problems. The physician should not depend on parents to invariably report emotional, social or behavioral problems occurring in their children at school which in turn jeopardize school attendance, attitudes or achievement. Neither should the physician expect a routine report from the school if his patient is experiencing difficulty there. Parents may not inform the physician of their child's learning or adjustment problems simply because they may not suspect that a given organic or health problem underlies or contributes to them. Some parents are anxious or embarrassed about the lack of progress or the severity of difficulties posed by their children in school and are reluctant to share this

information with others, including their physician.

Many communities in Maryland do not have adequate resources for mental health evaluation or treatment of children. Particularly in those communities, the family physician should be appraised of difficulties in the school and assist the family in coordinating their efforts into finding a suitable school program or placement. The physician may refer the child to sources for more specialized treatment, if these are indicated, available and affordable.

Many schools unwittingly make the mistake of directly referring the family or child to a mental health facility without the prior consideration or support of the family physician. In effect, this action bypasses a person who has been, and will continue to be, a significant and knowledgeable person in the life of the child and his family. Parents will more often accept a referral to their family doctor and his advice regarding the need for more specialized help. The same parents may be reluctant to take their child directly to a mental health professional or facility.

Even when a parent brings his child to the physician and describes a problem in some aspect of the school life of the child, the physician should not accept this as being necessarily a complete or objective report. When there are serious difficulties in school, it would be advantageous to request the parents to have the principal of the school send a brief note directly to the physician giving the concerns and position of the school regarding that patient.

In the course of a routine physical examination or in the treatment of illness or injury, the physician may not be mindful of the possible implications and influence of his findings on the school life of the child. Rather than to wait for a possible complaint relating to school, the physician should routinely ask the parents *and* child about his school adjustment and progress. The simple gesture of the physician's displaying an interest and obviously assigning value to the child's educational experience could, in itself, have a significant effect. Opening questions might be: "How are things going, what activities are you enjoying at school? How is the football team doing this year?", etc.

Any condition in the child, which in the physician's judgment might possibly impair learning or need special consideration, should be shared with the school. Again, this is better sent directly to the school in the form of a brief note than to rely on the parents to report such information. Communication with the school, besides the traditional notes to excuse his patient from physical education or for absences associated with illness, should include the physician's ideas for educational planning and programs commensurate with his clinical observations of that particular child.

For the physician to contribute in a constructive manner, such as to suggest refinements and modifications in a child's school experience, may have a special significance when parents of the child themselves are inadequate, ineffectual or indifferent in seeking a more appropriate school program. The physician, in effect, becomes an advocate for the child in school and shares his suggestions and impressions with the principal or teacher.

The school might be reluctant to call the physician when there is a concern about a child who is his patient because they do not want to interrupt his busy schedule or because of a concern about professional ethics or confidentiality. School nurses and school health physicians often bridge this *communication gap* between the school and private physician. In some communities, however, school health services are minimal or absent. Private and parochial schools in Maryland, with thousands of children enrolled, often do not have the range of supporting services provided by public schools, such as social workers, counselors, nurses and psychologists. For children in these schools, the private physician has far greater significance in his potential to assist the school in its planning and responding to their needs.

There are many ways in which the practicing physician might enhance the school experience for his patients beyond his direct involvement and contribution to a single case. For example, the physician might serve on a committee of his medical society or health department which studies and supports school health services and programs. The physician might volunteer to be a visiting lecturer and participate in health education programs of the school. The physician with children of his own in school may be active in parent groups or in other activities relating to

school. Physicians belonging to community groups and service clubs might support projects aimed at improving the quality of education in local schools. Some physicians offer themselves as candidates for elective school board offices.

Any improvement in school services—the recruitment and retention of qualified teachers, the morale of school personnel, curriculum design, instructional materials, the school health program, the physical environment,—directly or indirectly serves in promoting the mental health of children in these schools.

For the school to know that the child's physician understands and endorses their efforts for his patient, is a great step towards a meaningful physician-school relationship. Textbooks in pediatrics seldom emphasize the importance of such a relationship as being a significant factor in child mental health. For the physician to know that the school is responding to the physical and emotional needs of his patient with a timely and appropriate program, gives him the satisfaction and assurance of having made a positive contribution towards that child's mental health.

How come the world's richest companies buy the lowest priced dictating machine?

Eastern Airlines, Union Carbide or Gulf could easily afford any of the six nationally advertised dictating machines priced from $249.50 to $800. Yet they, as well as Ford, American Airlines, Allied Chemical, United States Lines, Goodyear Tire & Rubber, Home Life and many other giants of business, are buying the new Voca at $199.95. Could it be that the Voca is just as good, regardless of price? Or perhaps even better? Find out. We'll be glad to give you the full story. Phone, or mail the coupon today.

THE NEUROSES, Henry P. Laughlin, MD; Reese Press, Baltimore.

This publication is especially oriented to the private practice of medicine and psychiatry. Psychodynamics and therapy, and their correlation with today's clinical findings are stressed. The author comments that, "this represents the textbook in extra-mural psychiatry which I very much wanted in my own student days."

We couldn't agree with him more.

It is a book that succeeds the previous publication by the same author, The Neuroses in Clinical Practice published in 1956.

A MANUAL OF TROPICAL MEDICINE, fourth edition, George W Hunter, III, Ph.D.; William W. Frye, MD, and J. Clyde Swartzwelder, PhD; W B Saunders Company, Philadelphia.

This represents an updating of our needs with respect to tropical medicine as they exist today. The three previous publications, originating with World War II, engendered all the knowledge that was existing at that time. This volume brings up to date the information needed by those persons who serve the many undeveloped nations through the Peace Corps, Viet Nam; *AID, HOPE,* and other philanthropic groups.

EMERGENCY CARE OF THE SICK AND INJURED. Robert H. Kennedy, MD; W B Saunders Company, Philadelphia.

This small, illustrated booklet consisting of 128 pages, is primarily a manual for law-enforcement officers, firefighters, ambulance personnel, rescue squads and nurses. Well done under the auspices of the Committee on Trauma, American College of Surgeons, it is a booklet that can be used by all in training courses.

PERIPHERAL ARTERIAL DISEASE, Wiley F. Barker, MD; W B Saunders Company, Philadelphia.

This illustrated book is Volume IV in a series. In it, Dr. Barker concisely reviews the basic pathology and physiology of peripheral vascular lesions, defines the indications for and limitation of corrective surgery and provides practical and up-to-the-minute details of operative technique. This should prove of special value to all whose interest and previous training have drawn them into this rapidly expanding surgical field.

EARLY MANAGEMENT OF ACUTE TRAUMA, Alan M. Nahum, MD; The C V Mosby Company, St. Louis

This book represents an attempt to provide a practical medical background for the physician who is concerned with and responsible for the earliest care of patients who have sustained acute trauma. Emphasis has been placed upon measures necessary to resuscitate and maintain patients without a detailed examination of definitive surgical procedures.

HEMATOLOGIC PROBLEMS IN THE NEWBORN, Frank A. Oski, MD and J. Lawrence Naiman, MD; W B Saunders Company, Philadelphia.

The book's purpose is to provide a single source from which can be drawn what is known concerning the normal and abnormal hematologic processes of the first month of life and the effects of prenatal factors on them. It is a useful guide to all who care for, or are interested in, the newborn infant.

DISORDERS OF CARBOHYDRATE METABOLISM IN INFANCY, Marvin Cornblath, MD and Robert Schwartz, MD; W B Saunders Company, Philadelphia.

This is the third volume in the series of Major Problems in Clinical Pediatrics. The current concepts of the normal and abnormal physiology of carbohydrate metabolism in the fetus, the pregnant mother, the neonate and the infant have been presented as seen by the authors.

HERITABLE DISORDERS OF CONNECTIVE TISSUE, Victor A. McKusick, MD; The C V Mosby Company, St. Louis.

This book is addressed, in particular, to the general practitioner, the internist and the pediatrician. This is because he is in the best position to size up the total situation in the individual patient and with reference to the family background, with which he is most likely to have firsthand familiarity. It is an updating of a series of articles that have appeared in the Journal of Chronic Diseases. It is well-presented and worth reading.

RADIOLOGY IN WORLD WAR II, Kenneth D. A. Allen, MD; US Government Printing Office, Washington, DC.

The volume, part of the series dealing with the US Medical Services in World War II, describes in detail the development of the routine diagnostic use of X-ray under field conditions in disease and in combat and noncombat trauma. The material was provided entirely by medical officers who served in World War II and had first-hand knowledge of the total radiologic experience. Nothing in it is second-hand.

The last chapter unfolds the radiologic story of the Manhattan Project the top-secret World War II project which developed the atomic bomb. Despite what may seem to be a dull subject, this book makes exciting reading.

The Library has one set of the paperbound monthly *Index Medicus,* 1966, which we will be glad to donate to any hospital library lacking this Index. Please request immediately if you desire these issues; otherwise, due to space shortages, we will have to dispose of them.

Woman's Auxiliary

JULY, 1967

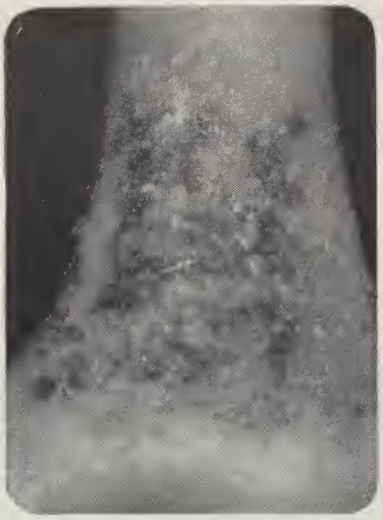
PRESIDENT VISITS COUNTY AUXILIARIES

One of the pleasures that accompanies the honor of serving as President of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland is the privilege of visiting all of the county auxiliaries.

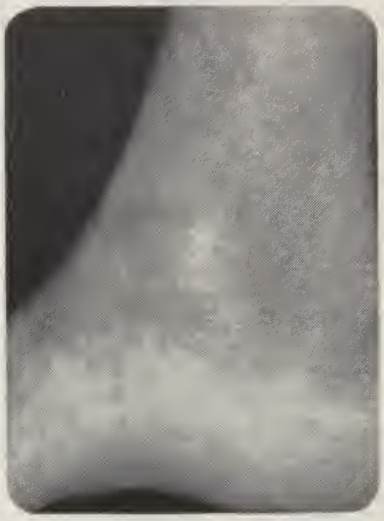
Although I served in this capacity several years ago, it was with great delight that I accepted the invitation of Mrs. Frederick Dove, Jr. to the annual meeting of the Washington County Auxiliary on May 8. There are many changes in the Hagerstown area, new highways, a beautiful addition to the hospital, and it was good to learn that the Alexander Hotel will once again be open to guests.

Washington County is one of our oldest auxiliaries, and has produced three of our state presidents, Mrs. Gerald Levan, Mrs. Robert Conrad and Mrs. Archie Cohen. Throughout the years it has been noted for its outstanding community work in the field of health.

The new officers installed at the close of the meeting at the Woman's Club are: Mrs. Frank Brumback, president; Mrs. Thomas Craig, president-elect; Mrs. John Clark, vice president; Mrs. Edmund Niklewski, recording secretary; Mrs. Edward Ditto III, corresponding secretary; Mrs. Charles Spencer, treasurer; and Mrs. Frederick Dove, Junior Parliamentarian.



On May 18, I attended the joint annual meeting of the Cecil and Harford County auxiliaries. Mrs. Edgar E. Folk III of Perry Point and Mrs. James Garey of Aberdeen will serve another term as presidents of their respective counties. The activities of these fine doctors' wives in the field of health are notable for their diversification, assistance with the Bloodmobile program, Child Day Care Centers, health careers programs in local high schools, and the support of the local hospital auxiliaries in their projects.



MRS. WILLIAM S. STONE

The officers of Cecil County are Mrs. Edgar E. Folk, III, president; Mrs. I. Randall Ross, vice-

Eczema of many years... controlled in two weeks

Before treatment

After treatment —
with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Available in 5 Gm. and 15 Gm. tubes and ½ lb. jars.

president; Mrs. James L. Johnson, treasurer; Mrs. Jay S. Barnhart, Jr., recording secretary; Mrs. Hugo P. Silva, corresponding secretary.

Mrs. H. Douglas Cooper, President of the Wicomico County Auxiliary invited me to the annual meeting at the Elks Home in Salisbury on May 23. During my journey I found new highway construction and the meeting place on the edge of a beautiful golf course, just beyond a delightful woodsy park. Salisbury has come into national prominence in the past few years because of the tennis matches held in the Civic Center, and one national magazine said that although the business and civic leaders had a part in bringing the matches to this area, the doctors had been the most outstanding.

Wicomico County is one of our first auxiliaries in the state. The members voted to disband after a short time, but I had the pleasure of attending the meeting of reactivation several years ago. The late Mrs. Kit Hargraves, executive secretary to the medical society at that time, reactivated the auxiliary by enlisting their help in reorganization and cataloging of the Medical Society library. This convinced the members that they were needed and wanted. Mrs. Raymond Yow has served on the state Board as Chairman of Health Careers for several years. The new officers installed are: Mrs. Talmadge Reeves, president; Mrs. Andrew C. Mitchell, vice president; Mrs. Aubrey C. Smoot, Jr., secretary and Mrs. David Shave, treasurer.

Summer Projects

Various summer projects are now shaping up in the Faculty library. Mr. Lee Ash, Library consultant, will return to continue his survey of the library's collection, with the help of extra personnel employed for the summer months, to follow up on processing the books after he has indicated the proper disposition.

Another note of progress occurred when the National Library of Medicine notified Mr. John Sargeant that this library is eligible for consideration for a construction grant. The next approval of applications will be November 1, 1967. These grants are awarded on a matching basis to applicants able to meet the requirements of the Medical Library Assistance Act of 1965.

During the Special Libraries Association meeting in New York City, May 28-June 1, Mrs. Elizabeth Sanford visited the New York Academy of Medicine for a short tour conducted by Miss Gertrude Annan, Director, and attended a dinner meeting later. Prior to that a tour and reception was held at the Medical Research Center of New York. This is a cooperative activity of several member libraries in the area providing a depository for both books and journals, with direct *TWX* communications between about ten of the participating libraries. The operation is located on the sixth floor of a garage building which the Center has purchased.

On Thursday morning buses were provided to transport librarians to the Medical Research Center of Brooklyn. Here the Academy of Medicine of Brooklyn, Downstate Medical Center, and Joint Library of the State University of New York have been combined. Mrs. Helen Kovacs, Librarian of the Downstate Medical Center presented the program, with film explaining the workings of the library for their borrowers, followed by a TV presentation of some of the computerized operations. These two audio-visual aids had been produced very reasonably by the library center with the help of the components staffs. After an elegant buffet luncheon this session resumed with a discussion on Regional Planning.

The Annual meeting of the Medical Library Association was held June 11-18, Miami, Florida and reports on these sessions will appear in later issue.

Solutions to Business Problems in Daily Medical Practice

ALL ABOUT AIDES-PART III

By Wilburn L. McClure, Jr.

Ways to Keep Valued Aides

The best ground rules one can use toward keeping valued employees are:

1. Maintaining mutual respect; and,
2. Conscientiously fulfilling the obligations one has to the other.

It is probably safe to say that most doctors believe that their aides are "the best in the business." However, far too often doctors fail to communicate this feeling to their aides. The lack of such overt praise leaves the employee in doubt regarding the respect her employer has for her responsibilities, quality of work and general value to the practice.

The devotion to duties, loyalty to the doctor and years of service to the practice demonstrate the respect and fulfillment of obligations most medical aides provide to physicians.

Review the following categories with your aides and see if each has a firm understanding as to the obligations one has to the other.

Duties:

Does each aide have some type of guide to act as a check list which will help her in understanding the task assigned, the order of importance and when they are to be completed if special circumstances prevail? Does she have some type of instructions concerning emergency situations? Has she been briefed on the limits of her authority? Is there a plan to bring such a check list up to date periodically?

Hours:

Have you defined the routine office hours of your practice? Does your aide know what to expect when overtime is necessary?

Salaries:

Do you have a defined salary scale or is it one that is made up as time goes by? Do you have a firm basis for giving future raises, such as a merit system, longevity system or a discretionary system?

Vacation:

Have you outlined when your aides can expect to have their vacation and how long it may be in accordance with their length of employment with the practice?

Sick Leave:

Do you provide allowances for sick leave with pay up to a certain limit, and without pay up to another limit? Do you have a system for account-

---

Mr. McClure is director of the Baltimore office of Professional Business Management, Inc. This monthly column is prepared as a complimentary service to the *Maryland State Medical Journal.*

ing for sick leave? Does your aide know what to do toward finding a temporary replacement when sick leave occurs?

Holiday Routine:

Do you have a specified list of regular and special holidays? Is there a long range plan for merging *special time off* with holidays when a holiday falls on a Friday or a Monday?

Fringe Benefits:

Do you, or should you, provide uniform allowances? Do you provide health insurance? Do you encourage additional schooling and membership in special associations which would enhance the proficiency of your aides? Do you pay for their parking? Is there a bonus system?

A semi-annual *mutual ventilation* conference is a good idea for every practice. This is true if it is a one-girl office or a twenty-girl office. The more employees you have, the more need you have for such conferences in order to gain a collective review of the administrative side of the practice.

The more interest you take in your aides, the more interest you will find that they will take in you and your practice. No one likes to be taken for granted or considered as a necessary evil.

Give your aides credit when credit is due. Give them criticism backed only by facts. Encourage them to discuss whatever problems they have as soon as possible. When you receive the request for such a meeting, grant it immediately under the most ideal conditions possible.

When you feel you have conscientiously fulfilled your obligations to the aide, but you are not receiving services required, contemplate replacing the aide. But, before you do that, you may wish to read next month's column.

SKIN PROBLEMS

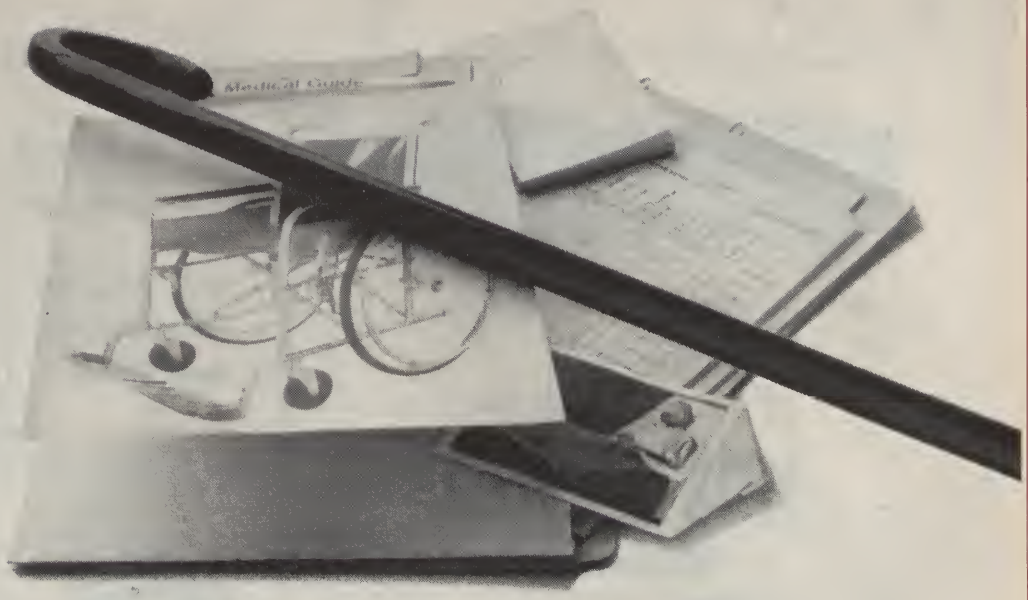
Caused by itching due to:

?

Dry Eczema	Acne
Chafing	Ivy Poisoning
Minor Burns	Cold Sores
Athlete's Foot	Heat Rash
Dry Skin	Diaper Rash
Wind Burn	Chapping
Insect Stings	Hemorrhoids

For Safe, Sure, Speedy Relief—
—Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching



New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, **Resinol Greaseless Cream** was developed. . . . A doctor's formula containing safe yet powerful ingredients, **Resinol Greaseless** contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try **Resinol Greaseless** . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

in chronic illness

B and C vitamins are part of therapy: An imbalance of water-soluble vitamins and chronic illness often go hand in hand. STRESSCAPS capsules, containing therapeutic quantities of vitamins B and C, are formulated to meet the increased metabolic demands of patients with physiologic stress. In chronic illness, as with many stress conditions, STRESSCAPS vitamins are therapy.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY

Each capsule contains:	
Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

WASHINGTON COUNTY

The Washington County Medical Society held its regular meeting at the Venice Restaurant on Thursday, May 25. **John C. Stauffer, MD** spoke and showed films on his recent experiences in Africa, where he took part in a project sponsored by Operations Cross Roads Africa, in cooperation with the Nigerian government's Ministry of Health. Since it was Ladies' Night, the wives enjoyed sharing this interesting program with the doctors. **Mr. and Mrs. John Sargeant** were guests of the local society for this meeting.

Mr. and Mrs. Robert Chatkins of Hagerstown were also present as guests on that evening. Mr. Chatkins is a pharmacist and was given a certificate by the Washington County Medical Society for outstanding service to the community and the physicians over the years.

* * * * *

The members of this Medical Society cooperated with the local health department to immunize as many children as possible in Washington County on End Measles Sunday, May 14. Some 2,735 area children were vaccinated.

* * * * *

In March the Auxiliary to the Washington County Medical Society held its annual Health Careers Day. Part of the program were tours of Western Maryland State Hospital and Washington County Hospital. **I. B. Lyon, MD,** Chief Physician, greeted the guests at Western Maryland State Hospital.

* * * * *

On Saturday, April 1, **John C. Stauffer, MD** and **James Dobbie, MD** took part in the Cumberland Valley Athletic Club's Fifth annual John F. Kennedy 50-Mile Hike. Dr. Stauffer shared fourth place with an excellent 11 hour 16 minute clocking. This was his third straight completed hike. Dr. Dobbie clocked 14 hours and 30 minutes and completed his second straight hike. Our congratulations to both of these fine physician athletes.

Dr. Stauffer also took part in the running marathon in Boston later in April.

* * * * *

Louis G. Graff, MD and **Edward W. Ditto, III, MD** attended a Post Graduate Medical Study at the University of Kansas Medical Center in Kansas City, Kansas, April 16-19. Their interest was in anesthesiology.

Lloyd Hoffman, MD and **Edson B. Moody, MD** attended a Seminar of the Northern Virginia Heart Association held in Washington D.C. in April. **John H. Hornbaker, MD** attended the American College of Physicians meeting in San Francisco, April 10-14.

John W. Clark, MD

* * * * *

BALTIMORE CITY

Board of Directors Meeting

Seven members of the Board of Directors of the Baltimore City Medical Society, were present at the monthly meeting held May 9, 1967, at 1211 Cathedral Street, Baltimore, Maryland. The meeting was called to order by the President, Harry J. Connolly, MD. A reply from Roy F. Perkins, MD, Director, Department of Health Case Services AMA, regarding the Society's interest in health manpower in the state of Maryland was

read. He pointed out that several states have indeed instituted active efforts to study local manpower conditions. Perhaps the largest such program is in California with the establishment of a Health Manpower Council. This was established as a voluntary agency to coordinate efforts in recruitment, training, and utilization of health manpower in the state. The Council states that its interest will also include environmental as well as personal health.

A problem case was referred to the Board from the Professional Relations Committee by Martin Singewald, MD. Similarly, a "problem case" was brought to the attention of the Board by R.C.V. Robinson, MD. Both complaints were referred to the State Board of Medical Examiners. Frank Kaltreider, MD, proposed that cocktails and dinner be served prior to the Society meetings with the hope of increased attendance. Martin Singewald, MD offered an alternative approach, it being to utilize various community hospitals for meetings—thus obviating the parking problem, a deterrent to good attendance. John C. Harvey, MD, voiced the opinion that this possibility also offered the likelihood of physician unification. John Wiswell, MD, stated that the Policy and Planning Committee is presently undertaking an active study relative to increasing attendance at Society meetings.

Frank Land, MD, formerly a GP, has been appointed to the Dept. of Health Education and Welfare as Director, Division of Family Services. His sole role will be with Title XIX. Mr. Sargeant advises that Dr. Land suggested meeting with BCMS. Mr. Sargeant also advises that Dr. Land will be in Baltimore to speak to the Faculty Fee Schedule Committee, May 24th.

The Board was pleased with a favorable reply to its support of Operation "Reason," from Senator Joseph Tydings. The Senator informed the Board that $300,000 has been appropriated by the Economic Opportunity Committee for the support of Operation "Reason." H. Doyl Taylor, Esq., Director, Dept. of Investigation, A.M.A., urged the Board to bring to the attention of the membership, that a very active department of the A.M.A. is involved in the investigation of problems of "Quackery." Members are urged to report their suspicions to this department.

Dr. John C. Harvey called the Board's attention to the recent Public Law 89-749. This law demands that the states formulate "one agency" to control all federal money appropriated to the state for health programs. Dr. Harvey stressed that this agency is soon to be formed and that the Society should inform the Governor of its interest in the planning and function of this agency. The Board unanimously supported this stand.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We knaw the difference between edema and enema; syndrame and symptam; sewage and sewerage. And when and why we shauld use 12 point Caslan Bold instead of 10 Stymie.

If yau, taa, need a *goad* printer, let's cammunicatel

DIARRHEA

CANTIL®
(mepenzolate bromide)

LAKESIDE

Diarrhea, one of the most vexing symptoms of common G. I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth, blurring of vision, constipation, nausea, vomiting, bloating and dizziness may occur but are usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy — withhold in glaucoma. Contraindicated in patients sensitive to phenobarbital and/or Cantil (mepenzolate bromide); in toxic megacolon, obstruction of G. I. or G. U. tract.

SUPPLIED: CANTIL (mepenzolate bromide) — 25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL — containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

Together these and many other heart and blood vessel disorders are your Number 1 health enemy. They take 981,000 U.S. lives annually, more than 54% of all deaths.

ETHICAL RESPONSIBILITIES IN PRESCRIBING DRUGS AND DEVICES

It is unethical for a physician to be influenced in the prescribing of drugs or devices by his direct or indirect financial interest in a pharmaceutical firm or other supplier. It is immaterial whether the firm manufactures or repackages the products involved.

It is unethical for a physician to own stock or have a direct or indirect financial interest in a firm that uses its relationship with physician-stockholders as a means of inducing or influencing them to prescribe the firm's products. Practicing physicians should divest themselves of any financial interest in firms that use this form of sales promotion. Reputable firms rely upon quality and efficacy to sell their products under competitive circumstances, and not upon appeal to physicians with financial involvements which might influence them in their prescribing.

Prescribing for patients involves more than the designation of drugs or devices which are most likely to prove efficacious in the treatment of a patient. The physician has an ethical responsibility to assure that high quality products will be dispensed to his patient. Obviously, the benefits of the physician's skill are diminished if the patient receives drugs or devices of inferior quality.

Inasmuch as the physician should also be mindful of the cost to his patients of drugs or devices he prescribes, he may properly discuss with patients both quality and cost.

Adopted by the Judicial Council, American Medical Association, March 12, 1967.

The MISSING LINK in Weight Control

Diet Control — **Appetite Control**

and now finally
. . . the neglected factor

Ex-Caloric Wafers *

Not marketed in combination with any anorexiant drug, since that would limit the dosage flexibility of both.

A SUBSTITUTE FOR FOOD

A DEVICE TO SATISFY THE HUNGER FOR BULK IN PATIENTS ON A REDUCING DIET.

Designed for bulk hunger . . . not laxation!

EX-CALORIC WAFERS CONTAIN NO LAXATIVE HEMICELLULOSE

ESCRIPTION:
rtificially sweetened and flavored. Each wafer contains 453 mg. of these non-nutritive, synthetic hydrophilic colloid bulking gents: carboxymethylcellulose 181 mg. and methylcellulose (400 centipoise type) 272 mg. Safe for use by diabetic patients aced on a restricted reducing diet. Usual daily intake less than 3 calories per day.

CTION:
x-Caloric Wafers produce such bulk in a part of the alimentary tract as to ordinarily impart a highly satisfactory sense of fullness r those obese patients who complain of an empty feeling ("hollow hunger") when placed on a reducing diet and deprived their between-meal snacks.

DMINISTRATION:
or 4 wafers t.i.d., a.c. or p.c. or mid-morning, mid-afternoon and mid-evening. At least 1 large glass of water must be taken ith each dose.

ONTRAINDICATIONS:
-Caloric Wafers are completely innocuous and may be administered with impunity in any necessary quantities to all obese tients, including children and the aged. The only contraindications are acute ulcerative colitis and organic intestinal obstruction.

(chlordiazepoxide HCl)

Also available as
LIBRITABS™ (chlordiazepoxide)
5-mg, 10-mg, 25-mg tablets

ROCHE

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral*—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 50. Libritabs™ (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

OFFICIAL PUBLICATION OF THE MEDICAL AND CHIRURGICAL FACULTY OF THE STATE OF MARYLAND

Whether the allergen is greenish or garish, unseen or unknown, your patient can get symptomatic relief with BENADRYL—the potent antihistamine with antispasmodic action. *INDICATIONS:* Antihistaminic, antispasmodic, antitussive, and antiemetic therapy. *PRECAUTIONS:* Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this product. Hypnotics, sedatives, or tranquilizers if used with diphenhydramine hydrochloride should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing diphenhydramine hydrochloride. *ADVERSE REACTIONS:* Side effects are generally mild and may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, blurring of vision, vertigo, headache, muscular aching, thickening of bronchial secretions, restlessness, and insomnia have been reported. Allergic reactions may occur.

BENADRYL is available in Kapseals® of 50 mg. and Capsules of 25 mg. 00867

The pink capsule with the white band is a trademark of Parke, Davis & Company.

(LTR22)

in vivo measurement of LUTREXIN (Lututrin) on contracting uterine of the guinea pig.

"George wants to know if it's okay to take his cold medicine now, Doctor, instead of seven o'clock?"

The long-continued action of Novahistine LP should help you both get a good night's sleep. Two tablets in the morning and two in the evening will usually provide round-the-clock relief by helping clear congested air passages for freer breathing. Novahistine LP also helps restore normal mucus secretion and ciliary activity—normal physiologic defenses against infection of the respiratory tract. Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

There are 35,700* undetected diabetics in Maryland

Most of these are probably among patients over 40; the overweight; relatives of diabetics, and mothers of large babies. By the time polyphagia, polyuria, polydipsia, pruritus or other overt symptoms of diabetes appear, damage may have been done that could have been minimized. DEXTROSTIX® gives you a reliable blood-glucose estimate in 60 seconds.

Why Wait?

Volunteer Physicians For Viet Nam

AMA Volunteer Physicians for Viet Nam is a program for supplying medical care to the civilian population of South Viet Nam through the volunteer services of US physicians.

It is administered by the *AMA* and financed by the United States Agency for International Development (*USAID*).

Physicians sent to South Viet Nam under the program serve a 60-day tour to duty at one of 16 provincial civilian hospitals. The volunteer receives only his transportation and an expense allowance of 10 dollars a day; otherwise his services are entirely unpaid.

At the hospitals the volunteers will work with teams of military physicians and corpsmen. These teams, assigned to *USAID* for service in provincial civilian hospitals, provide continuity in the volunteer program.

Twenty-four to 32 physicians are needed every month to keep hospital staffs at full strength. Most needed are general practitioners, internists, general surgeons and orthopedic surgeons. As of June-July, 1966, the greatest demand is for general and orthopedic surgeons to treat war wounded civilians. Small numbers of specialists in the fields of chest diseases, ophthalmology, otolaryngology, radiology and psychiatry are needed from time to time. Other specialists cannot be used at present but inquiries are invited in anticipation of future demands. Because of conditions in Viet Nam only male physicians are accepted. Non-physicans are not recruited.

Information about the program may be obtained by contacting:

AMA Volunteer Physicians for Viet Nam
American Medical Association
535 North Dearborn Street
Chicago, Illinois 60610

THE BACKGROUND:

Twenty-five years of war and insurrection in the area now known as South Viet Nam has placed tremendous health burdens on the people. To the ever-present diseases and malnutrition of Southeast Asia have been added war injuries, disruption of whatever public health measures existed, and a serious lack of doctors and nurses as more and more of the country's approximately 1,000 physicians were called into military service. Today only about 350 physicians are left to administer health care to 15 million Vietnamese civilians.

South Vietnamese authorities have asked the US government to encourage American physicians to volunteer their services to Vietnamese civilians.

Out of this request grew a program financed by the US government through the State Department's Agency for International Development (*AID*). Created to recruit US physicians for volunteer 60-day tours of service at Vietnamese civilian hospitals, the program was at first administered by People-to-People Health Foundation, Inc., with the *AMA* assisting in recruitment. At this point the program was called *Project Viet-Nam.*

After successfully implementing *Project Viet-Nam* on a pilot basis, People-to-People Foundation asked that the program be turned over to some other responsible agency, preferably the *AMA*. At the invitation of the Agency for International Development, the *AMA* assumed administrative responsibility on June 30, 1966, when the contract between the *USAID* and People-to-People Health Foundation, Inc. terminated. Under the aegis of the *AMA*, the program is known as *AMA* Volunteer Physicians for Viet Nam.

When the problem is only skin deep

USE 'POLYSPORIN'® brand POLYMYXIN B-BACITRACIN OINTMENT

for topical antibiotic therapy with minimum risk of sensitization

Caution: As with other antibiotic products, prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

Supplied in ½ oz. and 1 oz. tubes.

Complete literature available on request from Professional Services Dept. PML.

BURROUGHS WELLCOME & CO. (U.S.A.) INC.
Tuckahoe, N.Y.

THE CHALLENGE TO THE PHYSICIAN:

An American physician faces challenges in Viet Nam that most US doctors see only in textbooks. Important causes of death in South Viet Nam are malaria, tuberculosis, intestinal parasitism and other intestinal diseases, pneumonia, meningitis, typhoid fever, and a wide range of war wounds caused by mines, booby traps, small arms fire, and air or artillery bombardment. Thousands of civilians need treatment and rehabilitation after war injuries.

Diseases causing disability throughout the population include trachoma (four-fifths of the people infected at one time or another), leprosy, bacillary and amebic dysentery, smallpox, and nutritional disorders.

South Viet Nam has about 120 hospitals, of which 101 serve civilians. All are overloaded; at times, two or even three patients have been accommodated in a single bed.

Physicians serving through *AMA* Volunteer Physicians for Viet Nam are placed in government-operated hospitals in rural areas, where the need is greatest. All are in so-called pacified regions where the Viet Cong do not routinely conduct military operations in the open, although they are presumed to be nearby at all times.

Military teams in the civilian provincial hospitals will each comprise three medical officers, one administrative officer, and twelve enlisted men (corpsmen). Their responsibility will be for the civilian population in the province to which they are assigned.

RECRUITMENT:

To be accepted as a volunteer the physician must be in good health and not more than 55 years old. No dependents may accompany the volunteer, even if the dependent is medically qualified.

A passport and visa are required of all volunteers going to Viet Nam, and assistance is given the physician in obtaining them. The volunteer also must have a certificate of vaccination against smallpox and inoculation against cholera, received in the last four to six months. Immunization against plague, typhoid, tetanus, typhus and polio are recommended by *WHO*.

Transportation is supplied from the physician's home to Viet Nam and return. A standard baggage allowance of 44 pounds, plus an additional 22 pounds, is permitted.

Housing is provided in Viet Nam in available hotels or apartments. Each volunteer physician receives an expense allowance of 10 dollars a day. Expenses connected with passport, visa and immunization are paid by *USAID* through *AMA* Volunteer Physicians for Viet Nam. Each volunteer is covered, while in Viet Nam, by a $50,000 all-risk insurance policy at no expense to himself.

Upon arrival in Saigon the volunteer will be met by the Field Director of *AMA* Volunteer Physicians for Viet Nam or an associate, and directed to the proper destination. The Field Director also assists hospital staffs with supply and logistical problems.

Wounds, abscess, cellulitis

...and the complications of staph.

Staph reliably controlled with specific therapy

suitable dosage form for every staph situation

From time of birth, the child is exposed to a whole range of potential staph infections: wounds; secondarily infected dermatoses; primary lesions, such as deep impetigo (ecthyma), boils and felons; and more serious conditions such as osteomyelitis, staph pneumonia and staph meningitis.

Bactericidal

Hardly a staph organism can resist the bactericidal action of Prostaphlin® (sodium oxacillin), as shown by a 34-month *in vitro* study. Of all staph isolates tested, 99.5% were sensitive to oxacillin.[1]

Clinically Proven

There is a high correlation between these *in vitro* findings and clinical results. Of 610 patients treated with Prostaphlin (sodium oxacillin), 89.8% were reported cured or improved, including those with staph infections resistant to penicillin G.[2] And since resistance does not appear to develop *in vivo*, therapy with oxacillin can be extended when necessary.

Outstanding Safety Record

Besides being staph-specific and rapidly absorbed—Prostaphlin (sodium oxacillin) has established an outstanding record of safety during five years of widespread clinical use. Continuous high blood levels of oxacillin have not produced toxic effects on kidney function, assuring a significant margin of safety. However, as with all penicillins, the possibility of allergic response should be considered.

Capsules, Oral Suspension and Injectable

Prostaphlin (sodium oxacillin) is available in three flexible dosage forms to suit the age of the patient and severity of infection—an oral solution for pediatric use, capsules, and multi-dose vials for injection.

PRESCRIBING INFORMATION: For complete information, consult Official Package Circular. *Indications:* Infections caused by Staphylococci, particularly those due to penicillin G-resistant Staphylococci. *Contraindications:* A history of severe allergic reactions to penicillin. *Precautions:* Typical penicillin-allergic reactions may occur. Safety for use in pregnancy and premature infants is not established. Because of limited experience, use cautiously and evaluate organ system function frequently in neonates. Mycotic or bacterial superinfections may occur. Assess renal, hematopoietic and hepatic function intermittently during long-term therapy. *Adverse Reactions:* Skin rashes, pruritus, urticaria, eosinophilia, nausea, vomiting, diarrhea, fever and occasional anaphylaxis. Rare cases of reversible hepatocellular dysfunction have occurred. Moderate SGOT elevations have been noted. Thrombophlebitis has occurred occasionally during intravenous therapy and leukopenia was noted in two cases. *Usual Oral Dosage:* Adults: 500 mg. *q.* 4 or *q.* 6 *h.* Children: 50 mg./Kg./day. *Usual Parenteral Dosage:* Adults: 250-500 mg. *q.* 4 or *q.* 6 *h.* Children: 50 mg./Kg./day. Treat beta-hemolytic streptococcal infections for at least 10 days. Give oral drug 1 to 2 hours before meals. *Supplied:* Capsules—250 and 500 mg. in bottles of 48. Injectable—250 mg., 500 mg., and 1 Gm. dry filled vial for I.M./I.V. use. For Oral Solution—100 ml. bottle, 250 mg./5 ml. when reconstituted. **A.H.F.S. CATEGORY 8:12.16**

BRISTOL

BRISTOL LABORATORIES/Division of Bristol-Myers Co., Syracuse, N.Y.

Whenever you suspect staph PROSTAPHLIN®

SODIUM OXACILLIN

"You're up ten pounds since your last physical. We're going to have to do something about that."

Get them while they're easily reversible.

Obesity doesn't happen suddenly. This insidious process has its beginning—and the chances of reversing it are better—during the *first 10 to 15 pounds of weight gain.* When a new dietary pattern must be established, consider the adjunctive use of BAMADEX SEQUELS. Combining the proven *anorexigenic* action of d-amphetamine with the *tranquilizing* effect of meprobamate, BAMADEX SEQUELS controls appetite throughout the day, usually with a single capsule daily.

Contraindications: Dextro-amphetamine sulfate: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.
Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.
Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness. Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

EXECUTIVE SECRETARY'S NEWSLETTER

August, 1967

SEMIANNUAL SESSION

Plans are now complete for the Semiannual Session of the Faculty in Ocean City on September 8 and 9. Meetings of various specialty groups are also scheduled during these two days.

Headquarters for the meeting is the DIPLOMAT MOTEL, 26th & Boardwalk, Ocean City, Md.

Full details on the sessions are in the mail to all members.

ANNUAL MEETING AND CRUISE CONVENTION

The 1968 Annual Meeting is scheduled for April 17 to 19, followed by a Cruise Convention aboard the SS Argentina, April 21 to 28. Reservations for the cruise convention may be made during the Ocean City meeting.

NEWS NOTES

Donald B. Cheek, M.D., Baltimore, has been selected to receive the 1967 Borden award of the American Academy of Pediatrics.

Donald K. Wallace, M.D., Baltimore, recently began a two-month tour of volunteer service to the civilian population of South Viet Nam under the auspices of the AMA Volunteer Physicians for Viet Nam program.

Leonard Scherlis, M.D., and Thomas Connor, M.D., have both been named full Professors at the University of Maryland School of Medicine.

Jess V. Cohn, M.D., Baltimore, has been reappointed Editor of the NEWSLETTER of the Association of Medical Superintendents of Mental Hospitals.

Martin J. Birnbaum, M.D., Baltimore, has joined the offices of Drs. Copeland, Hyman, Shackman and Stofburg, in the practice of diagnostic and therapeutic radiology.

Harold Rosen, M.D., Baltimore, has written a book that went to press recently and is scheduled

for publication in the fall. Its title is ABORTION IN AMERICA.

RUBELLA ALERT PROJECT

The State Health Department is sponsoring a Rubella Alert Project. Its purpose is to determine the number of children born following the Rubella epidemic of the 1964 winter who have handicaps as a result of their mothers having rubella during the pregnancy.

It is hoped to identify the children clinically so as to determine the diagnosis and attempt remedies prior to reaching school age.

It is hoped that physicians will cooperate in this mass program and identify the children clinically for the State Department of Health's rubella registry.

AMERICAN MEDICAL ASSOCIATION MEETINGS

Once again, physicians throughout the State are reminded that they have the opportunity to to speak before the various Reference Committee meetings of the AMA on any subject in which they might be interested.

Unfortunately, it is not generally realized that all physicians, whether they be AMA members or not, have this privilege.

In this manner, a complete cross-section of opinion on subjects of major importance can be obtained.

AMA CONFERENCE

A regional Conference, for Maryland and surrounding states, on Aging and Long-Term Care has been scheduled for November 2 - 3 at the Emerson Hotel, Baltimore. The conference is sponsored by the AMA Committee on Aging. Interested parties should contact the Faculty office for further information.

NOT A CURE ALL—BUT
THE BEST AIDE KNOWN

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

MEDICAL NEWS

From Baltimore

JOHN M. DENNIS, MD

John M. Dennis, MD, Baltimore, will assume office as a Councilor of the Medical and Chirurgical Faculty at the conclusion of the 1968 Annual Meeting. Dr. Dennis represents the Central District along with others from that area.

Dr. Dennis is currently the Professor of Radiology and Head, Department of Radiology at the University of Maryland School of Medicine. A native of Maryland, he obtained his BS and MD degrees from the University of Maryland, where he also interned and completed his radiology residency. He served for an additional year as a Fellow in Radiology at the Hospital of the University of Pennsylvania.

From 1946-48 he served in the US Army as Chief of Radiology at the Station Hospital, Langley Air Force Base, Virginia.

He is the author of numerous publications and has served as an officer of the American College of Radiology; Maryland Radiological Society; Maryland Division of American Cancer Society; and the Medical Board of the University of Maryland Hospital.

From Washington

AMERICAN MEDICAL ASSOCIATION TO SPONSOR NINTH NATIONAL CONFERENCE ON THE MEDICAL ASPECTS OF SPORTS

The Ninth National Conference on the Medical Aspects of Sports, sponsored by the AMA under the auspices of its Committee on the Medical Aspects of Sports, will be held in Houston, Texas, at the Hotel America on November 26, 1967. The Conference is held annually in conjunction with and on the first day of the Clinical Convention of the AMA.

As was true of the previous eight Conferences, the Ninth will cover a wide range of subjects of interest to those serving school and college athletic programs. Included will be forums and discussion sections relating to prevention of knee injuries, sports cardiology, and quackery in sports. Two sessions will be devoted to a series of common clinical conditions of rather variable significance in the athletic setting (eg., gastroenteritis, concussions, genitourinary tract injuries, and rib injuries). At the Conference Luncheon, Eduardo Hay, MD, Director General of the Centro Deportivo Olimpico Mexicano, will discuss the preparations for the 1968 Olympic Games.

The Conference is open to key non-medical athletic personnel as well as interested physicians. Those who would like to receive further information concerning the Conference should address the Committee on the Medical Aspects of Sports, AMA, 535 North Dearborn Street, Chicago, Ill. 60610.

* * * * *

John W. Gardner, secretary of Health, Education and Welfare, called on the medical profession and others in the health field to "search for new and less expensive ways of doing things."

This was the main theme of his talk at the

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

Manufacturers of ethical pharmaceuticals since 1856

windup session of a two-day National Conference on Medical Costs attended by 300 physicians, hospital administrators and other leaders in the various aspects of health care. He said the conference discussions "reflected a universal recognition that change is necessary."

"We cannot go on as we have in the past," Gardner said. "New patterns will be necessary. Those who entertain some apprehension as to what the new patterns will be had better plunge in and experiment with their own preferred solutions . . . Standing back and condemning the solutions that others devise won't stem the tide of change. . . .

". . . . there is not yet any agreement as to what a more perfect system would look like. It seems likely that we will go through a period of experimentation and in true American fashion may end up with several variations in different parts of the country, suiting local preferences and conditions.

"Whether the health care system or the future should develop around the hospital as an organizational focus, or around the payment mechanism, or around group practice plans, or around all of these in some sort of collaboration with State health planning councils—or whether other variants will emerge—is still a wide-open question. . . .

"Essentially . . . the challenge is before the health profession. They must join the search for solutions. They must be willing to re-examine and overhaul long-established practices. The search for new and better and less expensive ways of doing things must be carried on by hospitals, medical schools, community agencies, and by the thousands of individual physicians serving the health needs of people. . . .

Acceptance of such responsibility by those in the private sector, Gardner said, "is the best insurance against the government having to shoulder more than its share of corrective measures."

Citing appointment of an advisory committee to study hospital effectiveness, Gardner said that *HEW* will do its part in the search for more efficient practices. The committee is to report by the end of this year.

Dr. Milford O. Rouse, president of the *AMA*, commended the Administration "for showing its concern for rising health care costs by calling a national conference on the problem.

"The American Medical Association and its member physicians pledge to accept their responsibilities in finding solutions to this vital problem," he said. "We expect that other full members of the health team—dentists, hospitals, nurses, pharmacists and pharmaceutical companies, the insurance industry and others—will do likewise.

"We hope the Administration will also accept its responsibility to find ways to ease the burden of inflation which contributes substantially to inflating the cost of medical care. We hope the Administration will call a moratorium on new health legislation until existing programs can be critically evaluated to eliminate overlapping and duplication and to achieve maximum conservation of tax funds. We hope available tax money, particularly in the health field, can be used to help those who really need help while allowing our more fortunate citizens to accept responsibility for their own care."

* * * * *

Congress passed and President Johnson signed into law a bill that extends the program of grants for the construction of community health centers for three years.

It authorizes the appropriations of $50 million for fiscal year 1968 and $70 million for 1970.

The amended law also extends the program of grants for the initial staffing of community mental health centers for an additional two years (until 1970) and authorizes the appropriation of $26 million for fiscal 1969 and $32 million for fiscal 1970. An appropriation of $30 million already was authorized for fiscal 1968.

* * * * *

President Johnson signed into law legislation extending the draft for four years. It includes a provision continuing special pay for physicians and dentists.

The new law also continues the authority to defer medical students until completion of internship. In the future, foreign physicians in this country will be liable to draft up to age 35—the same as for Americans. Under the old law, foreign physicians were exempt from age 26.

The present blanket military exemption for Public Health Service officers serving on loan to other agencies such as Food and Drug Administration was removed despite protests by the agencies involved. Such assignments with draft exemption can now be made only to the Coast

Guard, Bureau of Prisons and Environmental Services Administration. The *AMA* had asked Congress to allow no draft exemptions for non-military service.

* * * * *

The President of the *AMA* said that Sargent Shriver, Director of the Office of Economic Opportunity, was in error when he accused the *AMA* of being opposed to medical care for the poor because the *AMA* is opposed to the *OEO's* slum health care centers.

Milford O. Rouse, MD, Dallas, Texas, the *AMA* president said the *AMA* is opposed to the *OEO* projects because the health care problems in the slums can be taken care of under existing programs, particularly *Medicaid.*

"There is already too much proliferation of wasteful, overlapping federal health programs," Dr. Rouse said.

"Also of concern to physicians is the fact that at times it seems that government is too quick to set up health care programs without consulting with those who know most about health care—physicians."

The *AMA* president also said Shriver was misinformed about *AMA's* position on helping those who need help.

"I am now and always have been in full accord with *AMA's* long-standing position that those who need help in financing health care should receive it," Dr. Rouse said.

"The *AMA,* however, is opposed to the doling out of tax funds to the wealthy and well-to-do. The expenditure of public funds for those who can well afford to finance their own health care limits the amount of resources available to those who do need it. Such a policy cannot be justified morally or economically."

THE WORLD MEDICAL ASSOCIATION, INC.

Individual membership in the World Medical Association is now open to all members of the American Medical Association.

Dues are $10 per year. This includes a subscription to *World Medical Journal* and the privilege of participation in the World Medical Assem-

bly each year.

The 21st World Medical Assembly will be held in Madrid, Spain, September 10-17, 1967. The 1968 Assembly will be held in Australia.

The World Medical Association is a society of the free, professional medical associations of the free nations. Sixty national medical associations are members, including the *AMA*.

The 20th *World Medical Assembly* last winter in Manila created for the first time an individual associate membership within the *WMA*. Members of the national medical associations may now join *WMA* as individuals.

Gerald D. Dorman, MD, of New York City, member of the *AMA's* Board of Trustees, is Chairman of the Council, governing body of the *WMA*. The *WMA* Headquarters Secretariat is located at 10 Columbus Circle, New York City. Secretary General is Alberto Z. Romualdez, MD.

Application for individual membership may be made to *WMA* at the New York City office. Applications should be accompanied by a check for $10, with a statement that the applicant is a member in good standing of *AMA*. The letter should specify whether the applicant wishes to receive the *World Medical Journal* in the English, Spanish or French language edition. Checks should be made payable to *The World Medical Association, Inc.*, a tax-exempt organization. Five-year memberships are available for $50. Information regarding the 21st *World Medical Assembly* will be mailed promptly to all applicants for individual membership.

"The World Medical Association," said Dr. Dorman, "is uniquely qualified to act as a force for peace and understanding in the world today. *WMA* is a very real and vital part of the world health picture, continually seeking to solve world medical problems through the community spirit and action of its professional membership."

Dr. Dorman made it clear that *WMA* has no connection with any government, that it is committed to the philosophy that medical and scientific knowledge should be universally available and free of all political control.

The *WMA* is present at conference tables around the world where decisions are made affect-

In peptic ulcer... antacid therapy with a new benefit

CONTAINS A BALANCED COMBINATION OF THE MOST WIDELY USED ANTACIDS— FOR RAPID NEUTRALIZATION. PLUS SIMETHICONE— TO CONTROL THE FACTOR WHICH ANTACIDS ALONE CANNOT INFLUENCE.

Mylanta®

- In Mylanta, aluminum and magnesium hydroxides are balanced to minimize the chance of constipation or laxation and still achieve rapid acid neutralization and pain relief.
- The positive action of simethicone helps relieve the painful gas symptoms which often accompany the peptic ulcer syndrome.
- The nonfatiguing flavor and smooth, nongritty consistency of tablets and liquid encourage continued patient cooperation during long-term therapy.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) of liquid contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. **Dosage:** one or two tablets, well chewed or allowed to dissolve in the mouth, or one or two teaspoonfuls of liquid to be taken between meals and at bedtime.

The Stuart Company, Pasadena, California
Division of Atlas Chemical Industries, Inc.

Stuart

ing the practice of medicine—and where the practicing physician's free enterprise viewpoint would not ordinarily be considered, he said.

"Thanks to *WMA,* the individual doctor has an effective, recognized international voice in health and professional matters now being considered by such government organizations as the World Health Organization (*WHO*), United Nations Educational, Scientific and Cultural Organization (*UNESCO*), International Labor Organization (*ILO*), International Social Security Association (*ISSA*), and other governmental and non-governmental bodies."

WMA was organized in 1947. In 1965 it was incorporated as a non-profit educational and scientific organization under the laws of New York State, *USA*. With incorporation of *WMA* it was possible to obtain tax-free status recognition on funds donated to the organization.

PRACTITIONER-TRAINEE FELLOWSHIPS

Radiotherapy Fellowship for the Practicing Radiologist

A one-month Fellowship in radiotherapy is available immediately under the auspices of the Georgetown University Medical Center and under the direction of J. Robert Andrews, MD, Director of Radiotherapy at the Center and Chief of the Radiotherapy Section, Washington Veterans Administration Hospital. The Fellowship is designed as a refereshser experience in radiotherapy for the general radiologist doing radiotherapy in community hospitals. The Fellowship will stress practical aspects of cancer radiotherapy and will include operations with X-ray and cobalt-60 machines, orientation in cancer chemotherapy, and participation in tumor clinic conferences.

Cancer Chemotherapy Fellowship for the Practicing Physician

A one-month Fellowship is available to practicing physicians in the field of cancer chemotherapy. This is designed for interested physicians in all fields who would like to obtain experience with standard and investigational chemotherapeutic agents as well as with the special aspects of the care of cancer patients on an oncology service and in clinics. These programs are in progress at the District of Columbia General Hospital, the Veterans Administration Hospital, and the George-

After the picnic even Gramps Was a victim of intestinal cramps

Parepectolin for quick relief of acute diarrhea
... soothes colicky pain with paregoric*
... consolidates fluid stools with pectin

Fort Washington, Pa.

town University Hospital under the direction of Bruce I. Shnider, MD, Professor of Medicine, Director, Division of Medical Oncology, Department of Medicine, and Chairman of the Eastern Cooperative Oncology Group. Dr. Shnider is assisted in this program by Drs. G. Lennard Gold, Clinical Associate Professor of Medicine, John J. Lynch, Clinical Instructor in Medicine, and Pedro Matias, Instructor in Medicine. Fellowships are available for a one-month period.

Fellowship in the Practice of Nuclear Medicine

A one-month Fellowship in nuclear medicine is available immediately at the Georgetown University Medical Center under the direction of August Miale, Jr., MD, Director of the Radioisotope Unit. This program is designed to present more recent advances in the use of radionuclides in the diagnosis of cancer. Particular attention will be directed to the use of new instrumentation such as the scintillation camera for both static and dynamic studies of various organ systems. The Fellowship is best suited for those individuals practicing nuclear medicine particularly in community hospitals where such techniques have only recently been introduced. Previous experience in radioisotopes with licensure under the Atomic Energy Commission or State Boards is a prerequisite.

Fellowship in Surgical Oncology

A one-month Fellowship in surgical oncology is available under the direction of John F. Potter, MD, Associate Professor of Surgery and Head of the Division of Oncologic Surgery. The program includes refresher experience in the clinical diagnosis of malignant neoplasms and in the scope and techniques of appropriate surgical biopsy. The principles of current surgical treatment and observation of cancer operations are included in the program. Participation in clinics and cancer conferences is included.

For further information contact J. Robert Andrews, MD, Co-Director of the Program, Georgetown University Medical Center, Washington, D. C.

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

The Executive Committee at its July 13 meeting took the following actions:

1. Supplied a list of three names to the State Health Commissioner from which he will select a Faculty representative to serve on the Advisory Council to the Regional Medical Programs.

2. Approved cruise convention allowances for the 1968 Cruise Convention.

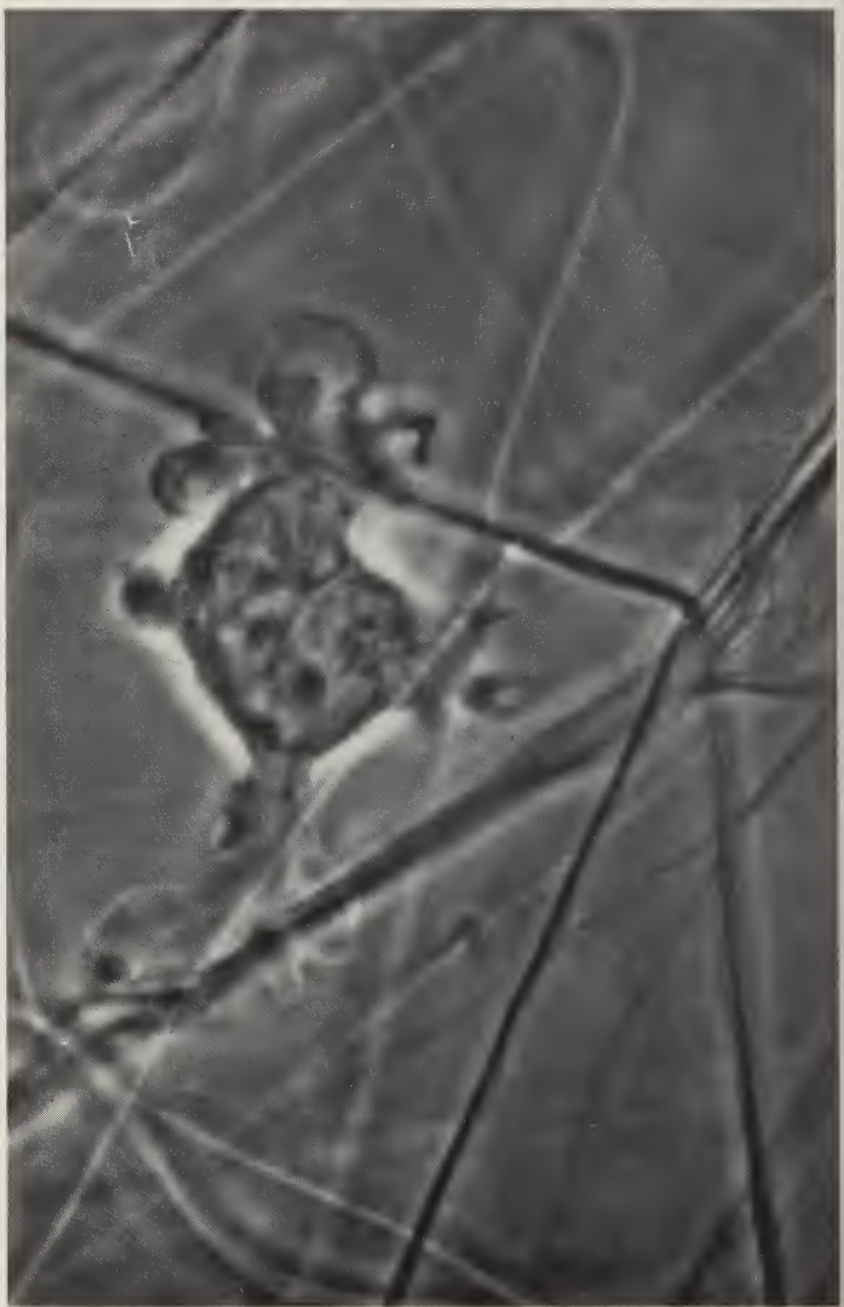
3. Endorsed a State Health Department project to seek out the children born following the 1964 winter rubella epidemic so as to, "identify the children clinically, educate the public to be aware of the problem and seek early medical care, and to mobilize the Heath Department and educational facilities to meet the diagnostic and educational needs of these . . . children."

4. Approved minor changes in the rate structure of the Faculty's Professional Liability program.

5. Heard that the appeal of Leonard Flax, MD, against the decision of the Executive Committee to a six-month suspension of Faculty membership had been denied by the AMA Judicial Council.

6. Deferred discussion on the newly proposed Rehabilitation Center on Montebello Hospital grounds until the medical director of this Center could be present to discuss it in detail.

7. Established a Liaison Committee with the Health Department so as to promote more effective "cooperation, candor and confidence," between the two groups, especially in connection with the Title 19 program.



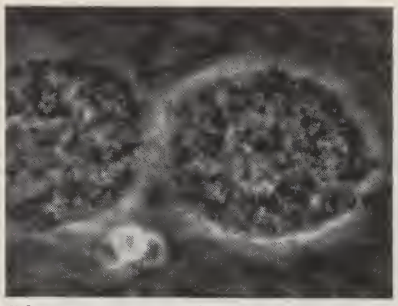
8. Approved mailing of a joint letter to be signed by the AMA President, the Faculty president and Component Presidents in connection with medicine's future.

INFLAMMATION:
A cellular fight for life

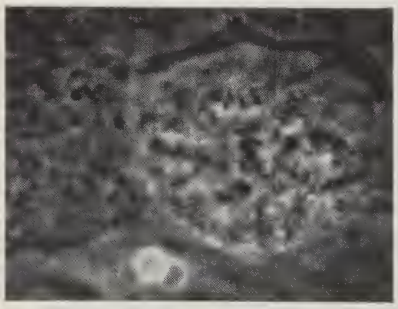
A SYNTEX REPORT based on recently developed hypotheses about topical corticosteroids, including the cellular theories of inflammation by Thomas F. Dougherty, Ph.D., University of Utah.

You are looking at a fibroblast fighting for life. This cell—one of the most common found in connective tissue—has literally been poisoned by cytotoxins released from other cells that have ruptured. Soon, if the abnormal activity of this fibroblast does not cease, it, too, will rupture and die—one more casualty in the inflammatory wave of destruction precipitated by injury.

Until a short time ago no one had ever witnessed such a scene at the cellular level. Now, through advanced cinemicrographic techniques, it is possible to view and photograph the inflammatory process as produced experimentally in living animal tissue. This method permits new insight into the mechanism of inflammation and the role of corticosteroids in therapeutic management. Equally important, these techniques shed new light on factors that may make one corticosteroid more effective than another—factors that can be correlated with other chemical, biologic, and clinical parameters.



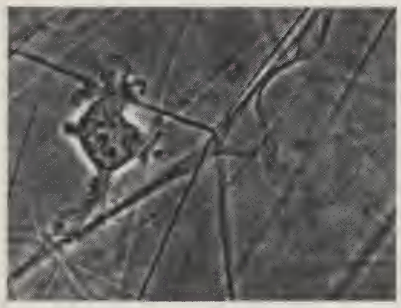
Visual evidence of how corticosteroids influence the inflammatory reaction



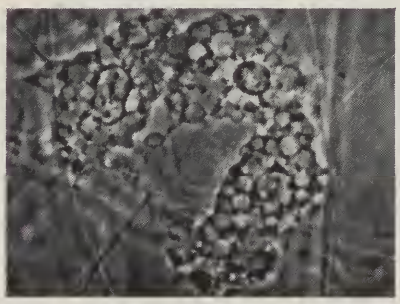
Working with phase-contrast cinemicrography on living animal tissue, Doctors Thomas F. Dougherty and David Berliner of the University of Utah College of Medicine have actually filmed cellular events that occur during the inflammatory reaction. This remarkable study* and additional work by these investigators, as well as by others, have established a new theoretical biologic basis for the antiinflammatory effect of the corticosteroids. (It must be noted that other theories, such as the lysosome or so-called "suicide bag" theory, have been postulated, although it is quite likely that there are more similarities than differences among the various theoretical models.)

The inflammatory wave of destruction

In this investigation an injurious injection of gelatin is used to set off an inflammatory reaction in living mouse tissue. What follows is a wave of destructive cellular activity that comprises the inflammatory response to injury. Mast cells (which contain heparin, serotonin and histamine) take up water, swell and rupture, releasing their contents, which are toxic outside the mast cell wall. These toxins, in turn, cause disintegration of other cells (such as fibroblasts) and the release of additional toxic material. Capillaries, too, take up water and leak unformed blood elements, causing edema. And polymorphonuclears, lymphocytes and perithelial cells invade the inflamed site. As a result of all these changes, the cellular environment reaches a state of turmoil.

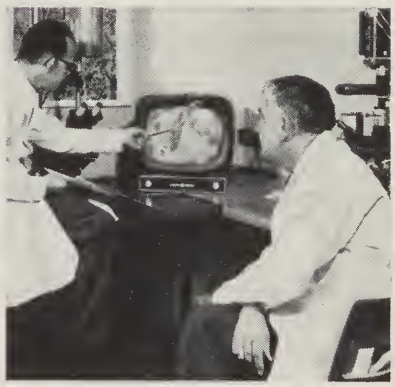


Phase-contrast microscopy showing mast cell before injury.



Mast cell (after injury) has broken up and released cytotoxins.

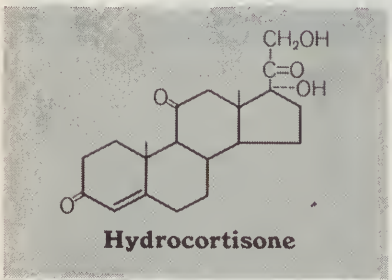
How corticosteroids change the picture



Corticosteroids appear to virtually stop the abnormal cellular activity that constitutes the inflammatory reaction. This permits the body's natural resources to clear up the inflamed area and repair the damaged tissue. This interpretation is supported by the fact that when the injurious gelatin solution is injected simultaneously with a corticosteroid —Synalar (fluocinolone acetonide)— the inflammatory pattern simply does not develop.

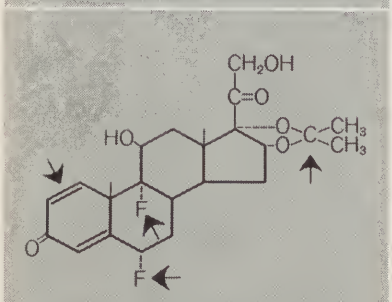
Fibroblast in high state of activity, much distorted.

Mast cells showing effects of corticosteroid action: cells are normal in size, shape and activity.



In summarizing his study Doctor Dougherty states: "...we also feel this work may explain why one corticosteroid helps a patient more rapidly and effectively than another. If it does, it is because one corticosteroid is the fastest, most effective inhibitor of the series of inflammatory events at the tissue level."

*A New View of Corticosteroid Action in Inflammatory Dermatoses, a film based on this study, is now available from your Syntex representative.

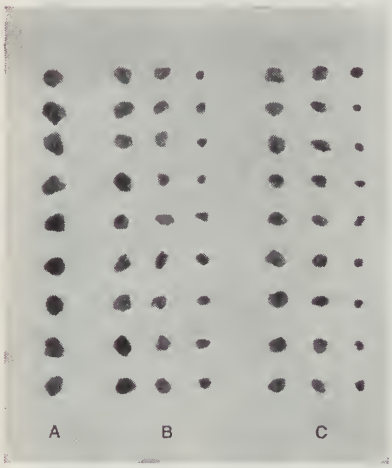


See last page for contraindications, precautions, side effects and dosage.

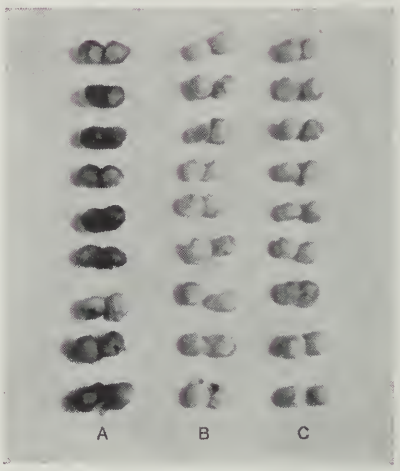
How advances in chemical design have achieved greater steroid potency

The chemical modification of corticosteroid molecules from the advent of hydrocortisone to the development of Synalar (fluocinolone acetonide) is a prime example of how biochemists can "design" to increase therapeutic activity and minimize undesirable side actions. Below, for example, we see the important changes that were made in reference to the hydrocortisone molecule to produce fluocinolone acetonide, one of the most active of all topical corticosteroids. As a result, a 0.01% preparation of Synalar (fluocinolone acetonide) has been reported to do the work of a 1% hydrocortisone product containing 100 times more cortiscosteroid. And it can often do it more effectively.

Hydrocortisone



Fluocinolone Acetonide (Synalar)



- ☐ *a double bond between carbons 1 and 2*
- ☐ *fluorine substitutions at* both *the 6-α, and the 9-α positions*
- ☐ *the addition of the acetonide at the 16-α, 17-α positions, thus providing one of the most potent topical corticosteroids available.*

How bioassay tests are used to "predict" therapeutic potential

Biologic assays are another tool used by researchers to help establish the relative activity of corticosteroids. To date no single method of assaying corticosteroid activity has emerged as the ideal "yardstick" for predicting therapeutic potential. Taken together, however, these methods have proved useful. When such tests are run on various corticosteroids, a definite order of corticosteroid activity becomes evident. Compounds with the highest order of activity may be expected to merit clinical trial to establish their high therapeutic potential. When assayed by these methods, fluocinolone acetonide (Synalar) emerges as one of the most active topical corticosteroids, milligram for milligram, available for clinical application today.

THE THYMUS INVOLUTION ASSAY[1-4] is run on adrenalectomized rats. The sizes of the glands are measured, and the degree of involution caused by the steroid is determined as an indication of its potency. In the above photo, the comparative involution of thymus glands achieved with hydrocortisone and Synalar (fluocinolone acetonide) is shown. Untreated controls (A) show normal size. Group B—injected with 1, 2 and 4 mg. of hydrocortisone—show progressively smaller thymuses as does Group C—injected with fluocinolone acetonide—but with only 1/500th the dose of hydrocortisone.

THE ANTIGRANULOMA ASSAY[1-4] also utilizes adrenalectomized rats. Granulomas are induced by subcutaneous implantation of cotton pellets on either side of the thorax. The degree of granuloma inhibition achieved by a steroid reflects its potency. The above photo shows the inhibition of granuloma formation achieved with hydrocortisone and Synalar (fluocinolone acetonide). Untreated controls (A) show large, red granulomas adhering to the pellets. Group B, receiving hydrocortisone and Group C, receiving fluocinolone acetonide, show little, if any, granuloma formation. Fluocinolone acetonide produced the same effect as hydrocortisone with only 1/500th the dose. This assay, as well as the thymus involution assay, measures systemic rather than topical corticosteroid activity. Nevertheless, results by these methods correlate well with other assays and with the milligram potencies of topical steroids in current clinical use.

Worldwide clinical experience confirms the predictable therapeutic potential of Synalar

It is particularly gratifying that the promise of the advanced chemical design and high order of bioassay activity of Synalar (fluocinolone acetonide) has been confirmed by widespread therapeutic application. Indeed, the impressive clinical response rate of Synalar has been documented in no fewer than 232 papers from 22 countries.

Representative Clinical Results with Synalar*

Efficacy Documented in over 4,000 Patients

Condition	Number of Publications	Number of Patients	Significant Improvement†
Contact Dermatitis	27	750	713
Eczematous Dermatitis	21	472	409
Seborrheic Dermatitis	18	442	426

*Complete bibliography on request.

†Expressed by the authors as excellent, very good, good, complete remission of inflammation, etc.

PRESCRIBING INFORMATION

For initiation of therapy: Cream 0.025%, 5 and 15 Gm. tubes, 425 Gm. jars; *for emollient effect:* Ointment 0.025%, 15 Gm. tubes; *for maintenance therapy:* Cream 0.01%, 15 and 45 Gm. tubes, 120 Gm. jars; *for intertriginous or hairy sites:* Solution 0.01%, 20 cc. and 60 cc. plastic squeeze bottles; *for infected inflammatory dermatoses:* Neo-Synalar® Cream (0.025% fluocinolone acetonide, neomycin sulfate, equivalent to 0.35% neomycin base), 5 and 15 Gm. tubes.

CONTRAINDICATIONS: Tuberculous, fungal, and most viral lesions of the skin, (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. PRECAUTIONS: Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. Prolonged use of any antibiotic may result in overgrowth of nonsusceptible organisms; if this occurs, appropriate therapy should be instituted. When severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. SIDE EFFECTS: Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. The neomycin in Neo-Synalar Cream rarely produces allergic reactions.

AMA PRESIDENT 1967-1968

MILFORD OWEN ROUSE, MD

Milford O. Rouse, MD, Dallas, Texas, took office as the Association's 122nd president in June, 1967, for a one-year term.

Before being named president-elect in 1966, Doctor Rouse served as speaker of the House of Delegates from June, 1963, and as vice-speaker in the preceding four years.

He was born in Jacksonville, Texas, August 10, 1902, the son of a Baptist minister, teacher and author.

Doctor Rouse graduated from high school in Vernon, Texas, and took three degrees at Baylor University—the AB, MA and eventually MD—from its College of Medicine in 1927. He interned at Ft. Sam Houston Station Hospital in 1972-28 and has practiced in Dallas since 1928, specializing in gastroenterology.

Since 1943, Doctor Rouse has been clinical professor of medicine (gastroenterology) at the University of Texas Southwestern Medical School. He previously taught at Baylor University's College of Medicine when it was located in Dallas.

Doctor Rouse was married in 1927 to a Baylor classmate, Leaureame McDavid of Henderson, Texas. They have one daughter, Mrs. C. L. Sawyer of Fort Smith, Arkansas, and three grandchildren.

Dr. Rouse has contributed more than a score of papers and medical articles to journals throughout the country. He is a past president of the Dallas Southern Clinical Society, the Texas Society of Gastroenterologists and Proctologists, and the Texas Medical Association. He was Councilor from Texas in the Southern Medical Association 1950-1955, Chairman of the Council in 1955, and was president of Southern in 1958-1959.

He is a member of the Texas Academy of Internal Medicine, Texas Geriatric Society, the Dallas Academy of Internal Medicine, the American Gastroenterological Association and the American Therapeutic Society. He is a diplomate of the American Board of Internal Medicine and the subspecialty Board of Gastroenterology, and a life fellow of the American College of Physicians.

Doctor Rouse is a charter member of the board of trustees of the Dallas Health and Science Museum, and is currently its vice president. He received the first Health Award of the Dallas Hospital Council in 1947. The Southwestern Medical Foundation gave him a special award in 1945. He received the first Distinguished Alumnus Award of the Baylor Medical Alumni Association in 1964, the Distinguished Service Award of the Texas Medical Association in 1964, and the Distinguished Service Award of the Southern Medical Association in 1965.

Dr. Rouse is a 32nd degree Mason in Scottish Rite, a member of Hella Temple, the Knights Templar, the Optimist Club, and the Phi Chi medical fraternity. A deacon in the Lakeside Baptist Church in Dallas, Doctor Rouse teaches an adult men's Bible class. He is a director of the Rio Grande National Life Insurance Company of Dallas. He was named Dallas' man of the year on January 1, 1967.

SEMINAR FOR PRINCIPAL

Greetings

J. Morris Reese, MD

This committee originated in a very casual manner. After one of the meetings of the technical committee attended by Dr. Peeples, we were discussing many extraneous matters, and out of that discussion arose the idea, to discuss this topic which I am sure you realize is coming more and more to the fore.

The purpose of establishing the Planning Committee for Principal Nursing Home Physicians was to plan for a general discussion of the problems encountered by nursing homes, and to try to do something about upgrading the quality of the care, and to discuss the role the physician should play in this regard, the responsibility of the physician in improving quality of care in nursing homes, and the responsibility of nursing homes also. So we have a dual purpose here today.

A committee was chosen to represent the principal nursing home physicians and the State Health Department. I really want you to know that is an *ad hoc* committee at the present time. They have done a tremendous amount of work, and have certainly been anything but derelict in their duty. That is why we are here today.

Their discussions have included many subjects,

Purpose Of Seminar

I want to express my appreciation for this show of interest in a subject that I think we are all very much interested in. I feel if nursing home care is really to be improved, you are the ones who could most likely bring about this improvement through your interest, through your practices, and through bringing about improved practices of caring for patients in nursing homes.

Admittedly, in many cases, care of the older patient is not a very rewarding type of experience, but nonetheless it is a branch of medicine, and it is going to be an even more essential branch of institutional care in the future than it is now.

I believe the only way that quality can be improved is if you physicians, who have patients in nursing homes, or who are principal physicians, taking care of State-aided patients in nursing homes, insist upon quality medical care. Then those patients will begin to get quality type services.

Last summer we had a physician make a study of some of the nursing homes here in Baltimore City. He picked a sample of 250 state aided patients out of a total of some 1200 to 1400 patients in the city, compared these in a degree with some private patients who were in nursing homes, and found some very startling facts.

Many of these patients had absolutely no notes, no diagnosis, no written orders. Only six of fifteen diabetics had ever had a urinalysis. Four-

NURSING HOME PHYSICIANS

expressing concern about the rise in nursing home costs which follow the establishment of requirements for additional services, such as social workers, record librarians, and so forth.

There was discussion of the role the present nursing home will play under *Medicare*. Many will not qualify as "extended care facilities" under Title 18. In fact, only about 20% of the present nursing homes could qualify under present federal law.

Under discussion here today will be the role of the principal nursing home physician, his responsibility for overall standards of patient medical care, and his responsibility for continually reviewing patient admissions, their care, and their discharge, with the intent of continuous upgrading of care.

Drug policies, training of staff, emergency procedures, food service, and the composition and economics of utilization review committees will also come under discussion.

We thank you for taking time from your already overcrowded schedules to attend, and I am sure you will find this time well worthwhile.

Thank you very much for being with us.

William J. Peeples, MD

teen percent of those who were diagnosed as having hypertension had never had a blood pressure recording.

Deaths after admission to nursing homes—and certain nursing homes were worse than others—were startling in that they occurred usually one to two weeks after being admitted. Patients who had come from hospitals, where one might think they might have had a good workup, were no better. The workups were no better than those referred from private physicians, when the hospital had many more facilities and many more opportunities to conduct diagnostic types of procedures. This is but a small example of what can occur.

Further, there was evidence that some 33% of the patients who were evaluated did not really need nursing care. I am sure you are aware there are many patients in the homes you serve who are there because they need custodial care, but don't necessarily need nursing care.

If you think the rest of the *Medicare* program is snarled up, the nursing home part of this program is just as confused, if not more so than the rest of it. For instance, the Federal Welfare Agency has decreed that all patients who are under the medical assistance program in this State, and other states, can only be cared for in homes which meet extended care facility standards.

As Dr. Reese said, this would constitute about

20% of the total number of nursing homes as a potential. There are others which have the potential of qualifying, but there are some 60 or 70 homes which have no real potential for qualifying, and in these homes there are over a thousand medically-aided patients.

It is hopeful that the welfare agency will change the deadline on this requirement and allow an evaluation of patients who are in nursing homes to determine whether they need medical assistance, just a certain amount of nursing care, or other medical attention, or whether they do not need any of these.

We hope you will join with us in making these evaluations. If the patient does not need nursing care or other medical procedures that can be carried out in the nursing home, then some other place can be found to take care of the room and board requirements of this patient.

If he does need skilled nursing care, then I believe the Federal Welfare Agency may change its policies and go along with present arrangements possibly until 1969. That is, there would be two levels of care: one is extended care; the other is chronic nursing home care, pretty much along the lines that have been drawn up in the regulations newly adopted by the State the first of this year.

You know we appreciate the services of the principal physicians, and appreciate your being here. I hope that this will be only the first of many discussions that will be concerned about the care of nursing home patients.

Role of the Principal Nursing Home Physician and Upgrading of Care

Raymond T. Benack, MD

What I will say today will provoke some anxiety in a few and great concern in many. However, we are entering a new era of patient care, and because of this, changes must be made, new responsibilities delegated and new roles assumed in the continuing care of the chronically ill.

In my short life span, and in my even shorter period of medical practice, I have seen nursing homes change from old, dilapidated, overcrowded, unsanitary and unsafe buildings, where patients were sent to die or be forgotten; to homes which are magnificent modern edifices with carpeted halls, beauty salons, and the latest in rehabilitation equipment. Unfortunately, I have not seen the physician's interest in the nursing home patient keep pace with the improved facilities.

We must now meet because of federal and state legislation to better define the role of the private physician and his relation to the nursing home patient. But before one can do that we must first clarify the role of the Principal Nursing Home Physician who will act as consultant to the private physician and the nursing home administration.

We cannot blame the physician alone, nor the nursing home administrators, nor even the federal or state governmental agencies. The problem is bigger than any one of them can resolve alone. So let us recognize from the beginning that every human being in need of, or receiving care in, a nursing home, is dependent upon all of us working together. If the physicians, nursing home administrators, or the governmental agencies fail in their respective role in the upgrading of the quality of patient care in nursing homes, then we will all fail.

When we fail the patient suffers. When the patient suffers, we must answer not only to ourselves, to our fellow physicians, or even to civil courts, but above all we must answer to God. We are given the opportunity to work together towards the ideal in nursing home care. If you fail to make the most of that opportunity, you violate the natural law. Violation of the natural law is answerable ony to God.

During the past year I spent over three hundred hours seeing patients in nursing homes. When you

are in a nursing home for that much time, you have to see and hear things. Much of what I have seen and heard would make you wonder how some people continue to survive. It is difficult for me to understand how the average nursing home patient can suffer from eight or more diseases, and still be seen once every three or four months.

Would a physician who is a patient in a nursing home be expected to be seen every three or four months? Would he accept the same care for his parents? Each patient must be considered as our own parent, and we should provide him with the same care we would expect or desire. The family and relatives have entrusted to us the care of that patient, expecting the best possible care, that is, the care you would expect for yourself or your own relatives.

It is now necessary for the principal physician in the nursing home to assume a new role, and new responsibilities to accomplish these goals. In assuming this new role, we must also give him a title which would more adequately clarify his position. I would prefer to call such a physician the *Medical Director* of the nursing home. The reasons for this will be amply demonstrated in the subsequent discussion. Most obvious will be the fact that the principal physician will not only be responsible for the care of those patients without attending physicians, or for emergencies, but also will be expected to develop, revise, enforce and continually evaluate medical policies for the institution.

What then is the role of the principal physician. The *Medicare* law states that the extended care facility must have a physician responsible for the execution of patient care policies, and that the facility have a physician available to furnish necessary medical care in case of emergency.

The new State of Maryland regulations governing nursing homes define the duties of the principal physician as "responding to calls at times of emergency, and being available as needed to advise the administrator on medical questions. He shall also provide guidance on the execution of patient care policies and the health program of employees."

If we develop these brief guidelines into the more specific responsibilities which they encompass, we will find that they require a great deal of time and effort on the part of the principal physician. The principal physician must develop medical policies in conjunction with the administrators and director of nursing. These policies must include not only a guideline for physicians, but also those policies necessary to insure optimum and continued use of the facilities.

The *Medicare* law and the State laws clearly define the frequency with which a patient must be seen, and what information must be available and when. My concern is what happens during the first 48 hours, or when the physician fails to provide the necessary information, or to see the patient with the frequency required. Therefore, the medical policies must not only include the listing of information already prescribed by law, but also include a description of the absolute minimum of information about the patient's illnesses, drug and other allergies, idiosyncrasies, unusual behavior, therapy, diet, and what particular care problems he or she might have.

It is not sufficient to know only that a patient has a hip fracture, particularly if he has heart disease or mild diabetes, or is disoriented at times. Any one of a number of emergencies can occur within the first 24 to 48 hours for which the physician may be called. Lack of basic information about all the patient's illnesses may lead to a patient's discomfort or even death. The physician should not depend upon the family or the patient; they may be no more informed, or equally as confused as you.

We must remember that most of the regulations spelled out in the *Medicare* law should not only be applied to *Medicare* patients, but should also include all nursing home patients. Therefore, the policies you outline should be applicable to all patients. For this reason you must develop a system to advise physicians when they are delinquent or fail to abide by the regulations. How would you go about this?

There is one method in which an initial telephone call is made to the physician. If he fails to follow up on that, then a letter is sent, with a check-off system whereby the administrator advises the private physician of what regulation he has failed to follow. Also, it should be clearly written down what steps must be followed by the adminstrator when the attending physician has failed to fulfill his obligation, after adequate notification.

I do not believe that the medical director should be responsible for informing the attending physician. Even though it is a medical policy, it is also a law which must be followed by the nursing home in order for it to retain its license. Also, many patients select the medical director as their private physician when their private physician cannot see the patient. Consequently, it would be unwise for the medical director to advise the private physician of his loss of privileges, when the medical director has an excellent chance of being asked to assume the patient's care. This obviously opens the door to many accusations and potential unethical practices.

The medical director should evaluate the facilities, equipment and services. He should make recommendations to the administrator wherever patient care might be improved. This includes even improvements in the building or maintenance policies, since these are often important to patient care. Inadequate physical therapy space, or lack of adequate light, even unusual odors, excessive heat, poor ventilation, insufficient recreation areas, are all an integral part of patient care. What good is a physical therapist if he has no room or equipment to work with? What good is an occupational therapist if she has no equipment?

The medical director also should insure proper diet therapy. He should check the kitchen, check diets, check the distribution of food. I have seen regular coffee, fried foods, given to patients on a bland diet. I have seen trays of food sit in corridors, becoming cold, while waiting for staff to distribute them. I have seen dirty kitchens, food stored in dirty storerooms, and disheveled, unkempt and occasionally drunk staff preparing meals.

Take an occasional trip through the kitchen, check the quality of food being prepared, walk into a patient's room at meal time, and see if the food served corresponds to the diet prescribed. If you have the intestinal fortitude, sit down sometime and eat the food. (You might be surprised; it might be good or bad.)

With the cooperation of a pharmacist, prepare guidelines for drug control. This includes not only the standard regulations as they pertain to identification of patients' drugs, but also such policies as they may pertain to drugs to be included in the emergency tray, such as digitalis, coumadin, pronestyl, adrenalin and similar drugs. Make sure that it contains drugs for all emergencies, not only cardiac emergencies.

There should be drugs for treatment of insulin shock, blood loss, acute pulmonary edema, regardless of cause. This tray should be on every wing or floor. Only one tray for the home with a few wings or floors is impractical. When an emergency occurs you don't have time to run around for drugs.

In connection with the emergency drugs, you should have clearly defined procedures to follow in case of emergencies. This should include not only immediate nursing procedures, but also procedures to be followed in contacting private physicians or, in their absence, the medical director. Delay may mean the difference between life and death. Waiting for a physician who is attending a meeting to call you back may take too long. It may be easier to contact the medical director or his alternate.

Despite what some may say, there should be a group of drugs available in the home which can be used when pharmacies are closed, or when delivery will be delayed. If I prescribe a drug stat, I mean stat. When I prescribe an analgesic or anti-emetic stat, I don't mean one or two hours later. Have you ever tried to get cough medicine, an injectable tranquilizer, analgesic or sedative at three o'clock in the morning?

Take time to look at the nurse's notes and see what time a drug was given in relation to the time it was ordered. I don't agree with borrowing a drug from one patient to give to another. I would much prefer a supply of cough medicines, analgesics, tetanus toxoid, and tranquilizers, available for use, regardless of the hour. The consultant pharmacist can check these supplies weekly and replace them when necessary. This is all within the limits of the law, and it is not difficult to accomplish, and certainly it is much more convenient.

The attending physician should be aware of all seriously ill patients, and review their charts. He should review all charts of *Medicare* admissions to see if they have adequate admission information, orders, and a planned program of therapy. He should also help prepare the utilization review plan when not done by some outside agency. He should be present at the review committee meetings. He should review prior to the utilization

review meeting all patients to be reviewed.

I might add that utilization review will ultimately involve not only *Medicare* patients but, must be applied to all recipients of Public Law *89-97*, which I believe would include Title 19 patients, those receiving benefits under the medicaid program.

Other responsibilities of the medical director include training of the nurses in the use of specialized equipment, such as intermittent positive pressure suction and even pacemakers which might be implants in patients, then transferred to the nursing home.

He should train the staff in emergency procedures. He should give special lectures to the staff on particular care problems.

He might develop a transfer form or referral form for use at the nursing home.

He should constantly evaluate the progress of patient care and improve where deficient. He should be known to, and have a direct line of communication with, the hospitals with which he has a transfer agreement, and with all homes in the area.

He should be familiar with the services available in the community, either through the Health Department or the voluntary agencies. He should be familiar with the State and Federal legislation as it pertains to the nursing home.

He should develop and carry out employee health programs.

What has been said pertains to extended care facilities and skilled nursing homes, but there is very little that could not easily apply to personal care homes. It is all good medicine, and anything less could be detrimental to patient care. It cannot all be accomplished at one time, but can be gradually introduced over a period of time, but hopefully not longer than a year.

We must realize that the interested medical director can accept and understand the new rules, regulations and responsibilities, but it will take a massive physician education program to inform all the practicing physicians in the community, and to have them accept the changes. This will take time, and we must be understanding, but at the same time we must enforce the law and not back down. If we give in now, we give in forever.

Obviously the job description for a medical director is more extensive than before. He will be required to spend more time at the home performing services not directly related to a patient's care and for which he cannot charge any particular patient. Therefore, I believe the medical director should be compensated for his services, and this could easily be accomplished on the basis of either a consultant's fee or included in the cost of patient care. To expect a physician to be this active, and assume so much responsibility in a nursing home without suitable compensation, would be foolish. We would end up where we started, and all I have said would have been said in vain, and I hope that this is not the case.

Drug Policy And Regulations

Darryl D. Zellers, R Ph

The establishment, maintenance and operation of nursing homes is regulated in all 50 states. The majority of the states vest the regulatory power in the State Health Department which is the case here in Maryland. Some few states vest the power in the State Welfare Department. The laws and rules and regulations themselves range from stringent to loose.

The importance of medication to the chronically ill and aged is obvious; unfortunately, the need for providing adequate pharmaceutical service in the past has not been apparent. State laws and rules and regulations governing nursing homes have been, in the past and still are in many states, generally vague about the handling of pharmaceuticals.

Recently, there has been considerable interest on the part of nursing home licensure agencies in drug control standards. Many states have revised their standards to provide for more effective control of pharmaceuticals.

The Maryland State Department of Health has established new minimum requirements which were adopted last October and became effective January 1 of this year.

Section 18 of regulation 43G02 governing nursing homes, extended care facilities, long term care, and personal care homes, deals with drug handling. This document far exceeds any other states' laws and regulations, regarding pharmaceutical services in nursing homes and extended care facilities, of which I am aware.

With the passage of the *Medicare* Program the Federal Government also expressed its concern for pharmaceutical services in nursing homes. This is evidenced by the "Conditions of Participation for Extended Care Facilities," section 3 titled "Patient Care Policies" and section 8, titled "Pharmaceutical Services."

Since section 8 of the Conditions of Participation for pharmaceutical services in an Extended Care Facility and the Minimum Requirements by the Maryland State Board of Health and Mental Hygiene are very similar in content, my presentation will cover, in general, both sets of regulations. I will also cover briefly the mention of pharmacy service in section 3 of the "conditions," which concerns the formation of a Pharmacy and Therapeutics Committee.

As you noticed on the program my presentation was listed as "Drug Policy and Regulations." Since all of you can read at your leisure the two documents I have mentioned previously I would like to take this opportunity to tell you what is behind these regulations; why they were made; and what they will mean to the nursing home. You should know what pharmacists can and should do for the operation of an Extended Care Facility and in turn why he is essential and not merely "a necessity" to conform with the regulations and Conditions of Participation.

Poor drug handling in nursing homes and small hospitals has been apparent to many pharmacy leaders over the past few years. This had lead to various studies in several nursing homes across the country. These studies and other observations have revealed that practically none of these institutions employ pharmacists. Pharmaceutical services in such institutions are either non-existent or leave much to be desired.

These studies did reveal that although most of the nursing homes were receiving some or all of their drugs from community pharmacists, very few of these pharmacists made routine visits to the nursing homes. They simply delivered the prescriptions the same way as they would to the home of a customer.

Some institutions have a regular drug room under the supervision of a nurse in which they keep supplies of more commonly used legend drugs. Most of these institutions do not even seek the advice of a pharmacist. This is in full violation of federal laws concerning legend drugs.

Briefly, some of the observations made in these studies were:

1. Medications were transferred from stock bottles into individual containers for patient use by non-pharmacists.
2. Improperly labeled drug containers were evident, including such things as handwritten data on tape or paper gum labels.
3. Excessive supplies of drugs resulting in cluttering and wasting of valuable storage space.
4. Excessive supplies of old drugs no longer reliable as to stability and efficacy.
5. External preparations kept together with internal preparations. In many cases they were not even marked "for external use."
6. All employees had access to locked drug cabinets or they were not locked at all.

Administrative deficiencies found were:

1. Lack of automatic "stop orders" on drugs.
2. Lack of proper storage for narcotics and adequate records of use.
3. Lack of separate refrigerator or separate container for drugs.
4. Delays in obtaining refills of a medication for a patient.
5. Lack of an emergency drug box.
6. Lack of written policies for handling drugs.
7. Lack of drug reference books.

Although these incidents were observed in studies scattered throughout the country in a small number of institutions, it is indicative of the pharmaceutical services in the majority of nursing homes. This is not to say that all of them are guilty of all of these deficiencies.

One thing that must be stated here is that nursing homes are not the only offenders. Approximately 45% of the hospitals in this country are still without the services of a pharmacist. It is true, however, that many of these are small and cannot have a full-time pharmacist and are, therefore, in the same position as many nursing homes.

I must also admit that the pharmaceutical services in many larger hospitals with established pharmacy departments still leave a lot to be desired. However, our American Society of Hospital Pharmacists (which incidentally is only 25 years old showing how new the area of institutional pharmacy is), through the leaders in hospital pharmacy, is taking great steps to correct these problems by an excellent educational program.

These brief observations of what has been happening are reasons for the new regulations for pharmaceutical services in nursing homes and small hospitals, and for the Conditions of Participation in an Extended Care Facility.

"The administrator of a nursing home has a moral and legal responsibility to provide optimum medical care for the residents of the home. In discharging this responsibility he must provide a scope of service that is commensurate with established legal and medical standards. Although the administrator is responsible for total operations, he cannot discharge his responsibility for pharmacy service except through the assistance of a licensed pharmacist. The pharmacist is the only individual who is qualified by law and by training to perform the pharmacy functions that are necessary for an adequate and safe health care program."*

"All nursing homes should be cognizant of the contributions made by a sound and organized pharmaceutical service for improved patient care and treatment."*

At this point it is important that we differentiate between the three phases involved in use of medications. These are prescribing, dispensing and administering. These are defined indirectly in both sets of regulations that we are concerned with.

Prescribing, which is the selection of a particular remedy to alleviate a particular symptom or group of symptoms, is held to be the prerogative of physicians and dentists in most states. It is therefore important that the practitioner provide a written order for any medication he wishes to be administered. Provisions, however, should be established for emergency orders given by other means.

The act of dispensing in most states is considered the sole prerogative of the pharmacist or physician. The principal duties involved in the act of dispensing is interpreting the physician's order, selecting the medication, transferring from an original container to an individual container for a specific patient and labeling that container in a proper format. This format is specific in the regulations in that it must contain the patient's full name, the name of the drug, potency, directions for use, date, name of physician, and expiration date if applicable. The Conditions for Participation recommends that the manufacturer and lot number also appear.

Administering the medication includes, besides actually giving the medication, recording the act, observing any reactions, and reporting medication errors. This is to be performed by the nurse on duty.

The method by which the necessary pharmaceutical service in the nursing home is accomplished may vary depending upon the size, organization, and policy and procedures of the institution. It will fall into one of the following categories:

1. No pharmacy in the home.
   (a) Working agreement with a community pharmacist.
   (b) Serviced by a pharmacist of a hospital.
2. Licensed Pharmacy in the home.
   (a) Pharmacist on duty continuously.
   (b) Pharmacist on duty at intervals.

This brings us to the point of what services a pharmacist can provide for a nursing home.

Whether a nursing home can support its own pharmacy with one or more full-time pharmacists, or with a part-time pharmacist, or if it only has a consultant who comes in on a regular schedule is immaterial. There are many functions of pharmacy service that can be accomplished.

First of all, he, along with some of the physicians, should organize a Pharmacy and Therapeutics Committee. This is spelled out in section 3 of the Conditions of Participation for an Extended Care Facility. It is this commitee's duty to develop policies and procedures that will regulate the

* "Pharmaceutical Services in the Nursing Home."

pharmaceutical service in the institution. It should also compile a drug list or a formulary listing the drugs to be used in the institution.

The main day to day function of the pharmacist of course would be to dispense drugs, properly label them, and make them available to the appropriate licensed nursing personnel. Wherever possible he should dispense the drugs directly from the prescriber's order or a direct copy.

The pharmacist may also prepare a medicine ticket that the nurse uses in administering medications, and possibly even a medication administration record that she uses to record each dose administered. In carrying out these functions the pharmacist may also keep a running drug profile on each patient which gives a total picture of the drugs given to that patient and also serves as record to check against, for possible incompatibilities, when new orders are written.

The pharmacist will make routine visits to nursing units to check medication cabinets for out-dated drugs, to be certain that heat sensitive drugs are refrigerated and that all drugs are still properly labeled and in satisfactory condition. It is his duty to destroy drugs no longer in use or for some reason are not fit to be administered.

The pharmacist will provide an adequate control system for drugs that, by law, need extra controls such as narcotics, barbiturates and the new group of drugs covered by the *HR-2 Bill* including amphetamines, hypnotics, and certain psychosomatic drugs.

If the institution has a pharmacy, the pharmacist may also be able to produce some of the drugs and related products such as antiseptic washes, soaps, etc., in the pharmacy.

There are other areas throughout the institution, in which the pharmacist, due to his wide background, can be utilized in an advisory capacity.

As I mentioned previously the average community pharmacist lacks knowledge and experience in providing the services I have mentioned. Institutional pharmacy over the last several years has become a somewhat specialized area of pharmacy with rapid development of additional services. Most pharmacy schools have only recently added courses in this area to their curriculum.

Since there is such a great number of Extended Care Facilities needing pharmacists and the present shortage of trained and experienced institutional pharmacists, the National Pharmaceutical Council has provided a grant to the American Society of Hospital Pharmacists to establish a training program to orient community pharmacists to institutional pharmacy. It is in the process of establishing a training program under this grant in Maryland that will be getting under way within the next few weeks. In this program we take the pharmacist into institutions and train him in an institutional atmosphere. I am confident that we will succeed in providing a sufficient number of pharmacists to provide excellent pharmacy programs for all of the Nursing Homes and Extended Care Facilities.

There is one other area I want to mention briefly and that is economics. I think everyone involved with nursing homes should not be too hasty in judging what this service will cost. With an actual feasibility study, many administrators would be surprised at the cost considering the money that the pharmacist could save in purchasing, in a limited amount of manufacturing, and in other areas in the institution. The results of such a study will determine whether the home needs a full-time or a part-time pharmacist or just a consulting pharmacist.

I hope that from what I have related to you here today about pharmacists, it can be seen that he can be an asset to any individual or organization using drugs. Every nursing home should avail itself of the service and skills of a pharmacist on no less than a consulting basis.

Interplay of Hospitals and Extended Care Facilities

J. Roy Guyther, MD

Those who wrote the Social Security Amendments that became PL89-97, known as *Medicare,* recognized that some type facility to serve as a Half-Way-House for hospitalized patients before being discharged to their homes would accomplish two important purposes. By extending the care that has been provided to a patient in the acute hospital to another facility, hospital beds could be emptied faster, and less costly care could be provided the patient during his or her convalescence. To accomplish this aim the Extended Care Facility was conceived. I do not believe that the framers of the law expected a very high percentage of nursing homes to modify their institutions to the necessary extent in meeting the conditions for participation as an Extended Care Facility. I believe the planners envisioned a new type facility, and in addition expected hospitals to establish separate divisions to meet a significant portion of the need. At any rate, the conditions for participation as an Extended Care Facility were rather stiff. The purposes of the regulations are to upgrade nursing care in the qualifying facilities, and to provide more comprehensive services.

In order to receive payments for extended care, under *Medicare,* a facility must have the following:

1. A transfer agreement in effect with one or more hospitals.
2. Be engaged primarily in providing skilled nursing care and related or rehabilitative services.
3. Have policies developed by a group of professional persons, including one or more physicians.
4. Have a physician or registered nurse responsible for execution of policies.
5. Guarantee that the health care of every person admitted be under the supervision of a physician, and that a physician be available for emergency medical care.
6. Maintain clinical records on all patients.
7. Provide 24 hour nursing service with at least one registered professional nurse employed full time.
8. Provide a method for dispensing and administering drugs.
9. Have a functioning utilization review plan.
10. Meet such other conditions relating to health and safety as the Secretary of Health, Education, and Welfare may find necessary.

All this must be in addition to meeting the licensing standards of the state in which the facility is located.

In order for a patient to qualify to have costs paid by *Medicare,* he must have been an inpatient of a hospital for at least 3 consecutive days and to have been transferred to the Extended Care Facility within 14 days.

In order for Extended Care to be efficiently given to a post-hospitalized patient certain things are necessary. Some sort of an agreement between the hospital which first treats the patient, and the facility which is to provide the after care needed. This agreement, referred to as *"transfer agreement"* may be as simple as Figure 1.

Model transfer agreement between

_____
Name of Hospital

and

_____
Name of Extended Care Facility

To facilitate continuity of care and the timely transfer of patients and records between the hospital and the extended care facility, the parties named above agree as follows:

1. When a patient's need for transfer from one of the above institutions to the other has been determined by the patient's physician, the institution to which transfer is to be made agrees to admit the patient as promptly as possible, provide customary admission requirements are met.
2. The transferring institution will send with each patient at the time of transfer, or in the case of an emergency, as promptly as possible, the completed transfer and referral forms mutually agreed upon to provide the medical and administrative information necessary to determine the appropriateness of the placement and to enable continuing care to the patient. The transfer and referral forms will include such information as current medical findings, diagnosis, rehabilitation potential, a brief summary of the course of treatment followed in the transferring institution, nursing and dietary informaton, ambulation status, and pertinent administrative and social information.
3. The transferring institution will be responsible for the transfer or other appropriate disposition of personal effects, particularly money and valuables, and information related to these items.
4. The transferring institution will be responsible for effectng the transfer of the patient, including arranging for appropriate and safe transportation and care of the patient during the transfer.
5. This agreement shall be in effect to and including the 31st day of December, 1967, provided it may be terminated by either facility upon —— days written notice and shall be automatically terminated should either facility fail to maintain its license or certification.

Signed:

_____	_____
(Name of Extended Care Facility)	Administrator
_____	_____
(Name of Hospital)	Administrator

It should at least provide for two conditions: First, that transfer in either direction from a hospital to an Extended Care Facility or vice versa can be carried out when it is thought to be appropriate by the attending physician. Second, that appropriate information about individual patients is forwarded at the time of transfer to provide continuity of care or to assist in determining whether patients can be cared for adequately in some other way in the community. This has not always been the case in the past. I am told that at times a patient arrives at a nursing home with no information other than a name. The agreements should also contain provisions making available the diagnostic and therapeutic services on an outpatient basis as ordered by the attending physician, to a reasonable extent under the circumstances. This is essential to avoid costly duplication of services. Charges for services performed by either facility should be collected by the institution rendering such services, whether directly from the patient, third party payor, or other sources normally billed by the institution; neither facility shall have any liability to the other for such charges.

Difficulties will be encountered. One difficulty that can be experienced is transportation of the patient. Even where the two institutions are in close proximity it is usually necessary to provide ambulance transportation. For a *Medicare* patient, fees for transportation are covered, but the mechanism for collection of this fee is vague. If the patient is indigent, more complications arise. The State Department of Health is attempting to provide a solution to this problem now.

A second problem that may occur is in the event of transfer back to the hospital of a patient whose condition becomes temporarily worse. There may be a feature in the transfer agreement providing that the Extended Care Facility shall retain—for a reasonable period of time the bed of a patient who has been transferred to the hospital, and shall accept him back upon discharge from the hospital. How far the obligation of the Extended Care Facility extends in this direction is uncertain, especially since the Social Security Administration advises that no *Medicare* payment will be made for unused bed space for the transferred patient.

A third problem arises because of the fact that the attending physician tends not to display the same level of interest in a patient in the Extended Care Facility as in the acute hospital. He is naturally reluctant to travel to the other institution, even though it may be only across the street. Therefore there is some unconscious resistance to transferring patients or recommending transfer as soon as it can be considered. The patient recognizes that he does not get the same attention in the Extended Care Facility, and he too develops resistance or dissatisfaction in the new surroundings.

We have touched briefly on the main features of interplay between hospitals and Extended Care Facilities. The key to success in this inter relationship is good communication between the two. The attending physician must keep the communication lines open. Problem areas inevitably develop, but they are not insoluble.

Utilization Review Committees

George Sharpe, MD.

When Congress wrote Title 18, it created a new institution, a dynamic type of institution, to exist possibly in every community in the country. This dynamic institution was to be called the Extended Care Facility as opposed to the so-called traditional nursing home.

However, the subject is apropos here because the intent of Congress was to provide an uplift in the medical services to patients and, as already noted, to relieve bed shortages that existed in acute hospital care.

There were many basic requirements for the establishment of an Extended Care Facility, but it was hoped much of the uplift in standards would come from review committees. This would also involve nursing homes caring for welfare patients as

well as others.

One of the keynotes of requirement for the upgrading of medical care was the establishment of utilization review committees. This utilization review committee concept is not new in hospitals over the country, but it is certainly new as far as institutions throughout the community, aside from hospitals, are concerned.

This meant of course that the burden of responsibility was going to fall into the hands of the physician. This is noted throughout here and I don't like to think of it personally as a burden I think of it more as a challenge. It really does give us a new instrument for the care of patients; however, at the same time it does give us a great deal of responsibility for providing for this care under the new laws that are going to be with us, and those who are going to practice medicine, for a long time to come.

It is to be noted that Congress actually in discussing all this wanted to provide flexibility in order to insure cooperation of MDs, hospitals, as well as Nursing Homes, Care Homes and others, health departments, county health departments, state health departments, and above all physicians; and flexibility is in the law at all stages, if one really looks at it that way. That is why we have some of the confusion, because of the flexibility that is present.

From the standpoint of the new facility that I mentioned, there are certain differences from a general hospital. First of all, we have to overcome old habits. We must change habits of patients and families, as well as their expectations of the new facilities.

In a hospital there is an intimacy of the staff we don't get when we talk about an Extended care Facility, as in most cases there is no large staff.

Another important point Congress noted was that traditionally patients selected nursing homes or Extended Care Facilities, or perhaps the social worker did, but in this situation it is going to be the physicians. The law provides that entrance to an Extended Care Facility is upon certification by the physician, and 14 days thereafter recertification by the attending physician.

The Extended Care Facility then in return is to provide high quality care, and this is going to have to take place, with a utilization review committee overseeing proper use of the facilities.

Also recognized by Congress, and by others, is that these facilities would have an educational value if properly used. It was also intended that the use of Extended Care Facilities should be encouraged so that a patient could partake of rehabilitative services as well as skilled nursing care and at the same time relieve the hospital bed situation.

There is one other point. This has not been mentioned today, but it is a key point that we must not forget. It is a duty of the Extended Care Facility to arrange for the future care of the patient. This is in the law. This was an intent of Congress. You now have a dynamic situation, and it is in the hands of the physician, as so ably pointed out by the speaker from St. Marys County, to provide for the flow of patients from hospital to Extended Care Facility, back to his own home or to a skilled nursing home or personal care type of home.

This flow is in the control of the utilization review committee which has certain responsibilities; to see that proper records are kept, to see that sampling of admissions is to take place to insure efficiency of operation, and so forth. It is also responsible for dissemination of the reports, and examination of every case of extended duration in an Extended Care Facility.

This is a term that is another key point, "Extended care duration." In our situation it was defined as 30 days. I have a hunch this is going to be accepted pretty generally all over the country or certainly in Maryland.

This means that the personal physician certifies the patient, then recertifies the patient after 14 days for a total of 44 days. Remember now on the second certification he must include a plan of operation as to what is going to happen to that patient afterwards.

Therefore, if we have an extended stay duration of 30 days, every one of the patients he certifies is going to be subject to a review. However, the law does provide in all cases where the review committee disagrees with the personal physician, this personal physician shall be consulted. It may be that he has something to add that will change their opinion. But his viewpoints are paramount.

At any rate, it is in the hands of a doctor, not a social worker, as to how much care this patient is going to need. He can control this patient's care in

the Extended Facility for 44 days. He may have to explain it, that is possible, but highly unlikely if he uses his own judment properly.

The utilization review committee under the law can be made up from the staff of the Extended Care Facility, including two or more MDs or other professional people, including a physical therapist, a social worker or—and this is important—by a group outside the institution which is similarly composed and which is established by the local medical society—this is specifically mentioned in the law—by the hospital, or hospitals of a community.

If none of these two or three, depending on how you want to look at it, groups or sources is used, then the Secretary of *HEW* can suggest or use another method that would be approved by *HEW* for the purpose of providing utilization review.

The utilization review committee must review, and appraise medical care that takes place within the facility. Remember, that this can be done by two different groups. In other words, one group could be so-called medical standards group—this is a term we developed—and a utilization review committee that would sample by various means all the admissions to the facility. The other function is that the utilization review committee has to pass each individual case of extended stay, and determine the duration.

The physicians who are involved can have no financial interest, or I should say at least one of those who is involved in the review shall have none, as provided by law. However, on local levels, this may be varied.

The review sample has to take into consideration the duration of stay, professional service, including drugs, use of them, and also whether the available facilities are properly being used, analysis of patterns of care and maintenance of high quality.

The staff of the review facility must cooperate with the physicians to improve the efficiency and to help place patients afterwards.

We in Montgomery County have devised an idea, and we were able to get a grant we have been holding in effect for about six weeks. We have used the society as a whole as a review committee. There are some 600 physicians in the area which has a population of half a million.

We have a coordinating committee. Under this we have a utilization review committee that has established a few criteria that each man who goes out has to use—and I won't go into those now. Then he uses his own medical judgment to pass on the patient, always then to consult with the attending physician. These are things we have developed.

I might say that these physicians who are on review are paid a fee of $25 an hour for their review. It takes an average of four to eight minutes to review a case, and they will do maybe fifteen or twenty cases. It has been very interesting.

The other thing we are doing is developing a fixed committee composed of various specialties concerning themselves with standards, and who will go to the facilities, and help them to develop their standards.

I would like to say in conclusion that we took this as a challenge instead of a burden, and we found it very interesting, and really exciting. This goes to all age groups, those who have been practicing for twenty years or more, and those who are just starting practice and who are going to have to live with it for the next twenty or thirty years.

Medical Records

Edyth H. Schoenrich, MD

Let me say how gratifying it is to see that so many physicians associated with nursing homes have been willing to take this day from their busy schedules and spend it at this meeting. The field in which we are all working is not one that in the past had either status or glamor, and yet it is a field of medicine which is becoming increasingly important. Those physicians who have grappled with the complex problems of chronically ill and aging persons recognize that the successful man-

agement of these cases demands the clinical task at its finest.

Though the topic of my discussion is medical records, I intend to talk about *clinical* records. The terms "medical records" imply restriction of the topic to physicians' notes. In truth, the discussion must be much broader and include not only physicians' notes, but also nursing notes, order sheets, medication records, and all other notations of every professional group concerned with diagnosis and treatment of cases in nursing homes.

Why need we be concerned about clinical records? Though many obvious reasons come to mind, I wish to make four major points.

First of all, in the management of the problems of chronically ill and aging persons, quality of care is unquestionably related to continuity of care. This continuity of care must be maintained as a patient moves from one institution to another. When there is a flow of patients from one institution to another, there must also automatically be a flow of appropriate information. Dr. Sharpe and other speakers have touched upon this point earlier today.

I have worked in chronic disease hospitals long enough, and have observed the nursing home situation closely enough, to have been all too frequently infuriated by the way patients are transferred from one location to another without adequate records. Though I could cite the details of individual cases, I know that all of you who have worked in nursing homes have received patients undiagnosed and too unstable medically to be cared for in your facilities—yet they arrive without adequate records.

As a second point, I am sure you will all agree that not only must there be a flow of information when patients move from one institution to another, but also when the responsibility for a patient's care moves from one physician to another, even within one institutional setting. It has been brought out several times by other speakers today that, though patients may have personal physicians, these personal physicians are not always available for visits to nursing homes when they are needed. In such circumstances it is very often the *Principal Physician* or the *Medical Director* of the nursing home who becomes responsible. It is highly probable that each one of you has had the uncomfortable experience of intervening in the care of another physician's patient without the benefit of adequate clinical records.

A third reason for concern about clinical records in nursing homes revolves around legal implications. Here I am concerned not only about the welfare of the patient, but also about the protection of the management and staff of the nursing home. Many chronically ill and aging persons are frail, severely handicapped, confused, and often seem accident-prone. They tend to fall, suffer broken hips, and receive lacerations. These facts mean that the persons and institutions caring for these patients are exceptionally vulnerable. So, for the protection of the staff as well as the patient, meticulous documentation of the diagnoses, special limitations, treatments, and untoward incidents is essential.

As a fourth point about the value of excellent clinical records, one becomes involved in the increasingly important field of medical audits. I recognize this is a very delicate question at the present time, but it is no longer possible to deny the fact that quality of care is now becoming a concern of more than physicians and related health personnel.

Let me digress to discuss briefly some of my own personal feelings about the question of medical audits. Surely most of us would agree that it is a solid American tradition that, at some level, the public has a right to inquire about how effectively public funds are used. For example, this right has long been recognized when public funds are used for highways or building construction. Now that more and more health services are being funded by broad-based tax resources, it is natural extension of the American pattern that there be a review of health programs. We all realize this is the principle behind the concept of utilization review which has had much discussion today.

I don't think the concept of the medical audit has to be frightening to the health professions. I also do not think that it has to be something imposed from above. How much better it would be if other medical societies would follow the example of one of the county medical societies in Maryland that has become deeply involved in organizing and supervising utilization review.

Also, one of the physicians at this meeting has recently been working with the Social Security Administration to establish guidelines—not absolute rules but guidelines—for what is a "meaningful visit" by a physician to a patient in a nursing

home or hospital. Even though this is a controversial matter, I feel that sometimes guidelines can be of positive benefit in that they describe, at least in general terms, what is and what is not expected in a given situation.

What actually are the regulations concerned with the clinical records in nursing homes? These are spelled out on pages 492 and 493 of the *Rules and Regulations for Long Term Nursing Homes* in the State of Maryland. I am sure most of you are familiar with these. These regulations concern items which I do not think any physician could possibly find objectionable if he is seriously concerned about the quality of care given to long term patients.

For example, it is required that there be accurate identification of the patient, including his age, where he came from, his identifying code numbers, and whom to contact in case of emergency. There also should be recorded the information which accompanied the patient when he arrived at the long term Care Facility. Both Dr. Sharpe and Dr. Guyther have discussed this. There should also be a complete work-up by the physician who will be caring for the patient in the nursing home. Surely there would be general agreement that the initial history and physical examination on each admitted patient should include all the significant medical events and a complete physical examination.

A few words are necessary regarding progress notes. All of us who have been active in providing direct patient care understand that a physician who has cared for a patient for a long time does not always record in progress notes every nuance of the problem and treatment. Those of you who work in rather small institutions may be able to know all the essential details of the complex problems of each of the patients under your care. However, we have to face the fact that in many of the larger nursing homes, where there may be as many as 100 or 150 patients supported by public funds, and in which the burden of care for most of these patients falls upon the *Principal Physician* of the home, good clinical records are the only practical channel through which the physician is able to provide care of appropriate quality.

In relation to this, I want to expand briefly the remarks made this morning about the survey of nursing home records that was done in Baltimore City this past summer. As you recall, the records of about 300 welfare recipients in nursing homes were examined. In 14% of these cases there was no note recorded by any physician at the time of admission. In 44% of the cases, the admission notes by the physician were less than 31 words. I want to point out that this is approximately three typewritten lines. In addition, there were many serious omissions, such as no recording whatever of a blood pressure reading even though the diagnosis of heart disease or hypertension was listed.

In what ways can physicians contribute to the improvement of clinical records in nursing homes? Obviously, they can see that their own data are recorded in a clear thorough manner, and they can insist that the records in the homes in which they work include dated and signed nursing notes, medication and treatment records, consultation notes, and laboratory reports.

In addition, physicians can assist the nursing home administrators to develop or to choose appropriate forms for recording clinical information. The very excellent book, *Concepts in Nursing Home Administration,* by Harold Baumgartner contains a chapter on medical records with examples of simple forms. A number of publishing houses prepare such forms which you might recommend adopting, or which you might wish to alter to meet specific needs.

I wish to say one final word. I have a deep conviction that the most important single influence capable of elevating the quality of care in a nursing home is the physician who goes in and out of that home and the professional conscience which guides him.

(*Continued on page* 58)

Discussions

Dr. Levitsky: We come now to the end of the formal presentation. The floor is open to all and we hope some of you who have not told us of your experiences in nursing homes will speak to us so we can all be aware of the many problems existing and have other than a parochial idea of what are nursing home problems.

Dr. Campbell: We have a convalescent home, with facilities for 137 patients. My chief concern is with the attitude of some hospitals, toward medical care patients, not particularly *Medicare* alone. Sometimes a patient is in dire need of hospitalization, the hospital will be called, and the situation is presented to the individual who answers, but it seems they have no concern at all about these people.

They do not want to accept them. On one occasion I had a man who was quite ill, in fact he was unconscious at the time. I called the hospital and identified myself, relating the situation of the patient. The question was, "Doctor, do you belong to this hospital staff?"

I said, "No, I don't. This is a *medical care* patient who is sick." The patient was refused as I did not belong to that hospital's staff.

This actually happened. Possibly other doctors have had that experience.

The next point is the ambulance. The ambulance people have a rule that states they must take the patient to the nearest hospital. This does not pertain to everyone. An accident occurred in which a woman's legs were crushed. It was about three minutes ride from this point to Provident Hospital, yet the ambulance service took the patient all the way to Maryland General.

On another occasion a man was struck just one block from Provident Hospital, yet the ambulance took him to Maryland General. This rule is not enforced, it is just for certain situations.

On another occasion the ambulance driver actually came to the nursing home where the patient was unconscious, and refused to take the patient because the woman was on the second floor. The nurse called me and by the time I got to the telephone they had driven away and I had to use some pressure to get them to return and take the patient to the hospital.

Later I called the person in charge of the program, and he told me that one of the ambulance men had developed a hernia by helping carry a patient. My reply was that if he were a doctor practicing medicine, would he object to going to a person with pneumonia or tuberculosis because he was afraid he might get the disease.

His reply was that those were the rules. I did not go to the newspapers, but called somebody else, and in half an hour a news reporter called me to find out what had happened. The next morning I received a call from the ambulance service that I would not have any more trouble. They did come for the patient, but the man died that night.

On another occasion I called an ambulance; it arrived; the man was on the second floor, and they refused to get him. While they were haggling about it, the nurse, who weighs 155 pounds, brought the man down in her arms to the ambulance driver.

While the ambulance personnel have done some good turns for us as physicians, I can't understand why an attendant would refuse to get a patient because he or she is not on the first floor.

Those are some of the problems we have. The man who died the next day might have died in any event, but they refused him, and we have to use strong measures sometimes to get them to take certain patients to hospitals.

Dr. Benack: Today we have placed pressure upon the physicians and their responsibility. The State has given us regulations which we are expected to abide by. I would like to place a little pressure upon the State.

We can't really do a thing, to be perfectly honest, until the classification of nursing homes according to standards tell us where we can ship patients when they are in need of this care. One of the confusing problems is the lack of clarification as to what type of facility is an Extended Care Facility, which is a nursing home, which is custodial care. They are all important, but unless we have homes so designated, we cannot do anything, because, even as the utilization review committee is expected to do, it is supposed to recommend the care beyond the Extended Care Facility, yet we do not know what is beyond this facility as nobody has so designated the homes.

I think it is imperative that the State Health Department designate these facilities. It is eight months since the law has been in operation, and still we hear only of the Extended Care Facility. I don't know where the other ones are.

*Mr. Fritz: We publish a directory at least once a year. This will list all types of homes by categories. Those nursing homes that have been certified as Extended Care Facilities will have an asterisk with a footnote to that effect.

The others listed will be long-term nursing care, and the personal care homes, of which there are very few, and these will be listed separately. As soon as they are collated, they will be made available to all the nursing homes, the *principal physicians* and other agencies.

Dr. Davens: But it really is not that simple, and I do not think the clarification will come for several years.

Dr. Sharpe and Dr. Guyther explained very clearly in their talks about the new concept of the Extended Care Facility which Congress had in mind. If you go back and read the Congressional report on Public Law 89-97, you will see very clearly, if one needs convincing, that Congress did not have 100 days of nursing home care in mind with respect to Title 18.

They did have, as you explained it very clearly, Dr. Sharpe, a new concept of *convalescent* care facility, and it was pursuant to that new concept of *convalescent* care for acutely ill patients that the guidelines of the Social Security Administration were developed.

However, the Welfare Administration, in connection with their interest in upgrading the quality of nursing home care, or long-term custodial nursing home care if you will, looked around for standards that it felt would be appropriate national standards, to require with respect to matching medical assistance programs, such as our medical assistance program, and *Mrs. Winston decreed that all nursing homes in medical assistance meet those standards.

In other words, these standards were developed for a different purpose, but it was thought that all nursing homes should meet those same standards, even though it were for a different purpose.

This is the problem that Dr. Peeples referred to this morning when he said that he was hoping we would get some time to work out a period of time where we could have the two grades; but I think the national intent is that all nursing homes would meet those standards.

Dr. Sharpe: I would like to follow through here on a slightly transcendental point, but one brought up which is very important. This is something where I think principal physicians could take a very firm stand right now.

In the Washington area, some of these Extended Care Facilities and some of the nursing homes, are advertising in a way that implies that all this is just coming to you. This puts a tremendous burden on the physician, because the advertising states—and I will quote it almost verbatim: "Remember, you can save thousands of dollars in our nursing home, which has been approved for *Medicare,* so bring your loved ones here, and they will be properly taken care of, and under the certification you will save."

This is tremendous "come-on" advertising, and this is something everyone here who is a principal physician could stop.

Another point, it is not just the nursing homes but it is the articles in the newspapers. If one reads the articles written on the law, one sees that they do not really spell out the fact that this is a new concept of nursing home care; they merely say you are entitled to a hundred days.

Here I am talking about the lay writers. Statements do not come out exactly the way they are supposed to.

If one reads the Washington papers one finds that Extended Care Facilities have been publi-

*Mr. H. Fritz, Chief of Division Medical Facilities, Development of the Maryland State Health Departhent.

*Mrs. Ellen Winston, Commissioner, U.S. Department of Education and Welfare.

cized and will be publicized more and more, because the Montgomery County Medical Society is taking a stand, and taking the lead.

This is the reason I am here. This is one of the things I was hoping we could get across here in this group, because you have a tremendous amount of power in your hands right now.

*Dr. Vollmer: Conversely the other thing is happening too, that is, homes primarily for custodial care are now being chastised by the public as second rate homes. For instance, the Edgewood is a custodial home, and patients are saying, "I don't want to go there because it is not accredited," so it is working in reverse too.

†Dr. Sachs: I wanted to say that as I have listened through today, I think it would be helpful if you could realize that under the Social Security Amendments, Title 18 and Title 19 are as different as if they were two separate laws. The State Health Department under the Medical Assistance Program, part of which is funded by Title 19, is essentially carrying out Title 19.

Title 18 is open-ended, and payments are different. There are standards set, and there is not too much intervention by the State Health Department, with the exception of the approval or recommendation for certification of participating hospitals, Extended Care Facilities and home health agencies.

The confusion that comes in is that two-thirds of our Maryland medical assistance program is funded by the State Legislature budget funds, and we are all aware of the tremendous discrepancies regarding what we have to put into the program. This is why you find very contradictory amounts of services that can be covered.

Oddly enough, Titles 18 and 19 cannot exist separately because where there are deductible and coinsurance factors, if the person sixty-five years and over is also eligible as a medical indigent to be covered by the Title 19 funds, that program must pick it out.

So it becomes utterly ridiculous to have, as you mentioned with a custodial home, somebody getting the feeling it is second rate. We can not have two levels of quality. We can not have the extent of care different, and we can not expect physicians or nurses or other people, to handle first rate citizens and second rate citizens.

Primarily, if you believe in the care of the chronically ill or the aged, you know that it is a continuous spectrum of care, and peo,le can not only move from an Extended Care Facility to a skilled nursing home, to perhaps a foster home, but may have to go back to an acute general hospital, and this I think has to keep rotating all the time.

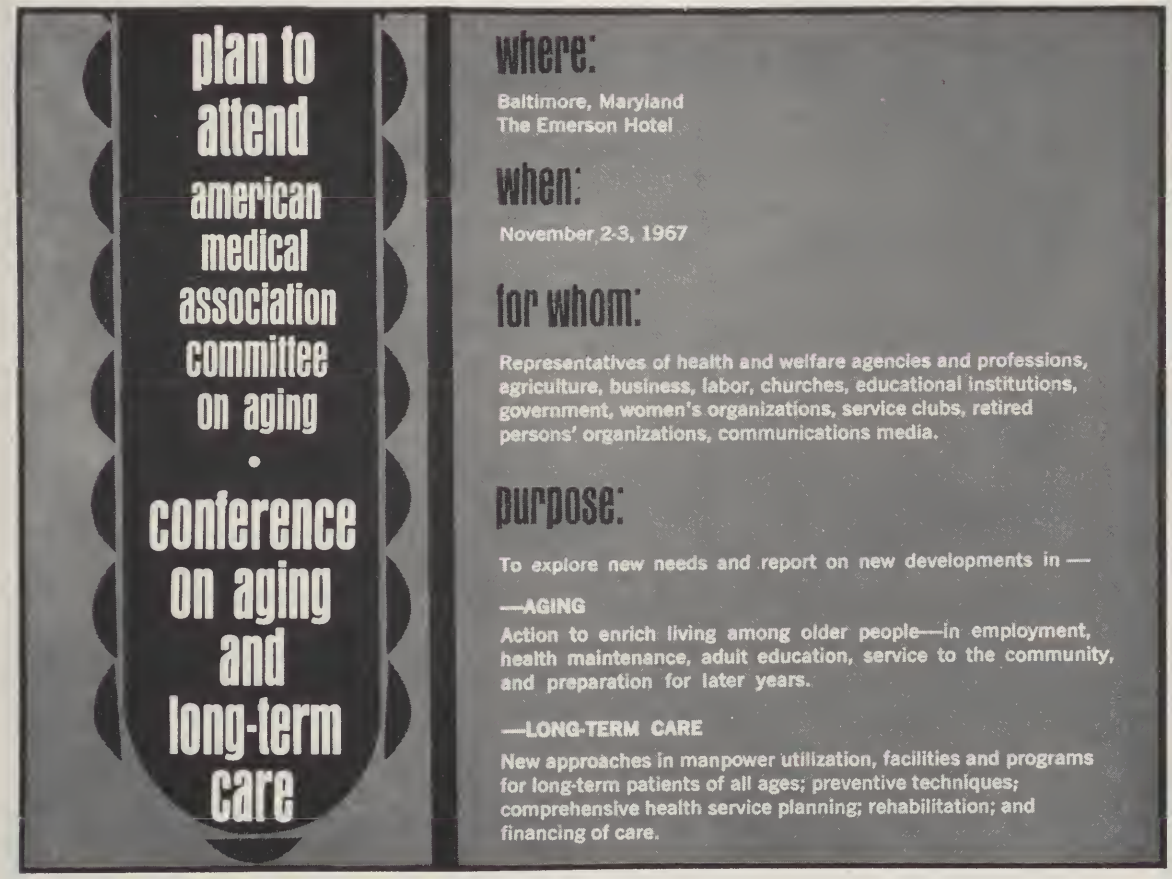
I think my primary job is to keep reviewing this material, and not get confused. Really if there are any major confusions which aren't spelled out in the beautiful jargon that creeps into regulations and laws, I am sure if you wrote Dr. Davens, he would see that one of us who are working all the time in this field clears it up.

Dr. Levitsky: In a short sort of summary, I find I have very little to say because everybody who spoke before covered the issues so well. In summary though I think it is certainly gratifying to find that so many people did take the time to come here and to be with us and to speak. I am even more amazed by the awareness of the problem and the almost universal problem that exists, that there is a certain desire to learn what is needed. It all seems to be tempered somewhat by the requirement to be practical and to try to find out what we can do.

I think there is a lot of confusion which comes about because we have difficulty defining words. The words "nursing home" no longer have a valid p'ace in our vocabulary—even though I have been one of the people who have been most consistently using the term.

I think one has to get some sort of educational program going. I think this is certainly one of the roles the Medical Society of this State plays. The responsibility of organized medicine is to help publicize this. The concept has to grow that there is such a thing as a hospital, as different to an Extended Care Facility, and from there to nursing homes, to custodial or chronic Extended Care Facilities (if there are such places), or long-term care facilities.

The education problem is with the people, with the government, with the agencies, and it is with the physicians. Physicians certainly also have to be educated, because they have to realize they no



*Frederick J. Vollmer, MD, Edgewood Nursing Home.
†Miriam Sachs, MD, Chief of Division of Medical Care Studies of the Maryland State Health Department.

longer have the luxury of keeping somebody with, say a stroke or heart attack, in an acute hospital bed at $40 or $50 a day. This no longer exists; these people should sometime, very early during their illness, be sent to a lesser staffed unit in the hospital, or to a chronic care facility. If there is no adequate care at home, then they should be sent to a custodial care or old age home. We all know that "old-age-home" has a bad connotation, let's find a new term for it.

It is hard to say where educational process starts, but I think the general public has to understand that it is really a different concept of the practice of medicine.

People have to be made aware they are being sent to the place best for them, for the kind of care they need, just as a pregnant woman goes to the obstetrical ward and not the pediatric ward.

It will take many years before we can do all this. But there are practical considerations as to what we can do now to make whatever we have work better. It is worthwhile to consider upgrading this care, and I think the principal physician has to take an active role.

In Memorium

EUGENE I. BAUMGARTNER, MD, of Oakland, Md., who died of a heart attack on August 7, will be sorely missed by his colleagues throughout Maryland and the entire United States. "Gene" as he was affectionately known by those close to him, was a personable individual and liked by all with whom he came in contact.

Active in medical affairs he had served for many years with the state organization in numerous capacities. Currently, he was acting as a member of the Advisory Committee to the Maryland Medical Assistance Program, the forerunner of which was the Council on Medical Care. He had been the medical profession's representative on this latter group for some 9 years. He had also served as a Vice-President of the Faculty in 1965; as well as on numerous Faculty Committees.

Gene was always present at Faculty meetings and was actively aware of "what was going on." Local physicians contacted him first when they wanted to know what was happening in the medical world.

Since 1962, he had served on the American Medical Association's Council on Scientific Assembly. This Council is charged with the preparation of the AMA's Annual and Clinical scientific programs. In addition, it is responsible for arrangements of the annual Science Fair, which the AMA co-sponsors along with other major professional organizations. This fair was held in Baltimore, Maryland, in 1965, and Gene had considerable to do with its outstanding success at that time. He always served as a judge for this fair as well as for the scientific exhibits at the AMA meetings.

Dr. Baumgartner was also one of the presidents of the Maryland Academy of General Practice and was a founder-member of this state group. He was also active in the American Academy of General Practice. At the time of his death, he was president of the Garrett County Medical Society.

A graduate of the University of Maryland in 1931, he began practice in 1933, and joined the Faculty in 1934. He was one of the fast-disappearing family physicians and firmly epitomized that position. He was a counselor and friend to all of his patients and was selected by the National Institutes of Health to portray himself as such a person in a film that received national distribution. The film portrayed the importance of a family or primary physician and showed the proper manner of handling patients.

An avid follower of the circus and theater, he acted as drama critic for the Garrett County playhouse; and served as ringmaster for the Oakland Rotary club when it sponsored a circus as one of its public service ventures. He was a past-president of the Oakland Rotary club; a Senior Warden of St. Mathews Episcopal Church; a former Deputy Medical Examiner; former Chief of Staff at the Oakland Memorial Hospital; and served on the board of that institution. He also served, at one time, on the Democratic State Central Committee.

Dr. Baumgartner was a native of Oakland having been born there in 1905, graduating from the local high school in 1928. He served his internship at Mercy hospital, Baltimore, following graduation from medical school. He is survived by his wife, Mrs. Helen Baumgartner (nee Tracy).

CURRENT APPROACHES TO THE MANAGEMENT OF PATIENTS WITH MALIGNANT LYMPHOMA

PAUL P. CARBONE, MD
Head, Solid Tumor Service
Medicine Branch
National Cancer Institute
National Institutes of Health
Bethesda, Maryland

The malignant lymphomas consist of the conditions, Hodgkin's disease, lymphosarcoma and reticulum cell sarcoma. These diseases tend to afflict young adults and middle-aged individuals at a time when either the hopes of the future are the brightest for the young patients or when the latter group has achieved the middle years of productivity. What can we offer these patients? At a recent conference at the National Institutes of Health, a provocative title was put forth. It states: "Hodgkin's disease, can it be cured?" By the end of the evening, it was suggested that the title should really have been, not can it, but how many.[1]

Thus, I would like to leave with you the feeling of optimism. For some patients with Hodgkin's disease, cures are possible. For many other patients a better symptom-free survival is possible with chemotherapy. Let us now examine some of the reasons why we can be more hopeful.

One of the recent advances in Hodgkin's disease has been the reclassification of the histopathology recently described by Lukes and Butler.[2] In the old classification of Jackson-Parker, the disease was characterized as paragranuloma, granuloma, and sarcoma. Unfortunately 90% of the patients fell in the granuloma group, 5% in each of the other groups, so that it was very hard to define any significant statistical relationship of histology to survival or prognosis, except for 10% of the patients. Lukes and Butler reviewed a large series at the Armed Forces Institute of Pathology and derived a classification based on the lymphocytic and histiocytic population and the degree of fibrosis which was either diffuse or reticular. As the disease progresses the histopathology appears to shift from one of lymphocyte predominance to that of lymphocyte depletion. Those patients presenting with the histiocytic predominance type have shorter survivals and poorer responses to treatment.

Another important finding has been the knowledge that with high dosage radiotherapy Hodgkin's disease patients can be expected to live out normal life spans, if the disease is localized and if adequate treatment is given. Thus it becomes important to establish the extent or stage of the disease.

For this reason a great deal of emphasis must be placed on determining the extent of disease or staging. Staging requires a careful history and physical examination. In the presence of hilar adenopathy, lung tomograms are done looking for small areas of parenchyneal involvement. A detailed skeletal survey and the use of calcium or strontium radioisotopes for scanning of the bone is also done. Probably the most significant advance in determining disease extent has been the use of lymphangiography which makes it possible to determine the presence of disease in the retroperitoneal space. This procedure has been very useful in defining those patients who are candidates for curative radiotherapy. A bone marow examination, including a needle biopsy of the bone marrow, is also done looking for bone marrow invasion. Liver function tests and radioisotope liver scans are attempts to look for involvement of that organ.

Table I defines studies of Hodgkin's disease as proposed at a recent conference.[3] Stage 1 is disease limited to one anatomical region. Stage 2 is disease limited to two or more contiguous or noncontiguous anatomical regions as long as the sites are on the same side of the diaphragm, either above or below. Stage 3 is where the disease is

I. Ridgeway Trimble Fund Lecture. Presented at 169th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland, April 1967.

Table I

STAGE 1	**Disease limited to 1 anatomic region or to 2 contiguous anatomic regions on the same side of the diaphragm**
STAGE 2	**Disease in more than 2 anatomic regions or in 2 non-contiguous regions on the same side of the diaphragm**
STAGE 3	**Disease on both sides of the diaphragm, but not extending beyond the involvement of lymph nodes, spleen, and/or Waldeyer's ring.**
STAGE 4	**Involvement of the bone marrow, lung parenchyma, pleura, liver, bone, skin, kidneys, gastrointestinal tract, or any tissue or organ in addition to lymph nodes, spleen, or Waldeyer's ring**
SUBCLASSIFICATION	
A	**Absence of systemic symptoms**
B	**Presence of fever, night sweats, or pruritus**

above and below the diaphragm, but still limited to nodal tissue. In Stage 3 the disease does not involve the bone, bone marrow, lungs, pleura, or liver. The spleen is considered lymph node tissue. Stage 4 is disease in non lymph node areas.

Another factor that has been shown to be related to survival and prognosis is the presence or absence of symptoms including fever, night sweats, and pruritis. Thus, the patient may be in any one of four stages and be symptomatic (B) or asymptomatic (A).

To illustrate the value of lymphangiography and staging, in a study at Memorial Hospital Lee has shown that in patients who present with a groin node, 6 of 6 (100%) had abnormal lymphangiograms.[4] On the other hand, when the presenting single area is in the cervical region, less than 10% of these patients had abnormal lymphangiograms. In patients who were clinically stage 2, where the disease was palpated only above the diaphragm, and who were symptomatic, 90% were found to have disease in the retroperitoneal space. Therefore, lymphangiography more clearly defines those patients who would not benefit by extensive treatment to the neck and mediastinum. On the other hand, it would be encouraging to find that the patient has disease in the neck or mediastinum, but not in the retroperitoneal space.

Kaplan[5] has shown that the percentage of recurrences in any one disease area was inversely related to the dose of radiation administered. In this report 80% of the patients had a recurrence when only very low doses of radiation had been administered. At 1000 rad tumor dose 60% had recurrences. However, if 4000 rads were administered the incidence of occurrence is only about 4%. Therefore, it is exceedingly important to make sure that the patients receive high doses of radiotherapy when the disease is localized. Easson was one of the first investigators to show that patients with localized Hodgkin's disease treated with high dosage radiotherapy and followed for up to 15 years have a normal expected survival after a slight initial decline in the first 2 to 5 years of follow up.[6] Accurate staging obviates the morbidity associated with high dosage extended radiotherapy in those patients with extensive disease.

What about the rest of the patients with stage 3 and 4 disease who represent about 60% of the patients with Hodgkin's disease? This group of patients should get chemotherapy.

One of the first chemotherapeutic agents used was "a nitrogen mustard," given in a dose of 0.4 milligrams per kilogram as a single injection or divided over 4 days. Nausea, vomiting and bone marrow depression occur with this agent. Another alkylating agent is *chlorambucil*, which is given orally in a dose of 0.1 to 0.2 milligrams per kilogram. It also causes bone marrow toxicity.

One of the newer alkylating agents is *cyclophosphamide*. It also causes the same kind of toxicity, nausea, vomiting, and bone marrow depression as the other alkylating agents, but may also produce alopecia or hemorrhagic cystitis. This compound can be given either orally or parenterally.

The "vinca" alkaloids, *vinblastine* and *vincristine*, are not alkylating agents, and they may be effective when alkylating agents are not. The vinca compounds cause bone marrow depression, but in addition, cause some degree of neurotoxicity manifested by numbness of the fingertips and peripheral nerve palsies.

Some of our own studies have suggested that *vinblastine* is as good as an alkylating agent as initial treatment in patients with Hodgkin's disease.[7]

Corticosteroids are useful in the treatment of thrombocytopenia or hemolytic anemia due to hypersplenism. Of the newer agents, *ibenzmethy-*

zin is one of the most effective. This compound is effective in patients refractory to both alkylating agents and the vinca compounds.

What do we have to know to use these agents in the best possible way? How can we achieve the best response or remission? Is it better to maintain a remission or to treat intermittently? These questions were asked and answered in a cooperative study by the Eastern Solid Tumor Group and Acute Leukemia B Group.[7]

In this study approximately 400 patients with malignant lymphoma were randomized to *cyclophosphamide* or to one of the two vinca alkaloids. Those patients who went into remission were then re-randomized to a maintenance regime that consisted of either *cyclophosphamide* or a placebo. These patients who received a placebo were than treated intermittently with parenteral *cyclophosphamide* on an intermittent treatment schedule.

In patients with Hodgkin's, *cyclophosphamide* treatment resulted in a complete plus partial response rate of 52%. In a comparable group of patients treated with *vinblastine* 76% of the patients had responses. Thus, for patients with Hodgkin's disease with no prior therapy, the response rate to *vinblastine* was better than it was to *cyclophosphamide*. In patients with lymphosarcoma the converse was true. The response to *cyclophosphamide* was better than to *vincristine*. In reticulum cell sarcoma patients no differences were noted between the two treatments. The remission duration for all these diseases was longer when maintained with an oral daily dose of *cyclophosphamide*. However, the intermittent type of treatment was as effective as the daily continuous treatment.

In patients with acute leukemia several drugs are effective in producing disease remission and combination chemotherapy is very effective in producing as well as prolonging remissions. We have seen that several agents are also effective in patients with lymphoma. What would combination chemotherapy do in lymphoma patients?

At the National Institutes of Health a preliminary study of combination chemotherapy was done by Doctors DeVita, Moxley, Brace, and Frei.[8] Ninety three percent of the patients had antitumor responses with combination chemotherapy and 86% of these patients had complete remissions. What was also exciting, was the finding that the duration of remission was exceedingly long and longer than expected following single drug treatment.

To follow up on this observation, at the National Institutes of Health, we have used in combination "nitrogen mustard," *vincristine, ibenzmethyzin* and *prednisone* for a 14 day treatment cycle and repeated after a two week rest for 6 cycles. This study was done in collaboration with Dr. Serpick of the Baltimore Public Health Service Hospital. Of the initial 30 patients on study, 83% of these patients had complete remissions. Of the patients who entered a remission, the mean duration of remission is in excess of 12 months. Only 4 patients have relapsed. We hope that some of these patients might indeed have very long remissions, indicating that the tumor population has been reduced to extremely small numbers.

I have talked about new concepts of management of patients with malignant lymphoma very rapidly. As I have tried to point out, we do not have to be pessimistic. We should examine these patients very carefully. The disease extent should be carefully documented using all the latest procedures. The treatment should be one most compatible with our latest information.

CYTOXAN—*cyclophosphamide*
DELTASONE—*prednisone* (Deltra, Meticorten, Paracourt)
LEUKERAN—*chlorambucil*
NATULAN—*ibenzmethyzin* (Methydhydrazine)
ONCOVIN—*vincristine*
VELBAN—*vinblastine*

MEDICINE'S NOT SO SILENT PARTNER

CONGRESSMAN DURWARD G. HALL
Representative from Springfield Missouri.

Since that crucial vote in the U.S. House of Representatives on April 8, 1965 when 236 House members defeated 191 opponents of federal medicine and *Medicare* started on its way—our profession has been asked by federal government officials to join in partnership with the federal government, which is building bridges these days.

Leaders in all branches of Medicine freely offered their time and experience attending advisory committee meetings held in Washington, D.C. and Baltimore. Even some of the most liberal members of the radio, television, press, and periodical world who had been chewing on physicians for 20 years commended the profession's new attitude of cooperation.

I, for one, urged cooperation then, and I urge it now, but its time to blow the whistle at the *fouls* being committed by Medicine's new "partner," or "intervener," the federal government. I know of no other profession, group or industry, certainly not labor, not the legal profession, not the professional chemists, or the professional engineers, who in spite of their good works and contributions to society, are the victims of such malicious invectives and accusations, as is the medical profession.

In spite of being the only group subject to the draft up to age 35, in spite of the fact that many physicians give so generously of their time caring for the indigent, on unpaid hospital and other medical committees and boards, in medical missions in Viet-Nam and throughout the entire world, there is a growing long list of current smears, legal actions, punitive investigations, and intended regulations, some of which I will cite, and all of which demonstrate that with a friendly partner like this, who needs enemies?

Let me cite a few examples: . . . The *Medicare* law's legislative author, John S. Millis Ph.D., guaranteed on the floor of the House of Representatives that the Social Security Administration would not use the new law to disturb existing patterns of medical practice. Yet Mr. Robert M. Ball, the Administrator, now proposes that hospital-based physicians, especially the pathologists and radiologists, become employees of hospitals.

During the testimony before the House Ways and Means Committee prior to passage of the legislation *HEW* officials vowed they wanted only to cover the 65 and older members of society, yet in the first session of Congress following enactment of the law, coverage of the disabled is requested—irrespective of whether such person is able to afford his own medical expenses.

Though the law guaranteed two modes of payment for physicians, ie, direct billing using receipted bill, or by the assignment method. Just three weeks ago organized labor stumped the nation and filled the press with charges that organized Medicine was ruining the program by not using the assignment route exclusively.

HEW officials, behind closed committee doors, sought to require a statement by the physician on his receipted bill that charges shown were his total charges, thus permitting the federal government to exercise fixed-fee-control over any physician in the *Medicare* program. This isn't "keeping the faith, baby," if you ask me. *HEW's* own testimony shows about half the doctors have used the assignment method during the first 6 months of the program.

Given at the Annual Meeting Conference of Presidents, Chalfont-Haddon Hall, Atlantic City, NJ, June 17, 1967.

Disregarding the advice of the medical profession, our fair-weather partner sends its emissaries throughout the land, at the taxpayer's expense, in support of the use of "generic-drugs-only" in welfare programs.

Pro-Administration Senators Phillip Hart and Gaylord Nelson, who possess not a single hour of medical credit in their educational backgrounds, and whose professional staff rosters fail to include any medically trained personnel unless you count hangers-on of the Kefauver inquisition as such, tell the American people, who have the finest medical system in the world, that physicians must:

(a) Turn over to the optometrists some elements of care and treatment of the eye

(b) Must relinquish to the druggists the right to select from their stocks of generic drugs the drug of the company which offers to the druggist the highest mark up

(c) And, they would deny physicians the right to prescribe either a generic or trade name drug.

Now Webster defines partner as "—An associate; sharer; participant." The federal government is hardly living up to its role in this definition when its *OEO* opens neighborhood clinics in cities where the local medical society's notice of the event is seen for the first time in a copy of the evening paper of the day of the grand opening. This has happened in several places, most recently, in my own state, in Kansas City. Nor is the government playing the game when, in its demonstration cities there is provided mortgage guarantees, wherein perference is given to those groups who offer prepaid care—these usually are labor organizations' plans wherein physicians are hired on a salary and their earnings exploited in a way contrary to medical ethics.

Nor is the federal government a friendly partner when in return for such good deeds as the voluntary *Viet-Nam Medic Program* for the civilians of that war torn country, its Commissioner of Internal Revenue proposed regulations to tax at the rate of 48% net, advertising revenue of national and state medical journals and the journals and magazines of nearly every cultural organization in this country including the Boy Scouts and the Girl Scouts, the American Bar Association, the American Farm Bureau, the US Chamber of Commerce. I could go on naming some 600 educational, scientific, service and cultural organizations whose members are from the professions, business and labor. These proposed regulations are based upon a 1950 (17 year old) law originally enacted by Congress to curb the abuse of tax free universities owning and operating manufacturing businesses in competition with tax paying businesses.

Our friendly partner's *IRS* has recently notified the *Student American Medical Association* that it is recommending withdrawal of the Association's status as a tax exempt organization. *IRS* says the group derives most of its income from advertising revenues in its magazine, the *New Physician,* and from sales of life insurance to its members.

Though we all know that voluntary community blood banks are organized "not for profit," and reduces costs of medically needed blood, yet our "friendly" partner's *FTC* claims they are a business, and in interstate commerce, and therefore are subject to the anti-trust laws.

Our friendly partner's Justice Department has filed a civil anti-trust suit charging the College of American Pathologists and its members with conspiring to monopolize the medical laboratory testing industry by price-fixing and forcing laboratories, owned by non-members—out of business by what it called "boycotting agreements." The College pointed out that the timing of this action, coming at the inception of *Medicare* and immediately following the *AMA* Annual Meeting, makes it appear that this is but the first step in a campaign of harassment of the entire medical profession by the government.

There are times when the American public can hardly escape the conclusion that the administration in power is deliberately out to destroy the good name of the American physician, and to make him a subject of ridicule and contempt. For those who in one pious breath attack "McCarthyism" and in the other breath use such broad brush methods of innuendo, there is a double standard of immense contradictions.

I am still convinced that cooperation is the best road to travel, but cooperation which must be in its best and truest and fullest meaning. It must work both ways, and those representing *quality* care of patients must have the guts to stand for belief and principle.

PUBLIC RELATIONS IN ACTION

Robert B. Goldstein, MD, Chairman, Public Relations Committee, Medical and Chirurgical Faculty of the State of Maryland

It is interesting to me that today's seminar is held in this particular room called Osler Hall, named for Sir William Osler, Professor of Medicine at The Johns Hopkins Medical School at the turn of the century. As you look around this room and gaze upon the portraits of the distinguished gentlemen in high wing collars, frock tail coats, beards and moustaches, remember you are looking at men who practiced medicine in an era far removed from the one we practice in today. Their era was one where the physician was placed high on a pedestal and he could do no wrong. He was thought of as a healer, friend, minister and adviser. He did not have to worry about such things as insurance forms, government controls and regulations, getting hospital beds and filling out charts to the extent that you spend more time with paper work than you do with the patient.

Today the physician is not on that same pedestal. In the eyes of many he is a wealthy, money-hungry individual who drives a big automobile and does not work on Wednesday afternoons, Saturdays and Sundays and who will not make house calls or night calls.

Since the physician of today tends to be pictured this way, we must take a good look at ourselves and make changes where necessary. Today more people are getting better care than ever before and yet physicians cannot spend as much time with the patient as they desire. This is where the medical assistant takes over. Whether this person be a nurse, technician, secretary or receptionist makes no difference. To have a smooth running office and satisfied patients certain principles must be carried out. This is *Public Relations from the Doctor's Point of View.*

*Presented at Medical Assistants' Seminar, held at the Faculty Building, Wednesday, April 6, 1966.

As his assistant you are his representative in the eyes of all who enter his office. The doctor is known not only by his own good works, but by the deeds of his assistant acting for him. Every patient, actual or potential, who comes into the doctor's office deserves courtesy, prompt and sympathetic attention. Thus every patient forms an impression, the degree and extent of which is measured in the public eye. Every word, act and attitude of the medical assistant should reflect confidence and admiration for her employer.

Until recent years, the medical assistant's duty was largely restricted to secretarial duties. However, today the demands are different. Most doctors now desire a receptionist, a secretary, an office nurse and a laboratory technician all rolled into one. This is the well-trained medical assistant. The Medical assistant receives with pleasantness and dignity every person who enters the doctor's office, whether he be patient, book publisher, drug salesman, insurane broker or the doctor's friends or relatives. She also answers the telephone in a courteous and diplomatic manner. A personality that pleases others amounts to more than personal satisfaction; it is a definite professional advantage.

The public likes fair play. When a number of patients are in a reception room never let it be felt because you showed an apparent socialite directly into the doctor's consultation room that he caters to the rich or that he has favorites. Such an act on your part is an injustice to his character. You must represent him in the public eye as having an attitude of fair play for all—rich and poor alike.

As a receptionist, one plays the part of hostess

and no form of hospitality should be lacking. In the case of the medical colleague who comes by without an appointment or steps in for an unscheduled exchange of opinion, his time is as important as that of the doctor whom he comes to see. Professional courtesy demands that the receptionist notify her employer at once and show him to the consultation room as soon as possible.

This might be very obvious to you but let me recite an example of *non*-public relations in action.

A practitioner who referred much work to an ear specialist had the occasion to take his 12 year old son to this doctor for consultation. On arrival, the indifferent secretary did not show the least interest in their presence. After waiting for half an hour, the practitioner approached the secretary and asked if the doctor was there, and introduced himself by his professional title. Her reply was, "Yes, he is in but he is busy now."

In response to the question as to how long he would have to wait, she said, "I don't know, he'll probably be some time yet."

"I'll have to step downstairs to make a phone call to cancel another appointment, will it be alright if I leave my son here for a few minutes?" the doctor asked.

Her reply was short. "Indeed, I don't know, it's your child, suit yourself." The physician did suit himself and needless to say he did not refer any more patients either. He felt that all his patients were treated in the same caustic manner as he was.

All that was needed here was a little pleasantness. I realize that it is not easy to be pleasant as one nears the end of the day, but every patient needs good humor, sympathy and a quiet manner, no matter how weary or upset the medical assistant may be personally.

One doctor asked his very efficient and sophisticated secretary to break down and smile once in a while. She replied that she always, "felt so silly when she smiled." Perhaps she did not value the healing quality of pleasantness as much as she valued what someone might think of her.

A medical assistant should study the role of her doctor-employer so that in the act of assisting him there may be a perfect coordination in the public eye. The relationship between the doctor and his medical assistant is very close. As is obvious when one considers how often the nature of the works brings the doctor and his assistant together in treating patients. The personality and the character of the medical assistant can do much to attract patients and keep the doctor's practice in good repair.

Occasions will arise when it is necessary to save your doctor's "face", this occurs to all of us. One afternoon when I was quite late the secretary observed an undercurrent of growing impatience in the reception room. Instead of remaining indifferent to this feeling or showing annoyance at its demonstration, the secretary revealed a sympathetic concern for those people who were involved in a difficulty for which neither they nor she were responsible.

At the same time, she managed to remain loyal to me. Her tact and thoughtfulness allayed their impatience and retained their good will.

For the most part, those who come to a doctor's office will be patients. A high degree of intelligence is needed to increase in them a feeling of their own individuality and to show them that their best interests are being respected. The lesser number of visitors consists of non-patients; detail men, insurance agents, and others; that is, the general public with whom it is diplomatically advantageous to maintain proper and helpful relations at all times. A golden opportunity may be lost as the result of a poor reception. The receptionist with a quiet and pleasing manner and a sense of timing and tact is one of the greatest assets that any doctor can have.

The patient feels primarily concerned about himself; secondarily interested in the doctor who is to help him; and only casually, if at all, interested in you. Nevertheless, the patient sees you first, and you must create the refined, pleasant and comforting atmosphere of the office. The place where you preside should be for the moment a refuge that will inspire confidence and release unnecessary tension. The medical assistant in her role as receptionist is called upon to relate the patient smoothly and pleasantly to the busy doctor and to make the experience of spending money for medical attention satisfying and agreeable.

The medical profession frowns upon any form of commercial advertising to attract the general public. However, this does not mean that a doctor cannot take advantage of the fact that his reception room is actually the "show window" of his profession. The medical assistant will be courte-

ous and efficient at all times because she realizes the importance of personal contacts and the necessity of tact in handling all who come: patients and non-patients; the well educated and the ignorant; colleagues and tradespeople; friends and relatives. She will recognize the dual role as a guardian of the goodwill of the public as well as the custodian of her employer's time and energy.

Situations will arise such as a referring doctor forgetting to make an appointment for his patient, and she arrives during a busy afternoon schedule. The able assistant, aware of good public relations will handle this incident adequately with no one being the wiser. However, I have experienced the opposite on occasions and it has hurt the physician considerably.

A feeling of security is an important factor that most patients desire and this is done by creating an atmosphere of confidence. Do not allow case histories, reports, financial statements and doctor's correspondence to lie carelessly exposed on your desk. Many patients do not like to think that their personal correspondence with the doctor may be handled by you. I have been in offices where the indifferent receptionist actually shouted into the waiting room to a new patient and asked for the following information: Why are you here? How old are you? Do you have insurance? And who is going to pay the bill?

I find that the waiting room serves its purpose to further public relations. The public relations section of the American Medical Association has much information available in pamphlet form that is geared for the layman's information on home treatment for emergencies, use of drugs, knowledge for baby-sitters, etc. And, more recently, information on Medicare. As a medical assistant you will have to be aware of these problems because you, as well as the doctor, will be asked for answers and opinions.

Another path to good public relations that occurs in my office and for which I take no credit is as follows. My secretary, faithfully, scans the paper for the death notices, marriage licenses and any news of our patient or their families. An appropriate letter or card is sent. The impression this personal touch leaves with the patient or his family is tremendous. Patients whom I admit to the hospital for surgery always receive a card—not from me but from my medical assistants. When a patient is discharged from the hospital, one of the girls always calls in three or four days to inquire as to the patient's convalescence. These are trivial, time-consuming aids that pay big dividends.

The telephone may be called the threshold to professional success. Good telephone technique is most important in a doctor's practice because much of his professional business comes to him and is maintained through its use. Do you have what the New York Telephone Company calls, "A Voice With A Smile?" Do you telephone others as you would be telephoned to? Have you a pleasing telephone personality? If you answer these questions in the affirmative, you possess an important requisite to medical assisting.

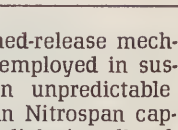
A doctor will forgive much and will overlook some shortcomings when they are compensated for by other more worthy talents; but he will not tolerate a medical assistant who turns patients from his telephone door.

The object of proper telephone technique is to attract new patients to your doctor's office and to serve every person who calls with such courtesy and satisfaction that he will enjoy his professional telephone relationship with you.

This phase of public relations was thought to be so important that one county medical society in Oregon scheduled a course in telephone techniques for medical assistants working in doctor's offices. It proved to be sound public relations because now instead of hearing a tiger on the line, you can hear a smile on the line. As a result 1965 was the year of the tiger on Madison Avenue, but now in the medical offices of Multinomah County, everyday one can hear the voice of the turtledove. After all, a coo is gentler than tiger talk.

While doctors vary, according to their specialties, as to the amount of medical assistance they require, nevertheless every doctor desires a trained and efficient co-worker. He needs a secretary who can save his valuable time, a technician who can submit reliable reports and, above all a person who will meet his patients with intelligence, tact, sympathy and integrity. These qualities are at the heart of his medical practice and with them he begins his art of healing.

This is Public Relations in Action from One Doctor's Point of View.

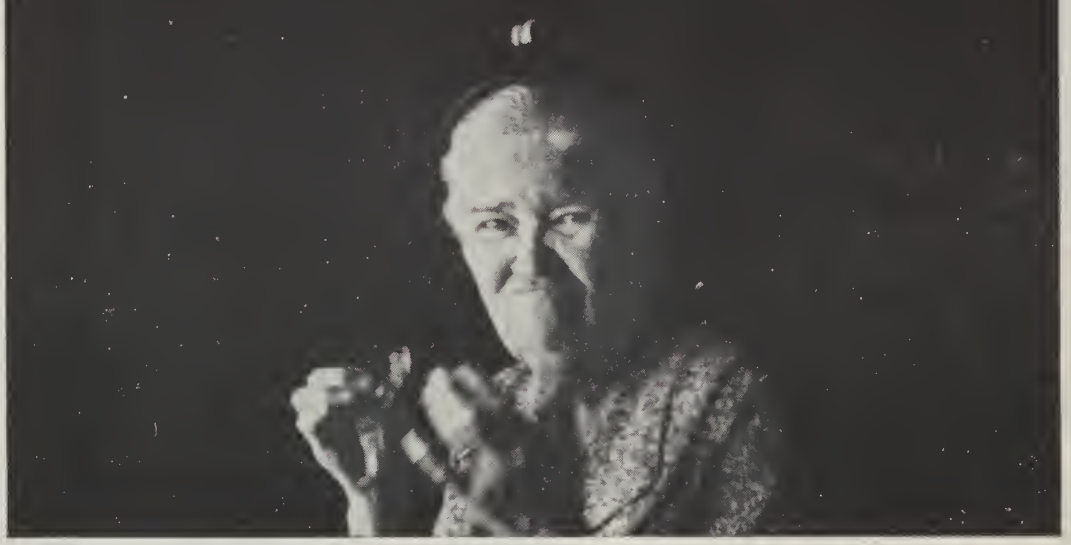


Unique Nitrospan micro-dialysis process* adds an important dimension–TIME–to nitroglycerin therapy

elps decrease frequency and severity of attacks; often ıcreases exercise tolerance. Decreases need for sub-ngual nitroglycerin, increases patient confidence. mooth, continuous release independent of gastrointes-nal functions reduces headache and other side effects ıat might result from peak concentrations of tablet or ıtermittent-release preparations.

ıdication and Dosage: For prophylactic use only in an-na pectoris, 1 capsule every 12 hours. **Precautions:** For rophylaxis only, not for relief of acute anginal attacks. olerance to nitrites may develop on long-continued use. **ontraindications:** Idiosyncrasy to nitroglycerin, and arly myocardial infarction. **Side Effects:** With use of itrites, transient headache, postural hypotension, nausea and vomiting may occur. Overdoses may cause flushing, dizziness, tachycardia, headache and syncope.

***The micro-dialysis cell.** Nitrospan's timed-release mechanism is different from those usually employed in sustained-action capsules, which rely on unpredictable digestive processes. The nitroglycerin in Nitrospan capsules is contained within hundreds of dialysis cells of controlled permeability. The contents of each micro-dialysis cell are released by diffusion rather than disintegration, at a continuous rate independent of gastrointestinal action. Only the presence of fluid is required.



NEW from USV **NITROSPAN®** CAPSULES

brand of **nitroglycerin** 2.5 mg. in micro-dialysis cells

USV PHARMACEUTICAL CORPORATION, 800 Second Avenue, New York, N.Y. 10017

IRON DEFICIENCY

ANEMIA

Imferon®
(iron dextran injection)

There's as much iron . . . 250 mg. . . . in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron . . . or orally administered iron proves ineffective or impractical . . . or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves. Precise dosage is easily calculated.

LAKESIDE

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

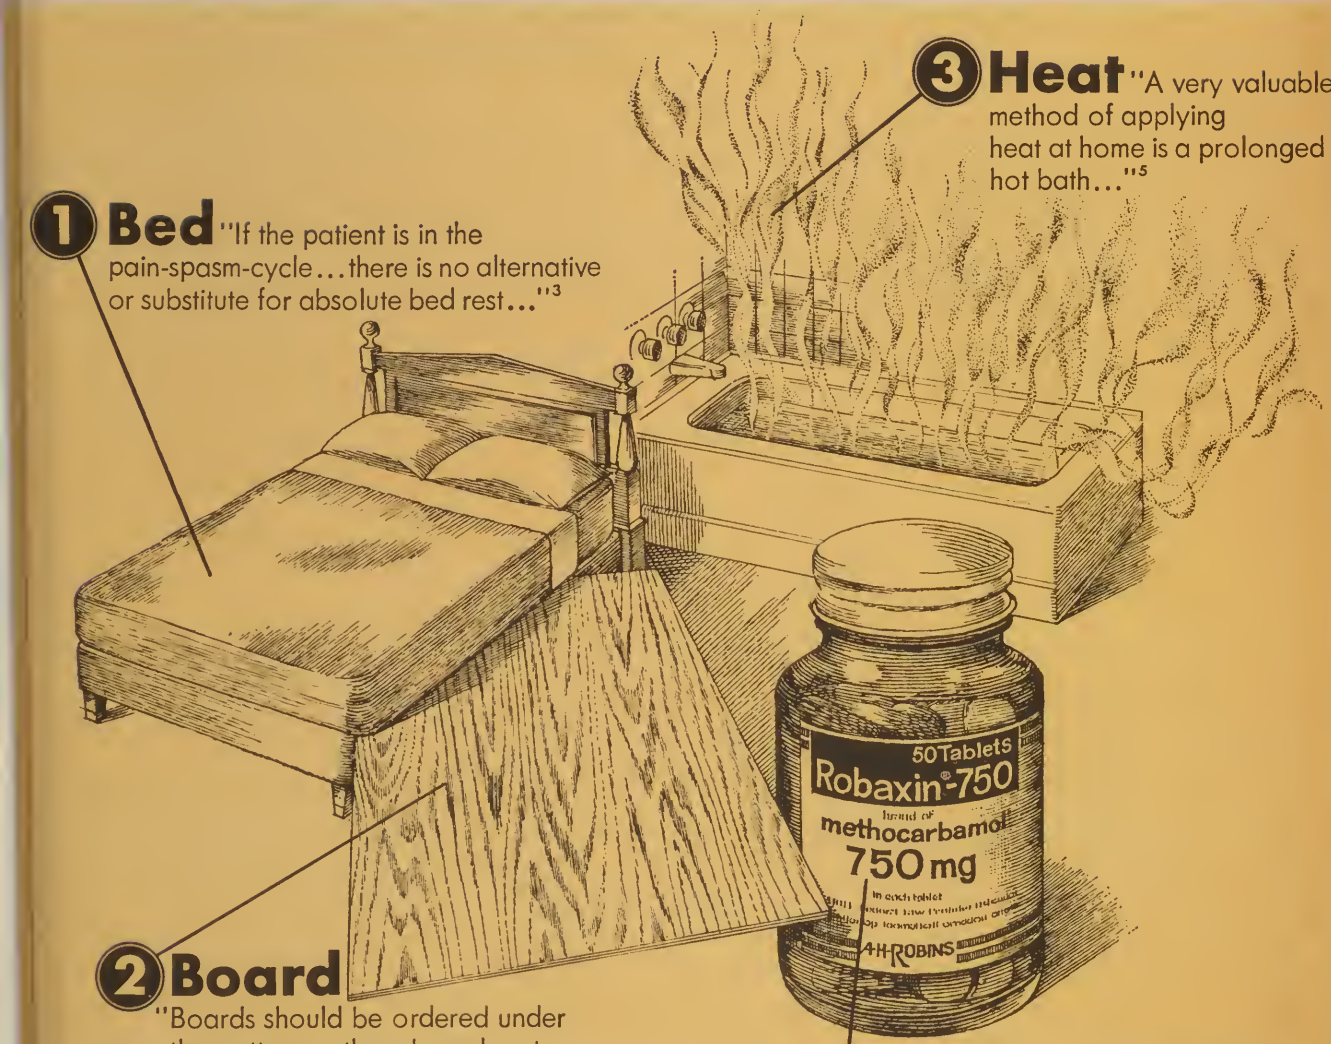
ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.



SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LOW-BACK PAIN

A CONSERVATIVE, FOUR-POINT PROGRAM

The low back pain that is most frequently seen in general practice is mechanical in nature, i.e., postural back pain, joint dysfunction and acute back strain.[1,2] For this type of discomfort, a conservative regimen is usually sufficient to relieve aches and pains, and to help keep the patient functioning. Components of this basic program include:

1 Bed "If the patient is in the pain-spasm-cycle...there is no alternative or substitute for absolute bed rest..."[3]

2 Board "Boards should be ordered under the mattress...these boards act by immobilizing the spine..."[4]

3 Heat "A very valuable method of applying heat at home is a prolonged hot bath..."[5]

4 Robaxin®-750 (methocarbamol, 750 mg. capsule-shaped tablets) A well-tolerated[6] skeletal muscle relaxant, methocarbamol helps relieve spasm "...without interfering with normal tone and movement."[7] And there is little likelihood of sedation.[6]

ndicated for relief of skeletal muscle spasm. **Contraindicated** in ypersensitive patients. **Side Effects** (lightheadedness, dizziness, rowsiness, nausea) may occur rarely, but usually disappear on reduced losage. Hypersensitivity reactions develop infrequently. See product terature for further details. **Also available:** Robaxin® Tablets methocarbamol, 500 mg.) Robaxin Injectable (methocarbamol, 1 Gm./10 cc.)

A·H·ROBINS A. H. ROBINS COMPANY RICHMOND, VIRGINIA 23220

NEW EVIDENCE:

Pro-Banthine® (propantheline bromide)
gives positive, selective benefits in gastrointestinal disorders.

Intragastric photograph of pyloric region showing complete relaxation of pyloric sphincter with 6 mg. of Pro-Banthine intravenously.

AN IMPORTANT PROBLEM in managing gastrointestinal disorders has been the choice of an anticholinergic agent which will act positively and selectively on the gastrointestinal tract without extensive secondary effects.

Recent direct observations with the cinefibergastroscope and intragastric photography[1] visually confirm previous evidence that Pro-Banthine does, indeed, possess such selective activity.

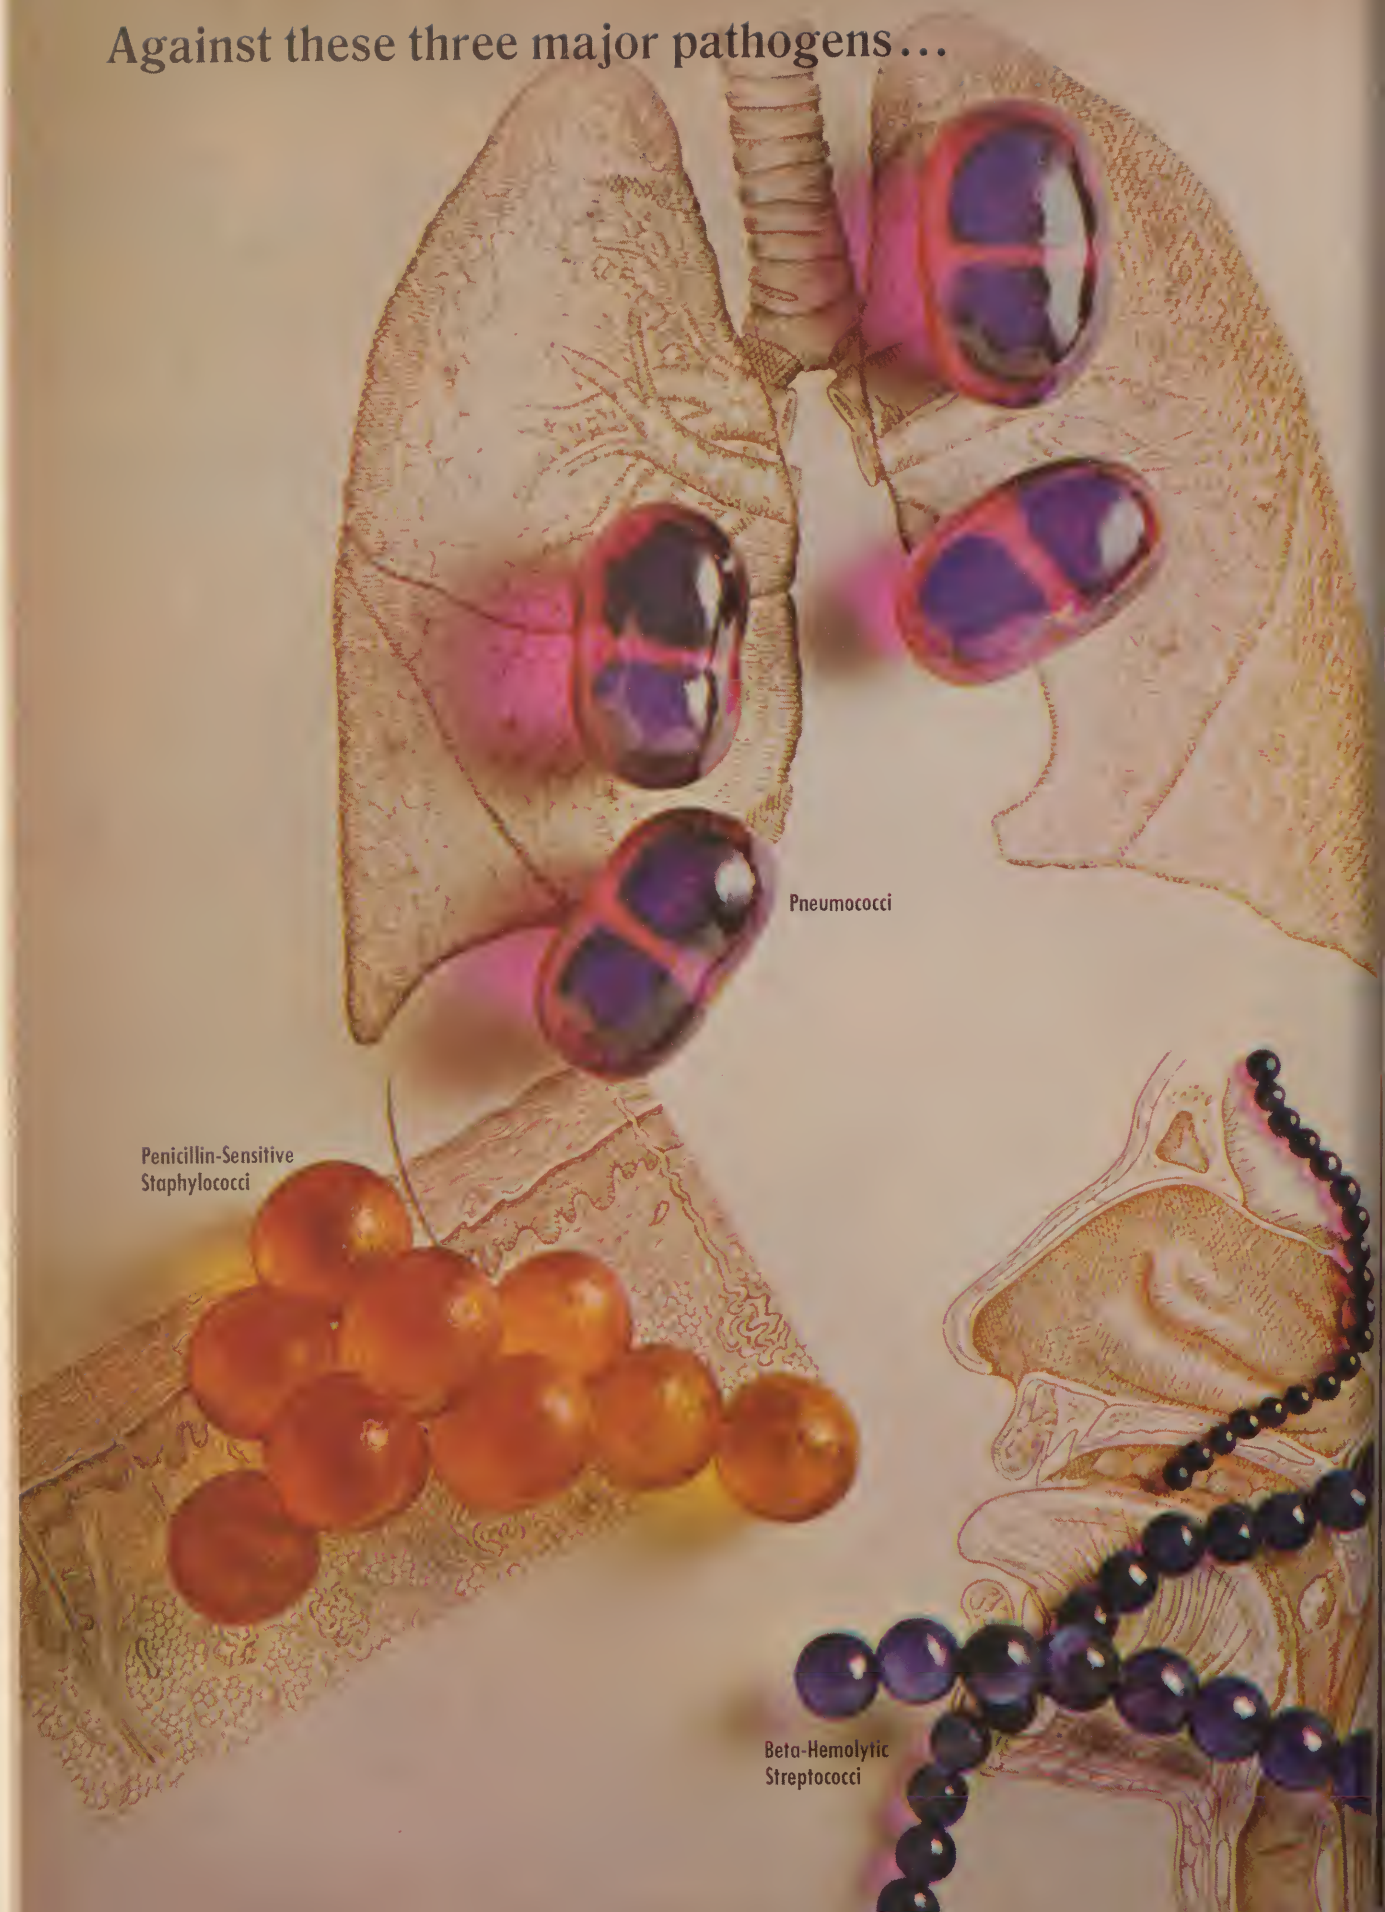
Barowsky and his associates demonstrated that a minimal dose of 6 to 8 mg. of Pro-Banthine intravenously produced complete relaxation of gastric activity. Secondary effects were not significant.

By contrast, it required 0.8 mg. or double the usual dose of atropine intravenously to achieve similar gastric relaxation. Side effects of this dosage of the belladonna alkaloid were pronounced. Ventricular rates were as high as 150 per minute.

For positive, selective anticholinergic benefits Pro-Banthine is indicated in patients with peptic ulcer, gastritis, irritable colon and other forms of gastrointestinal hypermotility.

Dosage: The maximal tolerated dosage is usually the most effective. For most *adult* patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type ampuls of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours, intramuscularly or intravenously.

Contraindications: In glaucoma or severe cardiac disease.



Precautions: Since varying degrees of urinary hesitancy may occur in the elderly male with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug.

Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.

Side Effects The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

V-Cillin K® Lilly 700867

Potassium Phenoxymethyl Penicillin

(See next page for prescribing informatio

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Warnings: In rare instances, the use of penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin and in those with bronchial asthma or other allergies. Resuscitative drugs should be readily available for emergency administration. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for relief of immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with high parenteral dosage schedules, frequent evaluation of the renal and hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory studies (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrowth of penicillin-insensitive organisms. In such cases, its administration should be discontinued, and appropriate measures should be taken.

Adverse Reactions: Although serious allergic reactions are much less common with administration of oral penicillin than with intramuscular forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it does possess a significant index of sensitization. The following hypersensitivity reactions associated with the use of penicillin have been reported: skin rashes ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; and reactions resembling serum sickness, including chills, fever, edema, arthralgia, and prostration. Severe and often fatal anaphylaxis has occurred (see Warnings). Hemolytic anemia, leukopenia, thrombocytopenia, and nephropathy are rarely observed side-effects and are usually associated with high parenteral dosage.

Administration and Dosage: For Tablets V-Cillin K and for V-Cillin K Pediatric, the usual dosage ranges from 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants the daily dosage may be 50 mg. per Kg. of body weight divided into three doses.

Beta-hemolytic streptococcus infections without associated bacteremia may be treated with 200,000 to 400,0000 units three times a day. Therapy should be continued for a minimum of ten days to prevent development of rheumatic fever and/or other serious complications. Dosage for routine streptococcus prophylaxis in patients with a history of rheumatic fever or congenital heart disease may be 200,000 units once or twice daily. When such patients undergo tonsillectomy, tooth extraction, or other minor surgery, the prophylactic dose should be 500,000 units every six hours given two days prior to surgery and for two days postoperatively. If oral medication is not feasible on the day of surgery, parenteral therapy should be considered. Mild to moderately severe pneumococcus pneumonia has been treated effectively with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be given every six to eight hours in conjunction with indicated surgical procedures.

For gonorrhea in males, 500 mg. (800,000 units) every four hours in three doses may be employed; in females, 500 mg. every four hours for six doses are recommended. Refractory infections generally respond to a second treatment three to four days following completion of the first. Treatment of gonorrhea with severe complications should be individualized, with prolonged and intensive treatment. Patients with suspected lesion of syphilis should have a dark-field examination before receiving penicillin and monthly serologic tests for a minimum of three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units) in bottles of 50 and 100; and 250 mg. (400,0000 units) and 500 mg. (800,000 units), in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) per 5 cc. of solution, in 40, 80, and 150-cc.-size packages. [03...

HEPATIC VENOGRAPHY WITH CARBON DIOXIDE

DAVID B. GOLDENBERG, MD
AND
BYRON G. BROGDON, MD

The Department of Radiology,
The Johns Hopkins Hospital, Baltimore, Maryland

During review of a series of patients in whom carbon dioxide filling of the right atrium was performed for evaluation of pericardial effusion, it was observed that contrast visualization of the hepatic veins was obtained in 23 of 24 cases. In all of these, good filling of the right vein was obtained, usually to the level of the sixth bifurcation or beyond; because of its course and direction the left hepatic vein was ordinarily less extensively filled (Fig. 1). Carbon dioxide also refluxed down the inferior vena cava for variable distances, according to whether or not the patient's feet were elevated. Similar incidental filling of hepatic veins during gas studies of pericardial effusions was noted recently by Burko and Klatte.[1]

The morphological evaluation of the hepatic veins has been a difficult angiographic problem. Because of superimposition of branches of the portal vein, liver capillaries and the liver parenchyma, evaluation of the hepatic venous phase has been difficult with splenoportography.

Attempts at selective hepatic venography by retrograde injection of opaque contrast medium into the large trunks of the hepatic veins via catheter[2] have met with limited success. Nordenstrom[3] observed reflux filling of the hepatic veins in dogs when intrabronchial pressure was raised during right atrial and/or inferior vena cava injection. However, Nogueira's[4] attempt to utilize this technique for visualization of the hepatic veins in one patient failed. Tori and Scott[5] occluded the inferior vena cava in a dog some 2-3 cm. above the diaphragm by use of a balloon catheter. Subsequent contrast injection below the level of occlusion produced excellent retrograde opacification of hepatic veins. Norhagen[6] employed this technique in 45 patients with cirrhosis and hepatic neoplasms. He found the method to be associated with negligible risk, there being only occasional extrasystoles during inflation of the balloon catheter in the right atrium.

Although the method of Norhagen is satisfactory for demonstration of hepatic vein morphology, it is cumbersome to employ, requiring a double retrograde catheter technique. Visualization of he-

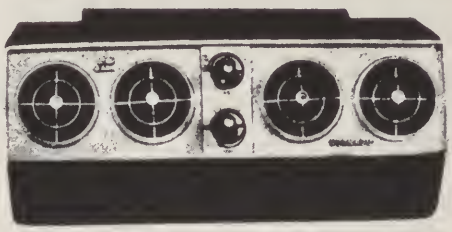
Fig 1
Proximal portion of inferior vena cava and right and left hepatic veins filled with carbon dioxide. (left lateral decubitus position)

Dr. Brogdon is now at the University of New Mexico School of Medicine, Albuquerque, New Mexico. This work was supported in part by USPHS Grant #5TO1 GM 01328 from the National Institute of General Medical Sciences.

patic veins with carbon dioxide promises to be a simpler method.

Method

With the patient lying on a stretcher against an upright Bucky cassette holder, scout film examinations of the chest and abdomen were obtained in the left lateral decubitus position. The foot of the stretcher was elevated approximately twenty degrees with respect to the head. Subsequently, a 16 gauge needle, connected to a tank of pure carbon dioxide by a three-way stopcock, was inserted into an antecubital vein. A 100 cc. syringe connected to the stopcock was repeatedly flushed with carbon dioxide to clear the system; then 100 cc. of carbon dioxide was hand-injected rapidly. Two 14 x 17 inch x-ray films were exposed sequentially as soon as possible thereafter. The patient was maintained in the left lateral decubitus position for at least five minutes following roentgenography in order to insure absorption of the carbon dioxide.



Comment

The hepatic veins may be occluded by thrombus or tumor arising either locally or by extension from the interior vena cava. Rarely, a congenital or acquired stricture is responsible for hepatic vein occlusion. The changes produced in the liver are those of severe congestion or cardiac cirrhosis, depending on the duration of the disease. Hepatic vein occlusion must be considered in the differential diagnosis of any case in which there is progressive enlargement and tenderness of the liver with rapid accumulation of ascites. Because of the technical difficulties pointed out above, morphological evaluation of hepatic veins rarely has been possible in the past. Reflux visualization of the hepatic veins and vena cava by carbon dioxide is a simple and expedient solution to this problem (Figure 1).

Additionally, although we have had no opportunity to apply this in clinical practice, carbon dioxide hepatic venography should prove useful in cases of deep-seated or central hepatic metastases where isotope scanning procedures may yield equivocal or negative results.

Summary

Intravenous injection of carbon dioxide is a simple and effective technique for radiographic visualization and evaluation of the hepatic venous system.

Elizabeth Sanford
Librarian

Miami Conference

Baltimore and Maryland librarians were very obvious at the meeting of the Medical Library Association for its 66th Annual Conference in Miami, June 11-18th, 1967. With representatives from the libraries of the two medical schools, Welch Medical Library and the Health Sciences Library; the National Library of Medicine, Medical and Chirurgical Faculty, and at least four local hospitals, including several hospitals outside the metropolitan area.

While the registration figure was near 600, the hotel very large, and the meetings diversified, there really never was a time when all Maryland delegates got together for a library talkfest. This suggests an idea for next year or, at least, some future planning, since the Denver librarians have their program for the 1968 meeting well organized already.

One of the most interesting presentations was the Sunday evening *Clinic on Medical Library Buildings*. Three building plans were presented. (1) The Library of Science and Medicine, Rutgers University, New Brunswick, New Jersey, by James Barry, Librarian, with Joan Titley, Librarian, Medical School, University of Louisville, Kentucky, as critic. (2) The Medical Library of the University of Nebraska, presented by Mrs. Bernice M. Hetzner, Librarian, and criticized by David A. Kronick, Librarian, South Texas Medical School, San Antonio. (3) The Division of Health Affairs Library, Chapel Hill, University of North Carolina, presented by Myrl Ebert, Librarian, and criticized by Sam Hitt, Librarian, Health Center, University of Connecticut, Hartford.

Librarians presenting plans defended the arrangement, design and decor of their respective buildings, while both the critics and audience unhesitatingly pointed out disadvantages and flaws. This produced a lively discussion which lasted late into the evening.

The five *Continuing Education* courses offered on Monday included subjects such as Implications of Machines in Libraries, Systems and Analysis, Human Factors in Administration Specialized Subject Field of Dentistry, and "Techniques of Interlibrary Loans." Aside from flooded classrooms on the lower floors where these courses were being held, and knee deep water in many streets, the meetings and library tours progressed as scheduled.

Highlight of the opening session was the *Janet Doe Lecture*: "The Medical Library Association in retrospect, 1937-1967," by Gertrude L. Annan, Librarian, New York Academy of Medicine, New York. Our own Marcia Noyes was among the prime figures in organizing *MLA* and headquarters was 1211 Cathedral Street for some time.

The Medical Societies Group dinner was chaired by Wesley Draper, Librarian, Academy of Medicine of Brooklyn (New York). Mrs. Helen Kovacs discussed "relationships of the Medical

Society Library with the Medical School Library Functions.

Other subjects on the agenda for general sessions were the evolving educational objectives and librarianship and the newer media.

* * * * *

Physicians who expect to attend the semi-annual meeting of the Faculty and would like special subjects or titles brought to them in Ocean City should send requests to the library as soon as possible. This is a service the library staff in pleased to furnish.

Pulmonary Function Tests for the Pathologist

The primary function of the lung is to adequately oxygenate and adequately remove waste CO_2 and H_2O from mixed pulmonary venous blood. To accomplish this, five general areas of activity are concerned, as follows: *ventilation,* for which *work* is necessary; *circulation, diffusion* and *gas exchange.* Each of these modalities may be measured, but, as Comroe emphasizes, ". . . physiologic tests indicate only how the disease has altered function; they cannot make an anatomic, a bacteriologic, or a pathologic diagnosis." In general, also, pulmonary function studies evaluate the *entire* lung, rather than any part of it. And so, to further paraphrase Comroe, they cannot tell where or what the lesion is; and they may not even indicate that there is a lesion. Therefore, as with all other laboratory tests, they simply supplement a good history and physical examination and the associated bacteriological, radiological, bronchoscopic, and pathological studies. Pulmonary function studies are not magical, any more than any other laboratory work is. If there is interference with a lung function by a pathological lesion and this interference falls within the parameters of available pulmonary function tests, they will measure it; if it does not, they will not.

Ventilation:

This modality is actually the movement of air in and out of the lungs; it is measured in terms of the four lung *volumes* and four lung *capacities.* The lung volumes are as follows: tidal volume (*TV*), inspiratory reserve volume (*IRV*), expiratory reserve volume (*ERV*), and residual volume (*RV*). The four lung capacities are the vital capacity (*VC*), inspiratory capacity (*IC*), functional residual capacity (*FRC*), and total lung capacity (*TLC*). Technically, none of these is a function test, but merely a measurable limit of ventilation. A spirometer will measure the *TV, IRV, ERV,* and *IC* and *VC.* The *FRC* is measurable by three different methods: the nitrogen wash-out (open-circuit), helium dilution (closed-circuit), or the body plethysmograph. The principal value of the plethysmograph, which actually measures thoracic gas volume, is that it will measure true *TLC,* whereas the other two methods will not measure non-ventilated lung areas. One may classify diseases which manifest themselves in measurable defects in lung volumes or capacities, as follows: those changing the anatomical amount of lung tissue, those affecting thoracic wall expansion, and those affecting diaphragmatic movement.

A corollary of and equally as important as the ventilatory volumes or capacities is the distribution of the air within the lung. In this regard, there is an *anatomic dead space* (ie, where no alveolar air exposure exists) and a *physiologic dead space* (in which inadequate circulation prevents gas diffusion in aerated alveoli). Only functional alveolar ventilation is ever effective, so that alveolar volume represents that portion of

the expired air with the same pCO_2 as pulmonary capillary blood and equals *TV* minus physiologic dead space volume. If ventilation is uneven, it is clinically manifest as increased work, decreased arterial pO_2 and increased pCO_2.

Work:

The muscles of respiration must overcome *elastic* resistance (lung and chest wall) and *frictional* resistance (principally due to airway air flow). The elastic resistance is measured in terms of *compliance,* which is volume change related to external pressure. The frictional or airway resistance is a function of alveolar pressure minus mouth pressure (air flow) and is measured in terms of three tests: maximum breathing capacity (*MBC*), timed forced expiratory volume (FEV_T), and maximal inspiratory and expiratory flow rates (*MIFR* & *MEFR*). Compliance is best measured with the plethysmograph; it is decreased in those diseases which interfere with lung expansion while the FEV_T, *MBC, MEF,* and *MIF* are decreased in diseases causing airway obstruction and air trapping.

Circulation:

It is obvious that adequacy of pulmonary capillary blood flow is equally as important to the organism as ventilation. The mechanisms which interfere with pulmonary circulation are anatomical shunts (cardiac or pulmonary), pulmonary vascular obstruction, and changes in blood flow (inflammation, atelectasis, and cardiac output). In the sense that it represents blood flow and does not take part in pulmonary gas exchange, the anatomic shunt is comparable to the anatomical dead space and is the only cause of hypoxemia not correctable by breathing 100% oxygen. Shunted blood includes both that through anatomical shunts as well as that flowing through physiological dead spaces. Shunts are measured by determinations of arterial pCO_2 and pO_2. Pulmonary blood flow is measurable by the Fick principle method (oxygen uptake/A-V oxygen difference), dye dilution, and the body plethysmograph, the latter measuring instantaneous capillary blood flow. Three other factors of importance in consideration of circulation are pulmonary vascular resistance, pressure, and volume. Resistance is measured as driving pressure in relation to blood flow. Pressure is measured by wedging a catheter into the smallest pulmonary artery possible or

measurement of the left auricular pressure by trans-septal puncture technique. Pulmonary capillary blood volume is indirectly measured by measuring the CO diffusing capacity when breathing gas of a high O_2 and then a low O_2 concentration. The ratio of ventilation to perfusion (V/P) is extremely important, since the most common cause of clinical hypoxemia is the inadequate oxygenation of the pulmonary capillary blood as a result of alteration of the average ventilation/perfusion ratio of 4/5. Conversely, the arterial pCO_2 will remain stable as long as it is possible to compensate for a decreased circulation with an increased ventilation.

Diffusion:

This represent the movement of gas molecules from a region of higher concentration to one of lower concentration. It is obvious that diffusing capacity, then, is the rate of oxygen transferred across the alveolo-capillary membrane. Anything hindering this transfer by decreasing the total *area* of the alveolo-capillary membrane will impair diffusion. Diffusing capacity is measurable by determining the pCO in the alveoli after breathing air and then oxygen. The term "alveolo-capillary block" is probably a misnomer, since there is some evidence that thickness of the alveolo-capillary membrane is of no significance in diffusion. There may be secondary changes in the diffusing capacity because of a decrease in the amount of functioning lung tissue.

Gas exchange:

Measurement of the arterial blood gas levels reflects the adequacy of pulmonary gas exchange, whose purpose it is to provide the oxygen needed and dispose of the CO_2 produced by the body's metabolic processes. The biochemical relationship of blood gases with hemoglobin and the solution of gases in the plasma are relatively well understood. The transport of these gases across the alveolo-capillary membrane is related to the gradient between the pO_2 and pCO_2 in the alveoli and the capillary blood. Thus, the relationship between the levels of arterial oxygen when a patient is breathing normally and when he is breathing 100% oxygen may help to clarify a case of hypoxemia; such a change may be due to any disease process that decreases alveolar ventilation, impairs diffusion, produces an uneven alveolar ventilation/pulmonary capillary blood flow ratio, or causes a venous-arterial shunt.

In the above paragraphs, an attempt has been made to condense a vast amount of complex, inter-related, and often poorly understood material. It is hoped that too much will not have been lost in this summarizing.

Sick, and worried sick

Professionally posed

Anxiety and tension stemming from organic illness may undermine your patient's cooperation and possibly retard success of primary therapy.

If his emotional symptoms persist in the face of your counsel and reassurance, you may want to consider adjunctive use of SERAX (oxazepam). It is indicated in anxiety, tension, agitation, irritability, and anxiety associated with depression. May be used in a broad range of patients, usually with considerable dosage flexibility.

When prescribing, carefully observe dosage recommendations and appropriate precautions, especially as pertaining to the elderly and when complications could ensue from a fall in blood pressure. (See Wyeth literature or PDR as well as "IN BRIEF" below.)

IN BRIEF.

Contraindications: History of previous hypersensitivity to oxazepam. Oxazepam is not indicated in psychoses.

Precautions: Hypotensive reactions are rare, but use with caution where complications could ensue from a fall in blood pressure, especially in the elderly. Withdrawal symptoms upon discontinuation have been noted in some patients exhibiting drug dependence through chronic overdose. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose; excessive, prolonged use in susceptible patients (alcoholics, ex-addicts, etc.) may result in dependence or habituation. Reduce dosage gradually after prolonged excessive dosage to avoid possible epileptiform seizures. Withdrawal symptoms following abrupt discontinuance are similar to those seen with barbiturates. Caution patients against driving or operating machinery until absence of drowsiness or dizziness is ascertained. Warn patients of possible reduction in alcohol tolerance. Safety for use in pregnancy has not been established.

Not indicated in children under 6 years; absolute dosage for 6- to 12-year-olds not established.

Side Effects: Therapy-interrupting side effects are rare. Transient mild drowsiness is common initially; if persistent, reduce dosage. Dizziness, vertigo and headache have also occurred infrequently; syncope, rarely. Mild paradoxical reactions (excitement, stimulation of affect) are reported in psychiatric patients. Minor diffuse rashes (morbilliform, urticarial and maculopapular) are rare. Nausea, lethargy, edema, slurred speech, tremor and altered libido are rare and generally controllable by dosage reduction. Although rare, leucopenia and hepatic dysfunction including jaundice have been reported during therapy. Periodic blood counts and liver function tests are advised. Ataxia, reported rarely, does not appear related to dose or age. These side reactions, noted with related compounds, are not yet reported: paradoxical excitation with severe rage reactions, hallucinations, menstrual irregularities, change in EEG pattern, blood dyscrasias (including agranulocytosis), blurred vision, diplopia, incontinence, stupor, disorientation, fever and euphoria.

Availability: Capsules of 10,15 and 30 mg. oxazepam.

To help you relieve anxiety and tension

STATE OF MARYLAND

Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

Kurt Gorwitz, ScD, Statistics Director

The National Scene

In 1966, for the first time, expenditures in the United States for the maintenance of state and county operated mental hospitals exceeded one and one-quarter billion dollars.* This represented an increase of 8.2%, or 98 million dollars, over the previous year's comparable figure. Total maintenance costs have nearly doubled since 1956 and are now one-third higher than they were five years ago.

Hospital expenditures have continued to go up although the average number of patients in these facilities has decreased steadily. Nationally, a decline in the patient population of 16.8% (from 555,103 to 461,910) occurred between 1956 and 1966. As a result, the average cost of caring for one patient for one day has gone up substantially. In 1956, the national daily per capita was $3.26. By 1966, this had increased 137.1% to $7.73. Despite this marked improvement, expenditures per patient continue to lag behind comparable figures from federal (VA) psychiatric hospitals.

While these data reflect rising personnel-patient ratios, the current emphasis on psychopharmacology and other improvements in treatment services, they are primarily related to the rapidly increasing patient turnover resulting from shortened periods of hospitalization and the release or transfer to nursing homes of many long term patients. As indicated in the following table, both admissions and the net number of releases have risen considerably between 1956 and 1966. In fact, this rise has been so large that the average expenditure required to produce one net release is now less than it was ten years ago.

If present trends continue, the average daily cost per patient must be expected to rise 10% or more per year at the same time that the average total cost of each treatment episode declines further. The only alternative to continuing, uninterrupted increases in state psychiatric hospital expenditures is to reduce drastically the size of the patient population by (1) curbing the flow of admissions (2) further decreasing the average period of hospitalization and (3) transferring chronic, custodial patients to nursing home type facilities. This can be accomplished through closely coordinated programs offering a variety of community and hospital services to the mentally disturbed and through the implementation of current and new concepts for the prevention of mental illnesses.

FISCAL YEAR	ADMISSIONS	NET RELEASES	TOTAL EXPENDITURES	EXPENDITURES PER NET RELEASE
1956	185,597	145,313	$663,280,934	$4,564.49
1958	209,823	161,742	806,711,228	4,987.64
1960	234,791	192,818	916,236,166	4,751.81
1962	269,854	230,158	1,033,567,884	4,490.68
1964	302,946	271,506	1,133,015,675	4,173.07
1966	330,399	311,827	1,300,622,459	4,170.97

FACTS, NOT FADS

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Public Health Responsibility For The Alcoholic

PART I

DAVID TRACHTENBERG, MD

I am honored to be invited to speak to this first alcoholism section of the Maryland Public Health Association. The fact of the establishment of this section reflects both the increasing concern at all levels with the problem of alcoholism and our growing sense of responsibility for this very large segment of our population.

We all recognize the traditional resistance to accepting alcoholism as a medical rather than a moral problem. The assignment of moral etiology to this condition has been, and still is, the major obstacle to successful prevention and treatment, although the elements of the moral lesion seem surprisingly contradictory. We learn that alcoholism is manifested through weakness of will power, and willfullness; by *lack* of foresight, and *excessive* tendency to worry about the future, which we call *lack* of faith. We call on the alcoholic to use more will power and at the same time to surrender his willfullness to a higher power.

Frankly, it seems to me that resentment of and resistance to the disease concept of alcoholism is often sharper in the medical community than in the public at large. How often do we intone down our noses at the patient, "If you *want* to stop, why don't you just *stop*?" As a matter of fact we go even a little further. We are very likely to say to the patient, "We will treat you as soon as you stop drinking." Now you must agree that this is like saying to the pneumonia patient, "Come back for your penicillin after your fever goes away and you stop coughing." As far as I know, alcoholism is the only condition in which we demand of the patient that he cure his symptoms *before* treatment begins. Can you imagine the bewilderment of the patient who is solemnly told that we will treat him as soon as he recovers.

Now why all this resistance to the alcoholic? Why must he be cured before we will deign to help him? Is it a moral problem? We don't seem to feel the same way about syphilis or gonorrhea. We don't ask it of the homosexual nor of the compulsive thief. Why the alcoholic? After all, our goal is to help the patient, and we pride ourselves on our ability to do so. It is from this ability that we receive personal satisfaction, status in the community, and our living. Why do we change the rules when it comes to alcoholism?

Perhaps one answer is that we change the rules on the alcoholic because the alcoholic himself threatens to change the rules on us. When you think about it, a great implicit assumption in the practice of medicine is that we are on the patient's side. We are working with *him*, against his *disease*. In fact, our patients always represent two sides: One working with us, and one—the disease process-working against us. It is taken for

Presented by David Trachtenberg, MD, Psychiatrist, Chief of the Bureau of Alcoholism and Drug Addiction, Montgomery County Health Department on June 1, 1967 before a section of the Maryland Public Health Association.

granted that it is Mr. Smith and I against Mr. Smith's pneumonia. A "good patient" is one who presents us with a strong ally against his disease process.

Now obviously with an alcoholic, or in other disorders that affect personality and behavior, this necessary, albeit implicit, *therapeutic triangle* is obscure. A part of the essential *patient* is the enemy, instead of a foreign element like a fracture or a tumor. It begins to look like a *two*-sided struggle instead of a triangle, with the doctor versus the patient. We are, as we all recognize, helpless in a two-sided struggle, and, in addition, it is somewhat annoying to be treated by the patient as an enemy instead of as an honored or at least, respected helper. It makes us angry to watch the patient thwarting our good intentions, and unmoved by our consummate skill.

If we are to be of help to the alcoholic, we must remember that the triangular configuration always exists, even when one part of it seems invisible. We must seek out our ally in the patient, strengthen it, and re-establish a working triangle so that the doctor-patient alliance versus the illness becomes operative. All this can be summarized in the phrase "motivating the patient." We must force ourselves to be constantly aware that latent motivation exists within the alcoholic. If we can't reach him at any particular time, that is *our* problem. It is we who fail the patient we are unable to motivate, not he us. This is crucially important, because the difference between an operating triangle and a latent triangle is truly the difference between a good patient with a disease, and a drunk. It is our job to make that triangle operative. Later on we will talk about how we might go about achieving this.

It is my conviction that we have compelling *professional* and *ethical* reasons to undertake in the treatment of alcoholics and to exert our utmost efforts toward prevention of this grave disease—which has long since reached epidemic proportions in all of our communities. There are also a number of practical reasons. Now, what are some of the practical reasons? Before we go on to discuss them, it might we well to define the term alcoholic.

Alcoholism may be considered from the point of view of the toxic effects of the *chemical*, alcohol, and its related nutritional disturbances; it may be seen as a *symptom* of an underlying psychological or social maladjustment or disease; or, thirdly, as an *addiction* or illness in itself.

The *World Health Organization* defines excessive drinking as "any form of drinking which in its extent goes beyond traditional and customary dietary use or ordinary compliance with the social drinking customs of the whole community concerned." It goes on to state that "alcoholics are those excessive drinkers whose dependence upon alcohol has attained such a degree that it shows a noticeable mental distrubance or an interference with their bodily and mental health, their smooth social and economic functioning; or who show the prodromal signs of such development." The *World Health Organization* Subcommittee on Alcoholism has distinguished two categories of alcoholics, namely the "alcohol addict" and the "habitual symptomatic excessive drinker." In both groups the *excessive drinking* is symptomatic of underlying psychological or social pathology, but in the alcoholic group, after several years of excessive drinking, loss of control over the alcohol intake occurs. The *World Health Organization* means by "loss of control" that as soon as any small quantity of alcohol enters the body a demand for more alcohol is set up which lasts until the drinker is too intoxicated or too sick to ingest more alcohol. This "loss of control" is not responsible for initiating the drinking but becomes operant after the first drink has been taken.

In our program in Montgomery County we find that most commonly an alcoholic is considered to be someone who drinks more than his doctor. This, no doubt, is a useful concept, but we have tried to substitute for it in our program the notion that for screening purposes an alcoholic is someone who someone else *thinks* is an alcoholic. This very broad definition assists us in case finding, allows us to do our own screening, and occasionally permits us the pleasure of reassuring an abstinent wife that her husband's two beers on a Saturday night does not really indicate pathologic dependence.

We estimate that there are some 6 million alcoholics in the United States of whom probably 90,000 live in Maryland. This awesome number becomes all the more frightening when we consider that for every alcoholic, at least three family

members are involved in the overall psychological and social deterioration that ensues.

We are well aware of the tremendous drain on community resources created by deteriorating families. A study conducted in Boston and reported recently in the *New England Journal of Medicine* demonstrated over three generations that families of alcoholics not only make heavy use of public resources but raise children who also tend to be alcoholic, and whose families in turn depend on public resources. While I am aware of no good evidence that alcoholism is genetically hereditary it most certainly is passed down through families. In the general population, one of fifteen drinkers will become alcoholic in his drinking pattern. However, children of alcoholic parents have a one-in-four chance of developing the disease. Thus, it is clear that successful treatment of alcoholism also serves the purpose of prevention, a primary traditional responsibility of public health.

The tremendous cost of alcoholism to industry in terms of absenteeism, under-production, rapid turn-over, and accident rates has spurred a number of our larger industries to establish alcoholism programs. Kemper Insurance, for example, has instituted such a program in which the supervisor is the key man. Allis-Chalmers Corporation estimates that in their own program the absentee rate has been reduced from 8 per cent to 3 per cent while the firing rate for alcoholics has been cut from 95 per cent to 8 per cent. Dupont, in their program, estimates that more than 1000 employees of their company are members of Alcoholics Anonymous. I am aware of no exception to the generalization that each company that has earnestly established an alcoholism program has found it eminently useful and profitable to business. While industry has itself taken the lead in setting up industrial programs, think of how much more they could do with moral and professional support and leadership of public health agencies.

For the *TB*-minded, I might mention that in Montgomery County last year we estimated that 30% of active *TB* cases were found in our alcoholic population. And for those concerned with traffic deaths, another *New England Journal* study done in Berkeley, California concluded that while in younger people social drinking appeared to present more of a problem, "it is believed that the majority of drivers and pedestrians involved in traffic accidents after drinking are not social drinkers." One could, go on and on citing evidence to support the magnitude of this problem, which requires, it seems to me, a public health approach.

The alcoholic himself

So far we have discussed one element in the resistance to treating alcoholics, defined alcoholism, and said a few words about the size of the problem. But who are our alcoholics?

We find that alcoholism is equally distributed through all social levels. In one study 69% of the alcoholic population were found to be married and living with their wives. More than 80% were under 50 years of age and 25% were less than 35 years old. Three out of four were living in an established household and nine out of ten had lived in their present town for at least two years. Known to have steady employment on one job for at least three years accounted for 65%, and 25% for at least ten years. Seven out of ten had held jobs involving skill or special responsibilities. Indeed, the popular stereotype of the "gutter drunk" represents only eight per cent of the total alcoholic population. This does not sound like a group unworthy of rehabilitation, nor like a transient, subterranean population irrelevant to the total health of the community.

Present methods of treatment

How are we handling the alcoholic today? The first thing we do with the alcoholic is ignore him until he is forcibly brought to our attention in the later stages of his disease, through the courts, through welfare agencies, or through the schools who pick up problems in the children.

The great preponderance of inpatient treatment for alcoholics is conducted in our jails. Disadvantages to this mode of therapy are: (1) that as far as I know it does not benefit the alcoholics; (2) some alcoholics die in the jails, as do some people who are picked up and thought to be alcoholics when they are really suffering from diabetic coma or some other condition that clouds their mental state; (3) while it is useful to have alcoholics in jail, since they do a good deal of the maintenance work, they seem to keep coming back and the proverbial revolving door is the standard state of affairs. In addition, of course, the stigma of a police record hampers any subsequent efforts

at rehabilitation and employment and justifiably embitters the alcoholic in his attitude toward society. In my opinion, what we succeed in doing with jail therapy is to more firmly establish the disease in the individual, cripple his efforts at rehabilitation, and increase the drain on public resources.

State hospital programs

All of our regional State hospitals have alcoholism programs. They are overcrowded and understaffed. I am told by Dr. Kurt Gorwitz, Chief of Mental Health Statistics, that in some months admissions of alcoholics to State hospitals have approached 70% of total admissions, but at Springfield State Hospital, the one with which I am most familiar, a virtual skeleton staff is working heroically with overwhelming numbers of patients who, while afforded an opportunity to dry out, and an introduction to *AA, receive* precious little else in the way of treatment.

It is said, of course, that most of these people are really unmotivated for treatment and that this is the best we can do. However, in Montgomery County we have found that this is not so. We now send a social worker and a public health nurse to visit our patients at Springfield Alcoholic Unit, and find that patients' awareness of our presence and our interest has resulted in a sharp increase in the number of successful clinic referrals from Springfield.

Most of these people want help. Even those that don't want it now, we find, often decide that they need it a few months or a year from now. At Springfield there are no facilities for women in the Alcoholic Rehabilitation Unit, and alcoholic women are admitted and maintained on the general psychotic wards of the hospital. Even the minimal kinds of treatment afforded the male alcoholics are *denied* to the females. I want to emphasize again, the staff at Springfield is excellent, highly motivated, and overworked. They are doing their best with completely inadequate staffing and facilities.

While it is clear that the state hospitals' services to alcoholics must be greatly improved, I do not believe that the best treatment approach to alcoholism lies in the state hospital. We know that by the time an alcoholic comes to the state hospital, he is far advanced in his disease. Perhaps more important than the drinking itself is the serious *social* disorganization which now affects him and his family, giving rise to a whole new level of problems.

If effective rehabilitation is to occur, the treatment site must be in the local community. Since alcoholic family problems are multiple and complex, all persons active in the rehabilitation of the alcoholic must have thorough knowledge of the community and the capability to follow closely the alcoholic's progress and that of his family. The state hospital, even at best, is remote and limited. There is essentially no continuity of personnel with the local community, and effective liaison is limited both by miles and by the responsibility of the state hospital to serve patients from many local areas.

Private medicine

If state hospitals are remote, overcrowded, and understaffed, what about private medicine? In our experience most practitioners are discouraged about their ability to treat alcoholism. This is partly due to the triangle phenomenon that I mentioned at the beginning but partly it is completely realistic, in that most private physicians are unable to assemble the time, the flexibility of treatment modalities, and the breadth of community resources that are required to rehabilitate the majority of our middle or late stage alcoholics.

In addition, there is a lack of hard knowledge, still, in the medical community, about the treatment of the *sober* alcoholic. All of us were trained in medical school to detoxify alcoholics. But how much training was there in the treatment of the sober alcoholic, of the alcoho*lism* itself, as opposed to acute intoxication, or the medical complications of vitamin deficiency, or poisoning? I went to a good medical school and I'm sure somebody must have mentioned this treatment at one time or another, but for the life of me I can't remember when or who. As a matter of fact, in my training the only alcoholics I saw seemed to be at three o'clock in the morning in the emergency room. By the time I was through with my internship there was nobody who despised alcoholics more than I did. Those patients that I treated for acute alcoholism at that stage had a right to consider me, for all practical purposes, their enemy rather than their ally.

General hospital

The last resource existing in the community at the present time is, of course, the general hospital. In Montgomery County at least we so far, have been totally unsuccessful in persuading general hospitals to admit alcoholics as such, although we have been told that approximately 15% of their actual admissions suffer primarily with alcoholism. Whether this is true in all communities or not, I don't know, but from the literature I gather that this is a problem that affects most general hospitals. It seems to me actually criminal for a general hospital to be able to refuse admission to a group of people who are in need of help and who, it has been repeatedly demonstrated, only rarely present any problems of management or offer any unusual drain on hospital resources. In fact, in my experience, those cases in which alcoholics do present problems in control are precisely those in which the patient was admitted under a false diagnosis, so that nursing personnel and others were unable to recognize early the problems that developed, such as seizures or delirium tremens.

I have not mentioned those hospitals which specialize in treating alcoholics because they are so few and so limited in those whom they can treat. Blue Cross, for example, usually does not pay for treatment of an alcoholic in a private facility. These hospitals are further limited by their isolation from general hospitals and thus are unable to pick up cases early or to consult on the general hospital wards.

Given this woefully inadequate treatment situation, it is no wonder that we aren't helping most alcoholics and it is no wonder that they resent us and don't trust us. But *we* have no right to be discouraged. *We* have no right to be pessimistic. *We* have no right even to an opinion about the effectiveness of treatment of alcoholics. We are entitled mostly to be *ashamed* of our lack of progress so far. We are *obliged* to develop programs for the treatment of alcoholics with an open mind and with full recognition of the immense size and crucial importance of alcoholism as a national disease. I remember as a child being deeply moved by posters showing little children with polio. I wonder if we shouldn't put up posters about these same little children trying to survive in a home ravaged by alcoholic parents.

Tandearil®
oxyphenbutazone

Tandearil in Painful Shoulder

Therapeutic Effects: Stiffness and pain may diminish within 2 days, and full mobility may be restored within a week. These effects are obtained with oxyphenbutazone alone or combined with physiotherapy or local hormonal injections. The drug is usually well tolerated and does not affect pituitary-adrenal function or immune response.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage. Make regular blood counts. Discontinue the drug and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, or a generalized allergic reaction may occur and require withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Painful Shoulder: 600 mg. daily in divided doses for 2 to 3 days; 300 mg. daily thereafter. Usual duration of therapy: 2 to 7 days.

Availability: Tablets of 100 mg. 6562-VI(B)R

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

Now available:
New! Ready-mixed Ilosone Liquid 125! (Contains erythromycin estolate equivalent to 125 mg. erythromycin base per 5-cc. teaspoonful.)

700970

Ilosone® Lilly
Erythromycin Estolate

(See next page for prescribing information.)

Ilosone®/the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have also been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Adverse Reactions: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have developed in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly, usually within forty-eight hours, if the drug is readministered to sensitive patients. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared to be definitely related to use of the drug, laboratory findings were characterized by increased direct-reacting bilirubin, elevated alkaline phosphatase levels, negative or weakly positive cephalin flocculation and thymol turbidity tests, elevated serum glutamic oxalacetic transaminase levels, peripheral eosinophilia, and normal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has not been reported in other patients taking prolonged courses of the medication. Patients with chronic infection have been given 1 to 2 Gm. of the drug daily for periods of two to six months, and patients with rheumatic fever have taken prophylactic doses of 0.5 Gm. daily for two years without difficulty. In one group of 144 patients who received the drug daily for two years, no jaundice was noted. It was of interest that members of six of these patients' families, who were not taking the drug, had episodes of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels were determined in a group of fifty-four adults and children who took 250 mg. of Ilosone daily for an average of sixteen months as rheumatic fever prophylaxis. The results were compared with those of a similar group of forty-four patients who received penicillin. There were no cases of jaundice in either group. Elevation of SGPT and serum alkaline phosphatase levels during the course of treatment was observed in one patient treated with Ilosone and in two patients treated with penicillin. Seven other patients in the group receiving Ilosone and four others in the penicillin group showed elevations in one of the tests at some time during administration of the drugs.

Very satisfactory therapeutic results, without toxicity, were reported in 102 pediatric patients who received short-term (ten day) courses of Ilosone in the treatment of streptococcus infections. Results of liver function tests in these patients were comparable to those in a similar control group who had received penicillin.

Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of individuals as a result of a local stimulating effect of the medication on the alimentary tract; however, the normal intestinal gram-negative bacterial flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Pulvules®, Ilosone Liquid 125, Ilosone, 125, for Oral Suspension, Ilosone Drops, Ilosone Chewable Tablets.

For infants and for children under twenty-five pounds of body weight, the usual dosage is 5 mg. per pound every six hours; for children twenty-five to fifty pounds, 125 mg. every six hours. (Tablets Ilosone Chewable should be chewed or crushed and swallowed with water.)

For adults and for children over fifty pounds, the usual dosage of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythromycin therapy should be considered.

In the treatment of syphilis, the recommended total dosage is 20 to 30 Gm. given in divided doses for a period of ten to fifteen days. Close follow-up of the patient is necessary since erythromycin drugs have not had adequate evaluation in all stages of syphilis. Examinations of spinal fluid are recommended as part of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days is recommended. In the treatment of gonorrhea, patients with suspected lesion of syphilis should have a dark-field examination before receiving antibiotics, and monthly serologic tests should be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 250 mg. (equivalent to base), in bottles of 24 and 100.

Ilosone Liquid 125, Oral Suspension, U.S.P., 125 mg. (equivalent to base) per 5-cc. teaspoonful, in 60-cc. and pint-size packages.

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equivalent to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size packages.

Ilosone Drops, 5 mg. (equivalent to base) per drop, in 10-cc. packages, with dropper calibrated at 25 and 50 mg.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to base) in bottles of 50. [032

TWO GOOD REASONS FOR STARTING A KEOGH RETIREMENT PLAN NOW

1. Immediate Tax Savings

A self-employed individual can set up a plan for his retirement and deduct 50 per cent of his contribution from taxable income up to a maximum of $1,250 as well as receive a 100% deduction for contributions for his employees. The tax savings a self-employed in a 48% tax bracket can NOW enjoy with a qualified Keogh Plan are illustrated below.

TAX SAVINGS NOW AVAILABLE

	Without a Keogh Plan	With a Keogh Plan
Self-employed's Contribution	$2,500	$2,500
Taxable Amount	2,500	1,250
Tax	1,200	600
Tax Savings	0	$ 600

By starting a Keogh Plan now, a self-employed can realize a 50% tax savings on his contributions this year—and in 1968, his contributions will be 100% DEDUCTIBLE!

2. Greater return at retirement

Call or write for the arithmetic of your age.

THE 'BLUE CHIP' COMPANY THAT'S LOW IN COST, TOO

when he just can't sleep

Tuinal

One-Half Sodium Amobarbital and
One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal is indicated for prompt and moderately long-acting hypnosis. It is not suitable for continuous daytime sedation.

Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Overdosage: C.N.S. depression. Symptoms—Depression of respiration and of superficial and deep reflexes, slight constriction of the pupils (in severe poisoning, dilation), decreased urine formation, lowered body temperature, coma. Treatment—Symptomatic and supportive (gastric lavage; intravenous fluids; maintenance of blood pressure, body temperature, and adequate respiration). Dialysis may speed removal of barbiturates from body fluids.

Dosage: 50-200 mg. (¾-3 grains) at bedtime.

Highlights

CANCER CYTOLOGY FIGURES AVAILABLE

In the 1966 calendar year, 377,809 cytologic examinations for the detection of cancer were performed in laboratories throughout the State; 120,772 in hospital laboratories, 212,169 in private laboratories, and 44,868 in Health Department laboratories. The vast majority of these were Papanicolaou smears for detection of cancer of the cervix. The total excludes research studies such as the self-administered irrigation pipette tests. The figures are available for the first time as the result of the 1966 law regulating clinical laboratories.

SYPHILIS TESTING CENTRALIZED

The syphilis serology testing of some 60,000 specimens formerly examined each year by the Baltimore City Branch Laboratory was recently consolidated in Central Laboratory. This centralization will improve the efficiency and uniformity of this diagnostic test and will increase the speed of reporting to physicians.

DR. STIFLER TO HEAD MEDICAL CARE SERVICES

Jean Rose Stifler, MD, has been named to the post of Assistant Commissioner of Medical Care Services, in charge of administering three Bureaus: Preventive Medical Services (headed by Dr. Stifler since July, 1965), Chronic Diseases, and Special Health Services. Dr. Stifler has served as Chief of the Division of Crippled Children's Services since 1954.

Miriam S. Van Gelder, MD, Acting Chief of the Inpatient and Outpatient Sections of the Division of Medical Services, is acting as Director of the Bureau of Special Health Services, a post left vacant by the death of Claude C. Dodson, MD, in May.

SINGLE FEE FOR PHARMACISTS SET

Regulations governing payments to pharmacists under the Medical Assistance Program have been amended to provide that a single fee of $1.50 be paid for filling any prescription, rather than the former $1 and $2 fees based on cost of the item.

MINERS HOSPITAL EQUIPPED FOR DISASTER

Miners Hospital in Frostburg has contracted through the Division of Emergency Health Services for emergency medical supplies which will assure the hospital sufficient material for 30 days of casualty care in the event of a disaster which might disrupt supply lines. To avoid deterioration, the hospital will rotate the supplies with materials used in daily operations, replacing items as needed.

The emergency supplies are furnished by the US Public Health Service, which plans to establish similar stockpiles at selected hospitals throughout the nation. The first in Maryland, Miners Hospital was chosen because it has met all Federal and State criteria for emergency planning, including community service capability and location.

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

701358

be offered in September in three locations —Frederick, Cheverly, and Salisbury. Three and one-half days will be devoted to technics of hearing screening, and one and one-half days to detection of possible visual disorders. Purpose of the program is to expand the training of supportive personnel.

FILM DESCRIBES VENEREAL DISEASE FOLLOW-UP

A 15-minute film, "Syphilis Epidemiology Interview," describes the epidemiologist's role in tracing sources of infection when a case of syphilis is reported to the Health Department. The important assurances of discretion and confidentiality are stressed in the film, which is recommended to medical societies, hospital staffs, and professional nurses. It is available for loan from the State Health Department.

DIAGNOSTIC AND ADVISORY SERVICE EXPANDS

The diagnostic and advisory services for handicapped children have been augmented by the establishment of another team consisting of a pediatrician, psychologist, public health nurse consultant, and a part-time social worker. These teams travel from Baltimore to the counties of Maryland where children with complex problems are evaluated. The additional team should permit more frequent visits to the eight counties now being served and the extension of this specialized service to other areas largely isolated from existing diagnostic and evaluation facilities.

RUBELLA REGISTRY PLANS GO FORWARD

The *Medical and Chirurgical Faculty* has circulated a letter to member physicians urging their cooperation in the rubella registry project, which seeks to locate children suffering from birth defects as a result of the rubella epidemics of 1963-64. It is now believed that the incidence of the rubella syndrome may be much higher than previously estimated, auguring serious overtaxing of the State's remedial and educational facilities a few years hence.

In studies performed on children with confirmed congenital rubella, less than 5 per cent had no detectable abnormality. Thirty-five per cent had cardiac disease; 50 per cent had hearing problems, half of these profound; 20 per cent had

visual problems, two-thirds of them severe; 54 per cent were retarded in development, half of these severely; and 60 per cent had small head size, many of these also showing poor growth and failure to thrive.

The Bureau of Preventive Medical Services and the office of Community Health Services are preparing materials to aid physicians and parents in locating and identifying the rubella-damaged child, and describing the services available to help meet the child's needs prior to reaching school age.

ANNUAL MEETING CRUISE CONVENTION

MEDICAL AND CHIRURGICAL FACULTY OF THE STATE OF MARYLAND

SAN JUAN and *ST. THOMAS* CRUISE CONVENTION, April 21 to 28, 1968

S. S. ARGENTINA

CRUISE ITINERARY

Sun., April 21st— Embarkation on board ship will be from 1:30 PM to 3:00 PM. Sail from Baltimore at approximately 4:00 PM — a gourmet dinner will be your first meal aboard this luxurious liner.

Mon., April 22nd and Tues., April 23rd—
Two wonderful days of sailing with fun and games — sunning, swimming, entertainment, excellent food, and special business and scientific meetings.

Wed., April 24th—Arrive San Juan about 1:00 PM — sightseeing tours will be available to enjoy this tropical island.

Thurs., April 25th—Sail from San Juan at 3:00 AM and arrive in St. Thomas at 9:00 AM — sightseeing tours will again be offered to see this charming island. Sail from St. Thomas about 4:00 PM.

Sun., April 28th— Arrive Baltimore in the afternoon about 2:00 PM.
Business meetings and scientific sessions will be held daily aboard ship.

Board of Directors Meeting

Seven of the members of the Board of Directors of the Baltimore City Medical Society were present for the Board of Directors meeting on June 13, 1967 at 4:30 P.M. at 1211 Cathedral Street, Baltimore, Maryland. Russell Fisher, MD, presided in the absence of Harold J. Connolly, MD. A letter was read from John B. De Hoff, MD, Director of the Local Health Services, sent to Mr. John Sargeant, Executive Secretary of the Medical and Chirurgical Faculty of the State of Maryland. Dr. De Hoff explained, that in December of 1966, James Wharton, MD, Chief, Community Health Services, U.S. Public Health Services, met with representatives of the School of Hygiene and the City Health Department concerning a study for the application of cost-benefit analysis to health planning. Such a program designed to study the solo-private practice of medicine in the local community was described. The Board decided that their support in cooperation for such a study would be given after the complete details of such a program were designed by the Public Health Service. Further, the Public Health Service was invited to come to the Board of Directors prepared to discuss in detail this project.

R. C. V. Robinson, MD, Chairman of the Professional Relations Committee, presented five cases to the Board for recommendations and course of management. These problems were dealt with in accordance with the complaint. Several members of the society eligible for Emeritus membership were discussed. The following members were approved for a membership in the Baltimore City Medical Society: Samuel S. Frankel, MD, B. MacGowan, MD, Col. Arthur N. Tasker, Helen I. Maginnis, Alexis M. Gagusin, and E. Ross Davies.

John W. Pearson, MD, Anesthesiology and member of the Baltimore City Medical Society since 1961, announced he was going on a teaching leave to Okinawa for two years. It was the Board's opinion that he should be classified as a member on leave, thus preserving his membership.

W. Mintzer, MD, Director of the Measles Vaccination Campaign for the Baltimore City Medical Society, reported that 14,424 patients had been immunized during the recent program sponsored by the Society. The meeting was adjourned at 6:20 P.M.

Arthur E. Cocco, MD

DIURESIS

MERCUHYDRIN®
(meralluride injection)

LAKESIDE

Twenty years ago the publication of "A System for the Routine Treatment of the Failing Heart"[1] established a schedule of diuretic therapy as a primary factor in the treatment of acute congestive failure. With emphasis upon daily injections of Mercuhydrin (meralluride injection) until dry weight was obtained, Gold, et al. achieved a 40% increase in improvement, in ⅓ the time, over other methods then current. Today, most medical texts continue to recommend parenteral mercurials in acute congestive failure when prompt diuresis is indicated.

Recently Modell[2] has stated: "The mercurial diuretics are the injectable diuretics of choice since they are the most potent as well as the most dependable. Their toxicity is not an important consideration either by comparison with other potent diuretics or in relation to the seriousness of the conditions in which they provide such excellent relief."

IN BRIEF

Mercuhydrin is indicated in edema of cardiac or hepatic origin and in the nephrotic syndrome; it is contraindicated in acute nephritis and in anuric or oliguric states. *The usual adult dose is one to two cc. daily or every other day until "dry weight" is obtained.* Sensitivity is rare but small initial doses are advised to minimize potential reactions; vertigo, fever, and rash have occurred. Overdosage may produce electrolyte depletion, muscle cramps, and G. I. reactions. Supplied: 1 cc. and 2 cc. ampuls in boxes of 12, 25 and 100; 10 cc. rubber capped, multiple-dose vials (intramuscular or subcutaneous use only) in boxes of 6 and 100.

Current Surgical Treatment of Congenital Heart Disease in Infants

JOSEPH S. McLAUGHLIN, MD
SAFUH ATTAR, MD
R ADAMS COWLEY, MD
Division of Thoracic Surgery,
Department of Surgery,
University of Maryland School of Medicine

Congenital heart disease is a common cause of death in children. Each year in the United States approximately 7,000 children die from such defects, the majority in the first four months of life. If one is to salvage these children, a vigorous approach to this problem must be undertaken making early diagnosis and early operative intervention mandatory. This report demonstrates the advantage of such an aggressive approach.

During an 18-month period encompassing March, 1965 to October, 1966, 21 infants and small children with congenital heart disease were operated upon at the University of Maryland Hospital (Table 1). Except for one ten-pound child of 2 years of age, all of these children were less than four months old when originally operated upon and ranged in weight from 4.75 to 10.7 pounds. Only one child was a product of a premature birth and thirteen were cyanotic.

This group of children were afflicted with a wide variety of cyanotic and acyanotic lesions. In each instance, operative intervention was carried out as a life-saving procedure. The operative procedure was varied for the particular lesion and while curative in six patients, was generally of a palliative nature. Fourteen of these children survived.

Joseph S. McLaughlin MD, is a John and Mary R. Markle Scholar in Academic Medicine.

Tetrology of Fallot

This abnormality is the most common cause of cyanotic heart disease and is characterized by a ventricular septal defect and pulmonary stenosis often of the infundibular or muscular variety. This anatomical combination produces a shunt of the blood from the right to the left ventricle, bypassing the lungs and results in arterial desaturation. The severe hypoxia clinically manifests itself by cyanosis of the tissues, squatting in older children and hypoxic "spells." The latter episodes are characterized by an increase in intensity of the cyanosis, unresponsiveness, inability to feed and bradycardia. Although heart failure in the usual sense is not common in these children, death from hypoxia frequently occurs at an early age often at the time of closure of the ductus arteriosus.

Surgical intervention is directed toward increasing pulmonary blood flow and is accomplished by creating a shunt between the systemic and the pulmonary arterial circulations. The classic operative procedures of Blalock (subclavian pulmonary artery anastomosis) and Potts (aortic pulmonary artery anastomosis) are the most com-

mon methods of producing such fistulae; however, the Blalock anastomosis has the frequent disadvantage of inadequate size in the small infant and the Potts anastomosis is difficult to take down at the time of definitive repair. A recent modification of the Potts procedure, described by Cooley, in which an anastomosis is performed between the pulmonary artery and the ascending aorta, is technically simple to abolish at the time of definitive repair but again has the disadvantage of small size in these children with small pulmonary arteries.

In the presented group of patients, all three of the methods described were utilized. In the case of A.P., a Blalock procedure was originally carried out. This resulted in marked improvement, the infant was less cyanotic, gained weight and no longer experienced hypoxic spells until 15 months later, at which time the symptoms returned. Reevaluation at 18 months revealed a functioning anastomosis; but now too small to cope with the increased size and activity. For this reason, a Potts anastomosis was performed on the contralateral size. At the time of operation, the effectiveness of the previous procedure was demonstrated by a three-fold increase in size of the pulmonary artery. The child has had a gratifying response. Both procedures were effective and the child now has a chance for completely corrective procedure when he is 4 or 5 years of age.

One child in this group died. The anastomosis functioned well for some hours, but then clotted. Re-operation was unsuccessful.

Transposition of the Great Vessels

Although Tetrology of Fallot is the most common cause of cyanotic heart disease, transposition of the great vessels is the most common cause of death in infancy in children with cyanotic heart disease. It is characterized anatomically by the aorta taking origin from the right ventricle and the pulmonary artery taking origin from the left ventricle. The pulmonary and systemic circuits do not mix unless a communication such as a septal defect or a patent ductus arteriosus exists between the two circulations. Fortunately this is usually the case, but unfortunately, such additional abnormalities may compound the problem by producing increased pulmonary blood flow and heart failure.

Complete surgical repair of the lesion is now possible but cannot be carried out in the small infant. Original efforts are therefore aimed at palliating the condition until the child has gained sufficient size for definitive repair. The palliative procedure must be tailored to the individual anatomic defect and is directed at increasing mixing of the circulations where such mixing is inadequate and decreasing pulmonary blood flow where such flow is detrimental. Adequate mixing of the circulations can be accomplished by creating an atrial septal defect and the excessive blood flow to the lungs is decreased by constricting the pulmonary artery. In those instances where marked pulmonary stenosis exists the creation of a systemic pulmonary artery shunt is indicated.

In this group of four patients, three had inadequate mixing of the circulation and one had a ventricular septal defect and a patent ductus arteriosus with overwhelming pulmonary blood flow. In the former three patients, each less than seven days old, an atrial septal defect was produced under direct vision utilizing inflow occlusion. One of these patients died 24 hours following the operative procedure, the other two children have demonstrated marked improvement. Important in the fourth case was the child's age of twelve days. She was intensely cyanotic at birth but was vigorous, cried strongly and took feedings avidly for the first week of life. Thereafter, her clinical condition rapidly deteriorated: she was in severe heart failure at the time of admission and moribund at the time of operation. She died during the initial stages of the procedure. One may only speculate on the outcome had the child been seen at an earlier stage. In recent months the balloon catheter technique of creating atrial septal defects was utilized in our institution.[1] This procedure carried out at the time of cardiac catheterization negates the necessity of open thoracotomy. Preliminary results are encouraging.

SYNOPSIS OF PEDIATRICS, by James G. Hughes, MD; The C. V. Mosby Company, St. Louis.

This second edition contains many revised texts, brand new chapters and rewritten sections. Its central purpose is to discuss the fundamentals of pediatrics in a clearcut, straightforward manner, and it does this.

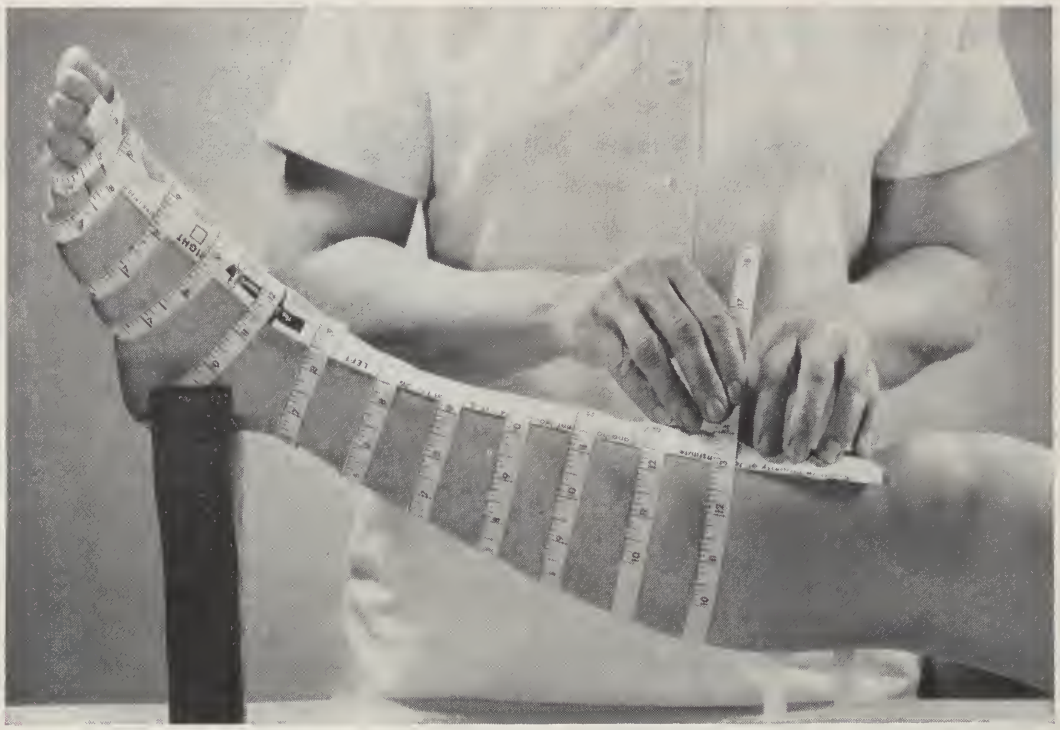
PATHOLOGIC PHYSIOLOGY, Mechanisms of Disease, Fourth edition; William A. Sodeman, MD, W. B. Saunders Company, Philadelphia.

Because of the ever increasing pace at which medical science is advancing, the editors and contributors to this fourth edition were confronted with the task of sorting and interrelating this mass of newer knowledge in a meaningful way. In every chapter an attempt has been made to reach deeper into subcellular mechanisms to promote a greater understanding of how and why symptoms appear. This new edition is a worthwhile book for every physician's library.

HANDBOOK OF ORTHOPEDIC SURGERY by Alfred R. Shands, Jr., MD, and R. Beverly Raney, Sr., MD; C. V. Mosby Company, Saint Louis.

Preparation of this seventh edition has involved no major rearrangements of the text, but outdated material has been deleted and new facts and new viewpoints have been added. The chapter on poliomyelitis has been sharply reduced, while new sections include avascular necrosis of the femoral head, acquired spastic paralysis in adults and traumatic paraplegia and quadriplegia. This book conveys the fundamental facts and principles of orthopedic surgery as concisely as is possible.

THE HOSPITALIZED CHILD AND HIS FAMILY, Johns Hopkins Press, by J. Alex Haller, Jr., MD.



This book is composed of six essays in terms understandable to parents and yet technically accurate enough to stimulate nurses, paramedical personnel and physicians in training. Many of the concepts are not original, but their correlation and personal interpretation by a group of concerned physicians are unique, it is believed. Divided into six distinct sections, this book is worthwhile for the physician to have and loan out to parents. This type of communication is one that is sorely needed and often forgotten in the rush of the busy practitioner's life.

PATHOLOGY by Stanley L. Robbins, MD, W. B. Saunders Company, Philadelphia.

The third edition of this book proves the need for a presentation of pathology specifically designed and written for students and clinicians. Particular attention is given to the pathogenesis of disease and to the clinical correlations. New illustrations have been added, many depicting ultrastructural change in recognition of the transition now occurring in the morphologic study of disease. Owners of this publication will have imparted to them a sound knowledge of pathology, providing at the same time a not unpleasant means of gaining such knowledge.

TEXTBOOK OF MEDICINE, Twelfth Edition, by Paul B. Beeson, MD, and Walsh McDermott, MD, W. B. Saunders Company, Philadelphia.

This twelfth edition, exactly 40 years after the first one, demonstrates how very different are the two worlds into which these two editions were born. This book has become a standard for reference purposes throughout the world and the new edition only serves to point up this purpose. Over 200 of the articles contained in it are newly written; and 57 subjects are included that were not in the last edition. Every medical library of any note must have this textbook to round out its collection.

Why Vascular Specialists Prescribe JOBST Supports

The JOBST VENOUS PRESSURE GRADIENT support is fitted by precise measurements to the contour of the affected limb of the individual patient and exerts precise hydrostatic counter pressures. JOBST supports represent an advanced clinical method of treatment known and accepted by most vascular specialists as the *treatment of choice* for leg ulcers, varicose veins, stasis dermatitis, postmastectomy lymphedema, post phlebitis syndrome, post-fracture, post-operative and injury edema. Trained experts will measure and fit your patients for you at JOBST Service Centers, Suite 200, 818 Eighteenth Street N.W., Washington, Phone 298-5530. Or Suite 415, Medical Arts Bldg., 101 West Read Street, Baltimore, Phone 539-0560.

© JOBST, 1966

JOBST offers a complete range of custom-made support garments for the treatment of venous insufficiency and management of lymphedema.

Round-up Report

Atlantic City 1967

A visit from two Vietnamese students, a talk by a noted proponent of sex education and a "Little Workshop" for state presidents and presidents-elect were outstanding features of the 44th annual convention of the Woman's Auxiliary to the American Medical Association. The meeting, held at Atlantic City's Shelburne Hotel, June 18-22, attracted a registration of 1,052 physicians' wives.

Auxiliary President Mrs. Asher Yaguda presided over the sessions. The Vietnamese students, both mothers of three-year-old daughters, visited the convention on Monday and were available to meet their auxiliary sponsors. The two young women were "adopted" by the auxiliary for their short-term, specialized medical training at the Georgetown University School of Medicine in Washington, D.C. Part of their living expenses for their three-month training, is being paid for by auxiliary sponsors.

Mary S. Calderone, MD, director of the Sex Information and Education Council of the United States, spoke during the Tuesday morning session

Taken at the AMA Convention, Atlantic City, N.J. were the Maryland delegation. Left to right: Mrs. Roderick M. Shipley, Mrs. Wallace H. Sadowsky, Mrs. William S. Stone (President), Mrs. James Gary (Alternate), Mrs. M. McKendree Boyer (Delegate), Mrs. Richard D. Bauer (Delegate), Mrs. Elmer G. Linhardt (Alternate), Mrs. DeWitt E. DeLawter (Delegate).

DEPRESSION

NORPRAMIN®
(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) in depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

IN BRIEF:

INDICATIONS: In depression of any kind —neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, anxiety, agitation and stimulation, insomnia, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy, agranulocytosis, altered liver function, ataxia, and extrapyramidal signs.

DOSAGE: Optimal results are obtained at a dosage of 50 mg., t.i.d. (150 mg./day). **SUPPLIED:** NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1000; and tablets of 50 mg., in bottles of 30, 250 and 1000.

LAKESIDE

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

on "Sex Education: Goals and Means." Other speakers included Anne R. Somers, Research Associate, Industrial Relations section, Princeton University; and Charles L. Hudson, MD, 1966-67 *AMA* president, who spoke on "The Women—Bless 'Em" during the annual luncheon honoring auxiliary past presidents and *AMA* officers, trustees and their wives.

* * * * *

A highlight of the convention was the "Little Workshop," a two-way discussion led by national committee chairmen on auxiliary programs.

The auxiliary's annual contribution to the *AMA* Education and Research Foundation—this year amounting to $384,649.48—was presented during the convention. Six state auxiliaries receiving awards of merit for raising the largest amounts in their membership categories were Wyoming, Maryland, West Virginia, Tennessee, Indiana and California.

Miss Margaret Wolfe, executive secretary of the Auxiliary, was made an honorary member of the organization in recognition of 25 years of service in her position.

* * * * *

Other convention highlights were the presentation of the Health Mobilization Award to the Robeson County, N.C., auxiliary for its work in training citizens in medical self-help; and a Sunday evening reception honoring Mrs. Yaguda and Mrs. Karl F. Ritter, president-elect.

Mrs. Ritter presented her inaugural address on Wednesday, June 21, following her installation as president. Present for the occasion were Milford O. Rouse, MD, newly installed *AMA* president, and Mrs. Rouse.

Other officers installed were Mrs. C. C. Long, Ozark, Ark., president-elect; Mrs. Howard Liljestrand, Honolulu, Hawaii, first vice president; Mrs. Robert F. Beckley, Eastern regional vice president; Mrs. John D. Dickie, Toledo, Ohio, North Central vice president; Mrs. R. C. L. Robertson, Houston, Texas, Southern regional vice president; Mrs. Clare W. Johnson, Phoenix, Arizona, Western regional vice president; Mrs. Erle E. Wilkinson, Nashville, Tennessee, constitutional secretary; Mrs. E. R. W. Fox, Coeur d'Alene, Idaho, treasurer; and directors, Mrs. George W. Gasser, Logan, Utah; Mrs. J. Murray Kinsman, Louisville, Kentucky; Mrs. Jost J. Michelsen, Boston, Massachusetts; Mrs. Paul E. Rauschenbach, Paterson, New Jersey; Mrs. Willard C. Scrivner, East St. Louis, Illinois, and Mrs. Herbert J. Ulrich, Buffalo, New York.

Serving their second year as directors are Mrs. Thomas Anton, Mrs. Norman H. Gardner, Mrs. Amos N. Johnson, Mrs. Burton E. Kintner, Mrs. W. A. Merritt and Mrs. Glenn T. Scott.

* * * * *

Additional convention features were:

The Monday Guest Day Luncheon for representatives of National Women's Organizations.

The Monday Family Night for auxiliary and *AMA* members, guests, children and teenagers.

Reports from state auxiliary presidents.

A political action discussion by Miss Evelyn Dubrow, legislative representative, International Ladies' Garment Workers' Union and Miss Lee Ann Elliott, assistant director, *AMPAC*.

A round-up report on the *AMA* House of Delegates activities by Ernest B. Howard, MD, *AMA* assistant executive vice president.

A report of the *AMA's* activities in home-centered health care by Roy F. Perkins, MD,

For Infants . . . .
For Adults . . . .

MARYLAND MEDICAL AUXILIARY RECEIVES FOUNDATION AWARD

The Woman's Auxiliary to the Medical and Chirurgical Faculty of Maryland received an award of merit for its outstanding effort in the American Medical Association Education and Research Foundation program in 1966-67. The presentation was made during the 44th Annual Convention of the Woman's Auxiliary to the AMA, held the week of June 18-22.

The Maryland Auxiliary made the greatest contribution of any state group in the 501-1000 member category—$5,564.

The entire national Auxiliary contribution was $384,649, part of which will be given to medical schools for unrestricted use. The remainder will go to the student loan guarantee fund. This fund makes possible long-term bank loans to medical students, interns and residents, with no payment due on either principal or interest until five months after completion of all training. For each $100 contributed, $1,250 in loans is made available.

1966-67 Auxiliary president was Mrs. Archie R. Cohen, Clear Spring. Mrs. G. O. Himmelwright, Cumberland, served as AMA-ERF chairman, and Mrs. Wallace H. Sadowsky, Havre de Grace, is president-elect.

The Maryland Academy of General Practice

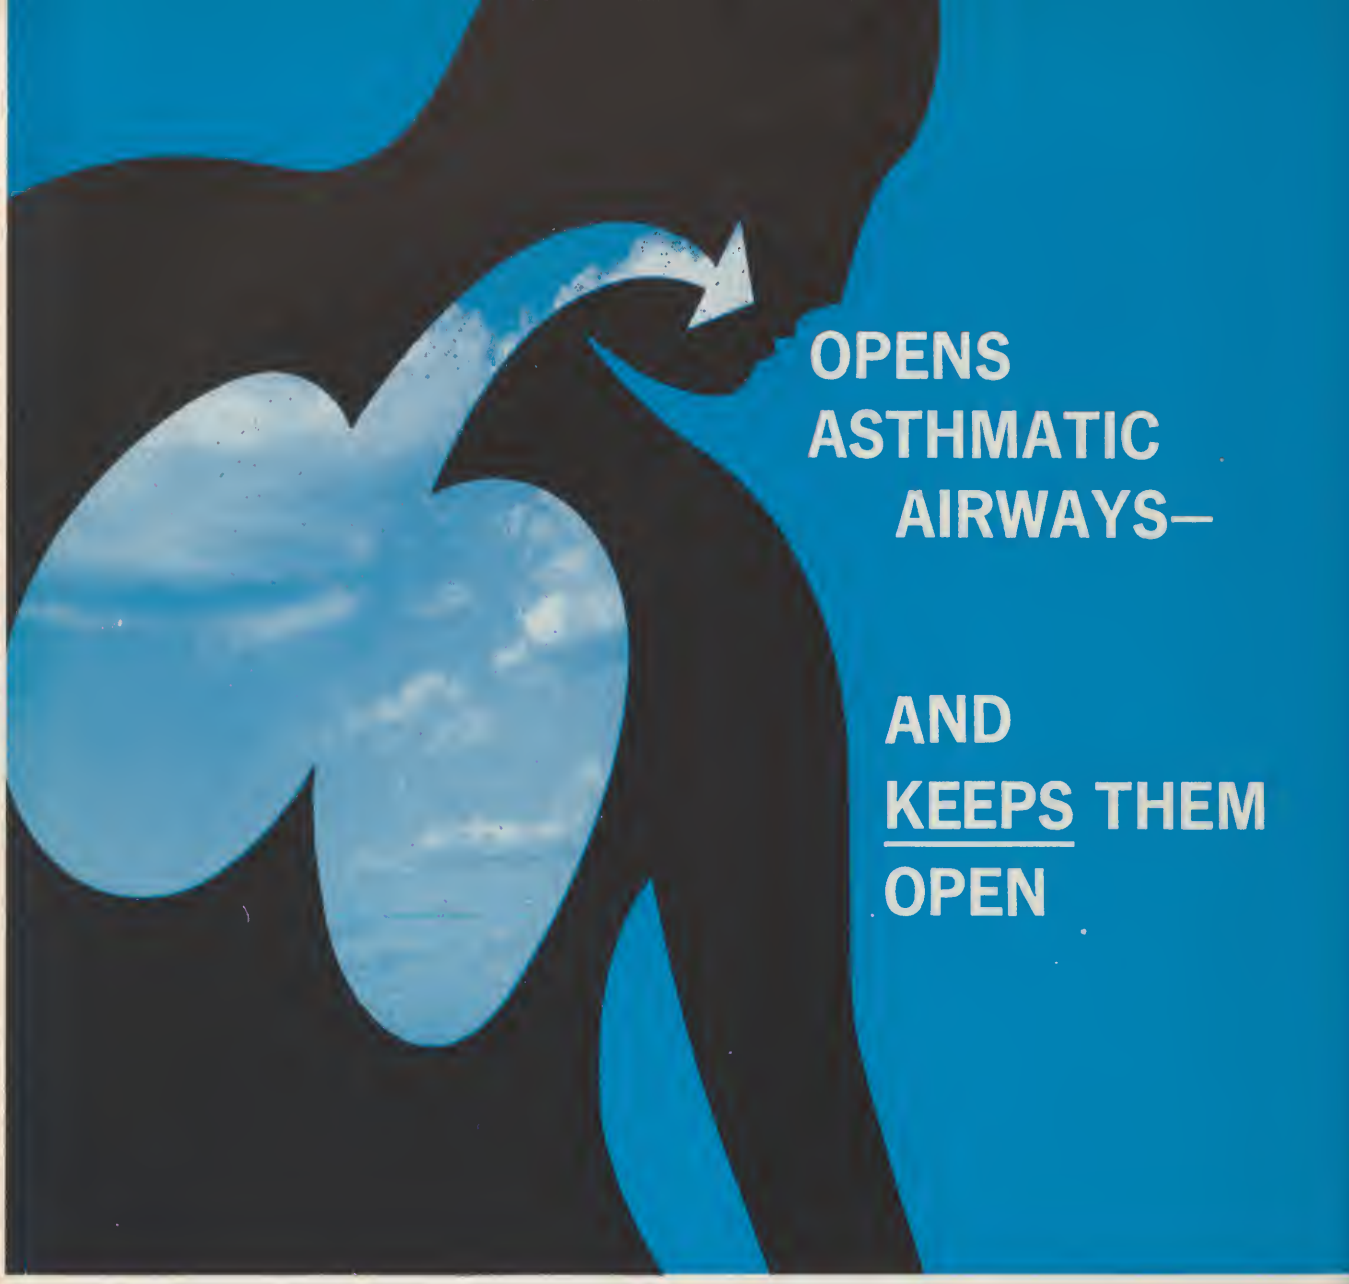
Standards for the New Specialty of Family Practice

G. OVERTON HIMMELWRIGHT, MD

Past-President, Maryland Academy of General Practice

In the May issue of this Journal the *Evolution of a New Specialty* was presented. This outlined the blueprint for the family practitioner of the future. With the development of this blue print it then becomes necessary to outline basic standards to be followed in order that this specialty will become a reality.

The Committee on Requirements for Certification (CORC), a joint *AMA-AAGP* group, is engaged in establishing standards for the new specialty of Family Practice, and early ground work on the development of examination to insure that these standards are met, have begun. After approval of the "Core Content of Family Medicine" by the *AAGP* Congress this provided the necessary ground work for the Academy to move into:



1. Translating the approved "Core Content of Family Medicine" into curriculum for graduate training programs with the results effecting even the undergraduate curricula.
2. Pursuing the formal requirements of the Advisory Board for Medical Specialties to secure approval for a primary certifying Board.
3. Developing examinations based on standards defined by the *AAGP* within the scope of the Core Content of Family Medicine.

One of the most controversial issues which the *AAGP* has met in trying to have the Family Physician approved as a Specialty with Status, which will provide for Departments of General Practice and/or Family Medicine etc. in medical education today, is that of the proposed requirements for qualification of applicants. I now quote from a paper written from our *AAGP* President, Carroll Witten, MD. "It has been and *is* the firm conviction of your *CORC* Committee that any automatic mass grand-fathering clause would be self-defeating, a detriment to general practice and to the public we serve, and indeed a serious impediment to achieving the goals we all so earnestly seek. An American Board of Family Practice must have meaning and substance from the moment it draws its first breath—not 20 or 30 years from now!"

Last October, the Congress of Delegates endorsed this concept by approving the report of the *CORC* Committee. The Congress faced the issue squarely by *defeating* two resolutions that would have written grand-fathering clauses into our considerations.

In response to the Congress and with the approval of the *AAGP* Board of Directors, this Committee proposed the following:

1. There will be no *AUTOMATIC* grandfathering.

NUMA® DURA-TABS®

for *prolonged* aid to ventilation

Each Numa Dura-Tab provides:

theophylline	225 mg.
ephedrine HCl	50 mg.
butabarbital	25 mg.

(Warning: butabarbital may be habit-forming.)

Numa Dura-Tabs provide *prolonged* three-way action to ease breathing. Theophylline, a potent bronchodilator with minimal effect on the CNS, opens air passages and reduces bronchial spasm. Ephedrine HCl improves breathing capacity through its decongestant action. Butabarbital, a mild sedative, allays fear and apprehension.

Dosage: One Numa Dura-Tab every 8 to 12 hours helps keep the asthmatic patient symptom-free all day/all night.

Precautions: Use with caution in cardiovascular or hyperthyroid disease, severe hypertension, circulatory collapse, prostatic hypertrophy, or glaucoma.

WYNN Pharmaceuticals, Inc. Phila., Pa. 19132 • Manufacturers of QUINAGLUTE® DURA-TABS®

2. There will be two categories of eligible candidates—"Residency Eligible Candidates" and "Practice Eligible Candidates."

3. The Residency Eligible Candidates—will be comprised of those doctors of medicine who have successfully completed three years of an approved training program which meets the requirements of providing instruction outlined within the "Core Content of Family Medicine."

4. The second category is for Practice Eligible Candidates who are physicians who have been in general or family practice or members of a medical school faculty for at least six years, and who present evidence that they have during the immediate consecutive 6-year period taken 300 hours of postgraduate instruction acceptable to the American Board of Family Practice.

Members of the Academy who have successfully completed two re-election periods as active members will therefore qualify as Practice Eligible Candidates. In other words, by actual determination of the *AAGP* records some 18,000 members of our association have already fulfilled this requirement, ie, the requirement of "eligibility to be examined" as to whether or not they shall be certified.

5. Finally, it is the belief that this Practice Eligible Candidate means of eligibility should terminate on December 31, 1975.

The *AAGP* is aware that many advocates of a grand-father clause hold that position because they believe that practicing physicians who have been removed from the academic environment for a number of years would find it difficult to pass a formal test. This fear is unfounded. There are two good reasons why it has no basis in fact. First, the certifying board does not propose identical examinations for the Residency Eligible Candidates and the Practice Eligible Candidates. For, while the Residency Eligible Candidates' examination will probably have strong emphasis in the basic science aspects of medicine, the examination for Practice Eligible Candidates will have a *decided emphasis* on clinical competence testing. Second, the Academy was founded on a cornerstone of continuing education and our existing network of facilities is capable of producing concentrated refresher courses at the state and national levels that will prepare a qualified physician for the proposed examination. The opportunity to implement meaningful programs directed toward well-defined goals is tremendous. I feel that this is an area that your Academy must be cognizant about, so that we, with two schools of medicine, in the State of Maryland will be able to receive this post-graduate study. It will be necessary, also, for all members of the specialty to become re-qualified after a given period of time in the specialty in order to prove continued competence. This new specialty will be unique in its standard—because you have become a specialist in 1967 does not necessarily mean that you will remain competent in 1987, as do all the other specialties in medicine. The new Family Physician will be required to continue his education even though he will be a specialist. This is a "first" for the Family Physician, as no other specialty has such a standard. To assist family physicians to maintain skills and techniques in all the areas of the new specialty as defined by the Core Content, a coordinated system of continuing education covering all the areas in family medicine will be developed and this together with the experiences in practicing family medicine will qualify the new specialist for "re-boarding."

The Maryland Vocational Rehabilitation Service

W. BIRD TERWILLIGER
Director, Administrative Services
Maryland State Department of Education,
Division Vocational Rehabilitation

A resource which the physician may find most helpful in obtaining a number of services designed to assist his patients in achieving their maximum economic and social usefulness, is the Maryland Division of Vocational Rehabilitation. This service, a function of the State Department of Education, is designed to help preserve, develop, or restore the ability of a disabled person to work, and is provided jointly by the State of Maryland and the Federal Government. Vocational Rehabilitation is broadly defined as the restoration of the handicapped to the maximum physical, mental, social, vocational, and economic usefulness of which they are capable. The program is not only humanitarian, in that it prepares disabled persons to hold positions of dignity and respect in society; but it is also economically sound, in that it prevents dependency, increases the circulation of money and the consumption of goods, and returns to the State and Federal Governments in tax money larger amounts than the cost of the program.

SERVICES AVAILABLE

The Division of Vocational Rehabilitation can provide a variety of services designed to enable persons permanently handicapped by accident, disease, or congenital conditions to recognize and make use of their remaining capabilities.

Evaluation

A complete evaluation, medical, psychological, vocational, and social, is secured on each applicant for service without any cost to him. Medical information is obtained from the family physician and other physicians who are familiar with the client's condition, and if necessary, further diagnostic studies, including in-hospital studies where indicated, may be provided by the Division in order to determine the existence and extent of impairment, the probable future course of the disabling condition, and what if any restorative measures can be taken to remove or reduce the disability.

Psychological evaluation is obtained where indicated to determine the client's level of mental functioning and to discover aptitudes, abilities, and skills which may be utilized in his vocational adjustment.

Vocational and social evaluation are accomplished through interviews with the client, his family, his school authorities where appropriate, previous employers, and other persons who have knowledge of his character and vocational potential.

Guidance and Counseling

Trained vocational rehabilitation counselors interpret to the client the results of the evaluation, and explore with him the possible courses of action which might lead to a satisfactory vocational adjustment. This service may be minimal, as in the case of a client with a good work history and

usable skills who needs merely a single service to enable him to return to work, or it may require many hours of counseling regarding the physical and mental capacities of the client, job requirements in a variety of occupations, the client's attitude toward work, and the various steps that will be required in order for the client to prepare for and enter employment. Guidance and counseling are provided without any cost to the client.

Physical Restoration

If the physical or mental condition of the disabled person can be substantially improved by medical, surgical, psychiatric or other treatment, or by the provision of a prosthetic device, to such an extent that his vocational potential is thereby increased, the Division will secure such treatment or prosthesis through cooperation with physicians, hospitals, and other medical and paramedical resources. The provision of physical restoration services, with the exception of prosthesis, through the use of public funds, is contingent upon the economic circumstances of the client.

All of the medical aspects of the program, with respect to both evaluation and physical restoration services, are under the supervision of a State Medical Advisor and District Medical Advisors in each district. Division policy with regard to medical matters is established by a Medical Advisory Committee consisting mainly of physicians representing each of the appropriate specialty fields, but with representation also from such paramedical fields as physical therapy, occupational therapy, nursing, and hospital administration.

Such treatment or care may be provided only for conditions which are stable, or slowly progressive, and not for acute conditions except as such conditions may arise *during* the rehabilitation program of the client and endanger the successful completion of the rehabilitation process.

Vocational Training

When, as a result of the evaluation process, there is indicated for the client a vocational objective requiring knowledges or skills which he does not possess, but for which he demonstrates aptitude and potential ability, the Division will provide training in the necessary academic or manual skills. The training may be obtained in public or private schools, by tutoring or correspondence, or in an on-the-job situation. Preference is given to public educational facilities within Maryland, but if the desired training cannot be obtained in these, any approved faculty may be used. Within Maryland, only those training facilities are used which are approved by the State Department of Education or other appropriate accrediting body. Only such out-of-State facilities are used as are approved for use by the Vocational Rehabilitation agency in the other State.

There is almost no job which some handicapped person cannot perform when properly trained, and the Division will provide whatever training, vocational, technical, or professional, may be necessary to enable the disabled person to attain the greatest potential of which he is capable. Training may provide a simple or complex skill for a person who has never been employed, or it may provide a new skill to an experienced worker who because of his disability cannot continue in or resume his former occupation. For example, a highly skilled and highly paid structural steel worker who becomes a paraplegic as a result of an accident may be trained as a draftsman, a watch repairman, or perhaps an accountant, according to his capabilities.

Any training provided by the Division is without cost to the disabled person.

Maintenance

The Division is not a public assistance agency, and in general cannot assume responsibility for the ordinary living needs of the disabled person or his family. However, if the client must live away from home during the process of physical restoration or training, or if he has no home and no other means of subsistence are available, the Division can provide maintenance for the duration of the rehabilitation process.

Placement and Follow-Up

The responsibility of the Division does not cease until the client has been placed in employment, and the employment has been determined to be satisfactory to both the client and the employer. Many clients return to their former occupations or otherwise obtain their own jobs. Others are referred to the Maryland State Employment Service for placement. It is ultimately the rehabilitation counselor's responsibility, however, to assist his client in obtaining employment, and in a large number of cases the counselor makes employer contacts for and with the client until satisfactory employment has been obtained. This

is necessary particularly where the disability is one which encounters considerable employer resistance, such as epilepsy, mental illness, paraplegia, or quadraplegia.

The counselor must also follow the client's progress on the job for a period of time long enough to demonstrate that the employment is suitable with respect to the disabling condition, ie. that the client can do the work and that the work or the workng conditions are not likely to aggravate the disability; and that the employer is satisfied.

ELIGIBILITY

There are three basic requirements for eligibility for vocational rehabilitation services:

1. There must exist a physical or mental disability which results in an impairment of function;
2. As a result of this functional impairment there must be a substantial handicap to employment; and
3. There must be reasonable expectation that the provision of vocational rehabilitation services will enable the person so handicapped to enter gainful employment.

(*Gainful employment* is interpreted to mean work for which payment in cash or in kind is received. For example, a family worker whose work releases the other members of the family for outside employment is said to be gainfully employed.)

There are other obvious eligibility requirements such as residence within the State, an appropriate age for employability, and the ability, or potential ability to manage ones own affairs without constant supervision; but no distinction can be made on the basis of sex, race, color, creed, or national origin of the disabled person, or the type of disability.

The basic requirements listed above indicate clearly that not every impairment constitutes a disability, nor does the existence of a disability necessarily result in a substantial handicap to employment. A bookkeeper who loses both legs in an accident may continue his former employment; not so a steeplejack. The bookkeeper, however, may need assistance in the fitting and obtaining of prostheses in order to return to work, and so may not be eligible. This the rehabilitation counselor must decide.

ORGANIZATION FOR SERVICE

The Maryland Division of Vocational Rehabilitation provides services through six district offices and thirteen local offices throughout the State. Each district is staffed by a supervisor, with perhaps an assistant, rehabilitation counselors, a medical advisor, and supporting clerical personnel. Rehabilitation units are operated by the Division in all of the State mental hospitals (the Springfield State Hospital Unit will not be in operation until after July 1, 1967). There is also a unit in the Correctional Institution for Males, in Washington County, which provides services to those public offenders who have physical or mental disabilities. It is anticipated that service will be extended to other correctional institutions as staff and funds become available.

Special units for providing services to school age children are also operated in cooperation with the public school systems of Baltimore City and several counties. This service also will be extended throughout the State as rapidly as possible.

EFFECTIVENESS

An indication of the economic value of this program is given in the results from client follow-up studies which the Division conducts from time to time. In fiscal year 1964, the most recent year on which a follow-up study has been made, the total cost of the Vocational Rehabilitation Program in Maryland was $1,633,761. Of this amount, State funds accounted for $690,345 and Federal funds for $943,415. During the year, 6,670 clients were served by the Division. Of this number 1,974 were rehabilitated into employment. Many of the others who were served were rehabilitated into employment in subsequent years. As a result of the follow-up survey, complete information was obtained on 794 of the clients who were rehabilitated in 1964. The total earnings of these rehabilitants from the time of closure until Dec. 31, 1966, amounted to $5,464,110. This is approximately 16 times the cost of their rehabilitation, which was $343,008, and approximately 4 times the total cost of the whole rehabilitation program in 1964.

The rehabilitated clients had an average of one dependent each and earned an average of $2,468 per year. If they worked at this rate for only one year, they paid taxes amounting to $254 each or a

total of $501,396, 52% of the total cost of their rehabilitation.

1,183 persons were removed from a state of dependency, either upon families or upon public assistance, thus releasing a considerable amount of money for other needs. Many others, while not in a state of dependency, were rapidly consuming their savings and other resources and undoubtedly would have become dependent at a future date.

HOW CLIENTS MAY BE REFERRED FOR SERVICE

Referral of disabled persons for service may be made to any district or local office, each of which is listed in the appropriate local telephone directory, or to the State Office, Division of Vocational Rehabilitation, 2100 Guilford Avenue, Baltimore—21218.

Solutions to Business Problems in Daily Medical Practice

All About Aides-Part IV

"Why Doctors Lose Aides"

WILBURN L. McCLURE, JR.

It is not easy to get good help these days. That is a recognized fact. Why then, do many doctors experience a high attrition rate in their offices? and with a representative of the State Department

A quick check with several personnel agencies and with a representative of the State Department of Employment Security revealed two very interesting facts: (1) They receive most of their calls from repeaters—those looking for another aide; and, (2) The demand is far greater than the supply.

The assistance of several aides was solicited to glean facts as to why they left former employers and as to why they might leave their present one. Here are a few of the most repeated statements.

Increasing Responsibilities: "Most doctors don't fully appreciate the ever-increasing problems handled by their aides."

"Some doctors actually believe that their aides say 'Hello' to the patients and lock the doors at night. That's all."

"My doctor's volume went from about $30,000 at the time I was hired to over $80,000. He hired an associate physician to help him. The volume is now over $100,000. They don't think I need a full-time assistant. To compensate for the tremendous increase in work, they gave me a $5 raise. I quit. In the past two months they have had five aides. They simply don't understand that it's not a one-girl office."

Credit where credit is due: "The office was greatly disorganized when I arrived on the scene. Two months later, after many extra hours without pay, the office was in top notch condition. One day the doctor remarked that it seemed as if the office were running more smoothly lately for some reason or another. I could have cried."

"Patients' continuous expressions of respect and gratitude provides doctors with their greatest satisfaction. Consider the effect this could have on an aide who is also trying to do the best job possible."

Salary arrangements: "Medical secretaries and aides are known for their dedication to their employers. Not many doctors take this into consideration when salary increases are due or long overdue."

"In my twenty-five years of working with doctors I've yet to hear of one who had a salary

---

Mr. McClure is director of the Baltimore office of Professional Business Management, Inc. This monthly column is prepared as a complimentary service to the *Maryland State Medical Journal.*

scale to secure the future and stimulate the morale of his aides."

Many other interesting ideas were brought to light through the interviews. It seems as if many offices lack adequate equipment, proper working space, and respect for hours the aides are paid to work.

Frustration seems to be another predominate issue with aides. It seems as if there is a genuine lack of communication between doctor and aide. This is particularly true when it comes to letting the aide know where the doctor is at a given hour; about the patients told to "come on in" without saying anything to the aide; extending or changing office hours without notice; and, seldom asking the aides when they would like their vacation.

The compiling of material for this article was an eye-opening experience. Chances are, Doctor, you'll find many startling comments from your aides if you give them a few minutes of undivided attention to ventilate their ideas and complaints.

In order to give them a fair chance, provide the following agenda for review prior to the session. Ask them to be ready with their comments on the following subjects:

1. Working space
2. Equipment
3. Duties and Responsibilities
4. Working Hours
5. Salary
6. Communications

A session, like the one mentioned above, should be conducted at least once a year. You'll find them to be informative and great morale builders.

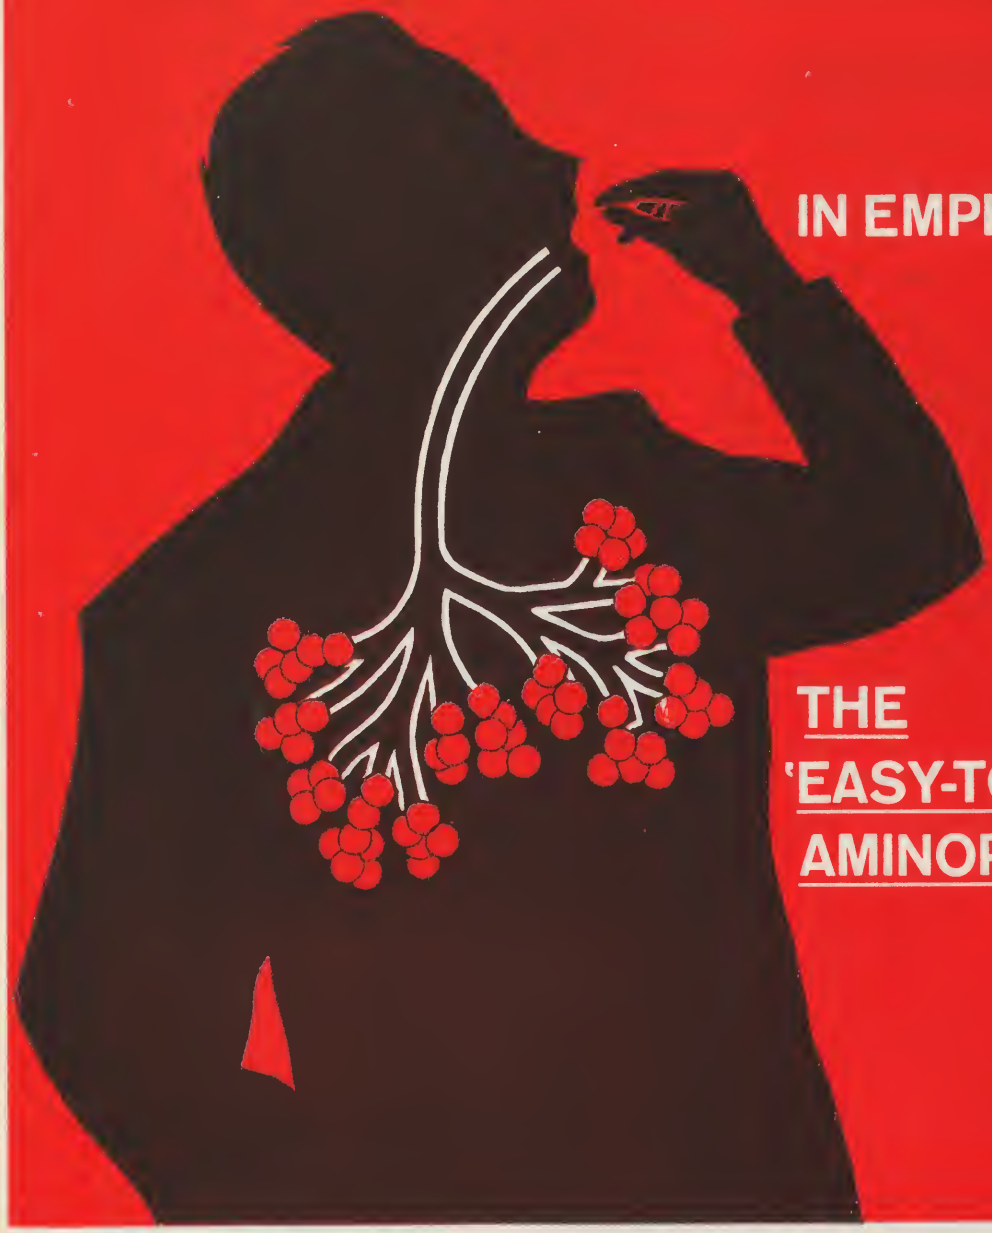
Learn To Do Your Part In The Prevention Of Disease

New Bureau of Special Home Services

On July 1 Operation *REASON,* a demonstration project to aid Baltimore's elderly and the infirm, particularly in inner city areas, becomes an administrative unit of the Baltimore City Health Department to be known as the *Bureau of Special Home Services.* Mr. Bailey Conaway, *MSW, ACSW,* director of the program, was appointed by the Health and Welfare Council of the Baltimore Area at the time the project was established in July 1965 with a grant of $112,650 from the U. S. Office of Economic Opportunity.

Operation *REASON,* so named as an acronym for a program of "Responding to the Elderlies' Abilities and Sickness Otherwise Neglected," has a current staff of 41 persons. Its main focus as the new Bureau of Special Home Services in the City Health Department will be to assist the aged poor to obtain the medical services they need for which they are eligible.



During the past two years Operation *REASON* has aided over 800 aged persons with physical, emotional and social problems. With the assistance of many cooperating agencies this work has enabled many of our older residents to overcome their disabilities or modify them to the extent that they can face their later years with a greater feeling of security and less misery and despair. While the project will be administered by the City Health Department, the funds for its operation will be provided chiefly by the Federal Government through the Community Action Agency.

Mr. Conaway, whose title will be Director of the Bureau of Special Home Services, has had a wide experience in medical-social work. He has been a caseworker in the Children's and Protective Services Division of the City Department of Public Welfare, a school social worker with the Baltimore Public Schools, Supervisor of Foster Care Services at Springfield State Hospital, psychiatric social worker for the Mental Health Clinics of the Maryland State Department of Health, and a consultant in psychiatric social work for the National Institute of Mental Health.

The new bureau staff comprises the following: assistant director, Miss Adele Wilzack, MS; clinical director, Bernard Harris, Jr., MD; social workers, Mrs. Harriet W. Jones, *MSW, ACSW,* and Mrs. Christine B. Hall, *MSW, ACSW*; health aide supervisors are Mrs. Myrtle Einhorn and Mrs. Celia Crawford, both of whom began in the program as Health Aides and who through superior work performance have been promoted to supervisory positions. There are also 30 Health Aides predominantly residents of the inner city and over 60 years of age who provide direct services to clients.

The new Bureau of Special Home Services will be on the 14th floor of the American Building, Baltimore and South Streets, where the central City Health Department administrative offices are located

Robert E. Farber, MD
Commissioner of Health

IN EMPHYSEMA

THE
'EASY-TO-TAKE'
AMINOPHYLLINE

Aminophylline dura-tabs®

prolonged-medication tablets 4½ gr. (0.3 Gm.)

Precautions: Use with caution in patients with poor renal function as a decreased rate of excretion may lead to accumulation and untoward reactions. Gastric irritation may occasionally be observed in certain patients sensitive to oral aminophylline.

Dosage: Adults, 1 to 2 Aminophylline Dura-Tabs each 8 or 12 hours, with food.

RARELY UPSET THE STOMACH

Oral aminophylline needn't disturb the stomach—nor a good night's sleep. Patients breathe easier all day, sleep better all night, as each Aminophylline Dura-Tab dose provides effective therapeutic activity for up to 12 hours. And unlike conventional tablets, AMINOPHYLLINE DURA-TABS seldom cause gastric distress. The special Dura-Tab process allows the gradual absorption of the medication from the intestinal tract with only a small fraction of the dose released in the stomach.

THERAPY SESSION ON WRC-TV-4 WASHINGTON, D.C.

THE DISABLED MIND

AUGUST 28-SEPTEMBER 8, 1967

6:30-7:00 AM

Patients representing all facets of mental disorders have been individually selected from St. Elizabeth's Hospital, Washington, D.C., to appear in the series showing stages of various therapies as they respond to the professional staff members. Included are demonstrations of experiments in behavioral studies and programs devoted to patients not only suffering from mental illnesses but who also may be blind, deaf or addicted to drugs or alcohol.

The program will be introduced by John W. Gardner, Secretary, US Department of Health, Education and Welfare and host on each program will be Francis N. Waldrop, MD, Director of Training and Behavioral Studies at St. Elizabeth's Hospital.

AMA COMMITTEE ON AGING

IN COOPERATION WITH THE

MEDICAL AND CHIRURGICAL FACULTY OF MARYLAND

Including Seven Surrounding Medical Associations

NOVEMBER 2-3, 1967

General conference sessions will focus on action to meet the needs of older people, and on new developments in facilities and programs for care of long-term patients of all ages. Among the topics discussed in the sessions on aging will be current research in the field, adult education, employment of older people, health maintenance programs, and community service projects by older people.

Details on the Conference are available from the Committee on Aging, American Medical Association, 535 North Dearborn Street, Chicago, Illinois 60610 and from The Medical and Chirurgical Faculty, 1211 Cathedral St. Baltimore, Md. 21201.

NEED A SPEAKER FOR YOUR MEDICAL SOCIETY OR HOSPITAL STAFF MEETING?

How to obtain a Speaker for your meeting through the

MEDICAL AND CHIRURGICAL FACULTY

1. Write or telephone the Faculty Office and request a speaker on the subject you wish.
2. Be sure to give the date, place and time of your meeting.
3. Advise us as to your official capacity with the organization at which the Speaker is to talk.
4. Let us know if you are willing to underwrite any out-of-pocket expenses the speaker may incur (bridge tolls, meals, etc.)
5. Let us know if it is a dinner or luncheon meeting so the speaker can be prepared.
6. Let us know the format of your program—does the speaker make his presentation ahead of your business meeting . . . is he able to leave after his talk to commence his return journey. Or any other information you feel will enable the speaker to make plans effectively.
7. Let us know if you can provide projection equipment or other visual or audio aids that the speaker may need.
8. And, lastly, when the speaker has been confirmed to you, write and provide him with any additional information you think he may need.

We are anticipating having our new Center ready for occupancy sometime this year. This Center will have 60 additional rooms, each with private bath, that will augment our present 100-bed psychiatric facility.

All accepted modern therapies are employed, and not a day is wasted in placing a new patient on active treatment. Despite our increase in size, we will maintain the concentrated professional individual attention for each patient.

When the realization of this project is completed, we hope that the added staff and environment will create one of the finest centers for psychiatric treatment, not only in the East but in the country.

Roche®

Before prescribing, please consult complete product information, a summary of which follows:
Contraindications: Infants, patients with history of convulsive disorders or glaucoma.
Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.
Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, hallucinations); changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.
Dosage—Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.
Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

Dilantin®
(diphenylhydantoin)

PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.
PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.
DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.
Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

PARKE-DAVIS 015R67

Lutrexin®

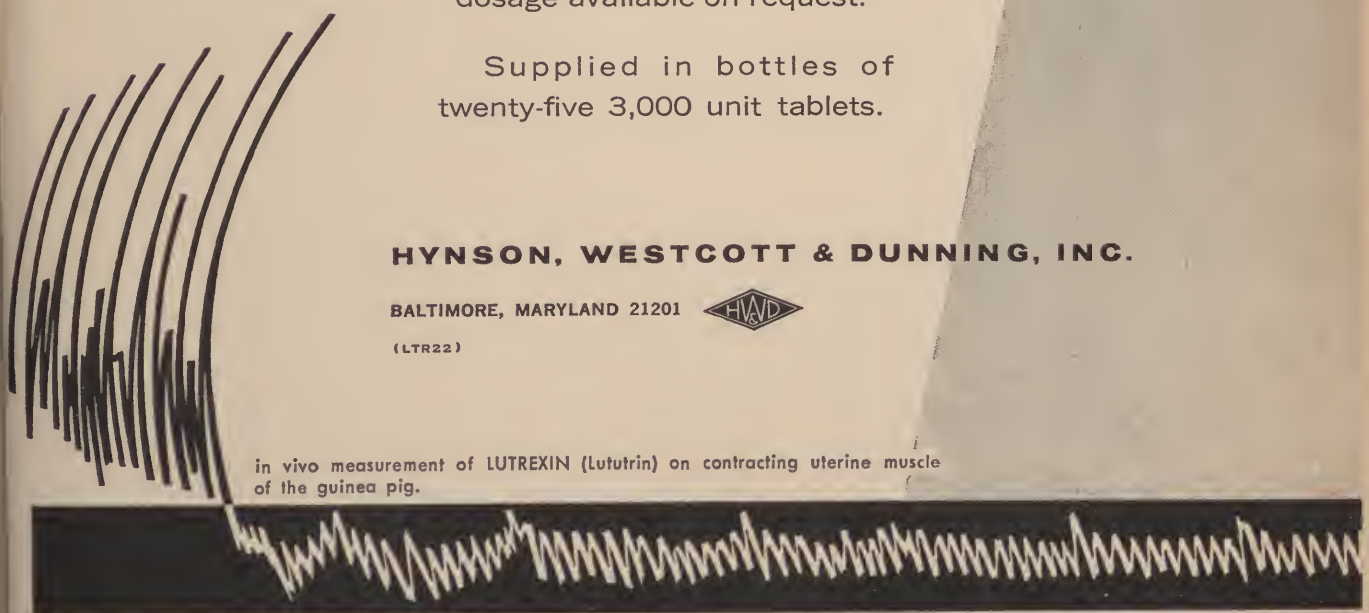
HW&D BRAND OF LUTUTRIN

3000 UNIT TABLETS

IN THE TREATMENT OF FUNCTIONAL DYSMENORRHEA ND SELECTED CASES OF PREMATURE LABOR AND 2ND AND 3RD TRIMESTER THREATENED ABORTION

In controlling abnormal uterine activity, LUTREXIN, the non-steroid "uterine relaxing factor" has been found to be the drug of choice by many clinicians.

No side effects have been reported, even when massive doses (25 tablets per day) were administered.



Literature on indications and dosage available on request.

Supplied in bottles of twenty-five 3,000 unit tablets.

HYNSON, WESTCOTT & DUNNING, INC.

(LTR22)

in vivo measurement of LUTREXIN (Lututrin) on contracting uterine muscle of the guinea pig.

Unique Nitrospan micro-dialysis process* adds an important dimension–TIME–to nitroglycerin therapy

Helps decrease frequency and severity of attacks; often increases exercise tolerance. Decreases need for sublingual nitroglycerin, increases patient confidence. Smooth, continuous release independent of gastrointestinal functions reduces headache and other side effects that might result from peak concentrations of tablet or intermittent-release preparations.

Indication and Dosage: For prophylactic use only in angina pectoris, 1 capsule every 12 hours. **Precautions:** For prophylaxis only, not for relief of acute anginal attacks. Tolerance to nitrites may develop on long-continued use. **Contraindications:** Idiosyncrasy to nitroglycerin, and early myocardial infarction. **Side Effects:** With use of nitrites, transient headache, postural hypotension, nausea and vomiting may occur. Overdoses may cause flush, dizziness, tachycardia, headache and syncope.

*__The micro-dialysis cell.__ Nitrospan's timed-release mechanism is different from those usually employed in sustained-action capsules, which rely on unpredictable digestive processes. The nitroglycerin in Nitrospan capsules is contained within hundreds of dialysis cells of controlled permeability. The contents of each micro-dialysis cell are released by diffusion rather than disintegration, at a continuous rate independent of gastrointestinal action. Only the presence of fluid is required.

THERAPEUTIC ABORTION— A VERY TIMELY TOPIC

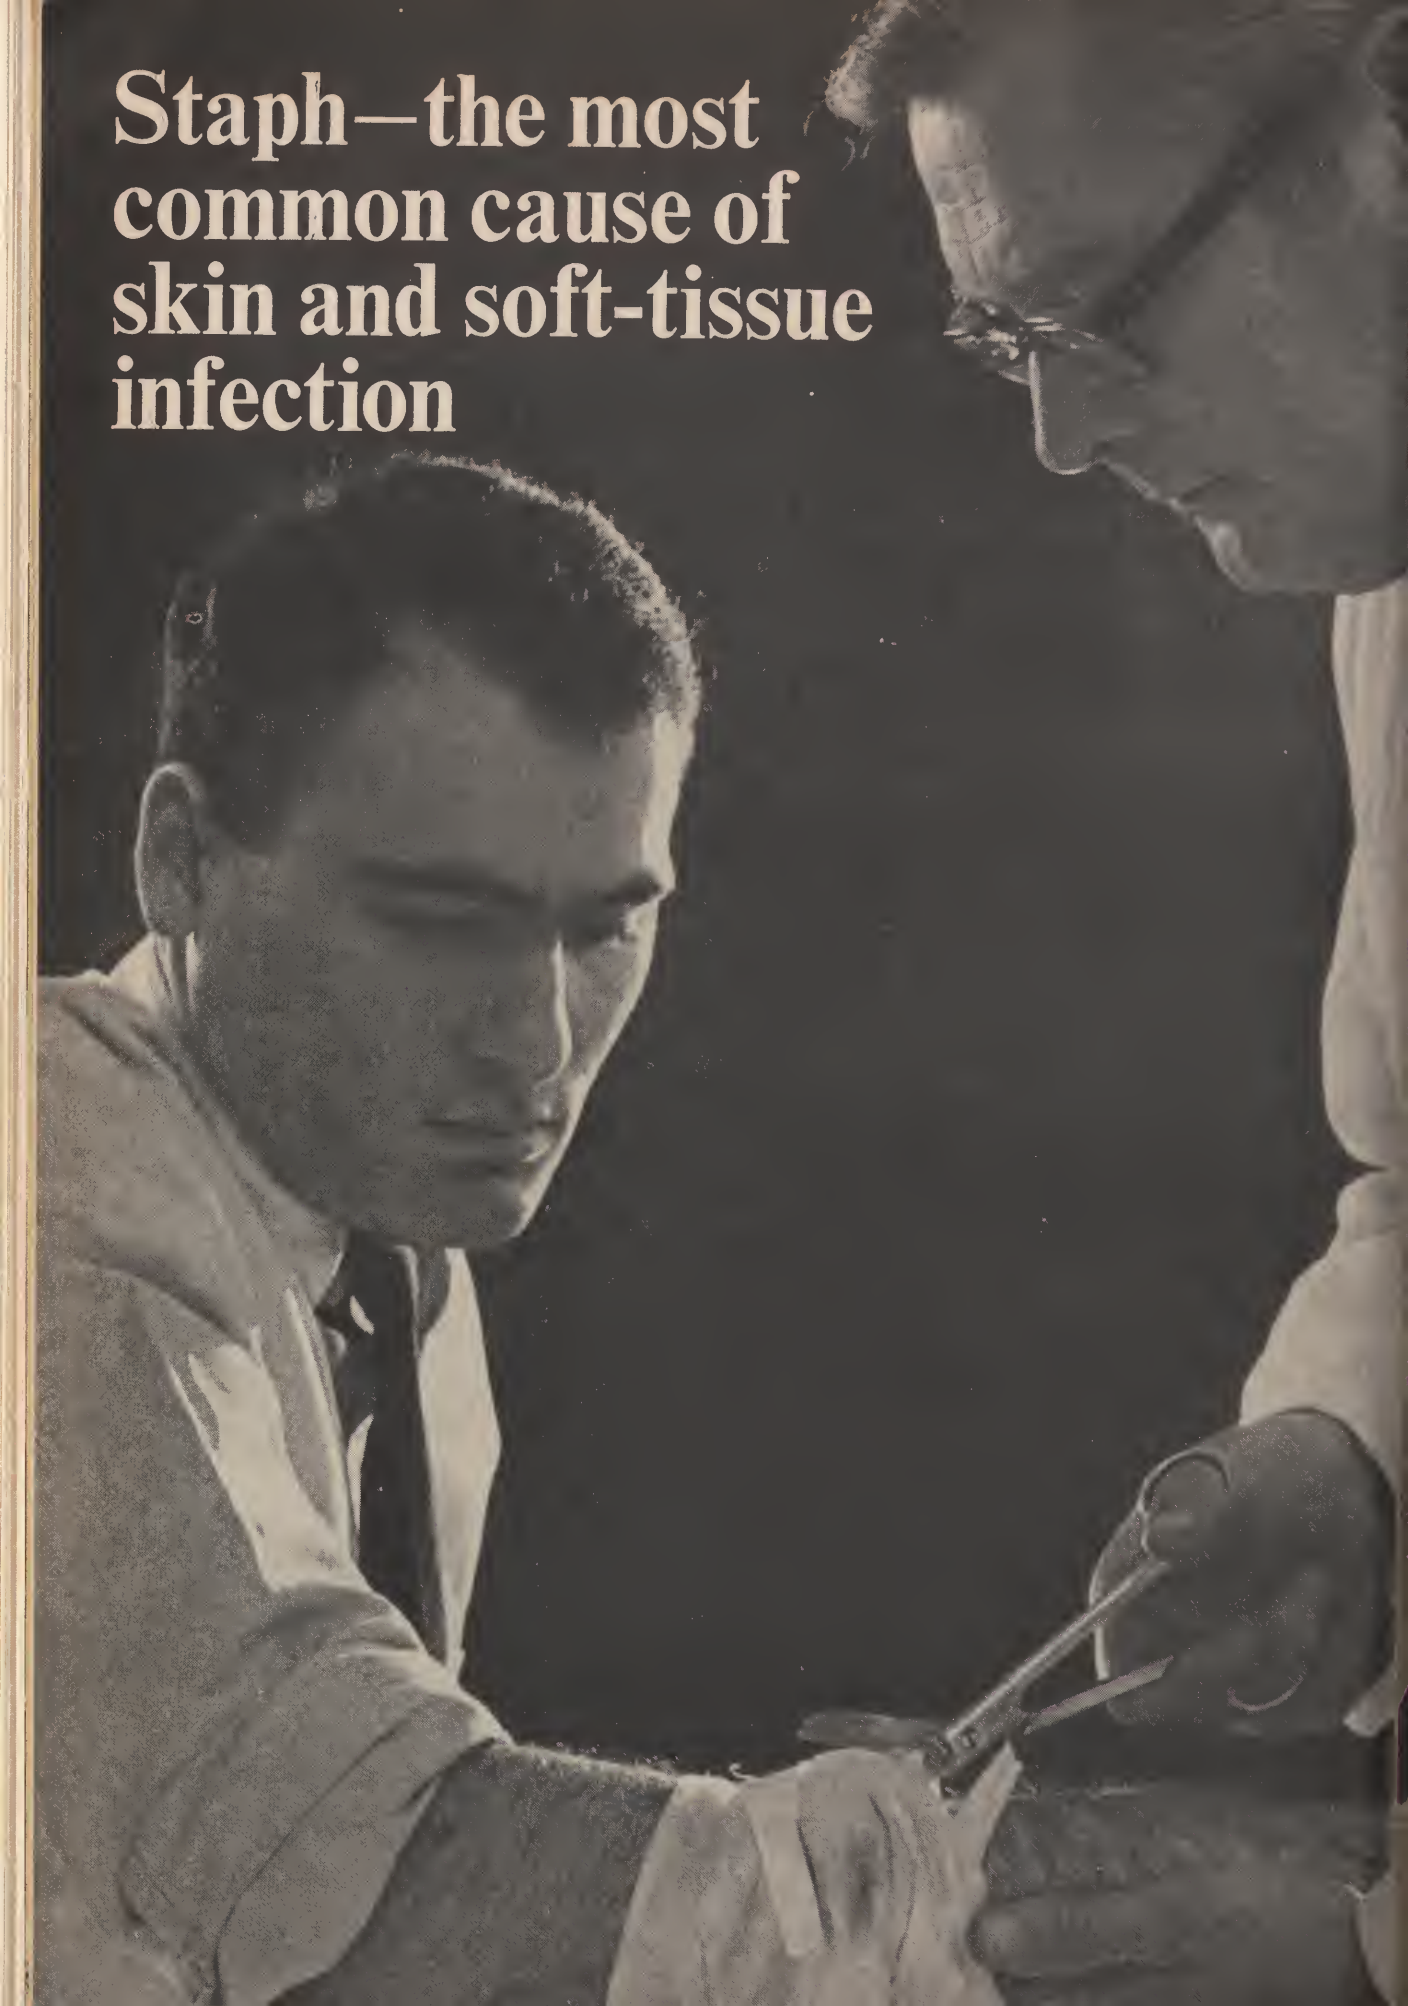
Whether or not to liberalize therapeutic abortion laws—one of the most controversial issues in recent years—is now being debated in religious and legal circles as well as in newspaper editorials and state legislatures throughout the country.

Bills designed to revamp existing laws have been introduced in twenty-one state legislatures so far this year and recently Colorado, North Carolina and California have enacted legislation which will permit abortions for reasons other than those generally permitted—to perserve the mother's safety, health or life.

According to the *AMA* News most states seeking to broaden their abortion laws are patterning their bills after the American Law Institute's model penal code which would permit abortion: 1 to prevent grave impairment to the physical or mental health of the mother; 2 when there is substantial risk the child will be born with grave physical or mental defect or 3 when the pregnancy results from rape or incest, and there is authoritative certification.

The *ALI* code further specifies that these pregnancies should be terminated only in certified hospitals by a licensed physician after two other physicians agree that the procedure is justified.

Certainly the matter of therapeutic abortion, as well as being a moral and religious problem, is also a medical problem. Many state and county medical societies recognizing the fact that therapeutic abortion is a medical problem have already taken active roles in reviewing and advising on existing and proposed legislation.



Reprint from the American College of Obstetricians and Gynecologists Newsletter, July, 1967, Page 1, 2, 79 West Monroe Street, Chicago, Ill.

The California Medical Association endorsed the state's bill at the time that it was proposed, and in February the House of Delegates of the medical society of New York State reaffirmed their 1966 guidelines for therapeutic abortions. In praise of the action of the New York group, Henry F. Marasse MD, wrote in the Winchester New York Medical Bulletin: "Time and again we stand accused of forfeiting our role of leadership in maintaining essential standards of professional practice. It is no exaggeration to say that most of the major changes in the field have been forced upon us by lay pressures. The regulation of the medical indications for abortion is no exception."

Last December the King County Washington Medical Society appointed an ad-hoc committee to meet with the bar association to draft appropriate legislation. Robert F. Willkens MD, wrote in comment at the time "we are often accused of failing to take the initiative in health care. Here is an area in which we can and should provide guidance and leadership—abortion has rested in the silent twilight of American medicine long enough. We endorse the appointment of the trustees of the committee which we hope will act with speed and effectiveness."

Probably the most active role taken in the matter of therapeutic abortion was taken last March by the Illinois State Medical Society. At that time it became apparent to members of the society that a great deal of confusion existed in Illinois regarding demands for a change in the law versus equally strong demands for a status quo situation. This led to a great deal of indecisiveness on the part of the state legislature regarding a new abortion bill which was then about to be intro-

Staph—the most common cause of skin and soft-tissue infection

.reliably controlled with specific therapy

A suitable dosage form for every staph situation

Staph—the most common cause of skin and soft-tissue infection—also is responsible for many more serious infections, such as pneumonia, osteomyelitis, and septicemia. Often, a seemingly minor skin infection is the source of metastatic spread to deeper structures. When findings on culture incriminate staph as the cause, Prostaphlin (sodium oxacillin) will provide specific effective therapy.

Bactericidal effectiveness. Hardly a staph organism can resist the bactericidal action of Prostaphlin (sodium oxacillin), as shown by a 34-month *in vitro* study. Of all staph isolates tested, 99.5% were sensitive to oxacillin.[1]

Clinically proven. There is a high correlation between these *in vitro* findings and clinical results. Of 610 patients treated with Prostaphlin (sodium oxacillin), 89.8% were reported cured or improved, including those with staph infections resistant to penicillin G.[2] And since resistance does not appear to develop *in vivo,* therapy with oxacillin can be extended when necessary.

Outstanding safety record. Besides being staph-specific and rapidly absorbed—Prostaphlin (sodium oxacillin) has established an outstanding record of safety during five years of widespread clinical use. Continuous high blood levels of oxacillin have not produced toxic effects on kidney function, assuring a significant margin of safety. However, as with all penicillins, the possibility of allergic response should be considered.

Capsules, Oral Solution and Injectable. Prostaphlin (sodium oxacillin) is available in three flexible dosage forms to suit the age of the patient and severity of infection—capsules, an oral solution for pediatric use, and multi-dose vials for injection, I.M. or I.V.

PRESCRIBING INFORMATION: For complete information, consult Official Package Circular. *Indications:* Infections caused by Staphylococci, particularly those due to penicillin G-resistant Staphylococci. *Contraindications:* A history of severe allergic reactions to penicillin. *Precautions:* Typical penicillin-allergic reactions may occur. Safety for use in pregnancy and premature infants is not established. Because of limited experience, use cautiously and evaluate organ system function frequently in neonates. Mycotic or bacterial superinfections may occur. Assess renal, hematopoietic and hepatic function intermittently during long-term therapy. *Adverse Reactions:* Skin rashes, pruritus, urticaria, eosinophilia, nausea, vomiting, diarrhea, fever and occasional anaphylaxis. Rare cases of reversible hepatocellular dysfunction have occurred. Moderate SGOT elevations have been noted. Thrombophlebitis has occurred occasionally during intravenous therapy and leukopenia was noted in two cases. *Usual Oral Dosage:* Adults: 500 mg. *q.*4 or *q.*6*h.* Children: 50 mg./Kg./day. *Usual Parenteral Dosage:* Adults: 250-500 mg. *q.*4 or *q.*6*h.* Children: 50 mg./Kg./day. Treat beta-hemolytic streptococcal infections for at least 10 days. Give oral drug 1 to 2 hours before meals. *Supplied:* Capsules—250 and 500 mg. in bottles of 48. Injectable—250 mg., 500 mg., and 1 Gm. dry filled vial for I.M./I.V. use. For Oral Solution—100 ml. bottle, 250 mg./5 ml. when reconstituted. **A.H.F.S. CATEGORY: 8:12.6**

SODIUM OXACILLIN

duced in the legislature. At this time the Illinois State Medical Society recognized a need and an opportunity to offer service and leadership to the public. Accordingly it scheduled a public symposium of therapeutic abortion to air both the "liberal" and "conservative" points of view.

Robert R. Hartman, MD, FACOG, who was chairman of the *ISMS* committee on maternal welfare, was appointed chairman of the symposium planning committee. At the time of his appointment, Doctor Hartman said "to the best of our knowledge this is the first time a state medical society has sponsored a public forum at which a panel composed entirely of physicians discussed a law which circumscribes their conduct."

The planning committee was comprised of representatives of the state legislature, public affairs and maternal welfare committees and the legal profession. The first decision that the committee made was to limit the discussion strictly to the medical implications of therapeutic abortion. It was the feeling of the committee that any discussion of the religious and moral overtones was more properly within the realm of the clergy and sociologists.

A basic consideration involved program format. So as to achieve the balance of liberal and conservative viewpoints previously mentioned the committee selected eight panelists—four "pro" and four "con" from the four major specialties of obstetrics, pediatrics, psychiatry, and public health with the hope that this would provide a good cross-section of balanced viewpoints.

Once the program was set, and as soon as the panel members were selected, an all out program was inaugurated to get maximum publicity. The symposium was to be held in the Sherman House ballroom in Chicago and was open to the public. All the publicity efforts were highly successful and all of the Chicago news media cooperated completely giving priority publicity to all aspects of the symposium.

In view of the fact that an overflow audience was expected, WFLD-TV video-taped the symposium and telecast it the same night during a prime time segment as a public affairs program. To build an audience for the telecast the station published ads in both the Sun Times and the Daily News and also included a questionnaire ballot to be filled out by the audience to measure the feed-back response. Even though the questions were asked only once at the end of the telecast the station received 1,119 responses in the mail which indicated that 86.7% favored abortion if the mother's life was in danger; 77.7% favored it if the pregnancy was caused by rape; 73.1% were in favor if the mother's mental health was threatened, and 72.1% favored it if the child was likely to be deformed. Ten percent thought all abortions should be forbidden.

Editors throughout the area felt that the symposium was most timely and of high news interest. The staffs of all the Chicago daily newspapers, the Associated Press, three radio stations, five television stations and several medical publications were present for the meeting.

All indications and all responses would indicate that this symposium was extremely successful. The symposium brought the question of therapeutic abortion out of the shadows of silence, reviewed and analyzed it in a spotlight of educational publicity, and most important, put the medical profession in the forefront of leadership in this highly controversial issue.

The College has named a committee of ten members to study this matter and to make proposals in this regard at the 1968 Annual Meeting. The House of Delegates of the *AMA* adopted a resolution at their recent meeting in Atlantic City which is generally along the lines of the previously mentioned *ALI* model code.

Committee on Human Reproduction

AMA POLICY ON THERAPEUTIC ABORTION

At its meeting in Atlantic City in June 1967 the *AMA* House of Delegates considered a detailed report and policy recommendation on therapeutic abortion which had been prepared by the Committee on Human Reproduction and transmitted to the House with the approval and recommendation of the Board of Trustees. The report recommended that the *AMA* adopt a policy on therapeutic abortion which, in essence, is a modification of the Model Penal Code of the American Law Institute. The proposed new policy did not address itself to state abortion laws.

This report evoked widespread interest and discussion at the Atlantic City meeting. All points of view were expressed with the preponderance of testimony favoring adoption of the recommendations. After lengthy debate and some minor modifications, the following statement was adopted as the policy of the American Medical Association:

> The American Medical Association is cognizant of the fact that there is no consensus among physicians regarding the medical indications for therapeutic abortion. However, the majority of physicians believe that, in the light of recent advances in scientific medical knowledge, there may be substantial medical evidence brought forth in the evaluation of an occasional obstetric patient which would warrant the institution of therapeutic abotion either to safeguard the health or life of the patient, or to prevent the birth of a severely crippled, deformed or abnormal infant.
>
> Under these special circumstances, it is consistent with the policy of the American Medical Association for a licensed physician, in a hospital accredited by the Joint Commission on Accreditation of Hospitals, and in consultation with two other physicians chosen because of their recognized professional competence who have examined the patient and have concurred in writing, to be permitted to prescribe and administer treatment for his patient commensurate with sound medical judgment and currently established scientific knowledge. Prior to the institution of a therapeutic abortion, the patient and her family should be fully advised of the medical implications and the possible untoward emotional and physical sequelae of the procedure.
>
> In view of the above, and recognizing that there are many physicians who on moral or religious grounds oppose therapeutic abortion under any circumstances, the American Medical Association is opposed to induced abortion except when:
>
> (1) There is documented medical evidence that continuance of the pregnancy may threaten the health or life of the mother, or
> (2) There is documented medical evidence that the infant may be born with incapacitating physical deformity or mental deficiency, or
> (3) There is documented medical evidence that continuance of a pregnancy, resulting from legally established statutory or forcible rape or incest may constitute a threat to the mental or physical health of the patient;
> (4) Two other physicians chosen because of their recognized professional competence have examined the patient and have concurred in writing; and
> (5) The procedure is performed in a hospital accredited by the Joint Commission on Accreditationof Hospitals.
>
> It is to be considered consistent with the principles of ethics of the American Medical Association for physicians to provide medical information to State Legislatures in their consideration of revision and/or the development of new legislation regarding therapeutic abortion.
>
> In adopting this statement, the House of Dele-

gates stressed that the rights of physicians to express contrary views and to practice their beliefs must be respected but that the new policy in no way suggests that physician or patients act contrary to their personal consciences. The House characterized the statement as one which is "in keeping with modern scientific knowledge, contains necessary safeguards, and permits the physician to exercise his personal conscience and medical judgment in the best interest of his patient." These should be the overriding objectives in any medical decision.

Finally, the House of Delegates noted the unmistakable evidence of restiveness in all segments of the population regarding our current therapeutic abortion practices and stated that "it is clear that change and reform in this area is inevitable." The House stated its belief that the new policy "is a reasonable and conservative approach" which will provide the American Medical Association with a position of leadership in this important contemporary problem.

Sports Authorities Warn Against "Spearing"

A group of coaches, physicians, and sports officials today joined the American Medical Association in calling for an end to football "spearing."

Spearing is the tactic in which a blocker or tackler uses his head as a battering ram. It's dangerous, both for himself and for the person he hits.

The football authorities called for coaches to emphasize correct, head-up blocking and tackling, and for strict enforcement by officials of the rules against spearing.

When polled by the American Medical Association's Committee on the Medical Aspects of Sports, the group was unanimous in warning against spearing. The *AMA* committee asked for their comments when recent studies showed that head and neck injuries continue to constitute a very high percentage of serious injuries in football.

Said Notre Dame football coach Ara Parseghian: "I can't begin to tell of the number of clinics where I have lectured on the (spearing) problem. We don't teach this at Notre Dame; and over the years, I have done everything within my power to influence others to coach against it."

A tackler can inflict a tremendous amount of punishment by driving his helmet into an opposing ball carrier. Moreover, he endangers himself, because his head and neck take the force of the blow. Serious injury and even death have resulted from damage to brain areas or the spinal cord.

In the correct, head-up tackle, the player uses his shoulders, arms, and chest to stop the ball carrier. In a "spear" or "butt tackle," he drives into his opponent with his head. By spearing, the tackler may prevent the ball carrier from advancing a few extra inches—if he tackles him. With his head down, however, he not only risks serious injury, but is more likely to miss the tackle because he has a harder time seeing where he's going.

"Many neurosurgeons are appalled by coaches permitting or even deliberately teaching the devastating techniques of 'spearing,' 'stick-blocking,' and 'head-butting'," said Richard C. Schneider, MD, an Ann Arbor, Mich., neurosurgeon and member of the *AMA* Committee on the Medical Aspects of Sports.

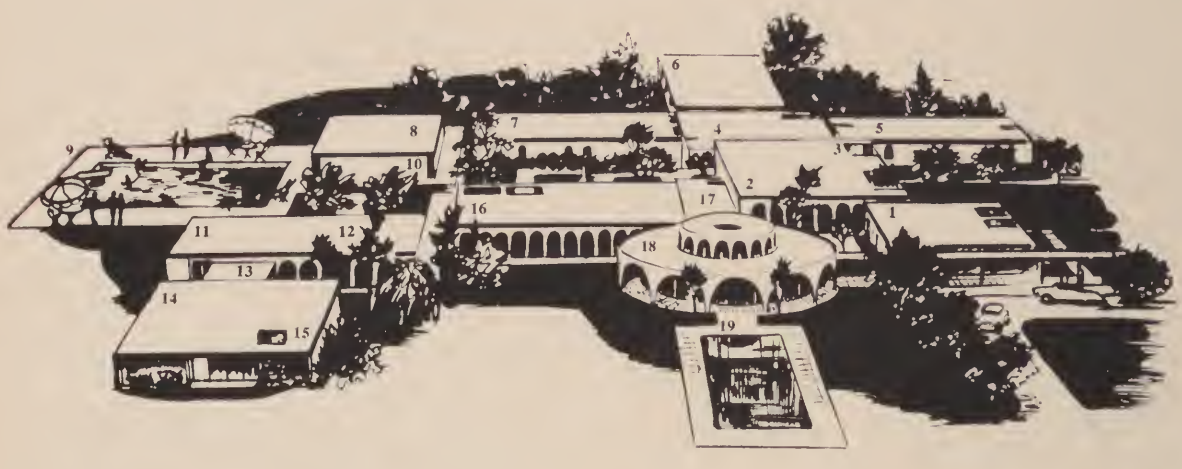
He pointed out that death may be only 30 to 60 seconds away if the blood vessels draining the brain are damaged by a heavy blow, or if hemorrhaging begins within the brain.

In the neck, the spinal cord is approximately the size of a man's ring finger. It lies within the bony spinal canal, an easy victim of bruising or cutting if neck vertebrae or cervical discs are forced out of place, Dr. Schneider said.

Such an injury may result in death or permanent paralysis of arms and legs and loss of bladder and bowel control. Thirty such cases were reported during the football seasons of 1959 through 1964, he said.

Studies of fatalities indicate that football has a good safety record, considering that virtually a million players are involved each fall. It could be even better, however, if head and neck injuries could be reduced. In 1966, head and neck injuries were responsible for 23 of the 24 fatalities directly attributed to injuries in college and high school football.

"Strict enforcement by officials of the rule against 'spearing' is important," said Donald B. Slocum, MD, chairman of the *AMA* committee and orthopedic consultant to the University of Oregon football team. "While every infraction may not be discernible, those that are should be rigorously penalized—particularly those that occur on second impact when a runner already has been tackled," Dr. Slocum said.



Although rules committees on all levels have voted for stricter enforcement of the "spearing rule," many players continue to spear in blocking and tackling, either inadvertently or as a definite

We are anticipating having our new Center ready for occupancy sometime this year. This Center will have 60 additional rooms, each with private bath, that will augment our present 100-bed psychiatric facility.

All accepted modern therapies are employed, and not a day is wasted in placing a new patient on active treatment. Despite our increase in size, we will maintain the concentrated professional individual attention for each patient.

When the realization of this project is completed, we hope that the added staff and environment will create one of the finest centers for psychiatric treatment, not only in the East but in the country.

Edith L. Taylor
Executive Director

Irving J. Taylor, M.D.
MEDICAL DIRECTOR

tactic, said William E. Newell, executive secretary of the National Athletic Trainers Association and head athletic trainer at Purdue University.

Players should be selected and trained more carefully, he said, particularly boys at two physical extremes—those with long, thin necks and those with short, stubby necks.

"Protective equipment is no guarantee against serious or even fatal football injuries," Newell said. "With proper attention, however, injuries from the so-called spear or butt block can be eliminated or greatly reduced in football at all levels."

Said Clifford B. Fagan, executive secretary of the National Federation of State High School Athletic Associations: "There is absolutely no place in interscholastic football for 'spearing.' Responsible athletic administrators and football leaders everywhere deplore the fact that a small number of coaches teach it. The high rate of serious injury which results from 'spearing' makes it self-evident that the teaching of its must not be tolerated. There are a great variety of safer blocking methods which are as effective as spearing and infinitely safer."

Elimination of spearing "would certainly cut down the number of fatalities in football," said L. W. Combs, MD, director of the student health center, Purdue University, and a leader in the Athletic Medicine Section of the American College Health Association.

"It has been disappointing for me as a team physician at a university to realize that some high school coaches are teaching 'spearing' as being a sound football practice," Dr. Combs said. "At the college level, we are very much aware that this technique makes the player much more vulnerable to injuries of the head and neck. The headgear has been highly developed by equipment manufacturers with the advice of physicians, trainers, and others as a protective gear. It is entirely unfitting, however, that some coaches persist in teaching its use as an offensive and defensive weapon."

"The primary problem is the present coaching techniques of 'butt' tackling or blocking. It is impossible for the rules committees to legislate 'coaching techniques'," said O. B. Murphy, MD, of Lexington, Ky., University of Kentucky team physician and representative of the *AMA* committee to the *NCAA* Rules Committee.

"In any case," he said, "the fact remains that since the advent of the hard helmet and face piece, coaches have felt that the head and face are adequately protected. This, however, affords no protection at all for the neck which is subjected to injury through this repeated 'butting' technique."

Said Murray Warmath, football coach at the University of Minnesota: "spearing will never disappear from the game until we quit coaching it and until we absolutely disallow its use on the part of our men."

"It isn't the first man who makes the tackle," Warmath said. "It's that second tackler. He puts his head down, closes his eyes, and piles into the man who's down with one intent, and that's to maim and cripple."

Since 1960, most of the football deaths resulting directly from football participation have been caused by head and neck injuries, said Carl Blythe, PhD, of Chapel Hill, N.C., chairman of the *NCAA* committee on football safety and president of the American College of Sports Medicine.

"The practice of spearing is condemned by all responsible persons truly interested in the game of football and the welfare of its participants," he said.

The *AMA* committee has waged a continuing campaign for prevention of injuries to the head and neck since it sponsored a "National Conference on Head Protection for Athletes" in Chicago in 1962. The Conference recommended that spearing be outlawed, but the practice persisted.

"Perhaps the only answer is the creation of public awareness of this problem to the point that a player who uses spearing will be branded as guilty of unsportsmanlike conduct," said a spokesman for the committee. "Anyone who would deliberately set out to injure his opponent, by spearing, while at the same time endangering his own life must be lacking in moral values and intelligence," he said.

The *AMA* Committee on the Medical Aspects of Sports called on all team physicians to discourage spearing, urged coaches to teach against the tactic, and warned players of the dangers of the practice. Concerted action to rid the game of spearing can make football a better game for all concerned, the Committee said.

saver's choice

Baltimore Federal offers a plan to meet the needs of every saver

PASSBOOK SAVING: the popular choice for profit, safety, and convenience. Your money earns Baltimore Federal's extra high dividends in insured safety. Accounts are insured up to $15,000 by the Federal Savings and Loan Insurance Corporation and are further protected by Baltimore Federal's own reserves of over $23,000,000. Savings may be added or withdrawn at any time in any amount at any Baltimore Federal office. If you're looking for the best combination of profit, safety, and convenience, open your savings account soon.

SAVINGS CERTIFICATES: two Savings Certificate plans designed to be of special interest to people who view their savings program as more of a high-yield investment. Six-month certificates earn dividends at Baltimore Federal's current rate, paid by check at our regular dividend period, plus an additional anticipated bonus paid at maturity. Available in minimum amounts of $2,000 (larger certificates in multiples of $1,000 up to $11,000). There is also a special six-month certificate available in minimum amounts of $12,000 which operates the same way but which will earn an even greater bonus at maturity. For extra return, invest now in Baltimore Federal six-month Savings Certificates.

J. PARRAN JARBOE, MD

J. Parran Jarboe, MD, La Plata, will assume his duties as Councillor from the Southern District at the conclusion of the 1968 Annual Meeting. A graduate of the Georgetown University Medical School in 1942, he interned at Providence Hospital, Washington, DC, following which he undertook graduate training at the Mayo Foundation, Minnesota from 1943 to 1946. He has the Master of Science Degree in Surgery from the University of Minnesota Medical School, and is a Fellow of the American College of Surgeons.

He is Chief of Surgery at Physicians Memorial Hospital, La Plata, has surgical privileges at the principal Washington, DC, hospitals and maintains his Faculty membership through the Charles County Medical Society.

THE HISTORY OF SPECTACLES

Samuel L. Fox, MD. was awarded the Knapp Prize for the best exhibit in Ophthalmology at the 116th Annual Meeting of *AMA* held at Atlantic City in June, 1967.

The exhibit consisted of almost 200 pairs of old spectacles, beginning with forged iron frames of the type worn by George Washington, of the period 1740-1760, and proceeding through the brass, pewter and steel frames of the early 1800's. The small rectangular "Ben Franklin" types as well as the small ovals and octagonals of the 1840's and 1860's were shown, as well as unusual varieties of double hinged lenses (early sunglasses attached to the reading lens frames). The "blued metal" frames of the post-Civil War period and the nickel-plated frames of the late 1800's were also exhibited. Many unusual varieties were

SAMUEL L. FOX, MD

shown: the amber frosted lenses for gunning; the blue lens wire-guard frames used by railroaders to keep cinders out of the eyes; the early splitglass bifocals of the Benjamin Franklin variety; the later paste-on bifocals of the 1890's and numerous models of prince nez and lorgnette eyeglasses were shown.

In addition, reproductions of the earliest eyeglasses known to be in existence were shown: the leather framed eyeglasses belonging to Professor Wilibald Perkheimer in 1500, which are now in the National Museum of Nurenberg, Germany; and the wooden framed spectacles of 1405 belonging to Cardinal von Soest. (Reproduced from his portrait)

Many manuscripts, letters from Benjamin Franklin and Thomas Jefferson, catalogues illustrating early eyeglasses, etchings and drawings, portraits etc. illustrating the early history of spectacles were displayed. The history of spectacles was traced by these historic means.

From New York

Physicians who are unable to attend the convention in Dallas of the American Academy of General Practice, September 18 to 21, will be able to keep right on top of the proceedings by listening to "Doctors Convention Report," which will be broadcast over 10 National Science Network affiliated stations in major cities.

Daily 15-minute broadcasts, morning and evening, from the convention city, will carry summaries of selected clinical papers delivered at the meeting, and interviews with leading speakers. Because the broadcasts will be on open-circuit FM radio, physicians will be able to listen at home, in their offices or in theirs cars.

The National Science Network also produced the "Doctors Convention Report" from the recent *AMA* meeting in Atlantic City, as it did the previous year's *AMA* meeting in Chicago and the *AAGP* convention in Boston.

The first broadcast from Dallas is scheduled for Monday evening, September 18. The following stations will carry "Doctors Convention Report:" *WTOW*, 101.9 FM, Baltimore; *WQAL*, 106.1 FM, Philadelphia; *WNCN*, 104.3 FM, New York.

The National Science Network coverage of the American Heart Association meeting in October in San Francisco. This "Doctors Convention Report" also will be carried over the full 10-station network across the country.

From Washington

The House Ways and Means Committee approved a social security bill including some Medicare and Medicaid changes sought by the medical profession and excluding others opposed by the *AMA*.

The committee also discarded an Administration proposal to extend Medicare coverage to disabled workers under age 65, as well as an Administration-opposed proposal that would have put federal government workers under Medicare. The actions were part of a general scaling down of the increases in social security benefits sought by President Johnson.

A committee bill (H.R. 12080) included these changes in the present law:

—Allow Medicare patients, or doctors, to collect from the government on the basis of an itemized bill. Present law requires a bill receipted as having been paid to the doctor if the doctor doesn't accept an assignment. (*AMA*-supported)

—Authorize states to allow physicians to bill Medicaid patients directly if they are not also cash assistance recipients. (*AMA*-supported)

—Eliminate the requirement for certification by a doctor before admission of a Medicare patient to a hospital. (*AMA*-supported)

—Shift coverage on Medicare outpatient diagnostic services provided by hospitals from Plan A to Plan B. (*AMA*-supported)

—Put limits on federal contributions to states for medicaid programs. Beginning July 1, 1968, the federal ceiling on eligibility would be 150% of the annual income set by a state for welfare eligibility. It would drop to 140% on January 1, 1969, and to 133⅓ per cent January 1, 1970.

—Require states to give birth control information to welfare patients who request it.

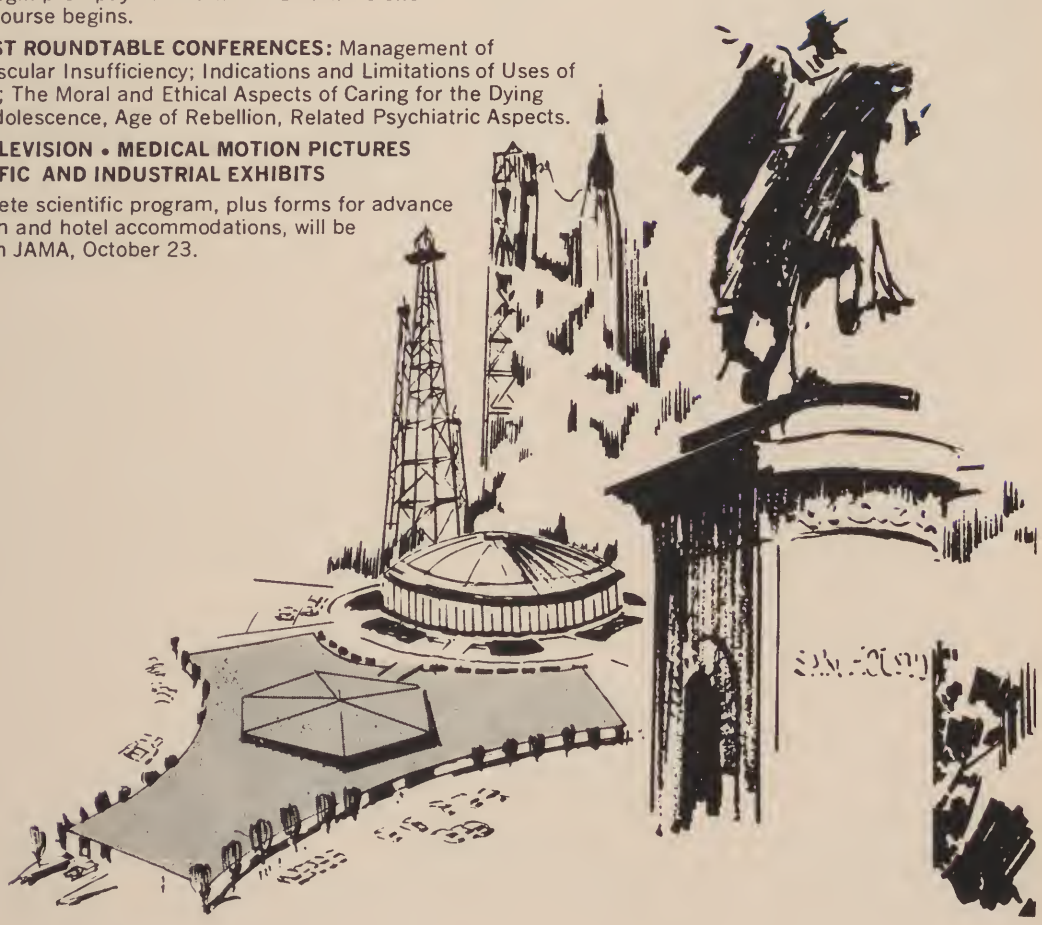
In addition to opposing extension of Medicare

AMA '67 HOUSTON

AMA 21ST CLINICAL CONVENTION • ASTROHALL • HOUSTON, TEXAS • NOVEMBER 26-29, 1967

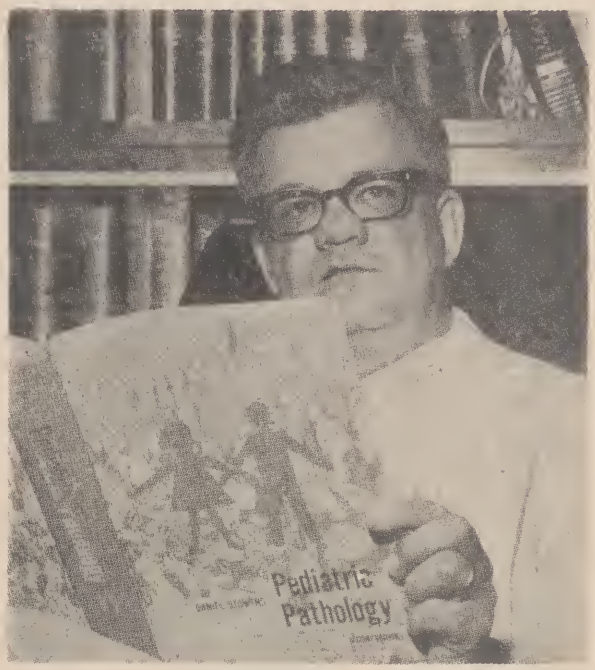
Plan to attend this year's AMA Clinical Convention in Houston, Texas. Eighteen scientific sessions, four postgraduate courses, breakfast roundtable discussions, color television, and scientific and industrial exhibits will bring you up to date on the latest medical advances. Attend lectures by, and discussions with, our nation's outstanding medical authorities.

Between sessions, enjoy the excellent restaurants, fine shops, visitors' attractions, and mild winter temperatures Houston offers. Mail the enclosed registration and room reservation coupons now, and look forward to an exceptional convention with a holiday plus.



SCIENTIFIC SESSIONS: Cardiovascular Disease; Cardiovascular Surgery; New Cares; Ophthalmology; Geriatrics; Arthritis; Gastroenterology; Cancer; Antibiotics; Endocrinology; General Surgery; Dermatology; Aerospace Medicine; Obstetrics and Gynecology; Psychiatry; Pediatrics; Genitourinary Diseases; and Otolaryngology.

POSTGRADUATE COURSES: Fluid and Electrolyte Balance; Oncology; Cardiovascular Disease; and Obstetrics and Gynecology. Register for these Courses on arrival in Houston at the PG Course Registration booth adjacent to the General Registration area. There is no charge for the Courses, but registration is limited to 200 per Course. The Courses begin promptly at 9 A.M. and 2 P.M. No one will be seated after the Course begins.



BREAKFAST ROUNDTABLE CONFERENCES: Management of Cerebrovascular Insufficiency; Indications and Limitations of Uses of Antibiotics; The Moral and Ethical Aspects of Caring for the Dying Patient; Adolescence, Age of Rebellion, Related Psychiatric Aspects.

COLOR TELEVISION • MEDICAL MOTION PICTURES • SCIENTIFIC AND INDUSTRIAL EXHIBITS

The complete scientific program, plus forms for advance registration and hotel accommodations, will be featured in JAMA, October 23.

I Hadn't Read One Novel Since 1948. Now I'm Reading 5 A Week! I Can Read Over 1600 Words Per Minute.

Meet Dr. Bennett Hill

Dr. Hill will soon be among the more than 300,000 Evelyn Wood Reading Dynamics Institute graduates who have increased their reading efficiency up to 470%.

SENATE LEADERS PRAISE TECHNIQUE

SENATOR TALMADGE, GEORGIA ". . . the greatest single step which we could take in educational progress."

SENATOR PROXMIRE, WISCONSIN ". . . one of the most useful educational experiences I ever had."

WHITE HOUSE BECKONS

The late President Kennedy invited Mrs. Wood to the White House to teach the Joint Chiefs of Staff.

Now I read all my Medical Publications at the office, with improved comprehension and greater recall. . . .

"Not since 1948," says Dr. Bennett Hill, "had I read a popular novel, or a great book. The reason for this was quite simple. My reading time was devoted to keeping up with my medical publications."

Now in his sixth week of the Evelyn Wood Reading Dynamics course, Dr. Hill states, "Since I started the course I have read 5 novels each week and am still keeping well ahead on my medical reading. This course is fantastic!"

Reading 5 novels a week is really no prodigious feat when you consider that Dr. Hill can read the average novel in 45-50 minutes. And the reason he reads more is that reading quickly is *fun.*

"I started the course reading 455 words per minute," Dr. Hill continues. "Now I read 1660 words per minute, with *greatly improved comprehension.*"

Using his hand as a pacer, Dr. Hill's fingers fly over the page. He sees and comprehends every word. He reads even highly technical material 10 times faster than the average reader. He is using the revolutionary reading technique now being taught at the Evelyn Wood Reading Dynamics Institutes.

COMPREHENSION IS STRESSED

Dynamic Reading is nothing like the skimming techniques commonly used in speed reading courses. You read five times faster, not by reading every fifth word, but by reading five times as many words in the same time!

In peptic ulcer... antacid therapy with a new benefit

CONTAINS A BALANCED COMBINATION OF THE MOST WIDELY USED ANTACIDS— FOR RAPID NEUTRALIZATION. PLUS SIMETHICONE— TO CONTROL THE FACTOR WHICH ANTACIDS ALONE CANNOT INFLUENCE.

Mylanta®

- In Mylanta, aluminum and magnesium hydroxides are balanced to minimize the chance of constipation or laxation and still achieve rapid acid neutralization and pain relief.
- The positive action of simethicone helps relieve the painful gas symptoms which often accompany the peptic ulcer syndrome.
- The nonfatiguing flavor and smooth, nongritty consistency of tablets and liquid encourage continued patient cooperation during long-term therapy.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) of liquid contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. **Dosage:** one or two tablets, well chewed or allowed to dissolve in the mouth, or one or two teaspoonfuls of liquid to be taken between meals and at bedtime.

The Stuart Company, Pasadena, California
Division of Atlas Chemical Industries, Inc.

Stuart

to disabled workers under age 65, the *AMA* opposed creation of a new Plan C under Medicare and a provision for chiropractor's services—both of which were rejected by the committee.

The House group slashed back the President's proposal for a 15% minimum monthly social security increase in cash benefits to 12.5%. The administration proposal for an increase in social security taxes also was scaled down to 4.4%, on the employer and on the employee, of the first $7,600 in wages starting in 1968. The taxable wage base now is $6,600, and the tax rate is 4.4%. The Administration had asked that the base be increased to $7,800 next year, and in later stages, to $10,800.

* * * * *

The *AMA* and the Kansas City (Mo) Community Blood Bank asked Congress to exempt community blood banks from the anti-trust laws.

Representatives of the groups testified at a senate judiciary subcommittee hearing in support of S.1945 which would amend the anti-trust laws to provide that a nonprofit blood or tissue bank, or hospital, or physician who refuses or who joins together with others in refusing to obtain or to accept delivery of blood, blood plasma, other tissue or organs from any other blood or tissue bank would not be in restraint of trade. The interstate shipment of blood, blood plasma, other tissue or organs also would not be deemed to constitute trade or commerce in commodities.

The legislation was introduced after the Federal Trade Commission ruled that a group of Kansas City pathologists, hospitals and blood bank officials had combined illegally to restrain commerce in human whole blood. An appeal against the ruling is pending in the Federal Eighth Circuit Court of Appeals in St. Louis, Missouri.

Robert S. Mosser, MD, President of the Kansas City Blood Bank, said it was inconceivable that groups of physicians may not have the right to discuss shortcomings of medical practice, including the use of blood and its derivatives.

Frank C. Coleman, MD, Tampa, Florida, pathologist, presented the views of the *AMA*:

> "Because serious health hazards may arise through transfusion by virtue of the medical condition of the donor, the care necessary in the selection of blood donors by blood banking

facilities cannot be over-emphasized. Serious consequences may arise unless the blood is properly drawn, processed, stored, and distributed. And it is imperative that these procedures be performed under high standards, under the guidance and control of proper medical supervision."

Dr. Coleman pointed out that the *AMA* in 1963 adopted a statement *"to the effect that the transfusion of blood constitutes the transplant of human tissue, and that physicians responsible for transfusions render a medical service to the patient."*

"The House of Delegates stated that the selection of the donor, the drawing of the blood, its processing and storage, the delivery, the typing and crossmatching, and the administration of the transfusion and the evaluation of its effects, were functions intimately involving medical judgment and requiring medical supervision," Dr. Coleman said.

"The *AMA* believes that the health interests of the community are best served when the supply of blood is maintained on a replacement basis. We feel that the patient, the donor, and the public benefit when blood is replaced by the patient, his family, or his friends in the various organizations of which he is a member.

"Since the consequences of any abuses can be tragic, it is our opinion that the physician and hospital must have available to them every means of insuring the safety of the patient."

* * * * *

The Public Health Service reported that, according to Hill-Burton state agencies, 3,327 of the nation's 6,716 general hospitals need modernization or replacement of facilities for 272,000 of their beds. Of the total, replacements are required for 70,000.

But William Stewart, MD, PHS Surgeon General, said that replacement or modernization was not the complete answer.

"Development of alternative care facilities, earlier preventive treatment, increased and more readily available out-patient services—all of these may offer a better solution to a given hospital's problems," he said.

Dr. Stewart said 143 hospitals in the survey were critically overcrowded with average annual occupancy rates of 90 per cent or more of reason-

What can be done for Susan Jane To stop the runs and crampy pain?

Parepectolin for quick relief of acute diarrhea
...soothes colicky pain with paregoric
...consolidates fluid stools with pectin
...adsorbs irritants with kaolin, and protects intestinal mucosa.

In children, Parepectolin may be used to control diarrhea promptly and prevent dehydration, until etiology has been determined. In some cases, Parepectolin may be all the therapy necessary.

Parepectolin®

New Agreement Provides Nationwide Blood Coverage

A new agreement covering the nationwide exchange of blood and blood credits between the country's major blood banking organizations was announced jointly today by the American National Red Cross and the American Association of Blood Banks.

The agreement, signed by General James F. Collins, president of the *ARC*, and George Hummer, MD, president of the *AABB*, replaces the original agreement which the two organizations developed in 1961, setting up a national reciprocal system to facilitate blood donor replacements and to utilize blood supplies more effectively.

"We welcome this new agreement with the *AABB*," General Collins said. "The two largest blood agencies in the United States, working in harmony, will strengthen and continue to improve our efforts to effectively and promptly meet the increasing blood needs of our countyr."

"The *AABB* is pleased to see this agreement with the *ARC*," said Dr. Hummer. "Member blood banks of the *AABB* are located in all 50 states and the District of Columbia. There is no question that the cooperative program will be beneficial to thousands of donors and patients, and we are confident that many more advantages will accrue as we continue to plan and confer together."

The purpose of the reciprocity agreement is to make possible the exchange of blood and blood donor replacement credits between *AABB* banks and *ARC* regional centers on a national basis as a service and special convenience for patients and donors who do not live in the same community.

For the most part, reciprocity exchanges are a matter of paperwork. Debits and credits posted to the accounts of regional centers and blood banks are coordinated through the *ARC* Central Exchange in Washington, DC and the *AABB* National Clearinghouse Office in San Francisco, and actual blood shipments are made at the end of the month in settlement of any imbalances.

The reciprocity system makes possible also more efficient utilization of perishable blood supplies by enabling the transfer of blood surplus from one bank or center to fill blood shortages in another.

During the six years the original agreement was

able capacity. Another 1,289 hospitals had occupancy rates of between 80 and 90 per cent, "substantially above the national average."

"Any hospital experiencing an average annual occupancy rate of 90 per cent or more exceeds the safe limit," he said.

* * * * *

The *AMA* and the Missouri State Medical Association argued against an *Internal Revenue Service* proposal to tax the advertising revenues of publications of non-profit associations.

Representatives of other affected, non-medical organizations also opposed the proposed tax at an *IRS* hearing.

Bernard D. Hirsh, director of the *AMA's* Law Division, pointed out that the pertinent law on unrelated income had been on the books for 17 years without any such tax being proposed by the government.

"The proposed regulations go beyond the law, first in arbitrarily classifying all advertising contained in trade and professional journals as unrelated, and secondly, in treating income derived from this source as if it were income from a business capable of separate existence," Hirsh said.

Hector W. Benoit, Jr., MD, *MSMA* President, noted that one of the states purposes of the proposal was to eliminate alleged unfair competition in advertising between non-profit association journals and profit magazines.

"If you have the stomach to read many of these advertisements (in Missouri Medicine), you will find they are directed purely to a professional audience and would be unlikely to enhance the public appeal to such lay publications as Atlantic Monthly, Look, etc. . . .," Dr. Benoit said.

He also noted that medical societies furnish many voluntary services for their communities, as well as provide physicians with much of their latest information on medical advances.

"Without the help of the advertising income from these publications and the income of exhibitors at these medical meetings, many of these sources of educational information would be severely restricted, even indeed in many instances, be eliminated entirely," he said.

Manufacturers of ethical pharmaceuticals since 1856

in effect, more than 600,000 replacement credits and units of blood have been exchanged between the two organizations.

In the United States, over 5,000,000 units of blood are transfused annually, and a steady increase is expected as newer medical and surgical techniques are developed. The majority of these blood needs are collected and processed by the 56 blood centers serving 1,700 chapters of the American National Red Cross and the more than 1,000 hospital and community blood banks belonging to the American Association of Blood Banks.

Members of the negotiating committees were: Mr. Frederic S. Laise, T. J. Greenwalt, MD, Allan S. Chrisman, MD, and Mr. Jack Henry, Washington, DC, representing the *ARC*, and Rosser L. Mainwaring, MD, Detroit, Michigan, O. B. Hunter, Jr. MD Washington, DC, and Mrs. Bernice M. Hemphill, San Francisco, California, representing the *AABB*.

Oral Contraceptives and Their Effects on Metabolism

How do oral contraceptives affect the metabolism of young, middleaged, and older women?

The National Institutes of Health announced today that Victor Wynn, MD., Head of the Alexander Simpson Laboratory for Metabolic Research at St. Mary's Hospital Medical School, University of London, England, has been awarded a $43,120 contract by the National Institute of Child Health and Human Development in Bethesda, Maryland to study the metabolic processes of women who take oral contraceptives.

Dr. Wynn will investigate the effects of oral contraceptives on carbohydrate, intermediary, and lipid metabolism to see whether changes produced are detrimental to the health of the women taking these drugs.

Preliminary studies by Dr. Wynn have indicated impaired carbohydrate metabolism—with symptoms suggestive of diabetes—in some women taking oral contraceptives. He has also found changes in lipid (fatty substance) metabolism and distribution which might be linked to atherosclerosis.

Although direct relations between metabolic problems and oral contraceptives have not been established, preliminary evidence indicates a need for a careful study of this relationship.

Under the terms of this contract, Dr. Wynn will begin a series of metabolic studies designed to follow a group of women over a long period of time to determine the effects of these drugs. He will study metabolism of women before taking the drugs, and during administration of the drugs. In addition, older women will be studied to determine effects of oral contraceptives on metabolism before and after menopause

About 1,000 women will take part in this study—500 women in the test group and 500 women using other contraceptive methods to serve as a normal comparison group. The women will be recruited from those being cared for by private practitioners and family planning clinics.

In addition to the general studies of metabolism, Dr. Wynn will conduct more detailed biochemical studies of some of the intermediate chemical reactions in metabolism (intermediary metabolism) to identify specific mechanisms of action of these drugs. As part of this detailed investigation, he will study several small groups of women with different metabolic problems. These will include women with diabetes, Cushing's disease, obesity, and those receiving hormone therapy for other problems. About 300 women will take part in this aspect of the study.

VALIUM® (diazepam) Roche®

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Infants, patients with history of convulsive disorders, glaucoma or known hypersensitivity to drug.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly or debilitated patients (not more than 1 mg, one or two times daily initially) to preclude ataxia or oversedation, increasing gradually as needed or tolerated. As is true of all CNS-acting drugs, until correct maintenance dosage is established, advise patients against possibly hazardous procedures requiring complete mental alertness or physical coordination. Driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. If such combination therapy is used, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), such as phenothiazines, barbiturates, MAO inhibitors and other antidepressants. Advise patients against simultaneous ingestion of alcohol or other CNS depressants. Safe use in pregnancy not established. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, acute hyperexcited states, hallucinations); changes in EEG patterns during and after drug treatment. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms (convulsions, tremor, abdominal and muscle cramps, vomiting, sweating) similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage—*Adults:* Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. *Geriatric patients:* 1 or 2 mg/day initially, increase gradually as needed and tolerated. (See Precautions)

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 and 500.

YOUR INSPECTION INVITED • BROCHURE ON REQUEST

OPENS ASTHMATIC AIRWAYS—

AND HELPS KEEP THEM OPEN

Each Numa Dura-Tab provides:

theophylline	225 mg.
ephedrine HCl	50 mg.
butabarbital	25 mg.

(Warning: butabarbital may be habit-forming.)

Numa Dura-Tabs provide *prolonged* three-way action to ease breathing. Theophylline, a potent bronchodilator with minimal effect on the CNS, opens air passages and reduces bronchial spasm. Ephedrine HCl improves breathing capacity through its decongestant action. Butabarbital, a mild sedative, allays fear and apprehension.

Dosage: One Numa Dura-Tab every 8 to 12 hours helps keep the asthmatic patient symptom-free all day/all night.

Precautions: Use with caution in cardiovascular or hyperthyroid disease, severe hypertension, circulatory collapse, prostatic hypertrophy, or glaucoma.

controls diarrhea

In six published studies[1-6] detailed results are given on the use of Lomotil in 111 patients with chronic ulcerative colitis. They show that Lomotil gave satisfactory to "excellent" control of diarrhea in more than two-thirds of these patients. As the disorder advances and destroys bowel musculature, the motility-lowering action of Lomotil, understandably, has less effect.

The successful use of Lomotil in a disorder as exceedingly difficult to treat as moderate ulcerative colitis emphasizes again its unsurpassed antidiarrheal effectiveness in these more common conditions:

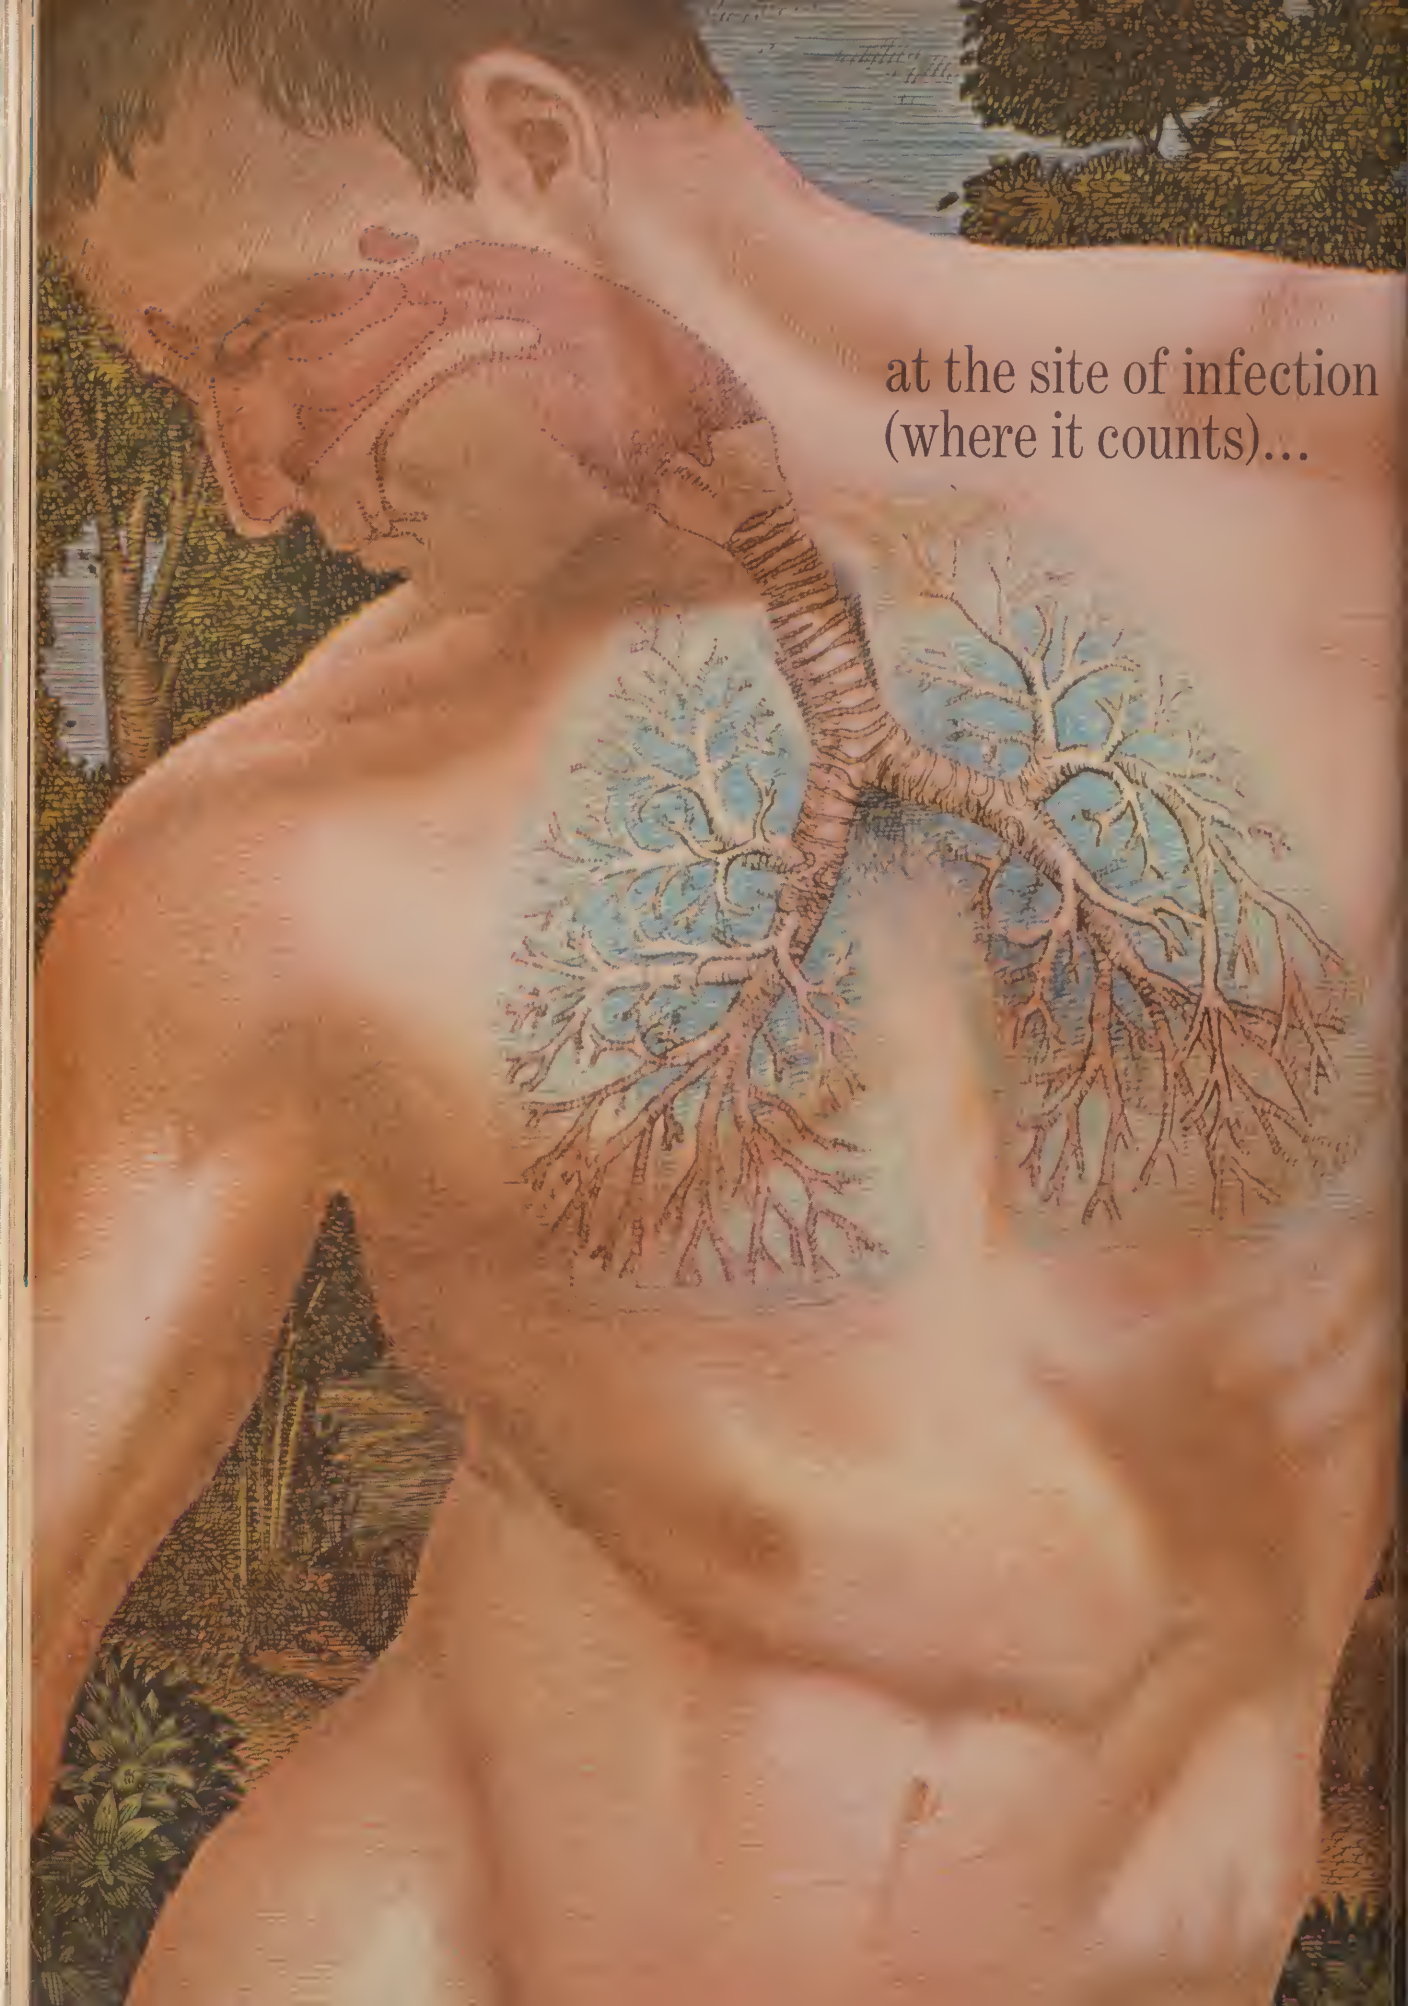
- **Gastroenteritis**
- **Acute infections**
- **Spastic colon**
- **Drug induced diarrhea**
- **Functional hypermotility**

For correct therapeutic effect
Rx correct therapeutic dosage

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are:

Children: Total Daily Dosage

3-6 mo. . . ½ tsp.*t.i.d. (3 mg.)
6-12 mo. . ½ tsp. q.i.d. (4 mg.)
1-2 yr. . . . ½ tsp. 5 times daily (5 mg.)
2-5 yr. . . . 1 tsp. t.i.d. (6 mg.)
5-8 yr. . . . 1 tsp. q.i.d. (8 mg.)
8-12 yr. . . 1 tsp. 5 times daily (10 mg.)
Adults: 2 tsp. 5 times daily (20 mg.) or 2 tablets q.i.d.



*Based on 4 cc. per teaspoonful.
Maintenance dosage may be as low as one-fourth the initial daily dosage.

Precautions: Lomotil is a federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded, and medication should be kept out of reach of children. Should accidental overdosage occur signs may include severe respiratory depression, flushing, lethargy or coma, hypotonic reflexes, nystagmus, pinpoint pupils and tachycardia. Lomotil should be used with caution in patients with impaired liver function or those taking addicting drugs or barbiturates.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of the extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

SEARLE *Research in the Service of Medicine*

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

Now available:
New! Ready-mixed Ilosone Liquid 125! (Contains erythromycin estolate equivalent to 125 mg. erythromycin base per 5-cc. teaspoonful.)

700970

Ilosone® Lilly
Erythromycin Estolate

(See next page for prescribing information.)

Ilosone®/the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have also been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Adverse Reactions: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have developed in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly, usually within forty-eight hours, if the drug is readministered to sensitive patients. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appea be definitely related to use of the drug, laboratory findings characterized by increased direct-reacting bilirubin, el alkaline phosphatase levels, negative or weakly positive ce flocculation and thymol turbidity tests, elevated serum glu oxalacetic transaminase levels, peripheral eosinophilia, an mal cholecystograms.

Individual idiosyncrasy seems evident since jaundice h been reported in other patients taking prolonged courses medication. Patients with chronic infection have been give to 2 Gm. of the drug daily for periods of two to six month patients with rheumatic fever have taken prophylactic do 0.5 Gm. daily for two years without difficulty. In one gr 144 patients who received the drug daily for two years, no dice was noted. It was of interest that members of six of patients' families, who were not taking the drug, had ep of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels determined in a group of fifty-four adults and children wh 250 mg. of Ilosone daily for an average of sixteen mon rheumatic fever prophylaxis. The results were compare those of a similar group of forty-four patients who receive icillin. There were no cases of jaundice in either group. Ele of SGPT and serum alkaline phosphatase levels during the of treatment was observed in one patient treated with I and in two patients treated with penicillin. Seven other pa in the group receiving Ilosone and four others in the pen group showed elevations in one of the tests at some time d administration of the drugs.

Very satisfactory therapeutic results, without toxicity, reported in 102 pediatric patients who received short-term day) courses of Ilosone in the treatment of streptococcus tions. Results of liver function tests in these patients comparable to those in a similar control group who had re penicillin.

Gastro-intestinal disturbances not associated with hepa fects are observed in a small proportion of individuals as a of a local stimulating effect of the medication on the alime tract; however, the normal intestinal gram-negative bac flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with th of erythromycin, there have been occasional reports of urti skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally

Ilosone Pulvules®, Ilosone Liquid 125, Ilosone, 125, for Suspension, Ilosone Drops, Ilosone Chewable Tablets.

For infants and for children under twenty-five pounds o weight, the usual dosage is 5 mg. per pound every six hour children twenty-five to fifty pounds, 125 mg. every six h (Tablets Ilosone Chewable should be chewed or crushed swallowed with water.)

For adults and for children over fifty pounds, the usual d of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythro therapy should be considered.

In the treatment of syphilis, the recommended total dos 20 to 30 Gm. given in divided doses for a period of ten to fi days. Close follow-up of the patient is necessary since ery mycin drugs have not had adequate evaluation in all stag syphilis. Examinations of spinal fluid are recommended a of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four day recommended. In the treatment of gonorrhea, patients w suspected lesion of syphilis should have a dark-field examin before receiving antibiotics, and monthly serologic tests s be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 25 (equivalent to base), in bottles of 24 and 100.

Ilosone Liquid 125, Oral Suspension, U.S.P., 125 mg. (equiv to base) per 5-cc. teaspoonful, in 60-cc. and pint-size pack

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equiv to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size packs

Ilosone Drops, 5 mg. (equivalent to base) per drop, in 10-cc packages, with dropper calibrated at 25 and 50 mg.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to b in bottles of 50. [0

V-Cillin K® Lilly 700867

Potassium Phenoxymethyl Penicillin

(See next page for prescribing informatic

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Warnings: In rare instances, the use of penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin and in those with bronchial asthma or other allergies. Resuscitative drugs should be readily available for emergency administration. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for relief of immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with parenteral dosage schedules, frequent evaluation of the renal hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory stu (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrowt pencillin-insensitive organisms. In such cases, its administration sh be discontinued, and appropriate measures should be taken.

Adverse Reactions: Although serious allergic reactions are much common with administration of oral penicillin than with intramus forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it does possess a sig cant index of sensitization. The following hypersensitivity react associated with the use of penicillin have been reported: skin ra ranging from maculopapular eruptions to exfoliative dermatitis; caria; and reactions resembling serum sickness, including chills, fe edema, arthralgia, and prostration. Severe and often fatal anaphy has occurred (see Warnings). Hemolytic anemia, leukopenia, th bocytopenia, and nephropathy are rarely observed side-effects are usually associated with high parenteral dosage.

Administration and Dosage: For Tablets V-Cillin K and for V-Cill Pediatric, the usual dosage ranges from 125 mg. (200,000 units) t times a day to 500 mg. (800,000 units) every four hours. For infe the daily dosage may be 50 mg. per Kg. of body weight divided three doses.

Beta-hemolytic streptococcus infections without associated teremia may be treated with 200,000 to 400,0000 units three time day. Therapy should be continued for a minimum of ten days to pre development of rheumatic fever and/or other serious complicati Dosage for routine streptococcus prophylaxis in patients with a his of rheumatic fever or congenital heart disease may be 200,000 u once or twice daily. When such patients undergo tonsillectomy, t extraction, or other minor surgery, the prophylactic dose should 500,000 units every six hours given two days prior to surgery and two days postoperatively. If oral medication is not feasible on the of surgery, parenteral therapy should be considered. Mild to mo ately severe pneumococcus pneumonia has been treated effecti with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be g every six to eight hours in conjunction with indicated surgical pr dures.

For gonorrhea in males, 500 mg. (800,000 units) every four hours three doses may be employed; in females, 500 mg. every four h for six doses are recommended. Refractory infections generally resp to a second treatment three to four days following completion of first. Treatment of gonorrhea with severe complications should individualized, with prolonged and intensive treatment. Patients wi suspected lesion of syphilis should have a dark-field examination fore receiving penicillin and monthly serologic tests for a minimu three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units) bottles of 50 and 100; and 250 mg. (400,0000 units) and 500 (800,000 units), in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) 5 cc. of solution, in 40, 80, and 150-cc.-size packages. [032

CONGENITAL ABSENCE OF THE GALLBLADDER AND CYSTIC DUCT CASE REPORT

SAMUEL R. PINES, MD FACS
and
MAURICE FELDMAN. Jr., MD

During daily surgical practice, one frequently encounters congenital anomalies which are described in the medical texts. But the occurrence of a rather rare anomaly in an adult causes one to inquire from his fellow physicians, review the literature, ponder the facts, and then report the unusual finding. A recent case of congenital absence of the gallbladder and cystic duct in an adult was noted and is described with the hope that this experience may be instructive to all physicians, especially those performing surgery.

Case Report

This 59 year old white female was admitted 21, Feb. 1965, to the South Baltimore General Hospital for an elective cholecystectomy. Approximately two months prior to admission, the patient was seen by her physician (M.F.) because of an episode of right subcostal pain. There was no history of previous surgery, no intolerance to any specific foods, jaundice was never noted, and a complete medical review was normal except for moderate obesity. The hemogram, liver function tests, and an intravenous pyelogram were all entirely normal. Two separate gallbladder visualization and function roentgen studies repeated twice with double doses of Telepaque did not outline the gallbladder and were reported as a "non-functioning gallbladder in the absence of liver disease."

Following this, the patient underwent a laparotomy for the proposed cholecystectomy and, unfortunately, without prior positioning of a cassette holder. After entering the peritoneal cavity via a right subcostal incision, a thorough search of the right upper quadrant revealed no evidence of the gallbladder. Instead, a small fibrous cord-like structure about 1.5 cm. long and 0.3 cm. diameter led from the area of the quadrate lobe of liver directly to the second portion of the duodenum. During the exploration, the duodenum was inadvertently opened at the junction of the cord-like structure and this opening was utilized to explore the duodenum. The rent was closed later. Further dissection in the proximal area of the duodenum and stomach revealed no evidence of any gross abnormalities of these structures. Dissection of the porta hepatis area outlined a normal right and left hepatic duct forming a normal common hepatic duct, a normal hepatic artery and portal vein. The common hepatic duct was about 0.8 cm. diameter, thin walled, and was not attached to any other structure but led directly and entered independently into the first portion of the duodenum. No stones were palpable and needle aspiration of the hepatic duct revealed clear, yellow, golden bile. This could also be ascertained by milking distally the common hepatic duct and noting the clear, yellow bile via the rent in the duodenum. Because of the benign clinical history, absence of

jaundice, and the normal extrahepatic biliary ducts, no effort was made to implant a tube in the common hepatic ducts. Instead, the decision was made to schedule an intravenous choledochogram at a later date. The abdominal wall was closed in layers.

The postoperative course was uneventful but the intravenous choledochogram unfortunately failed to visualize the biliary ducts. The patient was discharged from the hospital and has remained asymptomatic.

Embryology

According to Arey[1] and Gross[2] from the foregut of the 3 mm. embryo just distal to the stomach, the floor of the future duodenum gives rise to a sacculation or hepatic diverticulum which is hollow. This enlarges to form (a) a cephalad portion of glandular tissue which will become the liver and hepatic bile ducts and (b) a caudal portion which becomes the gallbladder and cystic ducts. This latter outpouching, originally hollow, undergoes changes so that it becomes a solid cord structure at age of 5 mm. embryo. As the embryo enlarges to about 7 mm., the solid cord structure develops a lumen which forms the gallbladder and cystic duct. Bile secretion is noted in the 3 month old fetus. Thus the development of the gallbladder and cystic duct is related but separate from the liver and hepatic ductal system.

Incidence

The congenital absence of a gallbladder and cystic duct is an extremely rare condition. Monroe[3] in 1959 performed an extensive survey of autopsy material and collected 181 cases in 1,352,000 autopsies (or about 1:7500), with a large percentage occurring in the newborn—many associated with other congenital abnormalities. In the newborn the occurrence of this anomaly in either sex occurred equally but in the adult, the anomaly was noted twice as frequently in the female. Gross[2] in 1936, reviewed 38 cases of this condition and in 1942, Finney and Owen[4] presented 2 of their own cases, reviewed the literature and totaled 46 cases of this abnormality in adults. Since then a number of authors[5-22] have reported approximately 26 new cases noted clinically, plus this reported case, bringing the total to 73 cinical reported cases. In the same review[5-22] 14 new cases were noted at autopsy and this resulted in a total of 195 autopsy cases. There probably are many others who have noted this abnormality but who unfortunately have not reported this in the literature.

Discussion

The problems associated with the congenital absence of the gallbladder and cystic duct are numerous and varied. A correct preoperative diagnosis is virtually impossible at present. Though this is a rare finding in the adult, clinical symptoms may tend to direct the physician to perform X-ray studies of the gallbladder. In all reported clinical cases, the radiologist reported a nonvisualization of the gallbladder which was interpreted to be pathognomatic of gallbladder disease if no associated liver disease was present.

At the time of surgical exploration, one must make certain to exclude abnormalities of the pancreas, stomach, duodenum and common hepatic bile duct. A patient who has a history or evidence of clinical jaundice, or shows any evidence of abnormality of the bile duct in size wall thickness or bile contained in the lumen, should have a thorough exploration of the main bile channel. This may include a needle choledochogram at time of surgery or insertion of a catheter or T-tube to be performed at time of surgery or at a later date. The procedure of using an endoscope may also be employed at time of surgery.

In this case, the absence of definite clinical symptoms and the grossly normal common hepatic duct did not warrant or justify further duct exploration—other than needle injection which I was not able to perform since no cassette holder had been positioned prior to surgery.

In reviewing the reported cases, approximately half had some abnormality of the common hepatic duct and in these, biliary calculi were found. Intriguingly, even though the gallbladder was absent, many of the reported cases had no compensatory dilatation or enlargement of the common hepatic duct. In discussions involving biliary surgery, one frequently hears that the common duct compensates by enlarging and dilating following the surgical removal of an abnormal gallbladder.

The findings of many, in which there is a congenital absence of the gallbladder and cystic duct with a normal calibre hepatic duct tend to minimize the idea of compensatory dilatation—unless there remains unrecognized pathology.

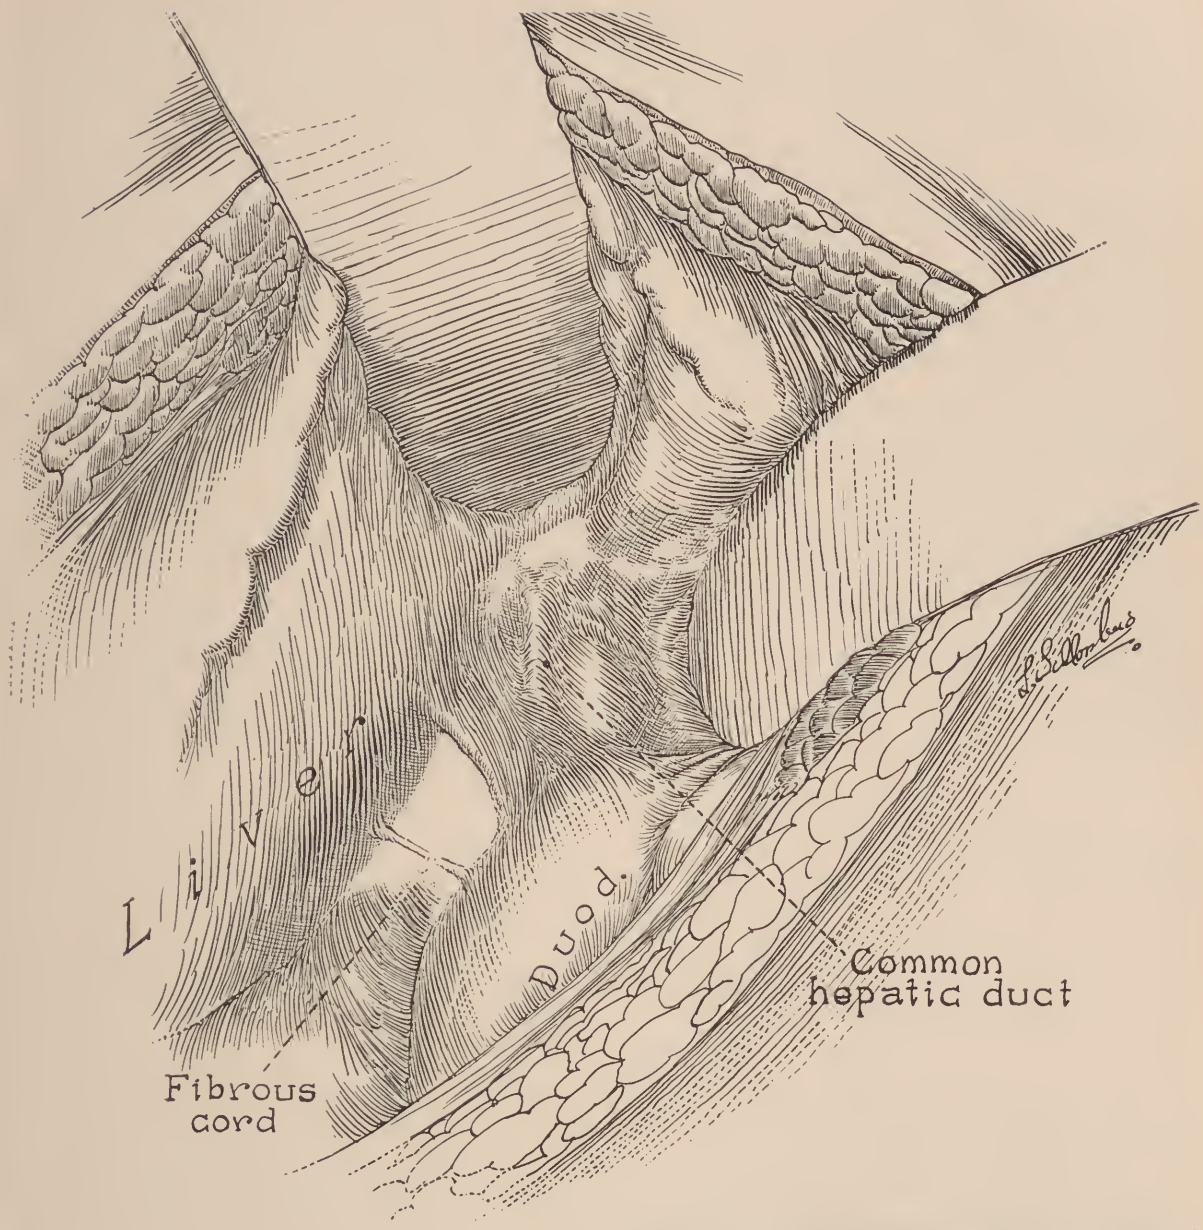

Illustration demonstrating operative findings of absence of gallbladder and cystic duct; fibrous cord from liver to duodenum; normal hepatic bile ducts.

Thus, when the gallbladder is absent, an abnormal common hepatic duct also warrants ductal exploration.

Summary

In the present era of space medicine, of computer diagnosis, of electronic monitoring and nursing, of vital organ replacement, the congenital absence of a gallgladder and cystic duct in an adult does not seem a major significance. Unfortunately, possibly because of the rarity of this condition, all reported cases were diagnosed only by laparotomy. Many cases may have abnormal common ducts which require further exploration, but if one is certain of the presence of the normal extrahepatic ducts no further academic investigation is required for the remaining ductal system may be unnecessarily traumatized.

This case is presented as a reminder to all

physicians that a radiological report of a "non-visualization of the gallbladder" may also infer the absence of a gallbladder and this abnormality may plague them also.

SCIENTIFIC EXHIBIT AWARD

MEDICAL AND CHIRURGICAL FACULTY ANNUAL MEETING

APRIL 17, 18, 19, 1968

The Alcazar, Baltimore

The Medical and Chirurgical Faculty, in cooperation with Mead Johnson Laboratories, will again present an AESCULAPIUS AWARD for the outstanding scientific exhibit displayed at the 1968 Annual Meeting. This award is designed to recognize and reward excellence in concept, originality, and execution of a scientific exhibit.

A committee of the Medical Society will be the judges and the winner will be presented with a certificate, suitably inscribed with the title of the exhibit and the author's name. A prize of $200.00, donated by Mead Johnson Laboratories, will be presented to the winner during the convention.

All scientific exhibits accepted for showing at the 1968 Annual Meeting of the Faculty will be eligible for judging. Physicians interested in submitting exhibits should make application to the Chairman, Committee on Program and Arrangements, Medical and Chirurgical Faculty, 1211 Cathedral Street, Baltimore, Maryland 21201.

THE COUNTY MENTAL HEALTH CENTER AND ITS ROLE IN COMMUNITY PSYCHIATRY

ALI MANIZADE, MD Director
Prince George's County
Psychiatric Day Center
Cheverly, Maryland

Great strides in the treatment of mental illness have been made during the past decade. Before that time, most mental hospital patients could expect to spend the rest of their lives in the confines of an institution. With the introduction and widespread use of the phenothiazines (Mellaril) and antidepressants, which restored many of these patients to a useful life in society, also came a new wave of hope. Mental hospitals became active treatment facilities rather than custodial institutions, with intensive treatment serving as a means of effecting short-term hospitalization. More striking has been the development of outpatient treatment as a means of forestalling hospitalization of patients, even those with major mental disorders.

A major step in this direction was the establishment of community mental health centers encompassing a range of services needed to combat mental illness. These centers have helped to break down the barriers between the hospital and the outside community through the use of transitional facilities as well as consultative and emergency services.

There are several county mental health centers in Maryland, such as Ann Arundel County Mental Health Center located on its grounds of the Crownsville State Hospital, Baltimore County psychiatric Day Center at Sparrows Point, Maryland and Prince George's County Mental Health Center presently being developed at Cheverly, Maryland. These are prime examples of efforts to develop community mental health centers designed to serve the psychiatric needs of the residents of the county. Circumstances may affect the nature of their design, but in their most complete form, they provide comprehensive care and continuity of treatment for the mentally ill through all stages of the disease, thus assuring each patient the type of care best suited for his condition. The following guidelines express the philosophy of such centers:

(1) The mentally ill, like those suffering from any other kind of illness, need a complete range of services;
(2) Any person eligible for service within any one element of the center is also eligible for treatment within any other;
(3) Transfer of patients among the various elements of the center can be effected without delay when indicated by clinical needs, eg, a patient in the day or night hospital can be admitted as an inpatient, or vice versa;
(4) The information obtained within one element is made available to those responsible for that patient's treatment within any other element.

The services through which these goals are achieved include:

Inpatient Service

This is designed to provide intensive treatment for patients requiring full-time hospitalization. Some patients, especially the agitated and violent or the suicidal and depressed, are admitted directly from the community while others are transferred from the day hospital or the outpatient service. The treatment program embraces psychotherapy, electroconvulsive therapy, occupational and recreational therapy as well as chemotherapy. Patient participation in hospital activities is encouraged and special emphasis is placed on the prevention of aimless loitering in the dormitories.

Partial Hospitalization Service

The partial hospitalization service consists of two separate facilities, a day hospital and a night hospital, each with a specific function.

The Day Hospital accepts patients referred by family physicians, private practice psychiatrists or one of the other elements of the Center, eg, the consultation service. Patients come from their homes in the morning, spend the day participating in group and individual activities and therapy, and return in the evening to spend the night with their families.

Admission to the day hospital avoids the stigma often associated with mental hospitalization, since the patient remains in his home environment. Involving the entire family in the treatment program prevents the abdication of responsibility which too often results in total abandonment of the patient. The day hospital has also fostered better understanding and acceptance of the mentally ill within the community by demonstrating that such people can be treated successfully on an outpatient basis.

All treatment modalities are available to patients on the partial hospitalization service, including group psychotherapy, chemotherapy and a therapeutic milieu. While each is important and indispensable, it is pertinent to note that drugs have made possible the entire concept of partial hospitalization by enabling patients to carry on many of their everyday activities while undergoing psychiatric treatment.

The Night Hospital is designed for patients who find the one-step transition from full-time hospitalization to full-time community living too burdensome. In this facility, patients go to work during the daytime, but return to the hospital in the evening for night programs and treatment activities. They sleep in the hospital and return to their jobs the next day. This continues until a patient improves sufficiently to be returned to the community. The success of the night hospital program is reflected in the reduced number of relapses and the prevention of many of the re-admissions that used to occur soon after discharge.

Emergency Service

The emergency service team consists of a psychiatrist, social worker and registered nurse, one or all of whom make home visits to those disturbed individuals who refuse to go to the Mental Health Center or to their family physician. One of their prime functions is to enlist the cooperation and help of the family to complement the available resources for total treatment. The emergency team also makes follow-up visits on patients who drop out of other treatment programs.

Consultation Service

This is perhaps the most important service available to the general practitioners, clergymen and welfare agencies of the County. Patients referred by them can be admitted to any of the elements of the center. After treatment these patients are returned to the care of the family physician. Clergymen, especially, are encouraged to refer cases for evaluation and treatment since it has been found that almost half of the mentally disturbed patients first go to their clergyman for help.

Outpatient Service

The outpatient service provides follow-up care to patients discharged from the inpatient or partial hospitalization services. Clinics are conducted regularly in several locations within the county, where patients receive both psychotherapy and chemotherapy. Appointments are scheduled at one-to-four week intervals, depending on the needs of the individual. Patients missing their appointments are contacted by one of the staff members or by emergency service personnel.

Treatment

Recognizing the importance of environment as an indispensable element of treatment, the milieu has been designed to enhance other treatment modalities on both the full-and part-time hospitalization services. Cheerful surroundings and staff empathy promote a healthy attitude while adequate recreational facilities combat boredom. Group psychotherapy and occupational therapy are additional methods employed in an effort to promote rapid rehabilitation and to prevent regression.

Psychotropic drugs play an important role in the management of patients at the center. The type of drug used, as well as its dosage, varies with the condition of the patient and with his hospital status.

In depressed patients, good results have been obtained with imipramine (Tofranil). Treatment is started with 25 mg. 3 times a day, then dosage is adjusted as needed. The phenothiazines have

been our most dependable agents for the treatment of both neurotics and psychotics. Experience with many of these has demonstrated the superiority of thioridazine (Mellaril) which we have found to be highly effective and, most important, well-tolerated.

Treatment with thioridazine is started with 25 to 50 mg. two or three times daily, depending on the severity of presenting symptoms. Thereafter, dosage is increased gradually until maximum benefit is obtained. This method obviates drowsiness, an especially important consideration for patient in the day hospital. The absence of extrapyramidal symptoms with thioridazine, even with doses as large as 300 mg. per day, has been noteworthy, and represents a major contribution to more effective management of the mentally ill.

One of the most important points we have learned about the psychotropic drugs is that they must be taken regularly to maintain optimum benefit. Questioning of outpatients not benefitting from the drug usually elicits the information that they take a pill only when they feel "ill" with the expectation that this will yield immediate relief from their problems—somewhat like the effect of an aspirin tablet for headache. Such a view is naive and inimical to their best interests, which are best served by taking their medication daily and without fail. This requires constant repetition and the wholehearted support of the family, for the rewards of maintenance are too striking to be thwarted by lack of cooperation.

Regression and relapse after initial improvement are also related to deviation from patterns of treatment, notably to inadequate dosage. Many of the patients referred to us are taking psychotropic drugs prescribed by their family physician, though apparently without the desired benefit. In many instances, we find that simply increasing dosage produces rapid amelioration of symptoms.

Uncertainty in using drugs such as the phenothiazines is unwarranted, for adequate doses of these drugs are not only well tolerated by disturbed patients, but are also absolutely essential to their welfare. The extensive use of these agents during the past decade has resulted in the accumulation of a wealth of experience providing a useful perspective between wanted and unwanted effects. The latter have been so well identified as to make rationalization in the use of these compounds self-defeating. The family physician is especially well-qualified to prescribe them to greater advantage for he enjoys the confidence of patient and family. A regimen of gradually increasing dosage enhances toleration, a factor which is reassuring to both patient and physician.

This has been especially evident in the use of thioridazine in a starting dose of 25 mg. two to three times daily. This is increased by similar progressive increments until the symptoms are brought under control. Dosage so attained should be continued for several months. Gradual reduction in dosage may then be attempted, but if symptoms recur, dosage should be restored immediately to the previous levels. It is far better to maintain proper therapy in adequate dosage than to risk relapses which make for increased difficulties in management. If digitalis (Digitora) is essential for the patient with heart failure or insulin (Iletin) for the diabetic, then the psychoactive drug is likewise necessary and desirable for the patient with a mental disorder.

A tendency to reduce dosage after the patient is discharged from a mental hospital is to be decried. The patient has been stabilized on a maintenance dose considered optimum and unwarranted reduction may nullify the benefits obtained. In fact, the re-adjustment to living in the community can be a period of heightened stress requiring more, rather than less, drug.

The family physician occupies a strategic role in which he can complement and enhance the worth of the treatment programs instituted by the Center. Proper diagnosis and early use of the appropriate psychotropic drug in therapeutic doses may suffice to maintain the patient in the community and prevent progression of the illness and possible hospitalization. On the other hand, recognition that such therapy can maintain the improved status of the discharged patient will serve to keep that individual within the community, and conceivably, as a useful member.

Summary

The county mental health center, through its several elements, provides a wide range of psychiatric services to county residents. Its facilities and treatment methods aim toward maintaining the mentally ill patient as a useful member of society, an endeavor which non-psychiatrics can complement through proper recognition of the role and use of psychotropic drugs.

ABNORMAL UTERINE BLEEDING

H. MELVIN RADMAN, MD
Baltimore, Maryland

The presence of irregular uterine bleeding, exclusive of pregnancy, without pain or a palpable tumor remains a persistent problem in women of every age group. In an attempt to arrive at some of the causes of dysfunctional bleeding, investigation has proceded along the lines of endocrine imbalance, iron deficiency anemia, blood dyscrasia, and the detection of unsuspected malignancy.[3,5-8,10]

For many years the necessity for operative removal of the uterus which macroscopically or microscopically showed no evidence of disease has been the concern of the gynecologist. Where preservation of the childbearing function is important, the problem is greater. The reluctance to perform a hysterectomy under the latter circumstances is understandable. Such enigmatic considerations as the frequency of curettage, the time interval and numbers, as well as the use of steroid therapy before or in lieu of a radical procedure remain unanswered. It is apparent that endocrine imbalance plays an important role in abnormal uterine bleeding. Any discussion in relation to this symptom complex must necessarily include factors that involve the glands of internal secretion. However an elaborate appraisal of this topic is not pertinent to this study at this time.

Dysfunctional uterine bleeding may be defined as that which occurs without demonstrable organic lesion. Other terms are functional bleeding and metropathia hemorrhagica. The complexity of the problem is such that it is often difficult to determine whether this abnormality should be considered as a distinct entity or a symptom of a yet undertermined disease process.

Profuse, prolonged or irregular uterine bleeding may be the first sign of an associated deficiency in the blood clotting mechanism.[8] Iron deficiency anemia may develop because of excessive blood loss and in turn may be productive of more intense menorrhagia. Other systemic causes may be hypertension, cardiovascular disease and hypo- and hyperparathyroidism.[3] Psychic shock or emotional upset is known to have produced irregular or profuse bleeding.[4] Whenever bleeding occurs in women of the childbearing age, it may be secondary to retained products of conception, abortion, or ectopic pregnancy. Although tumor masses or uterine distortion may not be present, maligancy of the cervix, endometrium, tube, or ovary should be eliminated as causative factors.

Dysfunctional bleeding is not uncommon. In a representative study, 5% of gynecologic hospital admissions fell into that classification.[3] While it may be seen at any age, the highest incidence appears in premenopausal women. Ever since the modern concept of menstruation has been advanced, it has been defined as a regular, bloody, uterine discharge associated with the histologic picture of endometrium in the secretory phase. Abnormal bleeding, on the other hand, is often associated with endometrial growth patterns which show lack of progesterone effect. However, numerous studies have demonstrated that there is no single endometrical pattern nor is there any limit to the varieties or relationship to blood loss, duration, or frequency. The study of the endometrium in patients of all age groups where there is abnormal bleeding, is emphasized. In addition to the discovery of heretofore unsuspected organic conditions, it is essential if hormone therapy is contemplated.

Usually menstrual periods begin at the age of 14 to 15. The physiologic variations are such that the interval may be every 21, 28, or 30 to 35 days. What then is to be considered abnormal? Kistner's classification is logical and understandable:[3]

1. Normal bleeding at less than usual intervals.

   Menses that appear at less than an 18 day interval merit investigation.

2. Normal bleeding at more than the usual intervals.

   When the intervals are more than 45 days, a study is indicated.

3. Prolonged or profuse bleeding at nor-

The author wishes to thank G. D. Searle and Company for the supply of medications used in this study, and for the opportunity to conduct the project. Appreciation is also expressed to Derek Calderwood, MD, for his critical review of the manuscript and his pertinent suggestions.

mal intervals.

This problem is relative since the profuseness and duration of the period varies with the individual. In this group, even a greater effort should be made to uncover organic pathology.

4. Constant or irregular bleeding

This is the most common type, and is usually found in premenopausal women.

The variety of measures used in the treatment of abnormal bleeding emphasized the complexity of the subject. No single method has been found to be entirely satisfactory. Before any curative steps are taken it is essential to obtain a complete history and thorough physical examination. A hemogram and the obvious laboratory procedures are integral parts of the evaluation. The next step is uterine curettage. Its role in the treatment of abnormal bleeding has been established, and cannot be disputed. It is impossible to explain why there is improvement in 70% of patients treated by this simple operative procedure. Apart from the methods employed specifically for the control of blood loss, general measures should be taken to improve the patient's systemic health. What are the roles of hysterectomy or radiotherapy? Repeated curettage or the administration of hormones are not effective in every instance. Many patients repeat the abnormal bleeding after a short period of time. How long must one wait before another curettage, and how many operations should be done before instituting radical treatment? Those decisions are governed by the nature and extent of the bleeding, the age of the patient, and her desire for future childbearing. Irradiation for benign uterine conditions has fallen into disrepute because its action is primarily on the ovary rather than the endometrium; and because of subsequently associated detrimental possibilities.

The discussion of the use of the progesterone—estrogen product for the control of abnormal uterine bleeding has deliberately been left for this point. The characteristic effects of the combination of those hormones have been well documented by voluminous literature, and have been generally accepted[3,5,6,10,11] The use of those medications for such maladies as dysmenorrhea, premenstrual tension, endometriosis, and the control of ovulation are also well accepted. Briefly, their action is such that they quickly produce endometrial changes identical with those that are found when estrogen and progesterone are given over a long period of time. The result is an endometrial picture which resembles pregnancy and the maintenance of endometrium free from break-through bleeding. Their efficacy in the control of dysfunctional bleeding, therefore, would be apparent.

A number of patients on steroid therapy have been reluctant to continue because of annoying side effects such as nausea, breast fullness, leg cramps, and headaches. A low dosage product that eliminated the disagreeable effects was developed in the hope that the useful action of the drug would be retained.

Clinical Study

For the purpose of this study, in order to demonstrate the effectiveness of the new product in the control of abnormal bleeding, and the elimination of side effects, a double blind study was made. The medication supplied by the manufacturer was labeled SC-11800 (*Metrulen* 2 *mg.*); the other product was (*Enovid* 5 *mg.*). They were packaged alike and similar in appearance so that the administrator was not aware of the identity of the drug until after completion of the project. The chemical constituents of each product are well known.

A group of 26 patients was studied. They were divided into Category A (14 patients) and Category B (12 patients), depending upon which drug they received. Patients in both groups had been studied previously so that all detectable causes of uterine bleeding were eliminated. A curettage was done prior to the treatment, and the endometrium was studied. Secretory endometrium was found in 8 patients of each group, while the proliferative type was present in 6 of Category A and 4 of Category B. The youngest patient was 15 years of age and the oldest, 40 years. In Category A there was 2 in the 15 to 19 age group; 3 in the 20-25; 2 in the 26 to 30; 3 in the 31-35; and 4 in the 36-40. In Category B there was 1 each in the 15 to 19, 20 to 25 and 26 to 30. In the ages between 31 to 35 there were 4, and in the 36 to 40 group there were 5. Of the 26 patients studied, 16 were over 30 years of age. Fig. 1. The age range and distribution coincides with the findings of other investigators. [3,5,10] The experiment continued for 6 months; there were no dropouts because of intolerance to the drug. The medication was given in

cyclic fashion. Break-through bleeding appeared in two that received the experimental product. When the code was broken it was found that the patients in Category A received SC-11800 (*Metrulen* 2 *mg.*) and Category B, (*Enovid* 5 *mg.*).

Of the 26 patients studied, 24 could be said to have had a satisfactory result. The 2 who had break-through bleeding (one aged 40, the other 37) were treated more intensively. However, every measure proved to be ineffectual, and eventually they were subjected to total abdominal hysterectomy. Although the study was conducted with a comparatively small number, some valuable data were obtained. It would appear that under given circumstances cyclic hormone therapy is beneficial. The fact that side effects were minimal in both groups might suggest a certain amount of psychic involvement. Constant medical attention

Fig. 1—DYSFUNCTIONAL BLEEDING ACCORDING TO AGE—GROUPS

was undoubtedly a factor in the satisfactory results which could not be credited to the drug alone.

Discussion

There are two prevalent theories that explain the cause of dysfunctional bleeding:

1. That the underlying element is a hormonal disturbance,[2] and
2. That bleeding is the result of the effect of autonomic drugs on the uterine vasculature.[2]

Many of the decisions in regard to conservative or radical treatment depend upon the condition of the endometrium obtained at curettage. The judicious use of the Novak curet often provides valuable information and frequently expedites a general gynecologic evaluation. However, the final decision should not be made until a thorough curettage is performed.

When surgical intervention becomes necessary from persistent or recurrent dysfunctional bleeding, when non-hyperplastic endometrium is found in women of premenopausal years, repeated curettage is the preferred treatment. In this group, cyclic hormone therapy should also be considered. For those in the menopausal classification, hysterectomy is the choice when curettage fails. Randall[9] and Corscaden *et al*[1] have shown that the choncer of endometrial carcenoma are three times greater im those individuals than in women who have had a normal menopause. Persistent or recurrent dysfunctional bleeding where hyperplasia of the endometrium of cystic glandular hyperplasia is found, makes hysterectomy the procedure of choice, for two reasons:

1. Because the disease recurs persistently, and
2. Because of the precancerous potentialities.

Summary

Some of the pertinent facts in regard to the origin and treatment of dysfunctional bleeding have been presented. In addition, the results of a double blind study that involved two steroid preparations in the control of abnormal uterine bleeding, have been recorded. An analysis of all of the factors readily demonstrates the complexity of the problems and accentuates the necessity to treat patients upon an individual basis rather than in accordance with a set of standards.

PERSONAL AND SOCIAL ADJUSTMENT CHARACTERISTICS OF SOME JUVENILE DIABETICS

LYNN K. OFFUTT
Graduate Student, University of Maryland

Do diabetic children feel that they have been stigmatized or set apart because of their chronic condition? Numerous investigations have sought answers to whether the diabetic child has difficulties concerning his psychodynamic adjustment.

Several studies[1-6] have revealed that there are particular personality patterns which are generally associated with juvenile diabetics. Other studies [7-11] reported that there are no unusual personality characteristics of the juvenile diabetic. The identification and knowledge of what factors influence the diabetic child's adjustment were not consistent in these research studies; thus, an understanding of the problems has been difficult.

In this study, the California Test of Personality (CTP) was administered to a selective juvenile diabetic population (both male and female summer camp members) to determine if their personal and social adjustment status was significantly different from the test norms. Variables within this population (present age, number of siblings, previous camp attendance and duration of diabetes) were also compared to the test norms in an attempt to define what factors may influence the diabetic's adjustment.

Materials and Methods

The subjects were 32 boys and 26 girls ranging in age from 8 to 14 years with an average age of 11.6 years who were attending the two week 1965 Maryland summer camp (Camp Med-Chi) for diabetic children. The purposes of the camp were to provide a camping experience for these children and to promote their diabetic education.

The Elementary Form *AA* of the California Test of Personality was administered (duration: 45 minutes) on Aug. 24, 1965, the second full day the subjects had been at camp. A specific age group (8-14 years) was selected for study because it represented the school grade range for which the norms on the personality test were available. Answers were marked in test booklets and the scoring was objective (yes or no answers). Data on the subjects' intelligence quotients and reading levels were not available for this study. The subjects were arbitrarily grouped according to population variables so as to have nearly equal sample sizes. Three boys omitted answering parts of the test and only the answers given were analyzed. Consequently, there was a variation in the sample number for the boys and for the total population.

The California Test of Personality is divided into two sections: Personal Adjustment and Social Adjustment. Each of these is then subdivided into six components (Table 1) whereby certain important personal and social characteristics are identified. Total Adjustment refers to life adjustment as a balance between personal and social adjustment. Precise definitions of these test components can be obtained in *CTP* Manual.[13] In general, the *CTP* provides normative data which

may represent a gauge for appraising the existence and the seriousness of adjustment problems. The test results are dependent upon the willingness of the subjects to introspect. With a test of this type, some children may be prone to misinterpret the questions because of their limitations in vocabulary and concept development and their inexperience in being objective about non-objective events.

The norms of the *CTP* are expressed in terms of percentile ranks (the percent of scores in a distribution equal to or lower than the score corresponding to the given rank) with the median for the test at the 50th percentile. In this study, the raw scores for each individual were converted, using the *CTP* tables, into percentile ranks for each test component and for the three test totals. Frequency distributions for each test component and for the adjustment totals were obtained for the number of subjects in the population and in each of its variables. The median percentile ranks (MPR) were calculated for the population and its variables and for all test components by summing the percentile ranks for all subjects and then dividing by the number of subjects (Table 2).

The statisticial treatment of the data employed the non-parametric Kolmogrov-Smirnov One-Sample Two-Tailed Test.[14] This is a goodness of fit test which was used since it is applicable for small samples. A summary of the significant levels of deviation from the norms of the *CTP* will be found in (Table 3).

Results and Discussion

Several characteristics appeared to emerge from the results of this study, although, the group in this study is not representative of the total juvenile diabetic population. The Personal Adjustment for this population had few areas which were significantly different when compared to the test norms. The total of the ($P<.05$/MPR of 63) and the girls who had attended camp before ($P<.05$/MPR of 68) were significantly better than the *CTP* norms in their Sense of Personal Worth. The total camp population did not differ significantly from the norms of any of ther personal adjustment components except Sense of Personal Worth ($P<.05$/MPR of 60). All the population variables for Sense of Personal Worth had MPR's above the 50th percentile for both boys and girls. This population, but particularly the girls, seemed to have a positive attitude of acceptance toward their situation and an adequate self-concept. It may be possible that the pattern for Sense of Personal Worth was actually some form of compensation for de-emphasizing the diabetic condition, but this seems unlikely.

The younger boys showed some negative deviations on the component of Sense of Personal Freedom ($P<.05$/MPR of 35) and Feelings of Belonging ($P<.05$/MPR of 34). They appeared to feel restricted and to be less personally involved with people (inadequate feelings of belonging) even though it is indicated that they have a high Sense of Personal Worth (MPR of 60). A possible explanation for these deviations might be that the younger boys have had limited chances to make decisions and were perhaps subjected to over-solicitous parents as suggested by Fischer and Dolger[2]. It was also stated by Knowles *et al* [15] that the diabetic child expressed hostility because of the need for self-assertion.

The social adjustment of this population showed negative statistical differences on many test components. The deviations within the population variables exhibited a trend which may indicate reasons for the population's poor social adjustment. All the boys ($P<.01$/MPR of 25), the boys who had not been to camp before $P<.01$/MPR of 20, and the boys who had diabetes less than three years ($P<.01$/MPR of 17) showed poor adjustment on the test component of Freedom from Anti-social Tendencies. Of the 15 boys who had had diabetes less than three years, nine were younger than 11.6 years and 13 had not been to camp before. All three variables showed a greater number of test components which varied significantly from the test norms. Because of the interrelationship of these three variables, none can be shown to be more significant for these boys.

No similar relationship between test variables was observed for the girls. Only the younger girls ($P<.01$/MPR of 27) and those who had three to six schlings ($P<.05$/MPR of 27) had significant difficulty in Freedom from Anti-social Tendencies. The denial or non-acceptance of diabetes might influence these children's anti-social tendencies since they may be unwilling to admit freely to others the presence of their chronic condition. Knowles *et al*[15] pointed out that at camp these youngsters may successfully experi-

ence achievement that they previously thought impossible (making friends, self-responsibility such as administering insulin injections and being cooperative). In their relationship with their siblings, these youngsters may not understand why their brothers and sisters are not diabetic. Etzwiler and Sines[16] concluded in their investigation that diabetic children have an inadequate understanding and a lack of insightfulness into the fundamental concepts of their diabetic condition.

The total population ($P<.05$/MPR of 38), all the girls ($P<.05$/MPR of 41) and two other population variables deviated significantly in Family Relations. These children's feelings of insecurity or inferiority in their home relations may be due to their family's attitudes of guilt and lack of the acceptance of their condition. Knowles *et al* [15] hypothesized that the possible hereditary factor involved in this condition may cause the parents to have guilt attitudes. However, Etzwiler and Sines[16] showed that parents, in general, had good contact with reality and an absence of neurotic manifestations. It would seem that more experimental study is needed in this area of the diabetic child's family relations.

In Total Adjustment, the total population deviated significantly ($P<.05$/MPR of 40) from the norms. In Total Social Adjustment, significant deviations occurred for the boys who had diabetes less than three years ($P<.05$/MPR of 28) and for the girls who had attended camp before ($P<.05$/MPR of 42). The poorer social adjustment of these girls may be due to chance clumping of the data (all percentile ranks between 20 and 60%). Because of the relatively high MPR's, one may question whether this statistical result is indicative of the true nature of the population variable. This may also be true of some other variables within the test. By chance alone, one would expect some erroneous results. The total population and particularly the boys in several of the variables appeared to have difficulty in adjusting to school and community life. The total of the girls ($P<.05$/MPR of 42) also showed significantly low adjustment in school. There may be an element of anxiety[15] (a feeling of being alone with the disease) present which caused the children to have difficulties adjusting to their school life.

Summary

The California Test of Personality was administered to a selective juvenile diabetic population to determine if their personal and social adjustment status was significantly different from the test norms. Variables within this population were also compared to the test norms in an attempt to define what factors in a diabetic's life may have influenced his adjustment. This population was found to be better adjusted personally than socially. A tendency for a high sense of personal worth was found for this population, particularly for all the girls and those girls who had previously attended summer camp. The girls seemed to be better adjusted socially than the boys in this study. The younger boys had greater difficulty in social adjustment.

WHAT THE SOCIAL SECURITY DISABILITY PROGRAM MEANS TO YOU AND YOUR PATIENTS

S. J. Venable, MD
Chief Medical Consultant
Disability Determination Program
Department of Education
State of Maryland
Division of Vocational Rehabilitation

In 1965, social security coverage was extended to physicians in private practice. Its disability protection can be a valuable supplement to your present disability coverage.

In the social security disability program, a person under 65 who is too physically or mentally disabled to work may receive up to $152 in monthly benefits. If he has dependents, family benefits can go as high as $339 a month.

Benefits can now be paid to a person whose disability has lasted or is expected to last for 12 months or longer, or to result in death. (Formerly, a person was eligible only if his impairment was expected to continue for a long and indefinite time, or to result in death.) This liberalized provision benefits a large number of persons disabled by non-permanent impairments resulting from accident or illness.

Already, in Maryland, some 14,000 disabled persons and 3,000 dependents are receiving about $1,400,460 a month in social security disability benefits. Nationwide, over a million disabled persons—plus about a million dependents—are getting payments of about $1.75 billion a year from the program.

You may have patients who are eligible for benefits but are unaware of the provisions of the law. You can perform a valuable service by refering them to a social security office for further information. You can also help speed the decision on your patient's claim by promptly responding to his request that you report the medical data from your records needed to evaluate his disability.

To give you a better understanding of how the program relates to your practice, here are answers to the questions physicians most frequently ask about the social security disability program.

ADVISING PATIENTS

Where do I send a patient to inquire about disability benefits?

Refer him to his social security office. If he cannot get there because he is in a hospital or is unable to leave home, the office will send a representative to visit him.

What do you mean by "disabled"?

A "disabled" person is one who has a physical or mental impairment that prevents him from doing not only his usual work, but any substantial work in keeping with his age, education, and experience.

Is the impairment the only factor in determining disability?

Not always. In most cases, a person who is found disabled has an impairment so severe that his condition alone prevents work activity. But it is possible for a person to be considered disabled because of a combination of medical and vocational considerations. This occurs when the medical condition prevents him from doing his usual work and—considering his age, education, and previous

work experience—he cannot be expected to do any other type of work.

Are benefits paid only in cases of permanent disability?

No. Benefits are paid if the disability has lasted or is expected to last at least 12 months or to result in death. This covers non-permanent impairments resulting from accident or illness as well as chronic conditions.

How soon can benefits start?

Benefits begin after a waiting period of 6 full calendar months following the onset of disability. Therefore, the first payment is for the 7th month after the month in which a person became disabled.

What about a person who did not apply for benefits while he was still disabled? Can he receive any back payments now that he is recovered?

Yes. Even a person who has returned to work may be eligible for some benefits if severe disability prevented him from working for at least 12 months. However, the longer the delay between his recovery and his application for benefits, the fewer months of back payments he can receive. If more than 14 months elapse after he recovers and before he applies, no benefits are payable.

A cardiac patient who gets angina on slight exertion tells me you turned down his claim.

Probably for a non-disability reason, such as his not having worked long enough in jobs covered by social security to meet the disability earnings requirement. To acquire disability protection, a worker must generally have social security work credits for at least 5 of the 10 years preceding the onset of his disability. (Note: Persons disabled by blindness before age 31 may need less than 5 years. Inquire at a social security office for further information.)

What are the most common impairments among workers who are found disabled?

The most frequent causes of disability have been: arteriosclerotic heart disease (including coronary disease), emphysema, schizophrenic disorders, hypertensive heart disease, pulmonary tuberculosis, osteoarthritis and rheumatoid arthritis. These conditions may help you identify patients likely to be qualified for benefits. But don't feel that they limit you in any way. Send any patient you think qualified to his nearest social security office.

Someone disabled from birth-or never been able to work.

Under the "childhood disability" provisions, a person continuously disabled since before age 18 can receive disability benefits starting at age 18 or later. He need not have a work record of his own. Benefits can be based on the earnings record of either parent. Payments begin when a parent covered under social security dies or becomes entitled to disability or retirement benefits. Benefits can continue as long as the son or daughter remains disabled.

The most common causes of disability in this program are mental retardation, epilepsy, cerebral palsy, congenital defects, and late effects of acute poliomyelitis, congenital syphilis and acute encephalitis.

THE DISABILITY DECISION

Who determines whether or not a person is disabled?

Disability decisions are made by a State agency evaluation team consisting of a physician and a counselor skilled in vocational evaluation. In Maryland the agency is in the Division of Vocational Rehabilitation and is designated as the Disability Determination Program.

Typically, the evaluating physician is a private practitioner serving the agency on a part-time basis. He reviews the medical, hospital and laboratory reports and, in conjunction with the vocational evaluator, decides whether the applicant's impairment is disabling under the law.

Does the State agency physician also examine the applicant?

No. He depends entirely on the evidence reported by you and others who have examined or treated the applicant.

Can a person appeal the denial of his claim?

Yes. He is entitled to have his claim reconsidered, submitting any new evidence that may be available. If his claim is again disallowed, he can have it ruled on by a hearing examiner located near his home. As a further appeal, the claimant can request that the decision in his case be reviewed in Washington, DC, by the Appeals Council of the Bureau of Hearings and Appeals. Then if he is still dissatisfied, he can file suit in his local US District Court to have the decision reviewed.

REPORTING MEDICAL EVIDENCE

What kind of medical report on my patient should I submit?

Submit a standard narrative report, such as you would send any colleague to give a complete medical picture of the patient. This should include the history, and physical and laboratory findings—as much objective data from the patient's chart as possible.

Who pays for my report?

Your patient is legally responsible for providing initial medical evidence in support of his claim. Therefore, he is responsible for any fee you would charge for preparing your report.

Is the initial report from the treating physician all the medical information the State agency needs to decide a case?

In many cases, yes. Frequently, reports from other treatment sources such as hospitals and clinics are also used. If the evaluating physician requires certain data that was not reported, he may call or write you to find out if you have the needed information in your records. When necessary, medical examinations by qualified independent sources are arranged by the State agency.

Who are these independent sources?

Generally, other physicians in private practice. Any qualified physician may ask the State agency to place his name on its consultant roster to perform examinations.

How are the consultants' fees set?

The fees are based on a schedule which the agency has worked out with the assistance of its representative medical advisory committee.

MOTIVATING REHABILITATION

What is done for applicants who need rehabilitation help?

Every applicant filing for benefits is considered for possible services by the Maryland Division of Vocational Rehabilitation. Such services include counseling, teaching of new employment skills, training in the use of prostheses, and job placement. These services are generally financed from State-Federal appropriations. Additional resources are now provided through social security funds to pay the costs of rehabilitating certain disability beneficiaries.

Do benefits stop when a beneficiary who has not recovered goes back to work?

Generally, not right away. A person who tries to work DESPITE HIS MEDICAL DISABILITY is usually given a "trial work period" of 12 months of continued benefits.

This is intended to reassure a person who might hesitate to go back to work for fear of losing his benefits before he knows whether he can hold down a steady job. Benefits are stopped at the end of the trial work period only if the beneficiary has shown that he has regained his ability to do substantial gainful work.

What happens when a beneficiary recovers medically?

His monthly benefit checks are continued for the month of recovery and 2 additional months. This is to help him adjust financially to being self-sufficient. Then, since he is no longer disabled, his benefits stop.

To be sure that beneficiaries continue to qualify for benefits, there are periodic reviews of all cases in which recovery is thought possible.

Does a person who has recovered or returned to work get special consideration if he becomes disabled again?

Yes. If he again becomes disabled within 5 years, the 6-month waiting period normally required before benefits begin is waived. He can immediately become reentitled to benefits, as long as he is still insured for disability purposes.

Family Planning and the Role of the Maryland State Department of Health

J. King B. E. Seegar, Jr., MD
Chief, Maternity Section
Division of Maternal and Child Health

The ramifications of family planning and birth control are so diverse that today an organized program would seem to be a major factor in solving some of the most pressing problems in the world and our community. I should like to discuss some of the aspects, pointing out specifically the work in family planning accomplished to date by the Maryland State Department of Health, and the type of program we should like to implement for the future.

To me the most urgent and frightening problem today is that of the world population explosion. Prior to the advent of modern science, population control was no problem; the appalling death rate from war, pestilence, and famine controlled population growth. Today the issue is one of population control now by effective contraception or later by starvation.

Dr. Robert C. Cook[1] has pointed out that at the beginning of the Christian era the world population was approximately one quarter of a billion, and required 16 centuries to double to one half a billion. By 1850, the world population had doubled again to one billion, and since then has more than tripled itself, now standing at 3.4 billion. At the present rate of growth of 2% a year, world population doubles in 35 years, which would mean a world population of 24 billion in 100 years. It is true that the most rapid and dangerous growth is in the underdeveloped countries of Asia, Africa, and South America. Yet, how long could the nations of the western world survive in plenty, with famine sweeping three fourths of the globe? Actually here in the United States, though our birth rate is declining, we still are doubling our population every 44 years.[2–3]

At present, the annual food supply of the world is insufficient and it is estimated that hunger is endemic for more than half the human race. Congressman Harold Cooley at a hearing of the House Agriculture Committee in 1966 reported that 12,000 people were dying daily from starvation, or more than 4,000,000 a year.[4]

There are those who argue that we should concentrate our efforts on the development of major new food technologies rather than directing them toward population control. Mobilizing world forces along these lines perhaps could solve the world food problem temporarily. However, in the population explosion we are dealing with a mathematical term known as an "exponential" which is a function rapidly approaching infinity, and soon becoming uncontrollable. Consequently, without a control on population growth, food supplies ultimately will fail before the realities of the exponential.[4]

In addition to this, overpopulation disturbs the balance of nature, creating problems of air, water, and soil pollution. These I shall not discuss, but mention here merely to point out the gravity and scope of our situation.

Next in importance we should consider the medical implications of family planning for both mother and child. Here unfortunately, there has been far too much said about the possible ill effects of some of the contraceptives. People are being unduly frightened by various articles concerning the possible dangers of thrombophlebitis associated with the use of the contraceptive pills. Yet rarely, if ever, in these writings have I seen

the counter statement that, if this complication results, the incidence probably is no greater than that seen in normal pregnancies. Consequently, it would seem there is nothing to loose by taking pills to prevent an unwanted pregnancy. In addition to this, by preventing a pregnancy the individual in many cases is avoiding a number of serious complications of pregnancy, many of which may be fatal. This would seem to weigh the scales in favor of the contraceptive pills.

Interesting medical evidence supporting family planning is found in a study made in India by Gordon, Singh, and Wyon.[5] They found that the neonatal mortality showed a definite decrease when deliveries were spaced 24 or more months apart, and that this also was reflected in the infant mortality. They showed further that with the exception of the high infant mortality rates associated with primiparity, there seemed to be a rise in infant mortality as parity increased.

Furthermore, limitation of the family is medically desirable. It is a well established fact that with multiparity there is an increase in obstetrical complications, creating a hazard to both mother and baby. Recently Dr. Meier[6–7] in a study of multiparous women who were welfare recipients in an urban area found that one fifth of the women had serious health hazards before their fourth pregnancy. In a follow up of these patients it was learned that after the fourth pregnancy an additional two fifths developed serious health problems.

These generalities certainly emphasize the drastic need for population control. One may say this is true for the world, but how does it apply to us in Maryland? Recently there have been several articles in the Sunpapers[8–9] indicating that on a percentage basis we are one of the fastest growing states in the Union. It was pointed out that in Maryland there are 14 new cities in various stages of planning and construction. It is true that a fair part of this growth is due to imigration. Yet, in the year ending July 1, 1966, there was an estimated increase of 80,740 people in Maryland bringing the total to 3,632,140. This is a 2.3% increase which is an interesting comparison with a 2% increase in the world population, and a 1.2% increase in the population of the United States. To illustrate the need for Health Department family planning clinics here, it was estimated that in 1966 there were 78,570 medically indigent Maryland women in need of this service. This figure was arrived at through the *Polgar Formula*[10] which estimates for a community, at any given time, the approximate number of medically dependent women of childbearing age who are fertile and not pregnant or seeking a pregnancy.

Actually, though there is still much to be done to meet this need, the Health Department is proud of its progress. In 1962, there were but four subdivisions offering family planning services. Now in the spring of 1967 this service is available through the Health Department in all 24 political subdivisions, one third of them having a number of clinic locations. Every subdivision offers a choice of contraceptive methods, and in all but two the intrauterine device is available. We are especially proud of the *Guidelines for Family Planning Clinics* which we developed, and which the National Planned Parenthood Association has asked our permission to distribute throughout the country.

The field of public relations and education has not been neglected. We have spoken before several county medical societies on the subject of our program and have met individually with a number of physicians throughout the State regarding our aims. Efforts have been made to stimulate interest in educational in-service programs for public health nurses at The Johns Hopkins and the Planned Parenthood Association.

At the moment the Public Health Nurse is the backbone of our program. She circularizes family planning information throughout the counties on home visits, and in Health Department clinics, especially pediatric and obstetrical. It is she to whom the patients most frequently confide their misgivings, and who through her understanding persuades the patient to attend the clinic.

Favorable comments of our program and clinics have appeared in Baltimore and county papers. Also, the *Bulletin of the Maryland State Department of Health* devoted the November-December 1966 issue to Family Planning in Maryland. It generated considerable interest, and requests for copies were received from many health, welfare, and social agencies.

Finally, through the cooperation of MEDIC (the telephone network which brings medical educational programs to physicians throughout the State) there have been several educational pro-

grams conducted on the subject. In April, 1967 several talks on Population Dynamics and Population Control were heard simultaneously in 32 locations in the State, and to which were invited Social Service workers from the State and local welfare departments.

Eventually it is essential to devise some method of evaluating our program. This is especially difficult, since there is no single index by which we can gauge our progress.

To this end we have developed several charts and graphs which we hope will be of comparative value in future years. Our first table (Table I) showing the total number of Maryland family planning patients registered with the Health Department, Planned Parenthood Association of Maryland and Planned Parenthood of Metropolitan Washington, DC, Inc. for the year ended June, 1966. These figures are compared with the total number of patients in need of this service as indicated by the *Polgar Formula*. From this it may be seen that together we are caring for 13,595 indigent women leaving 64,975 yet to be reached. A more recent report from the counties and Baltimore City would indicate that as of December 31, 1966 we were reaching 2,739 more women or a total of 16,334 leaving 62,236 still without this service. Not all of these women may desire the service because of personal preferences or other factors. A number are certainly receiving care through private physicians or hospital clinics.

At present nearly all of our family planning patients in the counties are referrals from the maternity clinics. I believe it is interesting to note that the number of new family planning patients in the counties for the year is equal to 75.8% of clinic patients delivered. The total number of family planning patients both carried over and new, equaled 129% of clinic patients delivered. These comparisons give some indication as to the popularity and acceptance of our program, and indicate that the obstetrical clinics are adequately recognizing their responsibility for referrals and accepting family planning as an integral part of obstetrical care.

The first chart (Figure I) shows a comparative study of the patients receiving family planning services in each county health department as a per cent of the *Polgar Formula* estimated need. In succeeding years the number of patients receiving this service in each county should increase thus raising their percentage closer to the ideal 100%.

Our second chart (Figure II) was drawn up with the thought that the target number of new family planning patients in each county should be 10% of the *Polgar Formula* estimate. Here it is seen that there is a wide variation between the counties. Two had not opened their clinics by July, 1966 and a number of others were just getting underway. It is hoped that for the 1967 fiscal year the graph will not show such a wide variation.

The latest statistics released by the Maryland State Department of Health show that there were 2500 fewer babies delivered in 1966 than in 1965 and that the birth rate for the State fell from 20.9 per 1000 population in 1965 to 19.7 in 1966. Bettie Rogerson, MD, Acting Chief of the Division of Biostatistics of the Maryland State Health Department, states that the decline in the birth rate in Maryland has accelerated in the past two years. She points out that between 1957 and 1964 the birth rate for Maryland showed an over-all decline

Table I
ESTIMATED NUMBER OF MEDICALLY INDIGENT WOMEN IN NEED OF FAMILY PLANNING SERVICES, THREE MARYLAND AREAS, FISCAL YEAR 1966

Area of Residence	Total Estimated Need From Polgar Formula*	Patients Registered with Health Departments for Family Planning Services	Patients Registered with Planned Parenthood	Patients Still to Reach
State of Md.	78570	6595	7000	64975
Baltimore City	25690	3500	5500	16690
Total Counties	50880	3095	1500	48285

*** The Polgar Formula determines for a community, at any given time, the approximate number of medically dependent women of childbearing age who are fertile and who are not pregnant or seeking pregnancy.**

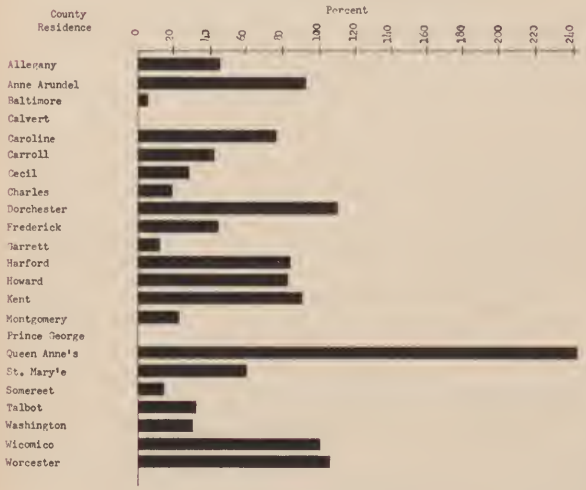

FIGURE I

Total Patients Registered for family planning services with the County Health Departments as a Percent of the Estimated Number of Medically Indigent Women in Need of Family Planning Services, Each County of Maryland, Fiscal Year 1966.

FIGURE II

New Patients registered for family planning services with County Health Departments as percent of Target* Population, each county of Maryland, 1966 Fiscal Year.

*Target Population set as 10% of total number of medically indigent women of childbearing age who are fertile and who are not pregnant or seeking pregnancy as estimated by the Polgar Formula.

of 13 per cent. Between 1964 and 1966 she states the rate fell by an additional 14%. Family Planning may not be solely responsible for this trend, but it most certainly plays a part and is encouraging to us.

However proud we are of our accomplishment, we are well aware that still there is much to be done. Though good clinics may form an excellent foundation, they alone do not constitute a program. At this point we are greatly in need of personnel. In a few counties we have been able to offer direct services which have proven most successful. On the basis of this experience we should like eventually to engage four physicians as OB and GYN Regional Directors. Each would be assigned a quarter of the State where he would direct that part of the Maternal and Family Planning program. Here, however, it would appear most sensible to expand slowly, one area at a time. There is also the need for a physician skilled in genetic counselling. Next we believe there are certain problems that can best be solved by the employment of aides. These aides would work in the communities where they live and would be given a course of training at Planned Parenthood Association in Baltimore, where they would learn to set up clinics, instruct patients, keep records and assist the physician in examinations. It is also hoped that they may make follow-up visits to the home to be sure that the patient is carrying out instructions correctly. Many patients miss clinic appointments because of lack of transportation and the need for baby sitters. Arrangements for these could be one of the aides duties. They could also develop facilities for delivering pills to patients unable to pick them up at the clinics. We would like to begin with 10 aides. To supervise these aides the services of one maternal and child health nursing advisor would be necessary. Prominent on our essential list is at least one health educator. It would be his duty to disseminate health and family planning information through all available channels. This would include utilizing the local press, radio or television programs; organizing small groups in private homes where family planning can be discussed; and generally availing themselves of any other opportunities for public health endeavors. Finally a social worker and two stenographers would round out our personnel requirements. We feel that this investment would be well worthwhile and in the long run would result in an economic savings for the community. In a study of family planning in North Carolina's Mecklenburg County the statement was made, "We are spending a dollar to save $25.00."

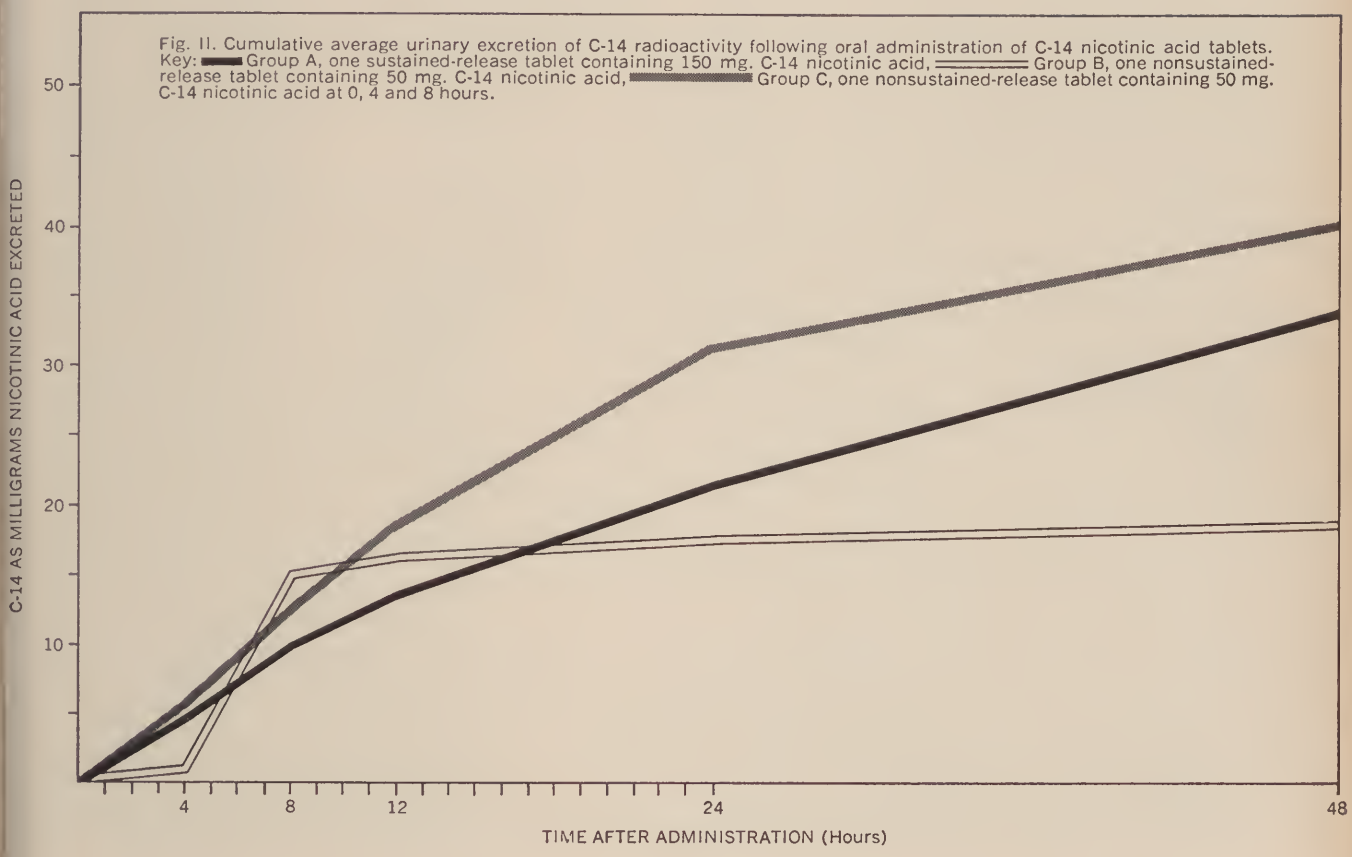
Sustained circulatory, respirator
and cerebral stimulation for th

Fig. I. Average plasma levels of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. nicotinic acid, ▬▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

Geroniazol® TT
nicotinic acid 150 mg., pentylenetetrazol 300 mg.
Tempotrol® Time Controlled Tablet

Photo professionally posed

Mike expects a penicillin injection. He's about to be pleasantly surprised.

His physician is going to prescribe an oral penicillin —PEN•VEE® K (potassium phenoxymethyl penicillin). It's usually so rapidly and completely absorbed that therapeutic serum levels are produced in 15 to 30 minutes. Higher serum levels generally last longer than with oral penicillin G.

Indications: Infections susceptible to oral penicillin G: prophylaxis and treatment of streptococcal infections; treatment of pneumococcal, gonococcal, and susceptible staphylococcal infections; prophylaxis of rheumatic fever in patients with a previous history of the disease.

Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.

Warnings: Acute anaphylaxis (may prove fatal unless promptly controlled) is rare but more frequent in patients with previous penicillin sensitivity, bronchial asthma or other allergies. Resuscitative (epinephrine, aminophylline, pressor amines) and supportive (antihistamines, methylprednisolone sodium succinate) drugs should be readily available. Other rare hypersensitivity reactions include nephropathy, hemolytic anemia, leucopenia and thrombocytopenia. In suspected hypersensitivity, evaluation of renal and hematopoietic systems is recommended.

Precautions: In suspected staphylococcal infections, perform proper laboratory studies including sensitivity tests. If overgrowth of nonsusceptible organisms occurs (constant observation is essential), discontinue penicillin and take appropriate measures. Whenever allergic reactions occur, withdraw penicillin unless condition being treated is considered life threatening and amenable only to penicillin. Penicillin may delay or prevent appearance of primary syphilitic lesions. Gonorrhea patients suspected of concurrent syphilis should be tested serologically for at least 3 months. When lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. Treat beta-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent rheumatic fever or glomerulonephritis. In staphylococcal infections, perform surgery as indicated.

Adverse Reactions (Penicillin has significant index of sensitization): Skin rashes, ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; serum sickness-like reactions, including chills, fever, edema, arthralgia and prostration. Severe and often fatal anaphylaxis has been reported (see "Warnings").

Composition: Tablets—125 mg. (200,000 units), 250 mg. (400,000 units), 500 mg. (800,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc.

Scoliosis

T. H. MORGAN, MD, FRCS, (Eng.)
Division of Orthopaedic Surgery
University of Maryland

Scoliosis is defined as a lateral curvature of the spine: this may vary from a slight curve to a severe deformity, which may be crippling and even life endangering.

Attempts to classify scoliosis on a pathological basis have led to complex classifications which tend to confuse rather than clarify. The one below, whilst incomplete, covers the great majority of scolioses, and as such, is adequate for the understanding of this condition—the purpose of this paper.

CLASSIFICATION

1. Non-progressive Scoliosis
2. Progressive Scoliosis
   - Congenital
   - Acquired
   - Idiopathic
   - Paralytic
   - Neurofibromatosis and other Neurological conditions

NON-PROGRESSIVE SCOLIOSIS

In non-progressive scoliosis, the spine is structurally normal, the curves resulting from defects outside the spinal vertebrae. There are three common types:

- Postural
- Secondary
- Reflex

Postural scoliosis occurs mainly in adolescents towards the end of the growth period. It is usually a mild lateral curvature due in many cases to lack of tone in the back and trunk muscles. The deformity is fully correctable, disappearing when the spine is flexed by the patient touching his toes in the erect position. Structural changes in the vertebrae, such as wedging and rotation do not occur, and there is no evidence to suggest that a postural curve becomes a progressive scoliosis.

Secondary scoliosis is, in a sense, also postural, for example, a patient with obliquity of the pelvis due to a short leg, will produce a lateral curvature of the spine in an attempt to correct his posture; when the leg length is equalized, but curvature will disappear. In some patients, however, where there has been a marked disparity in the leg length throughout a large part of the growth period, secondary structural changes may occur in the spine, due to abnormal pressures on the vertebral epiphyses, and in these cases the curves are not always fully correctable.

Reflex scoliosis is the name given to the lumbar curve frequently associated with unilateral erector spinae spasm, e.g. in an acute prolapsed intervertebral disc lesion. When the spasm passes off, the curvature disappears.

PROGRESSIVE SCOLIOSIS

CONGENITAL.

In this type of scoliosis, the curves are secondary to congenital malformations of the bony structure of the spine. The commonest abnormality being the hemivertebra which may be single or more commonly multiple, in addition there may be

associated abnormalities such as spina bifida, congenital fusion or absence of ribs, and cardiac defects.

The degree of angulation of a congenital curve will depend on the mechanical effect of the abnormality. Thus two hemivertebrae on one side of the spine may produce a marked curve, but if they are situated on each side of the spine, their individual effect is neutralized.

The commonest site for congential abnormalities is the cervico-dorsal spine, and lumbo-sacral junction. These curves are progressive, but usually comparatively slowly, the ultimate deformity depending to a large extent of the severity of the curve at birth.

ACQUIRED

Acquired scoliosis is essentially a disease associated with growth, starting at any time between infancy and the end of the growth period. In the great majority of patients, the curves progress during this period, and stop only when growth ceases; the resulting deformity remains for the rest of life.

IDIOPATHIC SCOLIOSIS

This is the most common type of acquired scoliosis, and is so named because its etiology is unknown. It appears to be a definite disease; being particularly apparent from analysis of variations in curve pattern occurring in scoliosis of different etiologies. In idiopathic scoliosis there are four such patterns, named according to the area of the spine affected.

Curve Patterns

1. Dorsal where the curve is restricted the thoracic spine.
2. Dorso-lumbar where the curve extends from the dorsal spine into the lumbar spine.
3. Lumbar where the curve is restricted to the lumbar spine.
4. Combined curve pattern where there is both a dorsal curve and a lumbar curve, with apices in opposite directions. (The *"S"* shaped curve)

The curve patterns are of significance because their individual symptomatology is varied, and they tend to occur at different ages. For this reason, it is convenient to further subdivide idiopathic scoliosis into three groups according to age of onset of the curvature:

1. Infantile group, onset between birth and 2 years.
2. Juvenile group, onset between 2 and 10 years.
3. Adolescent group, onset after age of 10 years.

INFANTILE IDIOPATHIC SCOLIOSIS

This type of scoliosis, whilst relatively uncommon, is of great orthopaedic interest as it has certain characteristics that differentiate it from idiopathic scoliosis starting after the age of 2. The average age at diagnosis is 15 months; it occurs equally in boys and girls; the curves affect the dorsal spine and the direction of the curve to the left. After the age of 2, girls outnumber boys; less than a third of all curves are dorsal, and with the exception of the lumbar pattern, the curves are predominantly to the right

The prognosis of infantile idiopathic scoliosis is usually poor, for these curves tend to progress from an early age, and since the dorsal spine is affected, the thorax becomes grossly deformed with reduction in vital capacity. In some, however, there is a delay between diagnosis of the scoliosis and the onset of deterioration, even up to 5 or 6 years, in these, the thorax has a better chance of developing, and though at maturity a severe curvature is present, the thorax may be well developed, with little functional impairment. On average these curves deteriorate by radiological measurement at about 6 degrees per year, and at the age of 16, the average major curve measurment is over 100 degree. In those that progress from infancy, the major curve may measure as much as 115 degrees by the age of 6, and the prognosis is correspondingly very poor.

Fortunately, not all infantile idiopathic curves are progressive, for in some the curves disappear without treatment within a year or two of diagnosis. This type is termed "resolving infantile scoliosis;" it is frequently, in the early months, similar to the progressive type, and may present a problem of diagnosis, time always provides the answer.

JUVENILE IDIOPATHIC SCOLIOSIS

Idiopathic curves with an onset between 2 and 10 years are relatively uncommon. The curves may be of the dorsal, dorso-lumbar or combined

patterns, and, as stated above, girls are more frequently affected than boys—they tend to progress at a fairly constant rate, with the result that the earlier the curve starts, the more severe the deformity is likely to be at maturity.

ADOLESCENT IDIOPATHIC SCOLIOSIS

Fifty per cent of all structural scoliosis is of this group and 40 per cent of the curves are of the lumbar pattern. This is in contrast to the earlier age groups in which this pattern is rarely seen. The remaining 60% of curves are equally divided between the other curve patterns.

Deterioration occurs while growth continues, the rate remaining constant until near the end of the growth period when it falls. Lumbar curves tend to deteriorate at a slower rate than the other curve pattern, and thus are milder; the average curve measurement at maturity being about 30 degrees, whereas for the dorsal and dorso-lumbar patterns the average is nearly 60 degrees. In the combined pattern the two curves deteriorate at much the same rate.

PARALYTIC SCOLIOSIS

Scoliosis occurs in about 5% of all cases of paralytic anterior poliomvelitis and especially in those in whom there is a severe degree of residual paralysis, though in rare cases the scoliosis may be the only significant effect of the disease. The onset of the curvature is usually within a year of the acute infection.

The incidence of paralytic scoliosis closely follows the agre incidence of *APM* and consequently is more common in the juvenile and adolescent age groups than in infants; there is no significant involvement sex difference. The curves are predominantly dorso-lumbar in pattern and tend to be longer with more vertebral involvement than in other types of progressive scoliosis. It is commonly believed that muscle imbalance is caussive factor in the development of the curvature.

In general the younger the onset of the curve, the more severe the ultimate deformity, although there are wide variations in the rate of progression amongst individual cases with similar age of onset. This may be expected from a disease in which the extent and degree of paralysis is so variable. Even so, the average rates of progression are 20% faster than idiopathic scoliosis of similar age groups.

NEUROFIBROMATOSIS AND OTHER NEUROLOGICAL CONDITIONS

SCOLIOSIS SECONDARY TO OTHER CONDITIONS

Scoliosis secondary to Neurofibromatosis, Cerebral Palsy, Syringomyelia, and the Muscular Dystrophies are, in general, rare, and for the reasons of simplicity have been excluded from consideration.

The Symptomatology of Scoliosis

1. *Decompensation.* Decompensation is a defect of posture. In a well compensated scoliosis, the secondary curves above and below the major curve tend to neutralize the lateral displacement caused by the major curve, and the occiput remains over the sacrum in the erect position. In a decompensated scoliosis there is inadequate compensation in the secondary curves, and the patient, in order to maintain his posture, attempts to supplement the compensation of the secondary curves by tilting his pelvis. This effected by flexing one knee (producing apparent shortening of a leg), or alternatively standing with one foot in the equinus position. The degree of decompensation varies with each curve pattern, in the double structural pattern the mechanical effect of one curve is neutralized by the other, and decompensation is unusual. In contrast with long dorsolumbar curves the natural correction produced by the secondary curves is frequently inadequate, resulting in decompensation which may produce severe disability.

Instability. Instability of the spine is essentially a symptom of paralytic scoliosis, especially late onset. In idiopathic and congenital scoliosis the curves are rarely unstable. This symptom is demonstrated clinically by lifting the erect patient off the floor by head traction, if there is any significant instability telescoping of the spine will be observed.

Pain. Pain is a common symptom of scoliosis in later life, and may be due to osteoarthritis degeneration in the spine, or alternatively nerve root compression.

In the growing child, pain is an unusual symptom, and if present, one should suspect a coexisting condition such as a spine tumour.

The Cosmetic Disability. The commonest complaint of patients with scoliosis concerns their appearance. Decompensation, inequality of shoulder height, prominent hip and the thoracic cage deformity are the major contributing factors. As stated above, the degree depends on the curve pattern, and its severity. In early onset scoliosis, besides the disproportion of the thorax to the rest of the body, the whole body may be undersized, due to a generalized failure of growth and development.

Paraplegia. This is a grave complication, occurring in less than 1% of all significant structural scoliosis. It is more commonly associated with congenital scoliosis than with idiopathic or paralytic, and is usuallly due to pressure of the spinal cord over the bony apex of the curve.

The Functional Disability. Decompensation, instability and pain cause functional disability, but without doubt the greatest factor is the thoracic cage deformity; the severity which determines the vital capacity of the lungs. In severe dorsal scoliosis the thorax is small, the ribs distorted, and due to their increased fixation, the breathing is mainly diaphragmatic, with the result that these patients are more prone to respiratory infections, and in later life cardiac insufficiency, both contributing factors to the significant mortality of the disease.

1968 ANNUAL MEETING

MEDICAL & CHIRURGICAL FACULTY OF THE STATE OF MARYLAND

April 17, 18, 19 Alcazar, Baltimore
April 21-28 Caribbean Cruise Convention

CRUISE ITINERARY

Sun., April 21st— Embarkation on board ship will be from 1:30 PM to 3:00 PM. Sail from Baltimore at approximately 4:00 PM — a gourmet dinner will be your first meal aboard this luxurious liner.

Mon., April 22nd and Tues., April 23rd—
Two wonderful days of sailing with fun and games — sunning, swimming, entertainment, excellent food, and special business and scientific meetings.

Wed., April 24th—Arrive San Juan about 1:00 PM — sightseeing tours will be available to enjoy this tropical island.

Thurs., April 25th—Sail from San Juan at 3:00 AM and arrive in St. Thomas at 9:00 AM — sightseeing tours will again be offered to see this charming island. Sail from St. Thomas about 4:00 PM.

Sun., April 28th— Arrive Baltimore in the afternoon about 2:00 PM.
Business meetings and scientific sessions will be held daily aboard ship.

THERE WILL BE DAILY SCIENTIFIC SESSIONS AND GRAND ROUNDS FILMS DURING CRUISE CONVENTION

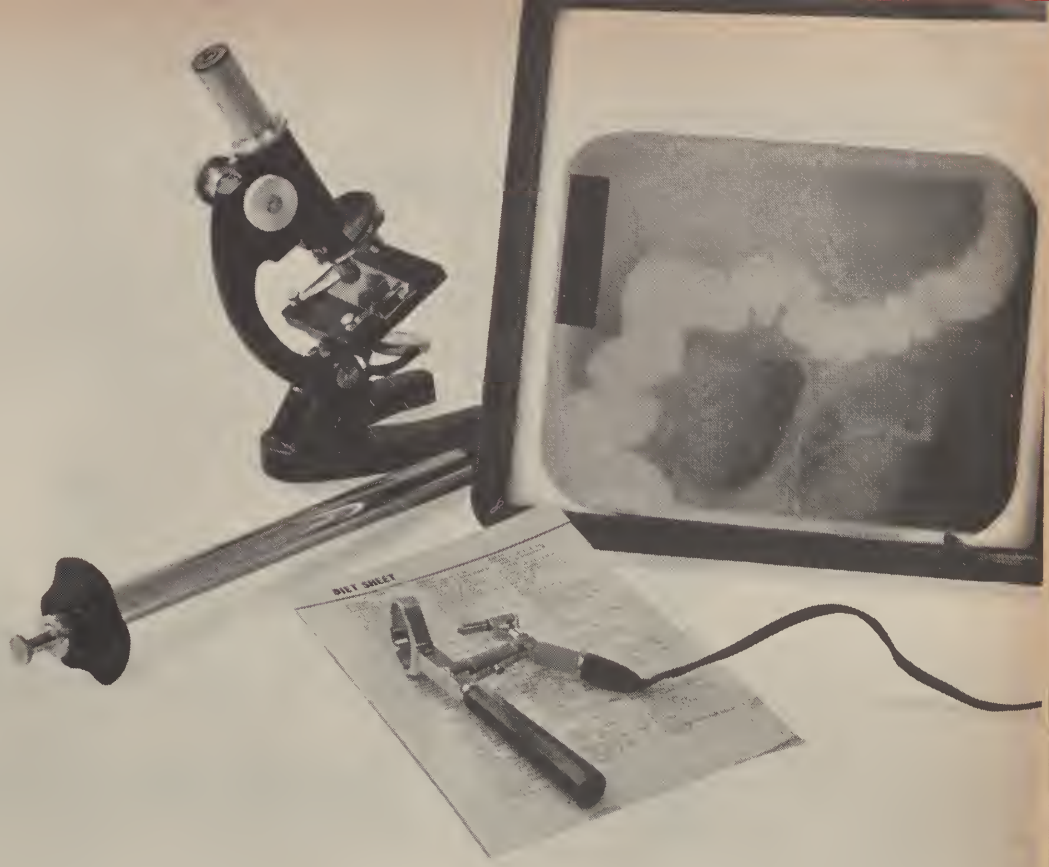
The Joint Meeting for 1967 of the Maryland Society of Internal Medicine and the Section of Internal Medicine of the Baltimore City Medical Society will be held on Monday, October 2, 1967 at 8:15 p.m. in the Osler Hall of the Medical and Chirurgical Faculty building at 1211 Cathedral St., Baltimore, Md.



These are crucial years for medicine and internists in particular. In keeping with the basic concepts of the American Society of Internal Medicine, this year's program will feature socio-economic topics of current interest.

Speakers for this meeting include: Richard Wilbur, MD, Chairman of the Board of California Blue Shield. His topic will be, "Who Says It's Reasonable?"

Jerome Chamovitz, MD, Member of *ASIM's* Committee on Labor and Management. His topic will be, "Current Labor Viewpoints Toward Health Insurance."

Charles Weller, MD, *ASIM* Trustee for the State of Maryland, will moderate the program."

The annual business meeting of the Maryland Society of Internal Medicine will follow the program.

in digestive disorders:

B and C vitamins aid therapy. Nausea, vomiting, and severe diarrhea may seriously interfere with the digestion and absorption of nutrients. STRESSCAPS capsules, containing therapeutic quantities of vitamins B and C, may help meet the needs of these patients. In digestive disorders, as in many stress conditions, STRESSCAPS vitamins aid therapy.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY

Each capsule contains:

Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

Winthrop

announces

a breakthrough in the control of pain

Talwin®

brand of

pentazocine

(as lactate)

a potent, injectable non-narcotic

For every physician who has ever prescribed morphine

Talwin is the new potent non-narcotic injectable analgesic which is indicated for relief of all types and degrees of pain in acute and chronic disorders. Talwin 30 mg. is usually as effective an analgesic as morphine 10 mg. or meperidine 75 to 100 mg., but needs no narcotics controls. The duration of action of Talwin may sometimes be less than that of morphine.

Talwin is relatively free from adverse effects of morphine, such as constipation, urinary retention, or severe respiratory depression.

It has been used, in varying dosages, in over 12,000 patients for relief of pain of medical disorders, of active labor and postoperative pain; also for preoperative or preanesthetic medication, and as an adjunct to anesthesia.

A brochure incorporating analyzed information on Talwin is available. The completeness of the information will permit you to evaluate the role Talwin can play in your practice.

You can depend on Talwin to relieve pain:

WHATEVER the intensity of the pain
the cause of the pain
the site* of the pain
the duration of the pain
the chronicity of the pain
the age† of the patient

Talwin does not require a narcotics prescription

The World Health Organization Expert Committee on Dependence-Producing Drugs concluded that "...there was no need at this time for narcotics control of pentazocine [Talwin] internationally or nationally." (*WHO Tech. Rep. Ser.*, No. 343, 1966, p. 6.)

It is our sincere belief that the discovery of Talwin by Winthrop Laboratories will be of great value to you and your patients for whom you may have to prescribe a potent analgesic.

*Talwin should not be used for patients with increased intracranial pressure, head injury or pathologic brain conditions.

†Until sufficient experience is gained, it should not be administered to children under 12 years of age.

Talwin—brand of pentazocine (as lactate)

Contraindications: *Increased Intracranial Pressure, Head Injury, or Pathologic Brain Conditions in which clouding of sensorium is undesirable.* Talwin (brand of pentazocine) should not be administered in these cases, since drug-induced sedation, dizziness, nausea, or respiratory depression could be misleading.

Precautions: *Pregnancy.* No teratogenic or embryotoxic effects attributable to the use of Talwin have been seen in extensive reproductive studies in animals; however, like all new drugs, Talwin should be given with caution to pregnant women. A large number of patients in labor have received the drug with no adverse reactions other than those that occur with commonly used strong analgesics. However, as with other strong analgesics, Talwin should be used with caution in women delivering premature infants.

Ambulatory Patients. Since sedation, dizziness, and occasional euphoria have been noted, ambulatory patients should be warned not to operate machinery, drive cars, or unnecessarily expose themselves to hazards.

Certain Respiratory Conditions. The possibility that Talwin (brand of pentazocine) may cause respiratory depression should be considered in treatment of patients with bronchial asthma. Talwin (brand of pentazocine) should be administered only with caution and in low dosage to patients with respiratory depression (e.g., from other medication, uremia, or severe infection), obstructive respiratory conditions, or cyanosis.

Patients Dependent on Narcotics. Because Talwin is a narcotic-antagonist, patients dependent on narcotics and receiving Talwin may occasionally experience certain withdrawal symptoms. Talwin should be given with special caution to such patients. It has been observed that some patients previously given narcotic-analgesics for one month or longer had mild withdrawal symptoms when the drug was replaced with the analgesic, Talwin. After a short period of adjustment the subjects were usually able and willing to continue taking Talwin, and relief of pain was satisfactory.

Nonaddicted Patients Receiving Narcotics. Symptoms believed to be indicative of antagonism to the opiate may be observed rarely with administration of Talwin to patients receiving opiates for a short time. Intolerance or untoward reactions are seldom observed after administration of Talwin to patients who have received single doses or who have had limited exposure to narcotics.

Impaired Renal or Hepatic Function. Although laboratory tests have not indicated that Talwin (brand of pentazocine) causes or increases renal or hepatic impairment, the drug should be administered with caution to patients with such impairment. Extensive liver disease appears to predispose to greater side effects (e.g., marked apprehension, anxiety, dizziness, sleepiness) from the usual clinical dose, and may be the result of decreased metabolism of the drug by the liver.

Myocardial Infarction. As with all drugs, Talwin (brand of pentazocine) should be used with caution in patients with myocardial infarction who have nausea or vomiting.

Biliary Surgery. Until further experience is gained with the effects of Talwin on the sphincter of Oddi, the drug should be used with caution in patients about to undergo surgery of the biliary tract.

Adverse Effects: Talwin is relatively free from the undesirable side effects associated with morphine, such as constipation, urinary retention, or severe respiratory depression. Furthermore, Talwin produces less nausea, vomiting, and diaphoresis than meperidine.

In over 12,000 patients who received Talwin intramuscularly, subcutaneously, or intravenously, nausea, the most frequent adverse effect, occurred in approximately 5.0 per cent. In decreasing order of occurrence were vertigo, dizziness or lightheadedness; vomiting; and euphoria. Respiratory depression was reported as an adverse reaction in 1.0 per cent.

The incidence of each of the other adverse effects was well below 1.0 per cent: constipation, circulatory depression, diaphoresis, urinary retention, alteration in mood (nervousness, apprehension, depression, floating feeling), hypertension, sting on injection, headache, dry mouth, flushed skin including plethora, altered uterine contractions during labor, dermatitis including pruritus, dreams, paresthesia, and dyspnea occurred rarely after administration of Talwin (brand of pentazocine). Furthermore, each of the following adverse reactions occurred in less than 0.1 per cent: tachycardia, visual disturbance (blurred vision, diplopia and nystagmus), hallucinations, disorientation, weakness or faintness, muscle tremor, chills, allergic reactions including edema of the face, taste alteration, insomnia, diarrhea, cramps, and miosis; laryngospasm in one patient.

Talwin has not produced severe respiratory embarrassment in adults (never apnea), even with large amounts. A small number of newborn infants whose mothers received Talwin during labor had transient apnea. The incidence of temporary diminution in the rate or strength of uterine contractions is low after administration of Talwin, similar to that following meperidine hydrochloride. (In reporting no interference with normal labor in patients receiving Talwin, one investigator further stated that the drug may increase uterine activity.) Generally, no significant fetal heart rate change occurs.

Laboratory tests of blood and of liver and kidney functions have revealed no significant abnormalities. A minimum and probably insignificant increase in the per cent of eosinophils in peripheral blood counts and bone marrow occurred occasionally.

Talwin is well tolerated by patients with diabetes mellitus, and no changes in insulin requirements have been observed.

Dosage and Administration: *Adults, Excluding Patients in Labor.* Average recommended single parenteral dose is 30 mg., by intramuscular, subcutaneous, or intravenous route; may be repeated every three to four hours. Pain has been relieved in most patients with not more than three doses daily. Infrequently, selected patients have received single doses as high as 60 mg. *Patients in Labor.* A single, intramuscular 30 mg. dose has been most commonly administered. An intravenous 20 mg. dose has given adequate pain relief to some patients in labor when contractions become regular, and this dose may be given two or three times at two- to three-hour intervals, as needed.

Children Under 12 Years of Age. Since clinical experience in children under twelve years of age is limited, the use of Talwin (brand of pentazocine) in this age group is not recommended.

Duration of Therapy. Patients with chronic pain who received Talwin for prolonged periods (e.g., over 300 days) experienced no withdrawal symptoms even when administration was stopped abruptly; furthermore, there was no tolerance to the analgesic effect.

CAUTION. Talwin should not be mixed in the same syringe with soluble barbiturates because precipitation will occur.

Treatment of Overdosage or Respiratory Depression. Talwin has not produced apnea or severe respiratory embarrassment in adults, even in large doses. Occasionally, however, moderate respiratory depression may occur. Means of maintaining proper oxygenation should be available in case of overdosage or respiratory depression, and methylphenidate (Ritalin®) should be administered parenterally. The usual narcotic-antagonists, such as nalorphine, are not effective respiratory stimulants for depression due to Talwin.

How Supplied: ***Ampuls of 1 ml.,*** **containing Talwin® (pentazocine) as lactate equivalent to 30 mg. base and 2.8 mg. sodium chloride, in Water for Injection. Boxes of 10, 25, and 100.**

Multiple dose vials of 10 ml., **each 1 ml. containing Talwin (pentazocine) as lactate equivalent to 30 mg. base, 2 mg. acetone sodium bisulfite, 1.5 mg. sodium chloride, and 1 mg. methylparaben as preservative, in Water for Injection. Boxes of 1.**

The pH of Talwin solutions is adjusted between 4 and 5 with lactic acid and sodium hydroxide.

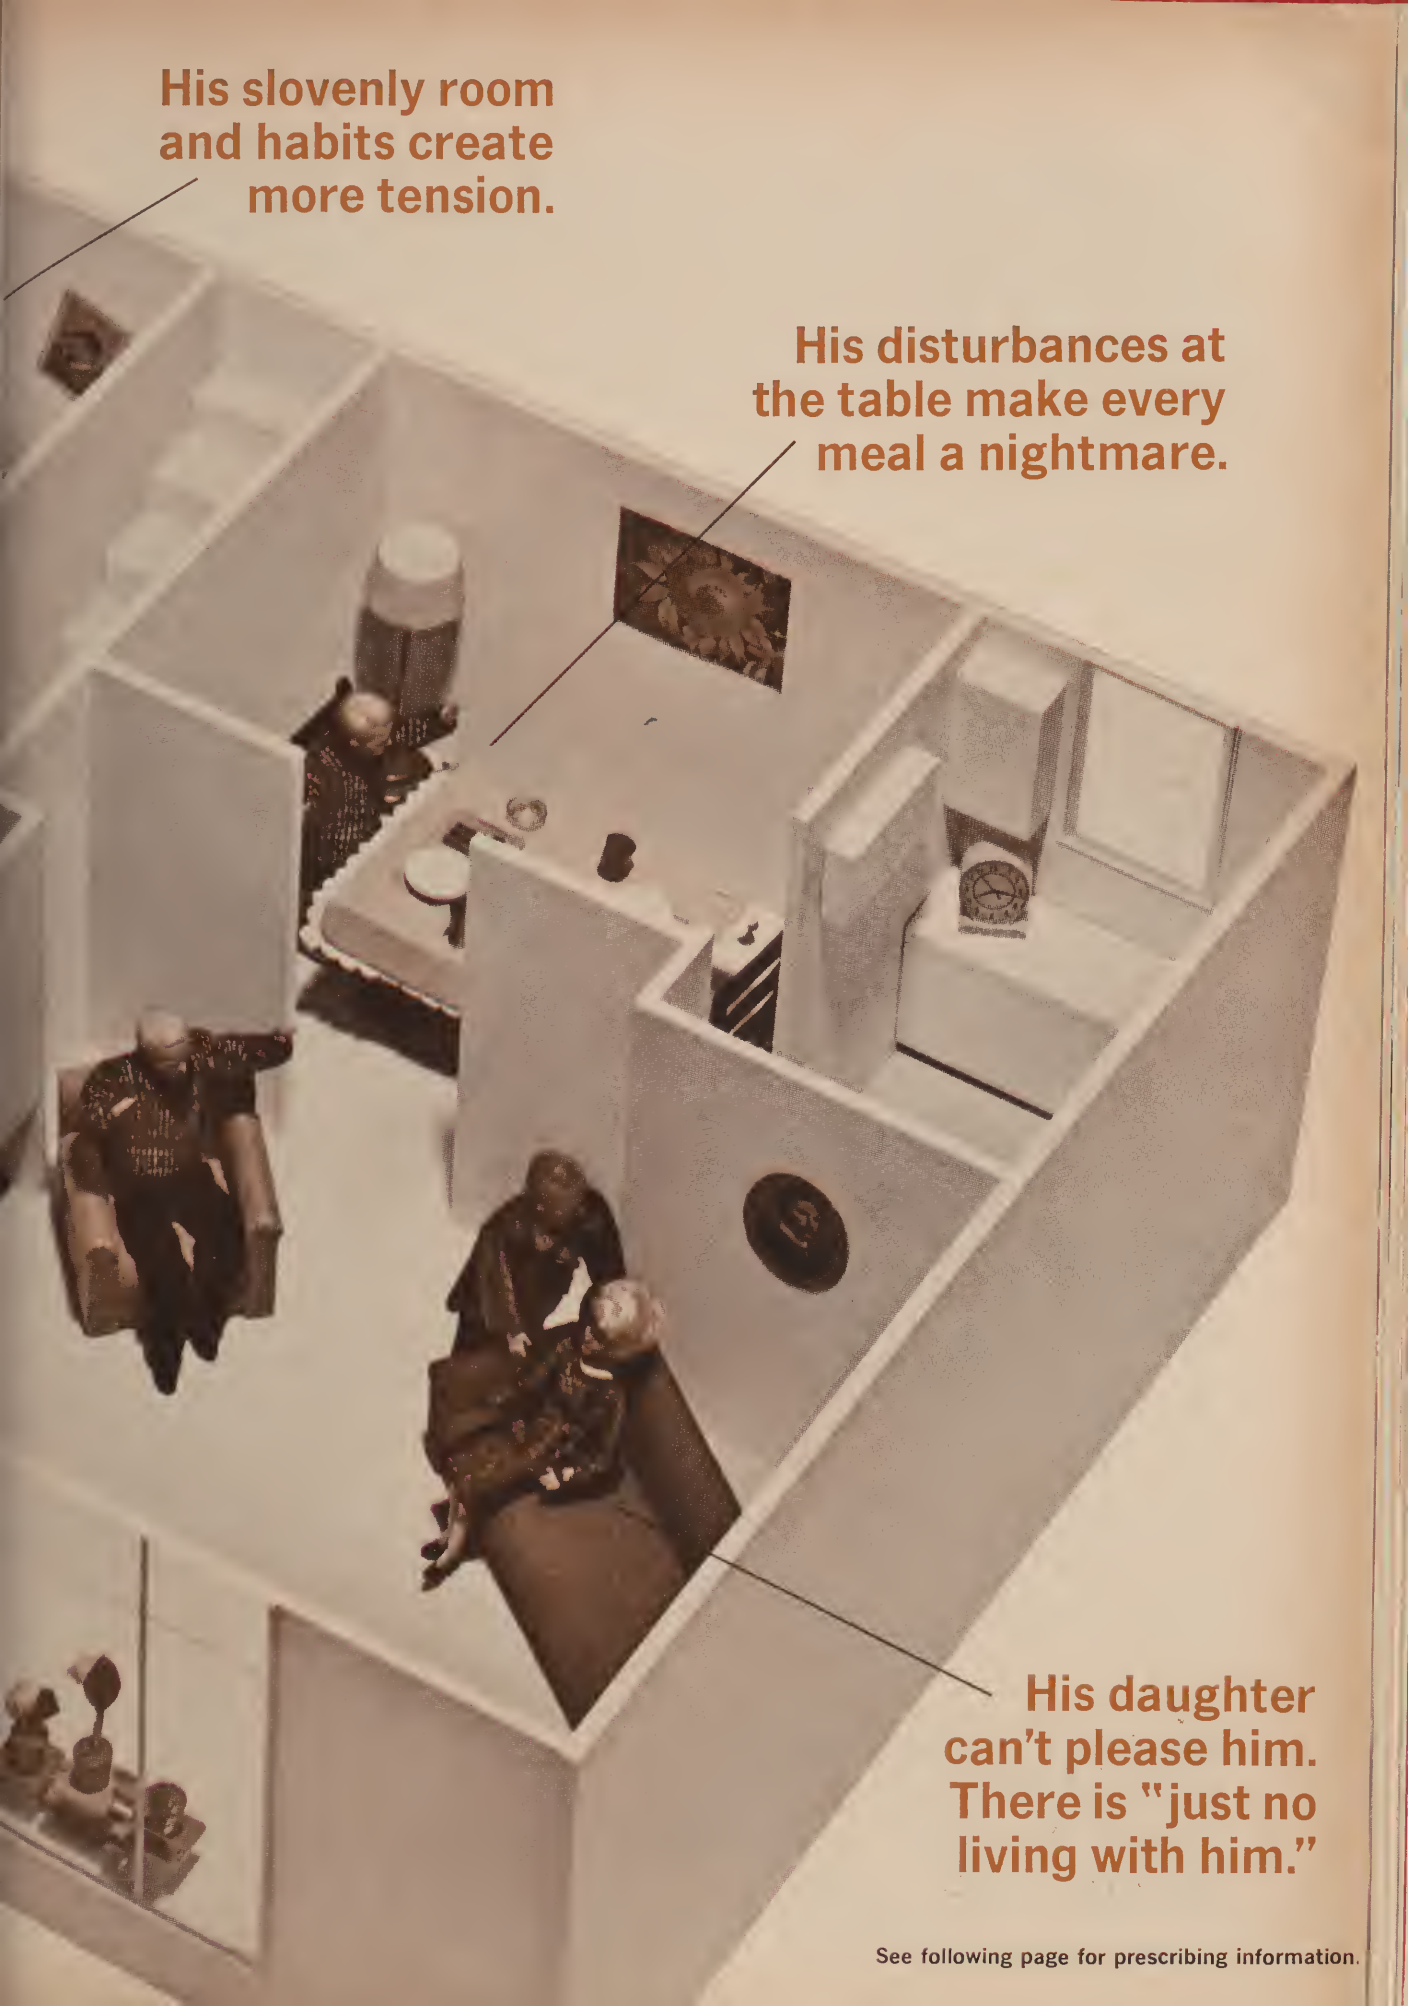
When moderate to severe anxiety strikes home...

(the agitated geriatric)

His teen-age granddaughter won't invite friends home because of his outbursts.



for moderate to severe anxiety

Mellaril®

(thioridazine)

25 mg. t.i.d.

SANDOZ

See following page for prescribing information.

When moderate to severe anxiety strikes home...

Anxiety that *seriously interferes* with the individual's performance at work, at home, or in the community may be regarded as *moderate to severe* in degree.

Mellaril often recommends itself to the treatment of moderate to severe anxiety because it

- helps control the most frequent symptoms: marked tension, agitation, apprehension, restlessness, hypermotility
- often alleviates anxiety-induced somatic complaints
- frequently helps strengthen emotional resources
- helps the patient maintain realistic contact with environment, closer harmony with family

Thus, when you consider the anxiety moderate to severe... consider Mellaril.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.

Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.

Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.

Before prescribing, see package insert for full product information.

for moderate to severe anxiety

SANDOZ

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

Vascular Rings

These anomalies of the great vessels mimic the embryonic vasculature and take a variety of forms. Most common is the double aortic arch: less common is the right aortic arch with a left ligamentum arteriosus. Less common, but notorious as the cause of dyphasia lusoria is an anomalous right subclavian artery arising from the descending aorta and passing posterior to the esophagus and trachea.

The clinical importance of these lesions lies in their ability to constrict the esophagus and trachea; however, the degree of obstruction is quite variable and many of these patients are asymptomatic. The presence of stridor, often relieved by lying the child on its abdomen, and recurrent respiratory infections are common clues to diagnosis and the constricting vessel is usually demonstrable by barium swallow.

Surgical treatment is aimed at freeing the esophagus and trachea by dividing the constricting ring in an area that does not interfere with blood flow. Cineangiography may provide the surgeon with this information prior to operation and thereby greatly expedite the operative procedure.

Ventricular Septal Defect

This is the most common congenital cardiac abnormality and is the most frequent cause of congestive heart failure in infancy. With proper management most of these children will survive until complete repair is possible. However, in those children with large defects or associated anomalies' (frequently patent ductus arteriosus) refractive heart failure and early death is common. While the present mortality rate of complete repair utilizing pulmonary bypass is prohibitive, pulmonary artery banding is a very effective means of palliation and is associated with a low mortality rate. The constricting band about the pulmonary artery accomplishes two purposes: First, by decreasing pulmonary blood flow the pulmonary vasculature is protected; and secondly, the left to right shunt is decreased and the left ventricle is able to function more efficiently. The latter effect is often striking; the child rapidly improves clinically, the heart size decreases and

the digitalis requirement may be curtailed.

In the four patients with ventricular septal defect, three had associated patent ductus arteriosus. In one of these patients, the ductus was the major lesion and following its interruption the pressure in the pulmonary artery fell to the high normal range. Therefore, pulmonary artery banding was not performed. Three of these children survived. The fourth suffered a respiratory arrest 24 hours postoperation and was resuscitated. Although the patient's cardiac status improved markedly, he died seven days later of brain damage and apnea.

Patent Ductus Arteriosus

This common extracardiac lesion is usually well tolerated in infancy, but on occasion the ductus is sufficiently large and the left to right shunt of such magnitude that refractive congestive heart failure results. Under these circumstances, interruption of the ductus is life-saving and is effectively carried out by suture ligature technique, although, on occasion division is indicated. Three infants with patent ductus in severe failure were operated upon. All survived and have demonstrated satisfactory improvement.

Other Lesions

Three other anomalies were seen during the study period. The first was an endocardial cushion defect with a common ventricle, cleft atrioventricular valves and an atrial septal defect. Pulmonary artery banding was planned, but the infant died during the early stages of the procedure. The second child had a patent ductus arteriosus with a right to left shunt through the ductus and lower body cyanosis thought to be on the basis of a preductal coarctation. At operation a ductus was present but a coarctation did not exist. Following occlusion of the ductus, the right ventricular pressure elevated significantly and failure ensued. Postmortem examination revealed pulmonary arteriolar stenosis. The third child was intensely cyanotic at birth and cardiac catheterization demonstrated pulmonary stenosis and an atrial septal defect. The pulmonary valve was divided under inflow occlusion and the child appeared improved. Twenty-four hours postoperation, the child suffered a respiratory arrest and despite artificial ventilation, died twelve hours later.

When the problem is only skin deep

USE 'POLYSPORIN'® brand POLYMYXIN B-BACITRACIN OINTMENT

for topical antibiotic therapy with minimum risk of sensitization

Caution: As with other antibiotic products, prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

Supplied in ½ oz. and 1 oz. tubes.

Tuckahoe, N.Y.

Discussion

Early recognition and definition of life endangering congenital heart disease is vital if children so afflicted are to be given a chance to survive. We wish to emphasize the necessity of early cardiac catheterization in the cyanotic child or the child in heart failure.

The magnitude of the problem of congenital heart disease in infants is apparent. These are small, ill children who must undergo major thoracic surgery. The cyanotic infant not only has a severe hemodynamic defect, but the hypoxic state results in anerobic metabolism and produces severe metabolic acidosis. The infant kidney and lung are capable of only minimal, very inefficient compensation for acidosis. Therefore, frequent determinations of arterial blood pH during the operative period and correction of the acidotic state by the intravenous administration of sodium bicarbonate is essential. Superb anesthetic management is vital. Oxygen concentrations must be maintained at maximum, safe levels, and anesthetic agents that cause arrhythmia or myocardial depression are contraindicated. Blood replacement on a mililiter per mililiter basis and strict management of fluid requirements require constant vigil.

Pulmonary complications are frequent, but controllable. Postoperation, these infants are placed in a high humidity constant temperature environment. Pharyngeal aspiration under direct vision using a laryngoscope is carried out routinely. Oxygen by mask is administered prior to and following aspiration. It is our policy to repeat this procedure at six hour intervals during the first 24 hours, at 8 hour intervals the second 24 hours, and thereafter, as indicated. If adequate tracheal toilet cannot be accomplished, an endotracheal tube is passed and aspiration is performed intermittently with respiratory assistance. We have found this manuever to be very effective and minimally traumatic to the fragile infant respiratory tissues.

Fluid requirements in the postoperative state are much less than the usual maintenance requirements. The amount given is dependent upon insensible loss and renal excretory needs, which vary considerably in the first months of life. Generally these children will take glucose water orally 12 to 24 hours postoperation. If this is tolerated, the formula is rapidly increased during a 48 hour period to insure adequate caloric intake.

The overall operative survival rate in this small series is approximately 70% and compares favorably with the 70% survival rate in children less than one year of age at the Texas Children's Hospital and the 60% survival rate at the Toronto Children's Hospital. These encouraging results demonstrate the feasibility of early operative intervention. With the continuing development of operative procedures that completely correct these defects, early recognition and treatment is increasingly essential.

"When I couldn't even smell corned beef and cabbage,
I decided it was time for you, Doc."

Maybe he doesn't know when he's well off. But you might want to prescribe long-acting Novahistine LP anyway.

Two tablets in the morning and two in the evening will usually provide day and night relief by helping to clear congested air passages for normal, free breathing. Novahistine LP is formulated to provide continuous therapeutic effect for 8 to 12 hours. The decongestant ingredients help restore normal mucus secretion and ciliary activity—physiologic defenses against infection of the respiratory tract.

Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

NOVAHISTINE® LP

Highlights

Rubella Registry to Identify Handicapped Children

John A. Grant, MD, Chief of the School Health Section of the Division of Maternal and Child Health, reports that actual case-finding of rubella-damaged children may point to a perhaps greater incidence of the syndrome than was originally feared.

Physicians are urged to make particularly close examination of children born between January 1, 1964 and March 31, 1965, whose pregnant mothers may have been exposed during the rubella epidemic of 1963-64, using as criteria for positive diagnosis: (1) Failure to thrive, (2) presence of one or more typical congenital anomalies such as heart defects, defects in vision or hearing, defects in other internal organs, and mental retardation, and (3) a positive HAI antibody titre (greater than 1:32).

The new high-speed HAI (*Hemagglutination Inhibition*) test requires 6-7 cc. of clotted blood in a serology tube, available with mailing container from local health departments. The sample should be labeled "Serology rubella syndrome," and sent to Central Laboratory, 16 East 23rd Street, Baltimore, Maryland 21218.

Rubella is a reportable disease. A positive diagnosis should be reported to the local health department for inclusion in the Rubella Registry, which the Department has undertaken to determine how many rubella-handicapped children will require special treatment and educational facilities now and on reaching school age.

Specialized consultation services are available on a regional basis through strategically located local health departments. Dr. Grant has developed a lecture and slide series on the rubella syndrome, for presentation to county medical societies, hospital staffs, and other interested organizations.

Dr. Garcia to Head D & A Team

The Diagnostic and Advisory teams, which operate regionally under the Division of Crippled Children's Services, have been augmented with the addition of Hector Orlando Garcia, MD, to the staff. A native of Havana, Cuba, where he was engaged in the private practice of pediatrics for a number of years, Dr. Garcia recently completed a two-year fellowship at the Diagnostic and Evaluation Center at The Johns Hopkins Hospital. He is a Fellow of the American Academy of Pediatrics and is certified by the Board of Pediatrics. He received the Gold Medal and Diploma Award in the Scientific Exhibit of the Seventh International Congress of Pediatrics in 1953.

US Gives Aid to Nicaragua in Polio Epidemic

Howard J. Garber, MD, Epidemic Intelligence Officer on assignment to the Division of Communicable Diseases from the US Public Health Service, recently served as technical advisor to the Pan American Health Organization, assisting the Nicaraguan Ministry of Health in its efforts to control a severe polio epidemic. As of mid-July, 400 cases of Type I paralytic polio had occurred,

93% in children under five, with 44 deaths. Epidemiologists estimate that for every case of recognized polio, 100 to 1000 cases were undiagnosed.

Between 400,000 and 500,000 doses of Sabin *trivalent* oral vaccine were administered in the immunization effort, followed by second doses in August. Polio of all three types has been epidemic in Nicaragua in the past six years. Although sporadic immunization programs have been carried out in recent years among school children, Nicaragua has no such program for infants and pre-school children.

Department Aids in Dental Survey

The Chief of the Division of Dental Health recently assisted US Public Health Service, Region III personnel in an evaluation survey of preliminary programming for dental services in two *OEO* Head Start projects, in Westminster and Oakland. Some dentists asked to provide remedial care have criticized previous Head Start dental programs as unrealistic, and attribute this to lack of professional guidance in the initial planning. A nationwide sampling survey is planned, to assist in developing guidelines for lay directors of these projects. It is hoped that improved planning will result in more comprehensive dental care for Head Start children.

Maryland Chosen for Health Planning Study

The Department has been awarded a $50,000 contract to test a system of analyzing the effectiveness of state health planning activities. The techniques were developed by the Bureau of Health Services of the US Public Health Service, which awarded the grant.

The study will be performed by an independent research organization, using data compiled by Maryland health agencies during the past five years. The "systems analysis techniques" call for planning around health problems, rather than fixed categories, and were designed in the hope of finding better ways to evaluate health problems, the effectiveness of health services, and the use of manpower and money.

Nursing Homes Press to Conform

Sprinkler manufacturers were overwhelmed with orders from nursing homes attempting to meet the August 1 deadline for installation required by new regulations. The requirement applies to all non-fire-resistive homes having 15 or more beds, those with fewer beds having more time to comply. The Health Department and the State Fire Marshal agreed to accept a valid contract signed and accepted by a sprinkler manufacturer as evidence of a nursing home's compliance with regulations.

Animal Feed to be Regulated

Because of salmonella contamination in the feed of animals destined for human consumption, new regulations are in effect, governing the manufacture of animal byproducts from offal. Monthly laboratory examinations of finished products and routine inspection of plants and operating procedures will be made. Out-of-state products offered for sale in Maryland are also covered by the regulations. The 545 cases of salmonella infection reported last year are believed to represent only a fraction of the true incidence, as many people fail to seek medical attention for a gastric upset.

TWO GOOD REASONS FOR STARTING A KEOGH RETIREMENT PLAN NOW

1. Immediate Tax Savings

A self-employed individual can set up a plan for his retirement and deduct 50 per cent of his contribution from taxable income up to a maximum of $1,250 as well as receive a 100% deduction for contributions for his employees. The tax savings a self-employed in a 48% tax bracket can NOW enjoy with a qualified Keogh Plan are illustrated below.

TAX SAVINGS NOW AVAILABLE

	Without a Keogh Plan	With a Keogh Plan
Self-employed's Contribution	$2,500	$2,500
Taxable Amount	2,500	1,250
Tax	1,200	600
Tax Savings	0	$ 600

By starting a Keogh Plan now, a self-employed can realize a 50% tax savings on his contributions this year—and in 1968, his contributions will be 100% DEDUCTIBLE!

2. Greater return at retirement

THE 'BLUE CHIP' COMPANY THAT'S LOW IN COST, TOO

How come the world's richest companies buy the lowest priced dictating machine?

Eastern Airlines, Union Carbide or Gulf could easily afford any of the six nationally advertised dictating machines priced from $249.50 to $800. Yet they, as well as Ford, American Airlines, Allied Chemical, United States Lines, Goodyear Tire & Rubber, Home Life and many other giants of business, are buying the new Voca at $199.95. Could it be that the Voca is just as good, regardless of price? Or perhaps even better? Find out. We'll be glad to give you the full story. Phone, or mail the coupon today.

Alfred S. Bright, C.L.U.
Agency Manager,
HOME LIFE INSURANCE CO., N.Y.

"In our offices, we need dictating equipment we can depend on . . . that's why we selected VOCA."

Voca Patent Nos. 3,243,133; 199,189, other patents pending.

Only $199.95 complete with dictating or transcribing accessories.

Why? I want to know why experts choose the Voca dictating/transcribing machine over more expensive makes. Please send me full details and full color brochure.

Dulcolax®

sacodyl

DU-5255

Few drugs work as predictably as Dulcolax. You can expect that when your office patient takes Dulcolax at home, it will be as effective as you said it would be. Your patient will be gratified, too.

The reliability of Dulcolax stems from its unique mode of action. The drug works directly on nerve endings in the colonic mucosa, producing normal peristalsis throughout the large intestine. It does not rely on systemic absorption for its effect.

This reliable action provides prompt relief of constipation. It also makes Dulcolax particulary useful for prepping the bowel for special procedures. In short, it makes Dulcolax ideal for your office practice.

Dulcolax acts so surely that the time of evacuation can often be closely predicted. Dulcolax tablets taken at night almost invariably result in a bowel movement soon after waking the following morning. Dulcolax suppositories generally work in 15 to 20 minutes, almost always within the hour.

General Dosage Information: *Adults:* When an ordinary laxative effect is desired, 1 to 3 tablets or 1 suppository usually suffices. Tablets must be swallowed whole, not chewed or crushed, and should not be taken within one hour of antacids or milk. *Children:* 1 or 2 tablets, depending on age and severity of condition. Tablets must not be given to a child too young to swallow them whole. For infants and children under 2 years of age, half a suppository is usually effective. Above this age a whole suppository is usually advisable. Side Effects: As with any laxative, abdominal cramps are occasionally noted, particularly in severely constipated persons. High dosage may result in loose, unformed stools. Contraindication: Contraindicated only in acute surgical abdomen. Availability: Tablets (5 mg.) and suppositories (10 mg.). By prescription or recommendation.

Under license from Boehringer Ingelheim G.m.b.H.

Geigy Pharmaceuticals

Geigy

You may be prescribing Hygroton®, chlorthalidone

You usually prescribe one tablet daily, but every once in a while you like to cut the dosage. So instead of giving the 100 mg. tablet every other day or breaking it in half, why not prescribe the new half-strength tablet every day?

See next page for a brief precautionary statement.

but you don't know the half of it.

New Hygroton 50 mg.

For a clinical supply, please mail us this coupon with one of your prescription blanks.

Geigy Pharmaceuticals
Division of
Geigy Chemical Corporation
Ardsley, New York 10502

DEPT. 7

Broad scope diuretic

Hygroton is indicated in certain conditions where the newer nonthiazide diuretics are not recommended, e.g. hypertension, edema of pregnancy, premenstrual edema, edema in obesity states, steroid edema.

However, the newer diuretics are probably superior to Hygroton in acute pulmonary edema and the nephrotic syndrome or any condition where the glomerular filtration rate is significantly low.

Hygroton
chlorthalidone

Geigy

Indications

Hypertension

Such as hypertension with or without congestive failure, where Hygroton can be used alone or in conjunction with other agents

(*Precaution:* Antihypertensive therapy with Hygroton should always be initiated cautiously in post-sympathectomy patients and in patients receiving ganglionic blocking agents or other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Barbiturates, narcotics or alcohol may potentiate hypotension.)

Edema

Such as edema associated with:
congestive heart failure
or renal disease

(*Precaution:* Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises.)

or hepatic cirrhosis

(Hypoproteinemia, if present, must be corrected concomitantly. *Precaution:* Take special care: discontinue if liver dysfunction is aggravated, since hepatic coma may be precipitated.)

or steroid administration
or obesity
or the premenstrual syndrome
or pregnancy, including toxemia

(*Warning:* Use with caution in pregnant patients, since the drug may cross the placental barrier and adverse reactions which may occur in the adult, e.g. thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc., are potential problems in the newborn.)

Contraindications

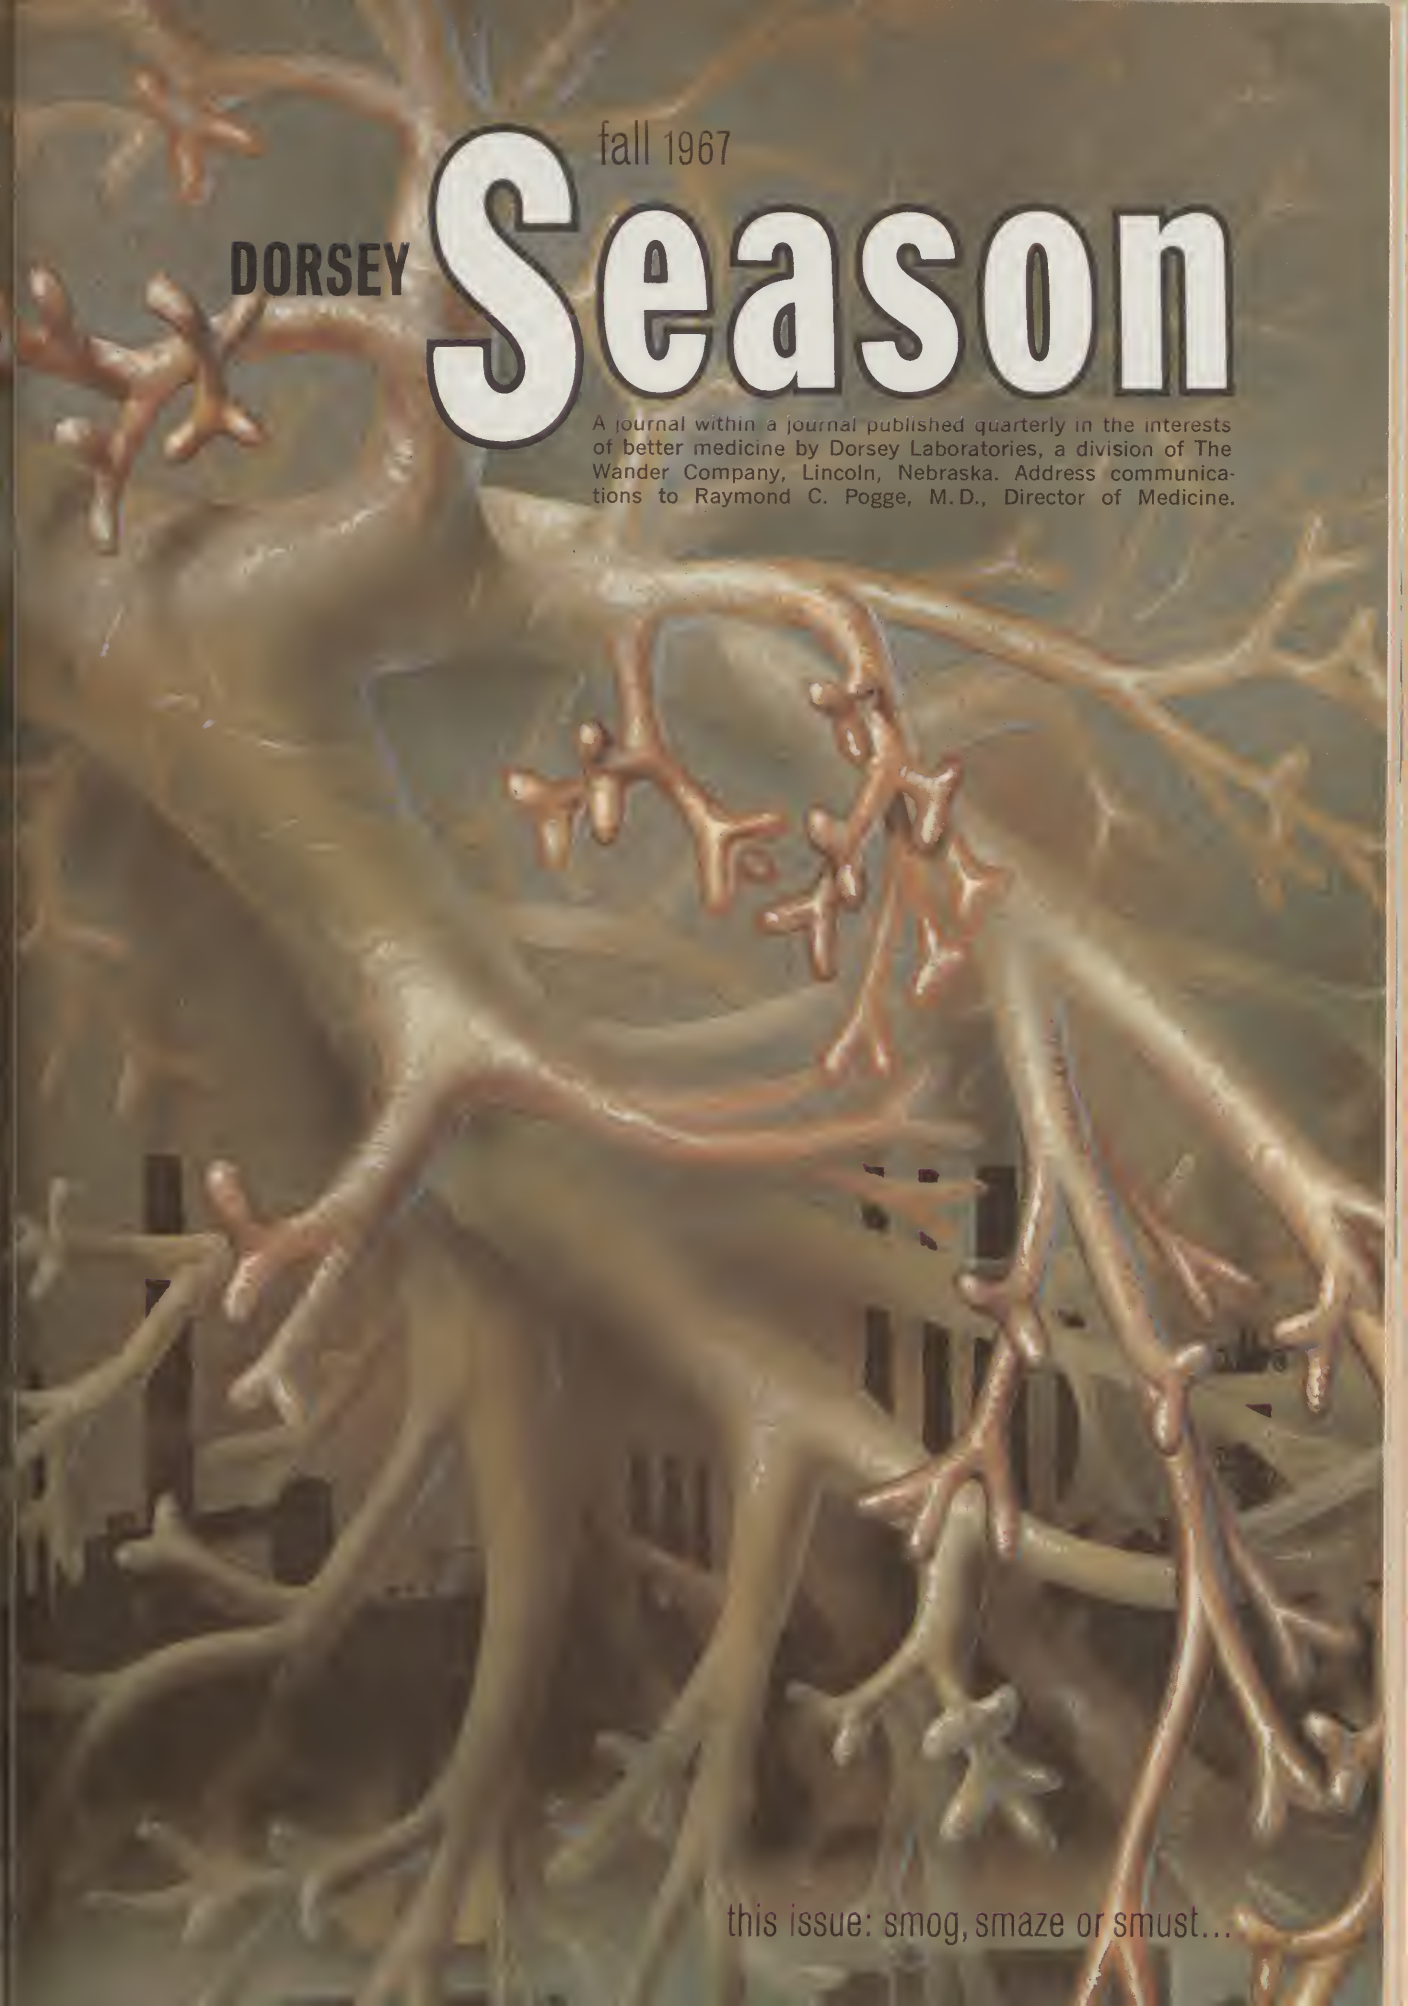
Severe Renal or Hepatic Disease and Demonstrated Hypersensitivity

Other general warnings, precautions and adverse reactions

Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur.

Precautions: Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Hygroton should be discontinued and potassium supplements given, provided the patient does not have marked oliguria.

Take special care in severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended.



Adverse reactions: Nausea, gastric irritation, vomiting, anorexia, constipation and cramping, dizziness, weakness, restlessness, hyperglycemia, hyperuricemia, headache, muscle cramps, orthostatic hypotension, aplastic anemia, leukopenia, thrombocytopenia, agranulocytosis, dysuria, impotence, transient myopia, skin rashes, urticaria, purpura, necrotizing angiitis, acute gout, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Other reactions reported with this class of compounds include: jaundice, xanthopsia, paresthesia, and photosensitization.

Average Dosage: 50-100 mg. with breakfast daily.

Availability: White, single-scored tablets of 100 mg. and aqua tablets of 50 mg. in bottles of 100 and 1000.

Smog, smaze or smust...effects of air pollution on upper respiratory tract

Nathan Flaxman, M.D., Diplomate, American Board of Internal Medicine, Chicago, Illinois

In Los Angeles it is *smog* (smoke and fog). In New York City *smaze* (smoke and haze). In El Paso *smust* (smoke and dust). The original factor was smoke plus such natural phenomena as fog, haze and dust, but air pollution has mushroomed from a smoke problem in our industrial cities into a major economic, esthetic and public health problem that affects practically every American locality and citizen.[1,2] Respiratory disease, of course, is by far the most costly effect of air pollution, for contaminated air can aggravate our illnesses, deplete our strength and shorten our life span.[1]

The greatest problem in dealing with solid wastes is that they are not quickly returned to dust. To aid the decomposing process, the great bulk of such waste is burned, polluting our air in the process.[3] Dr. Jack McKee of the California Institute of Technology[4] has calculated that in Los Angeles County, which has more than six million people, about three pounds of gaseous wastes per person per day (on a dry-weight basis) enter the atmosphere. This is twice as much as solid refuse disposal and six times as much as the contaminants in waste water. It is estimated that in New York City, 730 pounds of pollutants, a little over half the size of a compact two-door sedan of foreign make, is annually thrown into the air for each man, woman and child in the city.[5]

Air pollution is an evident factor, not only in the common cold and upper respiratory disease, but also in chronic bronchitis,[2] pulmonary emphysema,[6] bronchial asthma,[7] pneumonitis and lung cancer.[8] Its effect on the incidence of pulmonary tuberculosis is unproved,[9] although it is conceivable that the presence of various materials polluting the air might do this. A siege of smog in Denver, the "mile high city," in December 1965 was accompanied by respiratory infection that doubled normal absentee rates in schools, factories and city government.[10]

While air pollution is only one factor, it has become important in the causes of most of the afflictions of the respiratory tract. This has been shown not only by the Denver occurrence, but also by detailed study[2] of respiratory illness in a small group of 313 men

from October 1962 to May 1963 when there were 202 episodes involving the upper respiratory tract. The attack rate of illness was related in time to increased concentration of both smoke and sulphur dioxide in the atmosphere of the district in which the men lived.

Other factors often mentioned, include exposure to those who have colds, exposure to extreme changes of temperature, allergy and bacterial infection. However, when low individual resistance due to lack of rest, overwork, fatigue, improper or unbalanced diet, previous illness and emotional stress are included as causes, we enter the realm of somewhat obscure relationships. Much more emphasis can be placed on the role of polluted air.

The symptoms, signs and complications of involvement of the upper respiratory tract, especially the common cold, are the same regardless of the causative factor. Swelling of the lining of the nose, the scratchy dry throat, the discharge from the nose at first watery then thicker, discolored and more tenacious, the eyes tearing, and frequent sneezing are all part of the Number 1 human ailment. Concurrent or residual sinusitis when mucus is trapped there, middle ear involvement due to interference with drainage, laryngitis and bronchitis are complications of the common cold. The primary interference is with a most important function of the nose—the cleansing of foreign matter in the first line of "air defense" to prevent it from entering the breathing tract.

However, the diagnosis and subsequent decision on how to treat the patient so affected rests basically on the relief of symptoms that cause him the misery. The stuffed, runny nose, the clogged ears, and the harsh dry cough—all the symptoms that make common cold sufferers feel miserable and interfere with their sleep—can be alleviated with medications of the oral nasal decongestant/antihistamine combination type. The burning sensation in the throat, soreness of the chest and even chest pain can also be relieved by such medication. Rest in bed if there is fever (but confined to home at least), liberal fluids, uniformly warm surroundings and adequate humidity in the room, are all helpful adjuncts to the medication. Most common cold sufferers recover rapidly and are symptom-free in four to ten days.

Further treatment, altered by the fact that the affliction hangs on for more than the usual duration of the common cold, requires consideration of allergy, which is most frequently the prolonging factor. But air pollution itself may often be the culprit.

(Concluded on following page)

For nature's hazards:
nasal congestion
due to seasonal
allergies and
summer colds

Triaminic® *syrup*

Each teaspoonful (5 ml.) contains:

Phenylpropanolamine hydrochloride	12.5 mg.
Pheniramine maleate	6.25 mg.
Pyrilamine maleate	6.25 mg.

For nasal congestion regardless of cause, you can bring quick, lasting comfort to your little patients with Triaminic Syrup. You may occasionally encounter these side effects: drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: the possibility of drowsiness should be considered by patients engaged in mechanical operations requiring alertness. Use with caution in patients with hypertension, heart disease, diabetes, or thyrotoxicosis.

(Advertisement)

At the Third National Conference on Air Pollution held recently, it was emphasized that this subject had received more attention in the past four years than in all previous history. Spicer,[11] an active participant at this conference, reiterated that it behooves the practicing physician to be aware of trends in respiratory disease and to accept a major role in community action relating to air pollution and respiratory health. By taking a positive stand physicians have been instrumental in the development of anti-pollution legislation. An outstanding example is Los Angeles where major steps have been taken by abolishing coal burning, and even banishing oil burning, seven months a year. Natural gas must be used instead and it must be used by industry when available. Backyard incinerators have been abolished in favor of landfill disposal, and building incineration ended except for a few expensive smokeless furnaces.[10] Concerted action can be taken against particular industrial nuisances. One company that disregarded complaints discovered its error when thousands of its credit cards were returned by irate customers who decided to patronize competing companies.[12]

Summary. Respiratory disease is the most important and most costly effect of air pollution, whether termed smog, smaze, or smust. Air pollution is an economic, esthetic and public health problem that affects practically every American locality and citizen. New sources of air pollution are invisible and odorless, but the harmful gases and liquid droplets are there. Triggered by sunlight, some of these undergo mid-air chemical changes and the results are even more irritating to the upper respiratory tract. The symptoms, signs and complications, especially of the upper respiratory tract, can be readily aborted by modern medication but may be unduly prolonged by polluted air. In steps taken to prevent this, the practicing physician can take a major role.

How can he be a sport with a runny nose?

For summer allergies, summer colds, or nasal congestion due to almost any cause, you prescribe quick r-e-l-i-e-f with Triaminic. It's ideal for summer allergies:

1. Acts in 15-30 minutes due to decongestant.
2. Follows up with balanced dual antihistamines.
3. Up to 24-hour 'round the clock relief when dosed one tablet at morning, midafternoon and evening.

Summer time is sport time and who can be a sport with a runny nose?

provide patient comfort

Triaminic® relieves summer allergies

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitation, flushing, dizziness, nervousness or gastrointestinal upsets.

Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Public Health Responsibility for the Alcoholic. Part II.

DAVID TRACHTENBERG, MD

Court Decisions

In last month's issue (Part 1) I said we are obliged to set up treatment programs; if not morally and professionally, then finally legally. In the recent past there have been two federal court decisions in this area concerning the status of the alcoholic. One in the Fourth Circuit Court of Appeals in Richmond and another in the Federal Court of Appeals for the District of Columbia. There is at the present time, on its way to the Supreme Court, a similar test case which will affect the status of the alcoholic on the national level. In my opinion the Supreme Court will most certainly affirm the decisions of these two lower courts, and what will happen when the jails are no longer available as our primary treatment source? What will we have for these people on the day when our local courts begin to turn them over to us? In Montgomery County in the 18 months ending June '65 there were 1781 individuals convicted on the charge of public drunkenness alone. Of these, some 780 individuals were convicted more than once within a twelve month period, some up to 16 times in 12 months.

The experience in Washington is a good example of what can happen. The present situation resulted from a decision some time ago when the courts took the action that they never took previously. As a result, unprepared treatment facilities in the District have been completely overwhelmed. I am told that all real treatment programs have, in fact, broken down under the impact of these tremendous numbers of people. It would be unwise not to prepare and leave ourselves open for the tremendous difficulties that public health officials in the District are now suffering, not to mention the alcoholics themselves.

I have heard of a plan, where alcoholics will be disposed of by civil commitment for six months to two years, and thus, be salted away more effectively even than through jail. It is the opinion of Mr. Peter Hutt, the lawyer who represented Mr. Easter in the District, that civil commitment will also be found to be unconstitutional. He states, "I have grave doubts, however, about the constitutionality of wholesale civil commitment of chronic alcoholics. We have not fought for two years to extract Easter, Joe Driver, and their colleagues from jail, only to have them involuntarily committed for an even longer period of time, with no assurance of appropriate rehabilitative help and treatment. . . . The euphemistic term 'civil commitment' can easily hide nothing more than permanent incarceration. Thus I would caution those who might rush head-long to adopt civil commitment procedures, and remind them that just as difficult legal problems exist there as with the ordinary jail sentence." I would likewise advise you not to count on civil commitment for very long.

The alcoholics are out there, and we are going

Presented by David Trachtenberg, MD, psychiatrist, Chief of the Bureau of Alcoholism and Drug Addiction, Montgomery County Health Department, on June 1, 1967 before a section of the Maryland Public Health Association.

to be obliged to treat them, therefore what would good treatment be? What is needed? Let me divide the services into four broad areas.

Education

At the present time education, in addition to the treatment of alcoholism itself, represents our only means of prevention. It is essential that we inform the general population about the prevalence of alcoholism and its early signs. This in itself will be useless without a major effort on our part to change the emotional attitudes of the public toward alcoholism as a disease. Everyone must understand that the only shameful thing about alcoholism is to have it and know it and not have it treated. The alcoholic must be seen as suffering from an illness that he is unable to handle. The use of alcohol must itself be separated in the public mind from its association with masculinity, and from its necessary connection with swinging or celebrating or having a good time.

Attitudes towards drinking have been demonstrated repeatedly to be the most important element in the establishment of drinking *practices*. This can be seen clearly in cross-cultural studies of drinking practices. Note the traditional Irish attitude, that alcohol is to be used to celebrate and to get high, as a mechanism toward freedom and escape. In the Chinese or Jewish or Italian cultures alcohol is used freely, but it is clear in each culture that drinking is to be controlled and used in solemn family ritual rather than to produce euphoria. In these last three cultures, while drinking is encouraged, there are strong sanctions against drunkenness. The individual who overimbides is subject to the ridicule of his group. As one would expect, the incidence of alcoholism is far higher among the traditional Irish than among the other three groups. The development of responsible attitudes toward the use of alcohol, which takes into account actual social practices, is in my opinion the most important prerequisite to prevention of alcoholism.

If the general public must be educated, with particular emphasis of course on the adolescent, so also the professional caretakers must be made aware of the extent of the problem and particularly of their own prejudices about alcoholism. It has been said that alcoholism is the most frequently undiagnosed disease. I am certain this is so. This reflects several things in my opinion. First, the lack of awareness on the part of caretakers of the real prevalence of this illness; second, the feeling of futility on the part of caretakers toward alcoholism; and third, the anxiety which many of us feel about our own drinking.

Therapeutic Services

Recently I read of a physician who had divided alcoholics into four groups: the good, the bad, the mad, and the sad. In this way, he is separating those alcoholics which continue to be productive members of the community who will gradually come to depend on alcohol; those psychotics who use alcohol as self-medication; the psychopath whose excessive use of alcohol is part of a broader anti-social adjustment, and lastly those people with acute or chronic depression who use the alcoholic oblivion to make life bearable.

This simple classification itself would require a number of different treatment approaches in our efforts to manage the disease. If we separate these groups again into those who, for example, are still living with their families and those who are not; or those who require vocational rehabilitation or training and those who do not; those who have severe medical complications and those who do not; and those whose families are disorganized and those whose families are intact, you can see that we end up with quite a grid, each item on which requires a somewhat different treatment approach.

Obviously what is needed is a *system* of service broad enough to provide continuity as the alcoholic progresses through the various phases of his illness, and also to handle the spectrum of specific problems, tailoring the program to the needs of each individual family. Incidentally, I keep saying "family." This is intentional because alcoholism, except in its very earliest stages, is clearly a family disease. It cannot be approached on the individual level in most instances.

The system of services which I am proposing begins with an inpatient unit which offers four services:

1. A detoxification unit in which the patient would be expected to remain for 48 to 96 hours. Here, physical examination, diagnosis, and treatment of acute alcohol poisoning will be conducted.
2. A hostel where alcoholics can stay for a few days under supervised conditions should they

refuse more intensive treatment, but still require shelter. Alcoholics might be admitted to the hostel directly by the police as an alternative to jail or through the detoxification unit if their clinical condition requires.

3. Halfway house facilities for both men and women within the community which alcoholics can use as a base of operations during the time in which they are recovering from their intermediate brain syndrome, the phase between acute intoxication and full functioning. In the halfway house the alcoholic would be exposed to broad and intensive diagnostic procedures which would include a psychological and physical evaluation, family diagnosis, and vocational analysis. During his stay in the halfway house the patient's family would hopefully be brought into the treatment program and would also receive intensive assistance. An alcoholic might be expected to remain in the halfway house for from 3 to 12 weeks. During that period he would begin a job or vocational training. In addition, he would be expected to profit from the group living, with heavy emphasis on milieu therapy. Toward the end of his stay the halfway house would, in fact, function as a night hospital.

4. For those who require long-term hospitalization we might depend on the state hospitals which would be free of the burden of caring for the transient, rapid turnover group and could thus concentrate their resources on long-term treatment. Following a stay in the state hospital the alcoholic might then come to the halfway house or go directly into the community as the situation dictates.

Outpatient Treatment

Outpatient treatment must be available for the alcoholic and his family. Those who did not require inpatient treatment would, of course, be picked up directly in the outpatient clinics.

Community outpatient clinics already exist in many communities. Some have very few alcoholic patients. It is my opinion that where this is true, it is the responsibility of the clinic and not of the alcoholics. We have found that our patient load varies directly with our effort to reach various community agencies and make them aware of our program to provide them with consultation in

their efforts with these people. The outpatient clinic is a keystone in our local treatment program but alone it is not enough.

A day hospital would be part of the outpatient facilities. In addition, individual and family psychotherapy and supervision would be carried on. Adult education courses might be brought into the outpatient facilities specifically in terms of family planning, money management, social skills, etc. It is amazing to note how many of the families we deal with do not have even rudimentary information about how to run a family.

Vocational Training

Vocational training is an essential part of the overall rehabilitative process. Any alcoholic program requires full-time vocational rehabilitation service at every level, rather than as a pretermination referral.

Obviously the variety of treatment services I have proposed cannot become a program without effective and imaginative leadership at the program director level. The program director's office, in addition to the ordinary administrative functions, must be charged with the critical responsibility for community coordination. Without constant and strenuous efforts to reach the various caretaking agencies and citizens groups, any alcoholism program will fail. We must not only motivate the patients and their families, we must motivate the motivators. We must teach the various social agencies about alcoholism, help them to examine their own attitudes about the disease, and finally demonstrate to them that their efforts in referring patients and working with those people in the program will be rewarded by a sharply rising success rate. We have found that the community coordinating, or organizing if you prefer, functions are among the most important offered in the program. The more we look for patients the more we find, and the more we involve in a coordinated comprehensive treatment program the more we help.

Role of the Public Health Services

We have talked about who the alcoholic is, where he is, what is happening to him now, what we should have to offer him. What specifically can be the role of public health services in establishing and maintaining alcoholism programs?

It is at this point that I must confess that I wear two hats. That is, while I am half-time with Montgomery County Health Department, I am

also in private practice in psychiatry. I consider that I have a vital interest in private medicine as well as public health. My point of view then reflect my own efforts to integrate both of these, if only for my own mental health. With the exception of some outstanding achievements in prevention of infectious diseases, it seems to me that public health agencies have been the firemen and more often the garbage collectors of the medical community. In recent years, with increasing federal aid and emphasis on large scale research, the picture appears to be changing and public health agencies are moving into the forefront of American medicine. This is as it should be. You have the money and more important you have the big picture and so it should be with alcoholism programs. It must be the public health agencies, with the money to construct adequate facilities and with the staffs available to evaluate programs that must take the lead.

Any good salesman will state as one of the primary principles of selling that he must create a demand for his product. It is the health departments that must create the demand for adequate alcoholism and, incidentally, drug abuse programs. You must make your communities aware that alcoholism is a disease that can be successfully treated. Welfare departments, schools, and other community groups must be shown how to spread the word and they must be helped in examining their own attitudes about the disease.

It is the law in Maryland that junior high school and high school children be exposed to a course which includes information about alcohol, smoking, etc. These courses are often inadequate, concerning themselves with the chemistry of alcohol, for example, rather than alcohol as a significant social phenomenon. Not enough attention is paid to who are doing this teaching and what their attitudes are. The goals of teaching, that is, what we are really trying to say to these young adults must be more clearly formulated and evaluated and there must be some way of testing the effectiveness of our efforts.

Construction of facilities as a practical matter can be effectively accomplished through local governmental agencies. Hospitals are expensive to build and maintain and, with State and Federal aid, public health agencies are, in my opinion, in the best position to create them.

Supervision of facilities, the publishing of models plans and the final evaluation of individual programs should be supervised by your local health departments, not only to safeguard the public from abuses but even more important, to provide positive leadership and example for those who are in this who are working in the area. Finally, where the private sector is not yet providing even minimal service, or where services are required which are difficult for people in private medicine to organize, then these services can be provided through the health department. Day Care Centers, for example, or family therapy groups, vocational rehabilitation, welfare, can probably best be coordinated on the public health level.

Finally, having initiated programs and having provided leadership, having educated the professional and lay community about alcoholism, the final goal of the public health agencies should be to pull out, to turn the programs and the facilities, wherever possible, over to the private sector so that extended interests along other frontiers may be explored and the process repeated. In this way, public health can never again become the sometimes stale sedentary bureaucratic garbage dump that it has seemed to be.

Fact Sheet for 1967 Fiscal Year

In 1967 Maryland's hospitals for the mentally ill again treated a record number of patients, reflecting the continuing rise in admissions. In 1958 these facilities treated 16,197 patients; by 1967 this had increased 41.4% to 22,897. However, due to shortened periods of hospitalization and the continuing decrease in the number of long term patients, the average daily size of the patient population declined 12.5 percent during this period from 9,530 to 8,006. Detailed data are shown in the following table—

A similar upward trend has been observed in virtually all of the 101 clinics and other outpatient centers reporting to the Maryland Psychiatric Case Register. Total admissions to these facilities are estimated to have increased 10.0% from 14,691 in 1966 to 16,161 in 1967. Since comparable data have been reported by most states, the question is frequently posed whether or not this reflects a rising incidence of mental illness. This can not be readily answered since the numeric relationship between the number of individuals treated in psychiatric facilities and the total number of mentally disturbed or ill can not be determined. However, it is generally believed that the rate of occurrence of most mental illnesses has not changed appreciably and that these expanding figures therefore primarily reflect the growing acceptance and usage of psychiatric hospitals and clinics as short term intensive treatment facilities for alcoholism and acute psychoneurotic and personality disturbances.

Substantial overcrowding continued at Rosewood, the larger of Maryland's two hospitals for the mentally retarded. It therefore persisted in its policy of relating the number of admissions to available space and staff. Despite this restrictive policy, the average number of retarded patients at Rosewood and Henryton increased 109 to 2,997 last year. Ten years ago, prior to the opening of Henryton, Rosewood had a patient population of 1,865. In an effort to resolve this chronic problem, the Department is engaged in a three-pronged program involving the construction of additional buildings at Rosewood, the establishment of new facilities in the Baltimore and Washington metropolitan areas and the development, with the Health Department, of coordinated community based services as alternatives to hospitalization.

FISCAL YEAR	AVERAGE SIZE OF PATIENT POPULATION	TOTAL NUMBER TREATED DURING YEAR	ADMISSIONS	TOTAL SEPARATIONS

Aminophylline dura-tabs®

prolonged-medication tablets 4½ gr. (0.3 Gm.)

Precautions: Use with caution in patients with poor renal function as a decreased rate of excretion may lead to accumulation and untoward reactions. Gastric irritation may occasionally be observed in certain patients sensitive to oral aminophylline.

Dosage: Adults, 1 to 2 Aminophylline Dura-Tabs each 8 or 12 hours, with food.

RARELY UPSET THE STOMACH

Oral aminophylline needn't disturb the stomach—nor a good night's sleep. Patients breathe easier all day, sleep better all night, as each Aminophylline Dura-Tab dose provides effective therapeutic activity for up to 12 hours. And unlike conventional tablets, AMINOPHYLLINE DURA-TABS seldom cause gastric distress. The special Dura-Tab process allows the gradual absorption of the medication from the intestinal tract with only a small fraction of the dose released in the stomach.

Hand Function in Quadraplegia

DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

Andersen[1] has pointed out that at least one-third of patients with spinal cord injuries seen in a Veterans Administration Hospital are classified as partial quadriplegics. Although there is a good deal of variation in the pattern of paralysis depending on the level of cord injury, generally there is maintenance of neck muscles, shoulder abductors, elbow flexion, supination of the forearm and wrist extension. Shoulder adduction, elbow extension, forearm pronation, wrist flexion and flexion and extension of the fingers are frequently absent. Loss of shoulder muscle stabilizers and loss of triceps strength is crippling because it prevents the patient from lifting himself in a wheelchair and makes transfer from bed to wheelchair difficult. The maintenance of elbow flexion and wrist extension, however, allows the possibility of use of the hand to bring fairly small objects to the mouth and is helpful in such activities as feeding, shaving, washing and dressing. These actions depend on the use of weak lateral prehension between thumb and index finger on extending the wrist.

Eleven patients with quadriplegia were studied with the upper extremity function test *UEFT*.[2] most cases were caused by trauma but some had, in addition, osteoarthritis of the cervical spine; one was caused by a granulomatous lesion and one was unexplained.

Characteristic Hand Movements in Quadriplegic Patients

Figure 1 shows the maintenance of lateral prehension between the thumb and the lateral side of the proximal interphalangeal joint of the index finger during wrist extension. With this trifling tenodesis action, the patient may be remarkably independent. Figure 2 shows the characteristic way in which this action is used to grasp, and Figure 3 shows the use of this movement in pinch.

Generally the scores on the *UEFT* of the two hands of any individual patient were slightly different. Weakness of grip on dynamometer was universally present, pinch between thumb and the little finger was the most common loss of function. As the impairment became more severe, the ring and middle fingers dropped out as did grasp of the larger blocks. Moderate strength of dynamometer testing and good performance of grasp function were found to be necessary for a patient to control crutch handles.

Return of function was unusual in patients with traumatic quadriplegia. One patient with an idiopathic transverse myelitis of unexplained origin

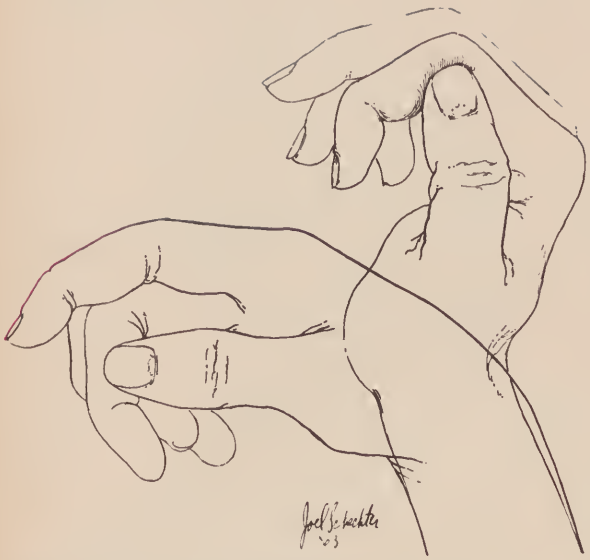

Fig. 1. Tenodesis type action of thumb and lateral side of index finger in Quadraplegia.

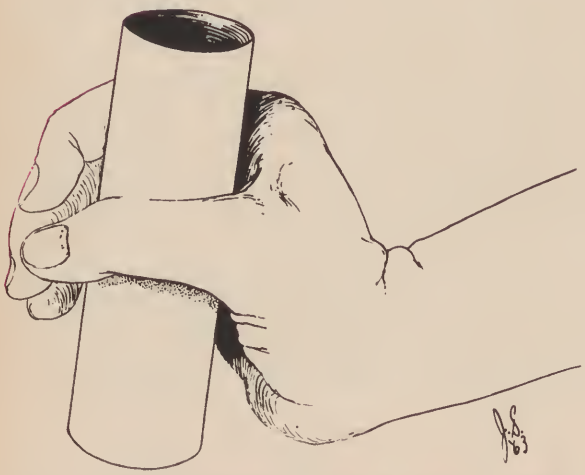

Fig. 2. Use of tenodesis action in grasp in Quadraplegia.

Fig. 3. Use of tenodesis action in pinch in Quadraplegia.

showed gradual increasing hand functioning over a period of about 6 months. The initial loss of function was of two types in this patient. First, there was clumsiness and difficulty with placing the objects onto the shelf. Secondly, there was loss of fine function of the ring and small fingers. Return of function was characterized by improvement in shoulder function without too much change in activities of the fingers. There was also a two to three fold increase in dynamometer grip.

Woman's Auxiliary

"Team Mates"

Richard Bauer, MD, President of the Maryland State Medical Society and his wife, Randy, Hospitality Chairman of the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland, make one of six husband-wife teams serving on Boards in Maryland.

A graduate of Jefferson Medical College in Philadelphia, Dr. Bauer has been in practice in Prince Georges County since 1949. He enjoys directing at the Adelphian Little Theatre of which he was founder and past president.

Randy is a past president of the Woman's Auxiliary to the Prince Georges County Medical Society and is president of the Adelphi Chapter of the American Field Service program.

The Bauers have three daughters: Suzanne, Phylis and Barbara.

A past president of the Maryland Chapter of the American College of Surgeons, John Connolly, MD, was elected president of the Baltimore City Medical Society this year while his wife, Marion, takes over the chairmanship of International Health in the Auxiliary. He is a graduate of Georgetown University and its Medical School, and served in Surgical Hospitals during World War II. In 1966 he was appointed to the Archdiocesan Council of Priests, Religious and Laity by Cardinal Lawrence J. Shehan, and in 1967 was elected to the National Board of Governors of the Alumni Association of Georgetown University, and President of the Staff of St. Joseph Hospital for three years.

Marion who modestly claims a lower rating but undeniably admits to as busy a life rearing seven children—six girls and a boy, likes to play bridge and travel.

* * * * *

In addition to being an office nurse for her husband in a busy small town practice, Ruth Barnhart manages to be the recording secretary in the Auxiliary to the Cecil County Medical Society of which he husband, Jay, is president. They met in his senior year of pre-med at Franklin and Marshall College after she graduated from Lancaster General Hospital Nurses Training in 1957. While he attended Jefferson Medical College, Ruth did private duty nursing in between having two babies—both girls.

After collecting such laurels as membership to *AOA* Honor Society and the award of being the best intern for the year 1961-62 at Lancaster General Hospital Dr. Barnhart decided to hang his shingle in the Northeastern part of Maryland near the Chesapeake Bay where, according to Ruth, there has never been a dull moment.

MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

SEPTEMBER, 1967

Medical Ethics Class

Presented by Ian Anderson, MD

On Wednesday, June 21, 1967, Ian Anderson MD, gave a lecture to the Baltimore Association of Medical Assistants on the subject of *Medical Ethics*. This is one of the subdivisions of the Certified Medical Assistant Examination which was given at the University of Baltimore on June 23 and June 24; consequently the lecture was most appreciated by the members of *BAMA* who intended taking that examination this year.

In spite of the fact that this was a very hard to define subject to discuss, Dr. Anderson did a remarkable job of ascertaining the points of information most necesssary to the medical assistant and correlated this most adroitly with bits of medicolegal information along the same line so that the presentation was most helpful. Discussion with the members present followed, and everyone present enjoyed the meeting.

Dr. Anderson is a graduate of the University of Maryland School of Medicine, graduating in June, 1962. He performed his internship and one year of residency at South Baltimore General Hospital. He then joined the staff of Church Home and Hospital in July of 1964. Dr. Anderson is now Chief Resident in Surgery at Church Home and Hospital and will complete his residency June 30, 1968.

IAN ANDERSON, MD

HAROLD ROSEN, MD, GUEST SPEAKER AT THE B.A.M.A. MONTHLY MEETING

At the Baltimore Association of Medical Assistants monthly meeting on June 13, 1967 held at Longley' restaurant in Towson, Harold Rosen MD, presented a very interesting discussion on thes ubject of "Hypnosis." Dr. Rosen introduced

when bursitis hits a 280-lb. tackle, hit back with Butazolidin alka

Indications: Osteoarthritis, rheumatoid arthritis, rheumatoid spondylitis, psoriatic arthritis, acute gout, painful shoulder (peritendinitis, capsulitis, bursitis and acute arthritis of that joint), acute superficial thrombophlebitis.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of Butazolidin alka are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make regular blood counts. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ul-

For 280-lb. tackles—or 108-lb. housewives—Butazolidin alka can hasten recovery from the agonizing pain of shoulder bursitis.

It's not for every patient. Check carefully the Contraindications, Warning and Precautions shown below.

And adverse reactions may occur. The most common are nausea, edema and rash. Rarely, agranulocytosis has been reported. All adverse reactions are listed below, too.

Play-for-pay or workaday patients—when they come up with shoulder bursitis and your clinical judgment indicates Butazolidin alka—go with it.

And watch the comeback.

cer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Mild drug rashes frequently subside with reduction of dosage. However, rash accompanied by fever or other systemic reactions usually requires withholding medication. Purpuric rash has also been reported. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, or a generalized allergic reaction similar to serum sickness may occur and require permanent withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur. 6509-V(B)R2

Butazolidin® alka

Capsules

100 mg. phenylbutazone
100 mg. dried aluminum hydroxide gel
150 mg. magnesium trisilicate
1.25 mg. homatropine methylbromide

Dosage in painful shoulder: Initial: 3 to 6 capsules daily in 3 or 4 equal doses. Trial period: 1 week. Maintenance dosage should not exceed 4 capsules daily; response is often achieved with 1 or 2 capsules daily.

For complete details, please see full prescribing information.

Geigy Pharmaceuticals
Division of Geigy Chemical Corporation, Ardsley, New York

Geigy

many aspects of hypnosis, and enlightened the audience on the precautions which must be taken when this psychiatric tool is employed.

Dr. Rosen is associate professor of Psychiatry at The Johns Hopkins University school of medicine, and has served as visiting professor of psychiatry in 19 other medical schools throughout the country. He is the author of two books and seventy-four research articles, and has recently written another book which is scheduled for publication in the fall. Dr. Rosen is also considered one of the country's authorities on the abortion problem, and has led combined psychiatric-obstetrical ward round on the subject since 1954. He is on the Board of Directors of the Association for the Study of Abortion.

BLUE SHIELD AND THE MEDICAL ASSISTANT

The medical assistant is a valuable person in helping Blue Shield maintain effective communications with the practicing physician and his patients.

According to a survey recently released by the National Association of Blue Shield Plans, most local Plans throughout the country have established a working relationship with the medical assistants in their areas.

Contact with individual aides in doctors' offices as well as liaison with organized groups of medical assistants through local chapters of the American Association of Medical Assistants were cited by the Plans as being "extremely worthwhile."

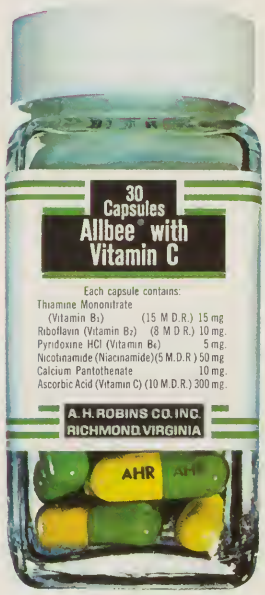
Blue Shield Plans sponsor seminars and workshops periodically to introduce new coverages and cooperate with local *AAMA* groups in planning chapter meetings and in providing speakers to discuss various aspects of health insurance and prepayment.

In addition, a number of Blue Shield Plans indicated that they publish a variety of materials specifically for medical assistants, including manuals and newsletter, and special items in their literature for participating physicians.

The survey showed that responsibility for the Plans' liaison with physicians' aides rests largely with the professional relations or physicians relations department.

Nationally, Blue Shield has increased its liaison with medical assistants by developing articles on prepayment for local *AAMA* chapter publications and for the AAMA BULLETIN, and by exhibiting at *AAMA* conventions.

In an editorial in the June 1967 issue of The Blue Shield newspaper, *NABSP* commended the work being done by the American Association of Medical Assistants and its affiliated chapters and urged that Blue Shield "continue to expand its liaison with, and support of, the medical assistant."



Two ways to give your patients a month's therapeutic supply of vitamin C:

118 grapefruit or 30 Allbee® with C

Your patient would have to eat 118 medium-sized grapefruit (almost 4 a day!) to get as much vitamin C as is provided in just one bottle of 30 Allbee with C capsules (taken one capsule daily). In addition, each capsule supplies full therapeutic amounts of the B-complex vitamins.

Your patients can purchase Allbee with C capsules in the convenient bottle of thirty—a month's supply at a very reasonable price. Also the economy size of 100. Available at pharmacies everywhere on your prescription or recommendation.

A-H-ROBINS

A. H. Robins Company, Richmond, Virginia

the spasm reactors in your practice deserve

"the Donnatal® Effect"

	each tablet, capsule or 5 cc of elixir (23% alcohol)	each Extentab®
hyoscyamine sulfate	0.1037 mg.	0.3111 mg.
atropine sulfate	0.0194 mg.	0.0582 mg.
hysocine hydrobromide	0.0065 mg.	0.0195 mg.
phenobarbital	(¼ gr.) 16.2 mg.	(¾ gr.) 48.6 mg.
(Warning: may be habit forming)		

Brief summary. Blurring of vision, dry mouth, difficult urination, and flushing or dryness of the skin may occur on higher dosage levels, rarely on usual dosage. Administer with caution to patients with incipient glaucoma or urinary bladder neck obstruction. Contraindicated in acute glaucoma, advanced renal or hepatic disease or a hypersensitivity to any of the ingredients.

A·H·ROBINS

A Building Block approach to treating hypertension

With these three therapeutic building blocks you can create a once-a-day regimen to fit almost any degree of hypertension. See the following pages for details . . .

Consider starting your hypertensives on this basic thiazide

A single daily dose of Enduron provides sodium excretion around the clock

Enduron is a true 24-hour single-dose thiazide. Its sodium excretion is not squeezed into an abrupt peak during the first several hours. It is well-sustained in a plateau-like effect—with little reduction for the first 12 hours, and decline thereafter only gradual.

Potassium loss, by contrast, is low. It reaches an early minor peak, then subsides rapidly. Moreover, since dosage is but once a day, there is but one daily peak of potassium loss. As with all thiazides, however, dietary potassium supplementation should also be considered, especially in long or intensive therapy.

Use Enduron as an ideal starting therapy in mild hypertension. Use it too, as a basic therapeutic building block with which other agents can be joined, for managing your more resistant hypertensives.

Once a day, every day

ENDURON®
METHYCLOTHIAZIDE

DAILY DOSAGE RANGE	Minimum	Usual	Intermediate	Maximum
	2.5 mg. tablet	5 mg. tablet	7.5 mg.	10 mg.

See Brief Summary on final page of advertisement.

To build added response, shift to Enduronyl

The deserpidine component adds enhanced antihypertensive activity

The rauwolfia component of Enduronyl is deserpidine (Harmonyl®), a purified crystalline alkaloid supplied only by Abbott. It augments Enduron with its own antihypertensive and tranquilizing action.

Thus the combined clinical effect of these two therapeutic building blocks in Enduronyl is greater than can ordinarily be achieved with either alone.

To add flexibility, Enduronyl comes in two strengths: regular and Forte. Both provide 5 mg. of Enduron. The variation is where most helpful: in the deserpidine. The tablets are scored, and give a surprisingly wide and economical choice of once-a-day doses (see below).

Choose Enduronyl for your patients in the broad range of mild to moderate hypertension. Patient acceptance is excellent!

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 MG. WITH DESERPIDINE 0.25 MG.

ENDURONYL FORTE

METHYCLOTHIAZIDE 5 MG. WITH DESERPIDINE 0.5 MG.

	Minimum	Usual	Intermediate	Maximum
DAILY DOSAGE RANGE	2.5 mg. methyclothiazide 0.125 mg. deserpidine	5 mg. methyclothiazide 0.25 mg. deserpidine	7.5 mg. methyclothiazide 0.375 mg. deserpidine	10 mg. methyclothiazide 0.5 mg. deserpidine
DAILY DOSAGE RANGE	2.5 mg. methyclothiazide 0.25 mg. deserpidine	5 mg. methyclothiazide 0.5 mg. deserpidine	7.5 mg. methyclothiazide 0.75 mg. deserpidine	10 mg. methyclothiazide 1 mg. deserpidine

See Brief Summary on final page of advertisement.

707075-R

Eutonyl affords a different kind of basic therapy for moderate to severe cases

ABBOTT

Effect tied to reduced peripheral vascular resistance; no central depressant action

Eutonyl is a unique nonhydrazine agent. It is reported to act by reducing peripheral vascular resistance.[1,2]

In clinical trials, significant reductions in mean blood pressure were seen in 84% of patients studied—all were moderate to severe cases. Eutonyl lowers diastolic in proportion to systolic, and in about half of the cases studied, reductions in the sitting and recumbent positions were nearly as great as in the standing position.

Most important: There is no central depressant action. In fact, some patients reported an *increased* sense of well being.

Here, then, is a highly effective *basic treatment* for moderate to severe cases—and one that will not hamper your patient with lethargy or drowsiness while on treatment.

Once a day, every day

EUTONYL®
PARGYLINE HYDROCHLORIDE

DAILY DOSAGE RANGE	Minimum	Usual starting	Intermediate	Maximum
	10 mg. tablet	25 mg. tablet	50 mg. tablet or as needed	200 mg.

1. Brest, A. N., et al., Cardiac and Renal Hemodynamic Response to Pargyline, Ann. N. Y. Acad. Sci., 107-1016, 1963.

See Brief Summary on final page of advertisement.

Eutron adds thiazide for enhanced therapy with milder side effects

ABBOTT

Only a 7/4 mm. span between standing and recumbent pressures in clinical trials—reduced chance of orthostatic hypotension

The combining of Eutonyl and Enduron in Eutron permits a significantly greater antihypertensive effect than with either agent used alone. This in turn may allow therapeutic success with lesser dosage—and correspondingly milder side effects.

A significant finding in clinical trials was the drug's action in lowering blood pressure to *nearly equal levels in all body positions*. Total average spread between standing and recumbent readings (after treatment) was only 7/4 mm. Hg.

Thus, in your moderate to severe cases, Eutron affords a usually smooth course of therapy, often with reduced likelihood of orthostatic effects. (The usual precautions against rising suddenly, of course, will always apply.) And, because of the thiazide component, Eutron may be used in the presence of congestive heart failure.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 MG.
WITH METHYCLOTHIAZIDE 5 MG.

DAILY DOSAGE RANGE	Minimum	Usual starting	Intermediate	Maximum
	12.5 mg. pargyline hydrochloride and 2.5 mg. methyclothiazide	25 mg. pargyline hydrochloride and 5 mg. methyclothiazide	37.5 mg. pargyline hydrochloride and 7.5 mg. methyclothiazide	50 mg. pargyline hydrochloride and 10 mg. methyclothiazide

See Brief Summary on final page of advertisement.

TM—Trademark

707075-R

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Enduron is used to control edema and mild to moderate hypertension; also used with other drugs for hypertension. Enduronyl is used in mild to moderately severe hypertension; when used with Enduronyl, more potent agents can be given at reduced dosage to minimize undesirable side effects.

Contraindications: Neither Enduron nor Enduronyl should be used in severe renal disease (except nephrosis) or shutdown; in severe hepatic disease or impending hepatic coma; in patients sensitive to thiazides. Hepatic coma has been reported as a result of hypokalemia in patients receiving thiazides.

Enduronyl is contraindicated in patients with severe mental depression and suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity reactions in patients with a history of allergy or asthma. If added potassium intake is indicated, dietary supplementation is recommended. Enteric-coated potassium tablets should be reserved for cautious use only when adequate dietary supplementation is not practical because those tablets may induce serious or fatal small bowel lesions consisting of stenosis with or without ulceration. These small bowel lesions have caused obstruction, hemorrhage and perforation frequently requiring surgery. Medication should be discontinued immediately if abdominal pain, distension, nausea, vomiting or GI bleeding occurs.

Precautions: Use thiazides with caution in severe renal dysfunction, impaired hepatic function, or progressive liver disease. In surgical patients, thiazides may reduce the response to vasopressors and increase the response to tubocurarine. Use thiazides with caution in pregnancy (bone marrow depression, thrombocytopenia, or altered carbohydrate metabolism have been reported in certain newborn infants). Also reported have been: blood dyscrasias including thrombocytopenia with purpura, agranulocytosis and aplastic anemia; elevations of BUN, serum uric acid, or blood sugar. Symptomatic gout may be induced. Antihypertensive response may be enhanced following sympathectomy.

Use Enduronyl with caution in patients with a history of peptic ulcer, as rauwolfias may increase gastric secretion. Discontinue at the first sign of mental depression. Rauwolfia alkaloids may increase hypotensive effects of surgery or anesthesia, and should be discontinued two weeks prior. They also lower the convulsive threshold and shorten seizure latency. In epilepsy, dosage adjustment of anticonvulsant medication may be necessary. Alcohol, barbiturates, or narcotics may potentiate action of deserpidine.

Adverse Reactions: During intensive or prolonged therapy, guard against hypochloremic alkalosis and hypokalemia (especially the latter if patient is on digitalis). All patients should be observed for signs of hyponatremia ("low-salt" syndrome). Reported thiazide reactions include: anorexia, nausea, vomiting, diarrhea, headache, skin rash, dizziness, paresthesia, weakness, photosensitivity, jaundice, and pancreatitis.

Reported rauwolfia reactions include: nasal stuffiness, nausea, weight gain, diarrhea, aggravation of peptic ulcer, epistaxis, skin eruption, and reduction of libido and potency. Excessive drowsiness, fatigue, weakness, and nightmares may signal early signs of mental depression.

EUTONYL® | EUTRON™

PARGYLINE HYDROCHLORIDE

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications: For treatment of patients with moderate to severe hypertension, especially those with severe diastolic hypertension. Not recommended for patients with mild or labile hypertension amenable to therapy with sedatives and/or thiazide diuretics alone. It is desirable to establish the dosage of Eutron by administering component drugs separately.

TM-Trademark.

Contraindications: Pheochromocytoma, advanced renal disease, increasing renal dysfunction, paranoid schizophrenia and hyperthyroidism. Hepatic coma has been reported as consequence of hypokalemia with thiazide therapy. Until further experience is gained not recommended for patients with malignant hypertension, children under 12, or pregnant patients.

Concomitant use of the following is contraindicated: other monoamine oxidase inhibitors; parenteral forms of reserpine or guanethidine; sympathomimetic drugs; foods high in tyramine such as cheese; imipramine and amitriptyline, or similar antidepressants; methyldopa. 2 week interval should separate therapy and use of these agents.

Methyclothiazide is contraindicated in patients with known sensitivity to thiazides.

Warnings: Pargyline hydrochloride is a monoamine oxidase inhibitor. Warn patients against eating cheese, and using alcohol, proprietary drugs or other medication without the knowledge of the physician. When indicated, alcohol, narcotics (meperidine should be avoided), antihistamines, barbiturates, chloral hydrate, and other hypnotics, sedatives, tranquilizers, or caffeine, may be used cautiously in reduced dosage. In emergency surgery ¼ to ⅕ the usual dose of narcotics, analgesics, and other premedications should be used avoiding parenteral administration where possible. Carefully adjust dose of anesthetics to response of patient. Withdraw pargyline two weeks before elective surgery.

Warn patients about the possibility of postural hypotension. Those with angina or coronary artery disease should not increase physical activity with an improvement in well being. Pargyline may lower blood sugar.

Avoid use of enteric-coated potassium tablets, as these may induce serious or fatal small-bowel lesions consisting of stenosis with or without ulceration. These small-bowel lesions have caused obstruction, hemorrhage and perforation frequently requiring surgery. Medication should be discontinued immediately if abdominal pain, distension, nausea, vomiting or GI bleeding occurs. These products contain no added potassium salts and if added potassium intake is desired, dietary supplementation is recommended. Coated potassium tablets should be reserved for cautious use when adequate dietary supplementation is impractical. In patients with a history of allergy or asthma the possibility of sensitivity reactions should be considered.

Precautions: Measure blood pressure while patient is standing to determine antihypertensive effect. Use with caution in hyperactive or hyperexcitable persons. Such persons may show increased restlessness and agitation. Withdraw drug during acute febrile illness. Watch patients with impaired renal function for increasing drug effects or elevation of BUN and other evidence of progressive renal failure; withdraw drug if such alterations persist and progress. Use with caution in patients with liver disease. As with all new drugs, complete blood counts, urinalyses, and liver function tests should be performed periodically. With prolonged therapy, examine patients for change in color perception, visual fields and fundi. Also reported have been: blood dyscrasias including thrombocytopenia with purpura, agranulocytosis and aplastic anemia; elevations of BUN, serum uric acid, or blood sugar. Symptomatic gout may be induced. In surgical patients thiazides may reduce response to vasopressors and increase response to tubocurarine.

Adverse Reactions: Pargyline may be associated with orthostatic hypotension. Mild constipation, slight edema, dry mouth, sweating, increased appetite, arthralgia, nausea and vomiting, headache, insomnia, difficulty in micturition, nightmares, impotence, delayed ejaculation, rash, and purpura have been encountered with pargyline. Hyperexcitability, increased neuromuscular activity (muscle twitching) and other extrapyramidal symptoms have been reported in a few patients with reduced cardiac reserve.

During intensive or prolonged therapy, guard against hypochloremic alkalosis and hypokalemia (especially the latter if patient is on digitalis). Observe all patients for signs of hyponatremia ("low salt" syndrome).

Reported thiazide reactions also include anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, and pancreatitis. Nocturia has been observed with the combination.

Selecting Journals for Medical Libraries

With the information explosion librarians are often puzzled regarding selection of journals for their individual libraries. A good criteria for selection is the list of journals indexed in *Index Medicus,* published since 1879 by the National Library of Medicine.

How to maintain quality as well as currency in their selection of journals has been a major problem for the National Library. In response to many suggestions, the Library decided in 1964 to base their decisions on the opinions of special subject specialists acting as a panel.

As with other organizations, the limitations of personnel and funds have controlled the number of journals which can be indexed. Initially, during the formation of the panel, the 1000 journals selected from the *List of Journals indexed in Index Medicus,* through a previous 'user' survey as the highest quality journals, were indexed in depth. The other titles were given limited indexing; that is, not over four subject headings were to be assigned to entries.

Following the recommendations of this panel, the chief of Bibliographic Services of the National Library prepared these criteria:

1. Sponsorship of the journal by a professional organization of recognized status in a given discipline or subject area.
2. Sponsorship by a national academy or national institute.
3. Existence of an active editorial board consisting of knowledgeable and critical referees with high professional standing.
4. Regular contributions to a journal by leaders in the subjects to which the journal addresses itself.
5. Strict adherence to an established format in presentation of methodology, tables, graphs, references and other data.
6. Publication policy that prohibits promotional, parochial, or secular approaches in the journal.

This information was excerpted from an article titled *Selection of Journals for Index Medicus* by Leonard Karel, PhD., National Library of Medicine in the *Bulletin of the Medical Library Association,* v.55, number 3, July 1967, p. 259-278. It is a comprehensive review of the subject and suggested reading for persons interested in one of the most specialized indexing projects in the country.

If librarians and physicians wonder why some of their pet publications do not appear on the *LJI* (List of Journals Indexed in *Index Medicus*) this article will shed some light on the methods of selection used.

IRON DEFICIENCY

ANEMIA

Imferon®
(iron dextran injection)

There's as much iron . . . 250 mg. . . . in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron . . . or orally administered iron proves ineffective or impractical . . . or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves. Precise dosage is easily calculated.

LAKESIDE

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. amputs, boxes of 10; 5 cc. amputs, boxes of 4; 10 cc. multiple dose vials.

MANUAL OF PREOPERATIVE AND POST-OPERATIVE CARE, W. B. Saunder Company, Philadelphia. Editorial Subcommittee: Henry T. Randall, MD, Chairman; James D. Hardy, MD, and Francis D. Moore, MD.

The purpose of this book is to provide a useful outline for modern methods of handling the major problems of preoperative preparation and postoperative management of patients undergoing both elective and emergency surgery. It provides quick and concise access to recent advances in all phases of care that is rendered in these circumstances. Included are descriptions of the metabolic and physiologic principles that underlie successful treatment. This is a concise and well compiled book.

A SYMPOSIUM ON THE CHILD, The Johns Hopkins Press, Baltimore. Edited by John A. Askin, MD, Robert E. Cooke, MD, and J. Alex Haller, Jr., MD.

This book consists of selected essays presented on the occasion of the 75th anniversary of the Johns Hopkins Hospital and the dedication of the Children's Medical and Surgical Center, May, 1964.

The purpose of its publication is to identify important developments in the field of Pediatrics and Pediatric Surgery. It does this well and is documentary evidence of what physicians have done for the well-being of children in general.

RESPIRATORY PHYSIOLOGY by N. Balfour Slonim, MD, and John L. Chapin, PHD. The C V Mosby Company, St. Louis.

This book is a monograph on the basic physiology of respiration in which fundamental principles are stressed. Clinical applications are pointed out as the basic material is presented.

The material presented is the produce of experience in both teaching physiology and practicing medicine. While designed primarily for the medical student, it should prove useful to the physician, the physiologist and the environmental scientist.

INFANT NUTRITION by Samuel J. Fomon, MD; W. B. Saunders Company, $10.50.

This book is a compendium of current information relating to infant nutrition in technologically advanced nations. It is hoped that a greater understanding of infant nutrition by all those concerned in this field can be attained through this publication.

For Infants . . . .

For Adults . . . .

BOOK REVIEWS Continued

CLINICAL NEUROSURGERY, Volumes 12 and 13, The Waverly Press, Baltimore.

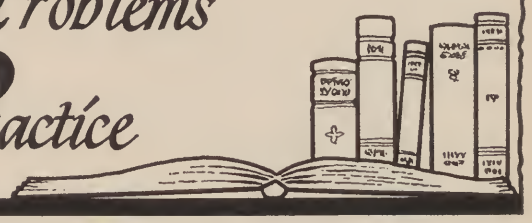
These two volumes published under the aegis of John Shillito, Jr., MD, who was charged with this responsibility by the Congress of Neurological Surgeons, add to the previous volumes published by this group. Most of the latest techniques, advances and procedures are carefully delineated in these books. This compendium of the talks given at the annual Congresses should prove useful to all those interested in this highly specialized field.

CONCEPTS OF NURSING HOME ADMINISTRATION, The Macmillan Company, New York, Harold Baumgarten, Jr.

This book is the first of its kind to treat the administrator's relationships to all nursing home activities and to provide him with a comprehensive basis for making the wide range of decisions commensurate with his authority. It is a valuable text book for graduate-level and continuation courses in nursing home administration but, better than that, it is a standard reference for nursing home administrators, nursing supervisors, public health, medical care and hospital administrators. It is a book well worth having in every nursing home.

CARE OF THE TRAUMA PATIENT, McGraw-Hill Book Company, New York, G. Tom Shires, MD.

Parkland Memorial Hospital, a name that will live in the memory of many of us because of President Kennedy's assassination, is the scene of the research that resulted in the publication of this book. It is devoted to the patient and, more specifically, about the patient with single or multiple injuries. The overall attempt has been to produce a guide to the principles, pathological physiology and clinical care of the patient who is injured.



HYSTERIA AND RELATED MENTAL DISORDERS, John Wright & Sons Ltd., Bristol, England, by Wilfred Abse, MD.

The author's original book on this subject published following World War II, The Diagnosis of Hysteria, has this follow-up volume. It deals with the increasing interest in this subject. This newer publication deals more fully with problems of diagnosis and their bearing on management and treatment; and on the other hand the nature of the disturbances have been explored. The author claims that, "the adequate study of hysteria becomes a gateway to the whole field of psychological medicine." We are inclined to agree with him.

PATHOLOGY OF THE KIDNEY, Little, Brown and Company, Robert H. Heptinstall, MD.

The task of presenting a comprehensive account of the pathology of the kidney is surprisingly difficult. Accepting the imperfect state of knowledge in this area, the author has attempted to present an account of the more common diseases that affect the kidney. The book is mainly for the pathologist and the internist specializing in renal problems, but it can be of use to others such as the urologist and the obstetrician.

Solutions to Business Problems in Daily Medical Practice

How to Release an Aide

WILBURN L. McCLURE, JR.

The lazy, dishonest or incompetent aide is easy to release. You can give her a check and send her on her way.

But, what about the sincere, dedicated aide who just doesn't seem to have the ability to cope with the responsibility of her position?

When confronted with the task of releasing an aide, evaluate your motives first. Write down your grievances. Review the list carefully. Make sure your judgments are fair.

Invite your aide to sit down and go over the list with you. Review adjustments that might be made by both parties. Ask if she fully understands what you consider to be grievances. Ask if there are personal circumstances, such as family problems, ill health, or nervous tension which are having and adverse effect on the execution of her duties.

If you have considered all opportunities to make adjustments, and the situation appears irreconcilable, then by all means, *make a definite plan* toward releasing her and stick to it.

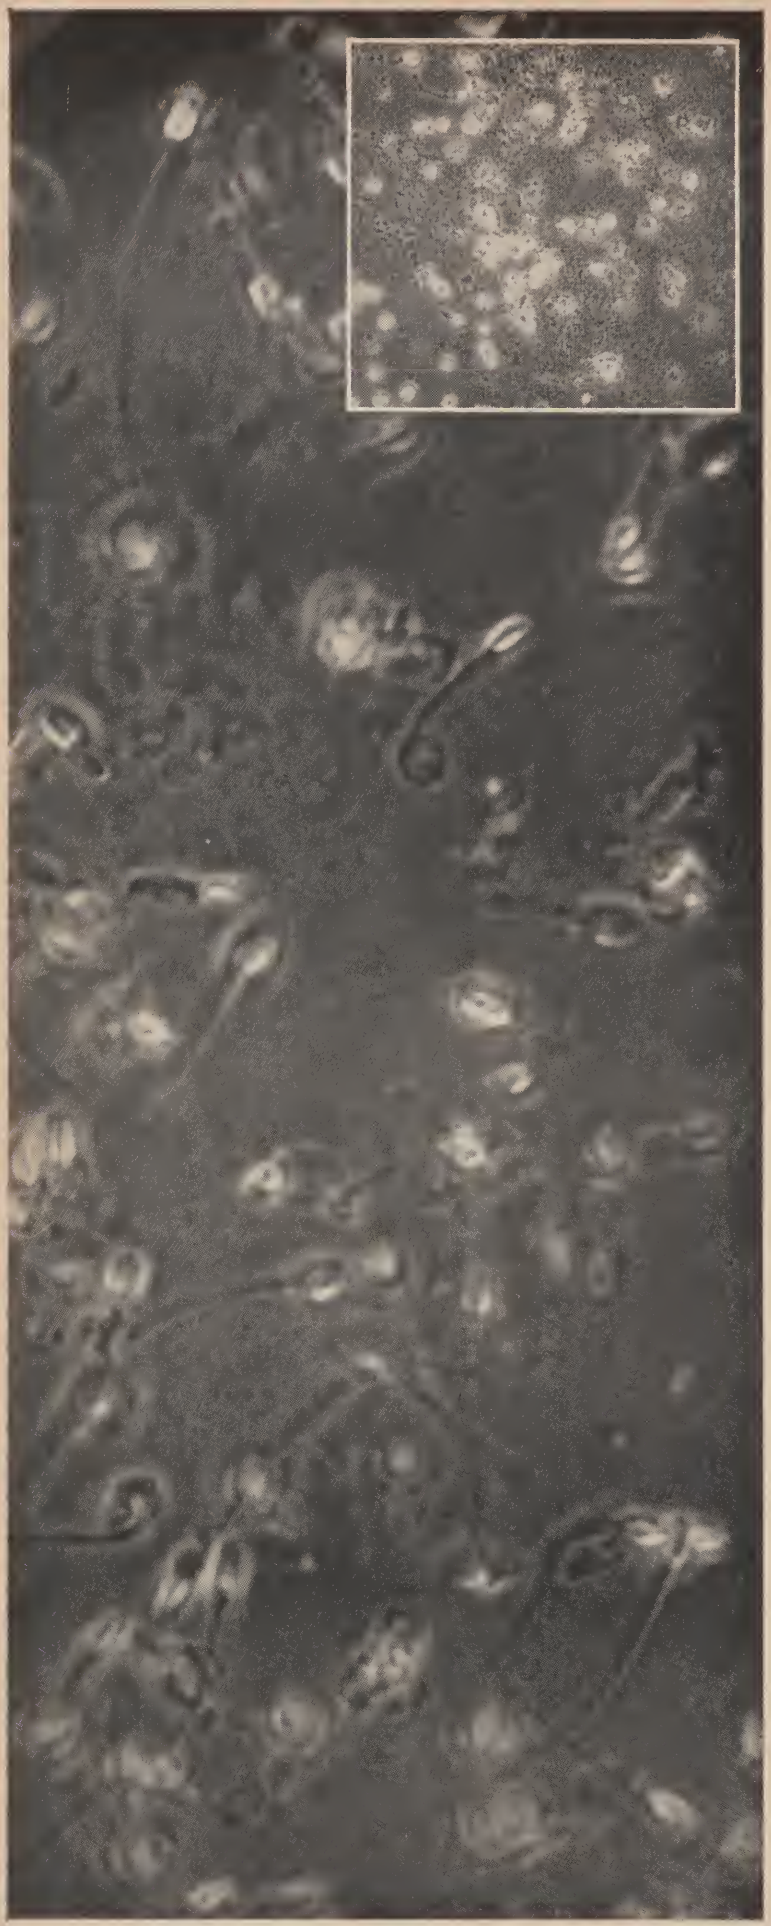
As soon as you have found what you consider to be a suitable replacement, then have a heart-to-heart talk, tactfully but firmly, with your present aide.

Explain why you feel this action is necessary. Don't just leave her hanging on a limb somewhere. It is customary to give an employee at least two weeks notice. If you intend to release her immediately, then make sure she is adquately compensated.

Once your former aide has left the office, be very careful when giving references to her new employer. One of the most serious mistakes made by doctors is to release an aide from her duties because of incompetence or dishonesty, and then give her a glowing recommendation.

One case comes to mind where a doctor released a girl who had embezzled some $3,000 from his office. He did not prosecute her, nor did he make any arrangements for her to repay the embezzled amount. He simply let her go.

A few weeks later, he received a call from a colleague who was thinking about hiring her. The doctor told him what a good worker she had been, but did not tell his colleague about the embezzlement.



You guessed it! Some time later, his colleague called him and discussed an embezzlement in his office. This caused a considerable amount of friction between the two doctors.

If you must release an aide, it is generally the best policy to let her go prior to the arrival of your new aide. You never know what axes your former aide has to grind. Of course there is always the chance that she will pass on bad habits and unknown errors of procedures to the new girl.

Make a clean break and start fresh.

You may wish to clip this series of articles, "All About Aides" (Parts One through Five), and file for future reference.

Mr. McClure is director of the Baltimore office of Professional Business Management, Inc. This monthly column is prepared as a complimentary service to the *Maryland State Medical Journal.*

New view of an oral contraceptive at work

Although suppression of ovulation remains the primary mode of action of oral contraceptives, newer knowledge indicates that products like Norinyl-1—a combination of both low-dosage progestogen and estrogen for the full treatment cycle—may provide multiple action that helps explain their unexcelled record of contraceptive effectiveness. This report explores the possible secondary protective mechanisms offered by combined hormonal administration.

Accumulating evidence has indicated that sparse, highly viscous cervical mucus has a possible adverse effect on the motility and survival of spermatozoa.

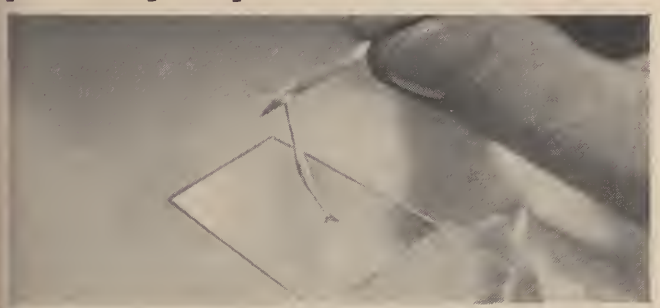
The estrogen-opposing progestational ingredient of Norinyl-1 (norethindrone 1 mg. with mestranol 0.05 mg.) changes the usual mid-cycle picture of a thin, watery cervical mucus. The result—a built-in barrier that appears to inhibit sperm from reaching the ovum should one be released. The inset in the adjoining photograph shows immobile spermatozoa as they appear in cervical mucus taken from a patient treated with Norinyl-1.

See last page for contraindications, precautions, side effects and dosage.

How the estrogen-opposing action of Norinyl-1 creates cervical mucus that may be hostile to sperm penetration

Normally, estrogen activity during the fertile midcycle stimulates the production of a profuse and watery cervical mucus that permits maximum sperm motility and promotes penetration.

But what happens when Norinyl-1 is administered? Its potent progestogen, norethindrone, opposes estrogen stimulation of cervical mucus. Consequently, the amount of mucus decreases and its viscosity increases. This results in a sparse but thick mucus barrier that appears to diminish the vitality of the sperm and to impair its powers of penetration.

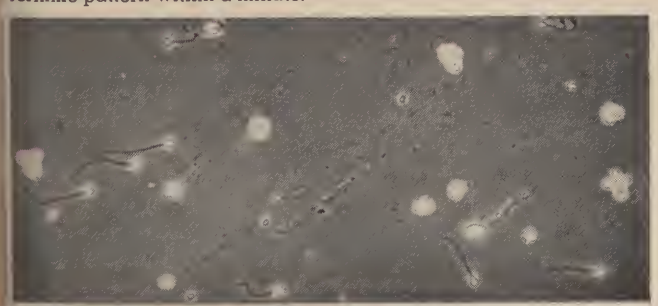


The role of viscous cervical mucus as a secondary action of Norinyl-1

In a report on 89 patients taking this medication,* cervical mucus obtained from cycle day 5 to cycle day 29 appeared scant and thick and exhibited little or no Spinnbarkeit.

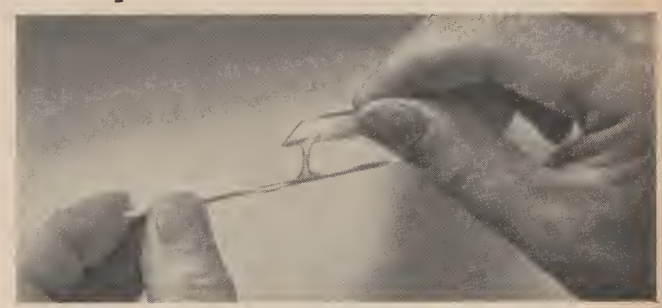
In the opinion of this investigator, the effect on cervical mucus may be sufficient to prevent conception.

*Cohen, M. R.: Symposium: Mechanisms of Action of Low Dosage Oral Contraceptive, Yale University Medical Center, New Haven, Conn., April 6, 1967.

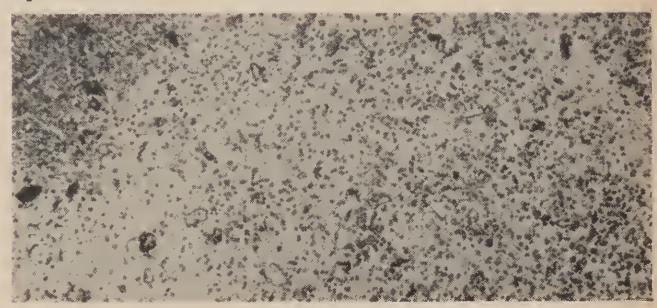


Normal cervical mucus at midcycle in untreated patient is known to permit sperm motility... promote sperm penetration.

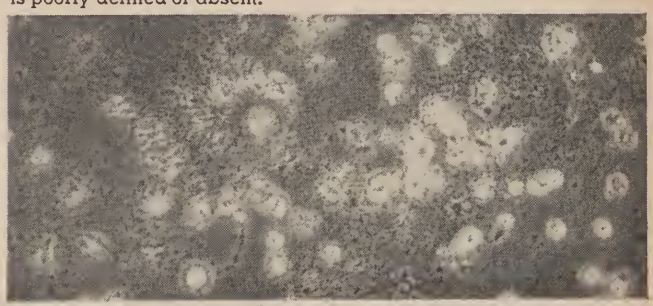
Cervical mucus is thin and watery with a stretchability (Spinnbarkeit) of 15 to 20 cm.



Thin, watery mucus crystallizes into this well-defined, fernlike pattern within a minute.



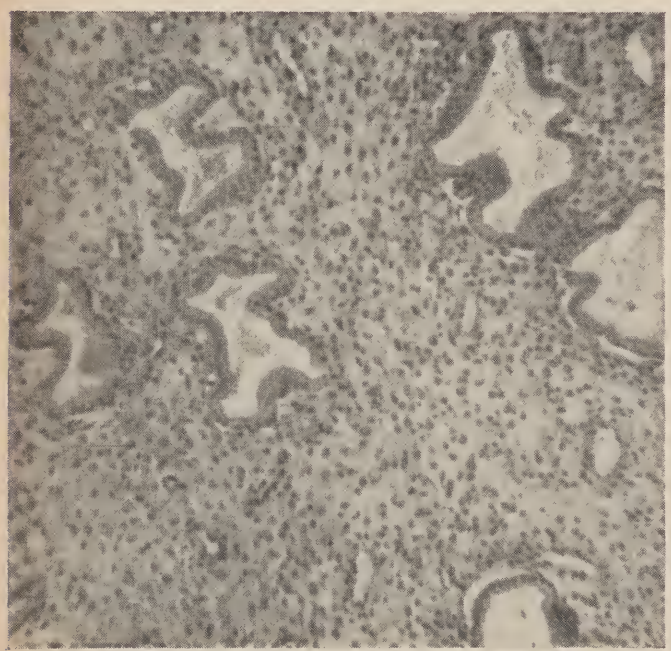
Spermatozoa appear healthy, are active and freemoving.



Viscous cervical mucus at midcycle produced by Norinyl-1 appears to impair sperm vitality... inhibit penetration.

Cervical mucus is scanty, thick and viscous. Spinnbarkeit is 1 cm. or less.

In thick, viscous cervical mucus the fern pattern is poorly defined or absent.

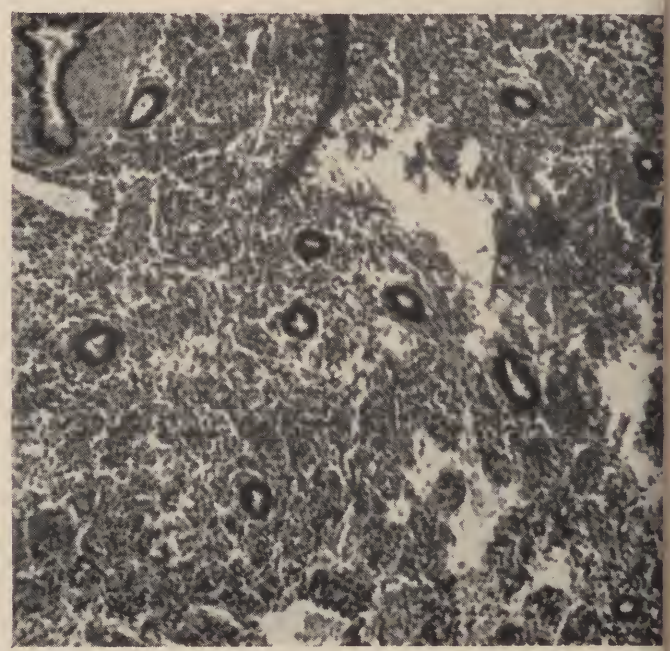


Immobile spermatozoa as they appear in cervical mucus taken from a patient treated with Norinyl-1.

How Norinyl-1 alters normal endometrial responses—another possible protective mechanism

Let us suppose that an ovum is released—as occurs in an occasional, rare case—and somehow a sperm succeeds in penetrating the cervical mucus barrier. Should this come about, one additional action of Norinyl-1 may protect the patient from unwanted pregnancy. The theory is that progestogen intake makes endometrial tissue unreceptive to implantation.

Endometrium of untreated patient



Normally, the endometrium progresses through a proliferative phase stimulated by estrogen and a secretory phase stimulated by progesterone. During the secretory phase the endometrium is receptive to the fertilized ovum.

Endometrium produced by Norinyl-1

When Norinyl-1 is administered its progestogen component—norethindrone—accelerates the secretory phase and suppresses glandular and vascular development.

See last page for contraindications, precautions, side effects and dosage.

lower cost

new Norinyl®-1

(norethindrone 1mg. c̄ mestranol 0.05mg.) **tablets**

Reduction of oral contraceptive dosage to lowest effective levels has become a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now available in a new strength in which *both* norethindrone and mestranol are reduced 50 percent. Studies show that Norinyl-1 achieves fertility control with only 1.05 mg. of combined progestogen and estrogen per tablet.

Norethindrone was first reported for use as a progestational agent in human beings in 1955. Norethindrone 2 mg. with mestranol 0.1 mg., as an oral contraceptive, is currently in use by over 2,000,000 women. Clinical experience now establishes that Norinyl-1 also amply meets the criteria of reliability and safety.*

*Symposium on Low-Dosage Oral Contraception, Palo Alto, Calif., July 15, 1965.

PRESCRIBING INFORMATION

Contraindications: 1. Patients with thrombophlebitis or with a history of thrombophlebitis or pulmonary embolism. 2. Liver dysfunction or disease. 3. Patients with known or suspected carcinoma of the breast or genital organs. 4. Undiagnosed vaginal bleeding.

Warnings: 1. Discontinue medication pending examination if there is sudden partial or complete loss of vision or if there is a sudden onset of proptosis, diplopia, or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. 2. Since the safety of Norinyl-1 in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. 3. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this dose to the infant has not been determined.

Precautions: 1. The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. 2. Endocrine and possibly liver function tests may be affected by treatment with Norinyl-1. Therefore, if such tests are abnormal in a patient taking Norinyl-1, it is recommended that they be repeated after the drug has been withdrawn for 2 months. 3. Under the influence of estrogen-progestogen preparations, preexisting uterine fibroids may increase in size. 4. Because these agents may cause some degree of fluid retention, conditions that may be influenced by this factor, such as epilepsy, migraine, asthma, cardiac, or renal dysfunction, require careful observation. 5. Although a cause and effect relationship has not been established, Norinyl-1 should be used with caution in patients with a history of cerebrovascular accident. 6. In relation to breakthrough bleeding, as in all cases of irregular bleeding per *vaginam*, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. 7. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. 8. Any possible influence of prolonged Norinyl-1 therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. 9. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Norinyl-1 therapy. 10. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. A cause and effect relationship has not been demonstrated. 11. Because of the effects of estrogens on epiphyseal closure, Norinyl-1 should be used judiciously in young patients in whom bone growth is not complete. 12. The age of the patient constitutes no absolute limiting factor, although treatment with Norinyl-1 may mask the onset of the climacteric. 13. The pathologist should be advised of Norinyl-1 therapy when relevant specimens are submitted.

Side Effects: The following adverse reactions have been observed with varying incidence in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms, breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma, breast changes (tenderness, enlargement and secretion), loss of scalp hair, change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately postpartum, cholestatic jaundice, erythema multiforme, erythema nodosum, hemorrhagic eruption, migraine, rash (allergic), itching, rise in blood pressure in susceptible individuals, mental depression.

The following occurrences have been observed in users of oral contraceptives. A cause and effect relationship has not been established: thrombophlebitis, pulmonary embolism, neurooocular lesions.

The following laboratory results may be altered by the use of oral contraceptives: increased bromsulphalein retention and other hepatic function tests, coagulation tests (increase in prothrombin, factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metapyrone test, pregnanediol determination.

Other side effects reported to have occurred in association with use of this drug are dizziness, hirsutism, pains in legs, back, chest and abdomen, dysuria, drowsiness, vaginal discharge, libido increased and decreased, eruptions, hypermenorrhea, hypomenorrhea, increased appetite, G.U. infections, varicose veins, abdominal fullness, acne, headache, nervousness, allergies, blurred vision, pain in eyes, and itching in eyes. *For complete clinical data, see package insert.*

Dosage and Administration: 1. One tablet of Norinyl-1 is administered orally for 20 days beginning on day 5 of the menstrual cycle. (Count day 1 of the cycle as the first day of menstrual bleeding.) Repeat this dosage schedule for each cycle. 2. If no menstrual period occurs after a cycle of treatment (20 tablets) in which patient adhered to the schedule, the patient must be instructed to resume taking the Norinyl-1 tablets 7 days after the previous 20-day course was completed. For example, if the last pill of a previous cycle had been taken on a Sunday, then a new cycle of treatment should begin on the following Sunday. 3. In the postpartum woman, it is recommended that the first cycle of treatment should begin on day 5 of the first menstrual cycle. However, Norinyl-1 should not be administered during lactation.

Availability: Norinyl-1 (norethindrone 1 mg. with mestranol 0.05 mg.)—Dispensers of 20 and 60 and bottles of 250 tablets.

Eczema of many years... controlled in two weeks

Before treatment

After treatment – with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Available in 5 Gm. and 15 Gm. tubes and ½ lb. jars.

Computer System for Tuberculosis Cases

A computerized tuberculosis case register system has been established in the Baltimore City Health Department as part of a national computer system sponsored by the US Public Health Service for recording information essential to the measurement and control of tuberculosis.

Baltimore is the first large city in the US to be selected by the Public Health Service to demonstrate the value of this technique in the control of tuberculosis. The city was so chosen because of its tuberculosis problem and its suitability for the trial due to the constructive progress that has been made here in recent years in tuberculosis control.

Information concerning tuberculosis patients will be recorded on suitable forms in the chest clinics at the five health district offices and forwarded monthly to the US Public Health Service for processing. Summary data will be quickly returned which will clearly indicate the status of every tuberculosis patient in the city and bring to attention those who are not under current medical supervision, receiving adequate treatment, or who are otherwise in need of prompt public health services.

The discovery of new drugs which are specific for, and effective in the treatment of tuberculosis have replaced the "rest cure." With adequate drug treatment, most patients are promptly rendered non-infectious, thus reducing long hospital stay and the associated high cost to the taxpayer for hospital care. Patients are thus returned safely to their homes earlier and can be cared for adequately and much more economically by their private physicans or at the city's chest clinics. Important strides, therefore, are being made in the extension and improvement of the Health Department's chest clinics to meet this increasing need.

The computer system is expected to prove a most valuable tool in keeping track of the ambulant patient and in assuring his long continued regular use of the drugs which will assure his return to good health.

The City Health Department's Tuberculosis Control Program is under the direction of James E. Peterman, MD, Director of the Bureau of Communicable Diseases, Allan S. Moodie, MD, Administrative Health Officer for Tuberculosis, and Meyer W. Jacobson, MD, Director of Chest Clinics.

What's all the fuss about bactericidal?

The ultimate aim in antibiotic therapy is to contain the bacterial colony and eliminate infection. Both 'cidal' agents and bacteriostatic DECLOMYCIN achieve this goal. DECLOMYCIN inhibits susceptible pathogens by stopping their growth; cidal agents affect the pathogens only while they are growing.

Though the two mechanisms differ, the end result is the same—containment of the infecting organism. *However, a very important attribute of any antibiotic is its potency against a broad range of pathogens.* DECLOMYCIN not only offers broad-spectrum potency, but high serum and tissue levels with persistent activity against tetracycline-sensitive organisms. Therapeutic benefits continue for 1-2 days after dosage stops to help prevent relapsing infection.

These are the reasons why so many doctors make DECLOMYCIN their basic broad-spectrum antibiotic. At last count, one billion doses had been administered since its introduction, and the number keeps rapidly growing.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

Prescribing information on next page.

For a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill.

True broad spectrum

DECLOMYCIN Demethylchlortetracycline should be equally or more effective than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes. A rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth — dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

Capsules: 150 mg; **Tablets:** film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

cash on the line

for all your existing and future accounts receivable

Now! A computerized billing and collection service that immediately puts, and keeps, your practice on a cash basis

Originated *by* physicians and dentists *for* physicians and dentists, CONSOLIDATED provides the first sensible solution for relieving the professional of the two most time-consuming, non-professional phases of conducting a practice. First, by releasing him of the responsibility of billing and collecting fees. And secondly, by converting *all* his receivables, past due and current, into liquid funds.

CONSOLIDATED is operated by prominent businessmen skilled in administration and modern computer techniques. Via punch-card telephone, information regarding daily transactions of your practice is transmitted to our computers. Once tabulated, you receive ready cash weekly on current billing; monthly, on old accounts.

Accurate, time-saving, and trouble-free, the system is also designed to preserve the important personal relationship between the professional and his patient. While several budget plans may be offered the patient, CONSOLIDATED pays your fee at once, subject to a nominal discount.

For a consultation and demonstration at your convenience, phone 486-4984.

when he just can't sleep

Tuinal®

One-Half Sodium Amobarbital and
One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal is indicated for prompt and moderately long-acting hypnosis. It is not suitable for continuous daytime sedation.

Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Overdosage: C.N.S. depression. Symptoms—Depression of respiration and of superficial and deep reflexes, slight constriction of the pupils (in severe poisoning, dilation), decreased urine formation, lowered body temperature, coma. Treatment—Symptomatic and supportive (gastric lavage; intravenous fluids; maintenance of blood pressure, body temperature, and adequate respiration). Dialysis may speed removal of barbiturates from body fluids.

Dosage: 50-200 mg. (¾-3 grains) at bedtime.

DIURESIS

MERCUHYDRIN®
(meralluride injection)

Twenty years ago the publication of "A System for the Routine Treatment of the Failing Heart"[1] established a schedule of diuretic therapy as a primary factor in the treatment of acute congestive failure. With emphasis upon daily injections of Mercuhydrin (meralluride injection) until dry weight was obtained, Gold, et al. achieved a 40% increase in improvement, in ⅓ the time, over other methods then current. Today, most medical texts continue to recommend parenteral mercurials in acute congestive failure when prompt diuresis is indicated.

Recently Modell[2] has stated: "The mercurial diuretics are the injectable diuretics of choice since they are the most potent as well as the most dependable. Their toxicity is not an important consideration either by comparison with other potent diuretics or in relation to the seriousness of the conditions in which they provide such excellent relief."

LAKESIDE

IN BRIEF

Mercuhydrin is indicated in edema of cardiac or hepatic origin and in the nephrotic syndrome; it is contraindicated in acute nephritis and in anuric or oliguric states. *The usual adult dose is one to two cc. daily or every other day until "dry weight" is obtained.* Sensitivity is rare but small initial doses are advised to minimize potential reactions; vertigo, fever, and rash have occurred. Overdosage may produce electrolyte depletion, muscle cramps, and G. I. reactions. Supplied: 1 cc. and 2 cc. ampuls in boxes of 12, 25 and 100; 10 cc. rubber capped, multiple-dose vials (intramuscular or subcutaneous use only) in boxes of 6 and 100.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

THEY'RE GAINING ON YOU.

Every time you turn around the overweights are overeating.

The spread is spreading.

What's needed is a printed regimen for a dieter to follow under your guidance. A sensible diet—no fads, no fallacies—that can break old habits, and build realistic new ones. Lasting ones.

That's what prompted preparation of research-tested scientific diets which are offered to you free. They're a balance of the 4 food groups—meat, bread and cereals, fruits and vegetables and dairy foods. They're diets that you'd write yourself, if you had the time.

Send for them. After all, you can enjoy people without their growing on you.

Send me the Project Weight Watch kit of materials including diets.

PROJECT WEIGHT WATCH

FACTS, NOT FADS

This pain is getting on my nerves.

Patients in pain often experience concomitant anxiety and tension, which may add to the burden of pain.

For such patients, you may want to prescribe a preparation that offers more than simple analgesia.

A good choice is often EQUAGESIC® (meprobamate and ethoheptazine citrate with aspirin). It helps relieve pain. And anxiety. And skeletal muscle spasm as related to pain or anxiety and tension.

Equagesic® TABLETS

(meprobamate and ethoheptazine citrate with aspirin)

Wyeth®

Contraindications: History of sensitivity or severe intolerance to aspirin or meprobamate.

Warnings: USE IN PREGNANCY: Safety for use during pregnancy or lactation has not been established; therefore it should be used in pregnant patients or women of child-bearing age only when the physician judges its use essential to the patient's welfare.

Precautions: Keep out of reach of children. Not recommended for patients 12 years old or less. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use of meprobamate may result in dependence or habituation in susceptible persons—as alcoholics, ex-addicts, severe psychoneurotics. Withdraw gradually after prolonged high dosage to avoid possibly severe withdrawal reactions including epileptiform seizures. Warn patients of possible reduced alcohol tolerance. If drowsiness, ataxia or visual disturbances (impairment of accommodation and visual acuity) occur, reduce dose. If symptoms persist, caution patients against operating machinery or driving. After meprobamate overdose, prompt sleep, reduction of blood pressure, pulse and respiratory rates to basal levels, and hyperventilation are reported. Give cautiously to patients with suicidal tendencies. Treat attempted suicide (has resulted in coma, shock, vasomotor and respiratory collapse and anuria) with immediate gastric lavage and appropriate supportive therapy (CNS stimulants and pressor amines as indicated).

Side Effects: Ethoheptazine and aspirin may occasionally cause nausea, vomiting, epigastric distress, and rarely dizziness. Overdosage may result in CNS depression (drowsiness and lightheadedness) or CNS stimulation and salicylate intoxication (requires induced vomiting or gastric lavage, specific parenteral electrolyte therapy for ketoacidosis and dehydration, and observation for hypoprothrombinemic hemorrhage [usually requires whole blood transfusions]). Meprobamate may cause drowsiness, ataxia and rarely allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. If allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Treat symptomatically such as with epinephrine, antihistamine and possibly hydrocortisone. A few cases of leucopenia, usually transient, have been reported following continuous use. Rarely, cases of aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis, and hemolytic anemia have been reported; almost always, in the presence of known toxic agents.

Composition: 150 mg. meprobamate, 75 mg. ethoheptazine citrate and 250 mg. aspirin per tablet.

Wyeth Laboratories Philadelphia, Pa.

Tissue's healing nicely. Yet anxiety slows his steps toward recovery.

By helping overcome anxiety and tension which can thwart the convalescent's progress, EQUANIL (meprobamate) often may play an important role in medical and surgical aftercare.

Cautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use may result in dependence or habituation in susceptible persons—as ex-addicts, alcoholics, severe psychoneurotics. After prolonged high dosage, drug should be withdrawn gradually to avoid possibly severe withdrawal reactions including epileptiform seizures. Side effects include drowsiness and, rarely, allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute non-thrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. If an allergic reaction occurs, meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Warn patients of possible reduced alcohol tolerance. Should drowsiness, ataxia, or visual disturbances occur, dose should be reduced. If symptoms persist, patients should not operate vehicles or dangerous machinery. A few cases of leucopenia, usually transient, have been reported following prolonged dosage. Other blood dyscrasias—aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia—have occurred rarely, almost always in the presence of known toxic agents. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. Prescribe very cautiously for patients with suicidal tendencies. Suicidal attempts should be treated with immediate gastric lavage and appropriate supportive therapy.

Contraindications: History of sensitivity to meprobamate.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

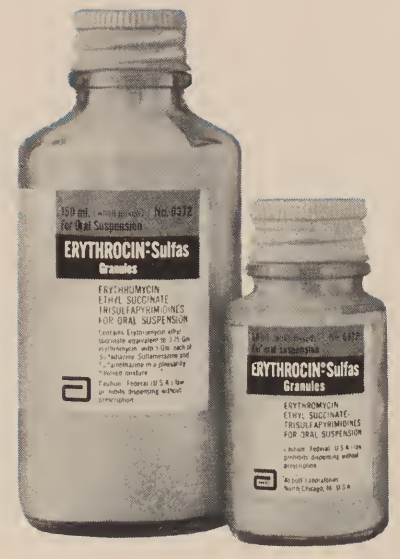
Equanil®
(meprobamate)
Wyeth



Professionally posed.

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New– Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

Brief Summary on next page

PROFESSIONAL COURTESY

The custom of professional courtesy embodies the ancient tradition of fraternalism among physicians in the art which they share, and their mutual concern to apply their learning for the benefit of one another as well as their patients. The Judicial Council reaffirms and endorses the principle of professional courtesy as a noble tradition that is adaptable to the changing scene of medical practice.

Professional courtesy is not a rule of conduct that is to be enforced under threat of penalty of any kind. It is the individual responsibility of the physician to determine for himself and within his own conscience to whom and the extent to which he shall allow a discount from his usual and customary fees for the professional services he renders, and to whom he shall render such services without charge as professional courtesy.

The following guidelines are offered as suggestions to aid physicians in resolving questions related to professional courtesy.

1. Where professional courtesy is offered by a physician but the recipient of services insists upon payment, the physican need not be embarrassed to accept a fee for his services.

2. Professional courtesy is a tradition that applies solely to the relationship that exists among physicians. If a physician or his dependents have insurance providing benefits for medical or surgical care, a physician who renders such service may accept the insurance benefits without violating the traditional ethical practice of physicians caring for the medical needs of colleagues and their dependents without charge.

3. In the situation where a physician is called upon to render services to other physicians or their immediate families with such frequency as to involve a significant proportion of his professional time, or in cases of long-term extended treatment, fees may be charged on an adjusted basis so as not to impose an unreasonable burden upon the physician rendering services.

4. Professional courtesy should always be extended without qualification to the physician in financial hardship, and members of his immediate family who are dependent upon him.

Adopted by Judicial Council of AMA June 17, 1967.

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

DEPRESSION

NORPRAMIN®
(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) in depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

LAKESIDE

IN BRIEF:

INDICATIONS: In depression of any kind —neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, anxiety, agitation and stimulation, insomnia, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy, agranulocytosis, altered liver function, ataxia, and extrapyramidal signs.

DOSAGE: Optimal results are obtained at a dosage of 50 mg., t.i.d. (150 mg./day). **SUPPLIED:** NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1000; and tablets of 50 mg., in bottles of 30, 250 and 1000.

Dietary Violations are Diminished Profoundly with...

†Stedytabs * Delfeta-sed ®

·**SEDAFAX** (brand of special micronized grade of AMOBARBITAL – Warning: may be habit forming. **120 mg.**

·**DELFETAMINE** (brand of dl-N-METHYLamphetamine HCl) . **30 mg.**

USUAL ADULT DOSAGE: One Tablet Daily. To be taken in the morning.

†**STEDYTABS DELFETA-SED** are so prepared that the active ingredients are released continuously to provide for prolonged therapeutic effects for a period of up to 8 to 10 hours.

The dieting obese sometime experience emotional problems as secondary symptoms resulting from restricted food intake: anxiety, depression, irritability and tension. Subjective relief is accomplished with Delfeta-sed ·(Delfetamine, dl-N-Methylamphetamine HCl) balanced with the mild euphoric sedative action of Sedafax, brand of Amobarbital-Warning: may be habit forming). The mood is altered to promote optimism and impart a cheerful sense of energy and well-being.

IN DEPRESSION: A completely logical synergistic combination of wide application as a mood normalizer for the common depressed states encountered in everyday practice. Induces a serene outlook without excessive tranquillity. The patient is alert but composed, free from emotional peaks and troughs. Relieves anxiety which is a part of every illness.

CAUTION:

Contraindicated in the presence of marked hypertension and in cases of coronary or cardiovascular disease; also, in patients hypersensitive to barbiturates or ephedrine-like drugs.

WHEN ANXIETY IS A SIGNIFICANT COMPONENT OF THE CLINICAL PROFILE

LIBRIUM®
(chlordiazepoxide HCl)

Also available as
LIBRITABS[T.M.] (chlordiazepoxide)
5-mg, 10-mg, 25-mg tablets

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral*—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 50. Libritabs[T.M.] (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

Dilantin®
(diphenylhydantoin)

PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.
PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.
DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.
Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

BSP® DISPOSABLE UNIT

HW&D BRAND OF SODIUM SULFOBROMOPHTHALEIN INJECTION, USP

(50 mg. per ml.)

BSP®

ROMSULPHALEIN®

IN A COMPLETE,

STERILE,

DISPOSABLE,

& ECONOMICAL

PATIENT-UNIT.

BSP, one of the more valuable single laboratory procedures for determining hepatic function, is now packaged in a complete individual patient-unit.

Each BSP Disposable Unit contains a sterile syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of terminally sterilized Bromsulphalein solution.

This all-inclusive disposable put-up lessens the chance of cross-infection and saves time and labor— the most costly commodities.

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

Treat yourself and your investments to professional management...

WITH AN INVESTMENT MANAGEMENT ACCOUNT AT THE TRUST DEPARTMENT OF MARYLAND NATIONAL BANK

You will be relieved of all the cumbersome details of investment management and, what's more important, you can stop worrying about what to buy and sell and when to do so.

Your securities will be under the careful supervision of our Investment Department with an Investment Officer assigned to your account. This Department, backed by our Investment Research and Administrative Departments, works under the direct supervision of our Trust Committee which is composed of senior officers and directors of our Bank.

Our annual fee for an Investment Management Account is based on the income and value of your account and is surprisingly low. As it relates to taxable income, the fee is tax deductible for Federal Income Tax purposes.

Why not discuss the advantages an Investment Management Account would have for you? There is no cost or obligation.

In Baltimore, telephone 685-3900 and ask for L. Dale Marvel.

On the Eastern Shore, telephone 822-3500 (Easton) and ask for Douglas H. Kiesewetter.

.....

Maryland's largest bank—82 Offices located in the Baltimore-Washington Region, the Eastern Shore, Southern and Western Maryland. Member Federal Deposit Insurance Corporation.

MARYLAND ACADEMY OF GENERAL PRACTICE

Wounds, abscess, cellulitis

...and the complications of staph.

From time of birth, the child is exposed to a whole range of potential staph infections: wounds; secondarily infected dermatoses; primary lesions, such as deep impetigo (ecthyma), boils and felons; and more serious conditions such as osteomyelitis, staph pneumonia and staph meningitis.

Bactericidal

Hardly a staph organism can resist the bactericidal action of Prostaphlin® (sodium oxacillin), as shown by a 34-month *in vitro* study. Of all staph isolates tested, 99.5% were sensitive to oxacillin.[1]

Clinically Proven

There is a high correlation between these *in vitro* findings and clinical results. Of 610 patients treated with Prostaphlin (sodium oxacillin), 89.8% were reported cured or improved, including those with staph infections resistant to penicillin G.[2] And since resistance does not appear to develop *in vivo,* therapy with oxacillin can be extended when necessary.

Outstanding Safety Record

Besides being staph-specific and rapidly absorbed—Prostaphlin (sodium oxacillin) has established an outstanding record of safety during five years of widespread clinical use. Continuous high blood levels of oxacillin have not produced toxic effects on kidney function, assuring a significant margin of safety. However, as with all penicillins, the possibility of allergic response should be considered.

Capsules, Oral Suspension and Injectable

Prostaphlin (sodium oxacillin) is available in three flexible dosage forms to suit the age of the patient and severity of infection—an oral solution for pediatric use, capsules, and multi-dose vials for injection.

Staph reliably controlled with specific therapy

A suitable dosage form for every staph situation

PRESCRIBING INFORMATION: For complete information, consult Official Package Circular. *Indications:* Infections caused by Staphylococci, particularly those due to penicillin G-resistant Staphylococci. *Contraindications:* A history of severe allergic reactions to penicillin. *Precautions:* Typical penicillin-allergic reactions may occur. Safety for use in pregnancy and premature infants is not established. Because of limited experience, use cautiously and evaluate organ system function frequently in neonates. Mycotic or bacterial superinfections may occur. Assess renal, hematopoietic and hepatic function intermittently during long-term therapy. *Adverse Reactions:* Skin rashes, pruritus, urticaria, eosinophilia, nausea, vomiting, diarrhea, fever and occasional anaphylaxis. Rare cases of reversible hepatocellular dysfunction have occurred. Moderate SGOT elevations have been noted. Thrombophlebitis has occurred occasionally during intravenous therapy and leukopenia was noted in two cases. *Usual Oral Dosage:* Adults: 500 mg. *q.* 4 or *q.* 6 *h.* Children: 50 mg./Kg./day. *Usual Parenteral Dosage:* Adults: 250-500 mg. *q.* 4 or *q.* 6 *h.* Children: 50 mg./Kg./day. Treat beta-hemolytic streptococcal infections for at least 10 days. Give oral drug 1 to 2 hours before meals. *Supplied:* Capsules—250 and 500 mg. in bottles of 48. Injectable—250 mg., 500 mg., and 1 Gm. dry filled vial for I.M./I.V. use. For Oral Solution—100 ml. bottle, 250 mg./5 ml when reconstituted. **A.H.F.S. CATEGORY 8:12.1**

AMA SCHEDULES NATIONAL CONFERENCE ON EMERGENCY MEDICAL SERVICES

"The Community and Emergency Medical Services" will be the theme of a national conference sponsored by the American Medical Association January 18-20, 1968 at the San Francisco Hilton Hotel, San Francisco, California.

During the 2½ day program all aspects of a community's emergency medical services system will be discussed in terms of identification, coordination, and implementation. This system includes: first aid and emergency care, transportation of the ill and injured, emergency communications, and emergency facilities.

Special emphasis will be placed upon the development of Community Councils on Emergency Medical Services and ways and means of financing the community's emergency medical services system. Roles of the US Department of Transportation, Public Health Service, state government and organized medicine also will be discussed.

The conference is open to all persons involved or interested in their community's emergency medical care. This includes physicians; allied health personnel; hospital administrators; providers of ambulance services; public safety officials—police, fire and sheriff; government officials—local, county and state; representatives of service organizations; planners; educators; and private citizens. A cross section of the various national leaders of the above groups will be featured on the conference program.

An added highlight will be industrial and organiational exhibits related to the various aspects of the emergency medical services system.

For further information, write to: *AMA,* Department of Hospitals and Medical Facilities, 535 North Dearborn Street, Chicago, Ill. 60610.

MARYLAND HEALTH FAIR—SPECIAL EVENTS OF INTEREST

The largest and most significant educational event for better health in this state—the Maryland Health Fair—will open next November 11 at the Baltimore Civic Center and continue from 10 a.m. to 9 p.m. daily through November 20.

Occupying the entire exhibition area of the Center, the Health Fair will present an expansive program of demonstrations, lectures, classes, special displays and will have approximately 250 booth areas filled with exhibits on all types and phases of health information. The Fair is free to everyone and there are no fees or other charges for any of the special programs.

The Health Fair is drawing its expected audience of more than a quarter of a million from the entire Maryland area as well as the District of Columbia, Pennsylvania, Delaware and New Jersey.

The lower area will house some 200 displays centered around the huge "Space Medicine" exhibit provided by the National Aeronautics and Space Administration. It describes the major medical advances which have occurred in the past decade and their relationship to the US space efforts.

Another major exhibit includes the 40 paintings by the international artist, Robert A. Thom, which immortalizes pictorially the highlights of pharmacy from antiquity to the present. Commissioned by Parke, Davis and Co., the "Million Dollar" series was completed after ten years of research and more than 250,000 miles of travel to all parts of the world.

Most outstanding of the ten displays loaned to the Fair by the *AMA,* is the *Transparent Twins,* two life-size transparent plastic female models, one showing 25 organs of the body and the other the 200-bone skeleton and the nervous system.

Heads you win,
Tails you win

saver's choice

Baltimore Federal offers a plan to meet the needs of every saver

PASSBOOK SAVING: the popular choice for profit, safety, and convenience. Your money earns Baltimore Federal's extra high dividends in insured safety. Accounts are insured up to $15,000 by the Federal Savings and Loan Insurance Corporation and are further protected by Baltimore Federal's own reserves of over $23,000,000. Savings may be added or withdrawn at any time in any amount at any Baltimore Federal office. If you're looking for the best combination of profit, safety, and convenience, open your savings account soon.

SAVINGS CERTIFICATES: two Savings Certificate plans designed to be of special interest to people who view their savings program as more of a high-yield investment. Six-month certificates earn dividends at Baltimore Federal's current rate, paid by check at our regular dividend period, plus an additional anticipated bonus paid at maturity. Available in minimum amounts of $2,000 (larger certificates in multiples of $1,000 up to $11,000). There is also a special six month certificate available in minimum amounts of $12,000 which operates the same way but which will earn an even greater bonus at maturity. For extra return, invest now in Baltimore Federal six-month Savings Certificates.

BALTIMORE FEDERAL
Savings & Loan Association

Downtown at Fayette & St. Paul Sts. • Reisterstown Road Plaza
Eastpoint Shopping Center • Carney at 9609 Harford Road above Joppa
Towson at 7 Alleghany Ave. • Westminster at 6 E. Main St.

Other *AMA* displays cover such subjects as medical quackery, alcoholism, human conception and birth, drug addiction, sight, hearing and weight reducing.

On the upper level of the Civic Center a series of small auditoriums will be used for continuous movie showings, special lectures and demonstrations. A second area will be occupied by a health screening test center where free tests will be given blood pressure, diabetes, vision, dental and hearing. An adjacent area will be used for individual consultation on problems of the aging, Medicare and allied subjects.

Sponsored by the ten member health agencies of the Commerce and Industry Combined Health Appeal in conjunction with the *Medical and Chirurgical Faculty of Maryland*, the Maryland State and Baltimore City Health Departments and the Hospital Council of Maryland, the Health Fair also is receiving much of its support from other voluntary health agencies, public health departments, local and national governmental agencies, medical schools, hospitals and allied professional groups.

* * * * *

SINAI OFFERING SPECIAL TRAINING IN COMPREHENSIVE MEDICINE

Applications are being accepted for training in comprehensive (psychosomatic) medicine in the Departments of Medicine and Psychiatry at the Sinai Hospital of Baltimore, a 500-bed community general hospital, closely affiliated with the Johns Hopkins Hospital and School of Medicine. The training program is based on a 34-bed medical ward service with clinical responsibility and close supervision by staff psychiatrists and internists. Training stipends paying $10,000-$12,000 a year are available through the USPHS. Applicants must be either an American citizen or have a permanent visa. Inquiries should be directed to Bernard R. Shochet, M.D., Liason Service, Department of Psychiatry, Sinai Hospital of Baltimore, Inc., Belvedere and Greenspring Avenues, Baltimore, Maryland 21215.

SUICIDOLOGY

The Department of Psychiatry of The Johns Hopkins University School of Medicine is conducting a fellowship training program in the new field of Suicidology. The fellowship focuses on the study of suicide and its prevention.

Supported by a five-year grant from the National Institute of Mental Health, the program reflects the increasing academic and community interest in suicide prevention. The object of the program is to prepare persons for a variety of roles in suicide prevention centers, emergency mental health services and in community mental health programs.

Courses will be conducted by a multidisciplinary staff from The Johns Hopkins, the National Institute of Mental Health, and selected city and state agencies.

The first year's program began in September 1967. Eight one-year fellowships will be offered for the year beginning September 1968. Candidates are being sought from a variety of social and behavioral sciences, including psychiatry, psychology, sociology, social work, nursing and public health. Stipends range from $9,000 to $15,000, depending on training and experience. Applications are now being accepted for 1968.

The program director is Seymour Perlin, MD, Professor of Psychiatry at The Johns Hopkins. Chester Schmidt, MD, Assistant Professor of Psychiatry at The Johns Hopkins, is program coordinator. The project officer at the National Institute of Mental Health is Edwin Shneidman, MD, who is Chief of the Center for Studies of Suicide Prevention. Inquiries regarding the program and requests for application forms should be directed to Dr. Perlin.

"All Registered Nurses are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards. Therefore, all registered nurses are alike.

That's nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all registered nurses aren't alike, either.

plan to attend

•

american medical association committee on aging

•

conference on aging and long-term care

where:

Baltimore, Maryland
The Emerson Hotel

when:

November 2-3, 1967

for whom:

Representatives of health and welfare agencies and professions, agriculture, business, labor, churches, educational institutions, government, women's organizations, service clubs, retired persons' organizations, communications media.

purpose:

To explore new needs and report on new developments in —

—AGING

Action to enrich living among older people—in employment, health maintenance, adult education, service to the community, and preparation for later years.

—LONG-TERM CARE

New approaches in manpower utilization, facilities and programs for long-term patients of all ages; preventive techniques; comprehensive health service planning; rehabilitation; and financing of care.

EXECUTIVE SECRETARY'S NEWSLETTER

October, 1967

RESOLUTIONS FOR ANNUAL MEETING

Wednesday, February 21, 1968, is the date on which resolutions for consideration at the Faculty's annual House of Delegates meeting must be received in order to be considered at that time. While no date has been set for the Reference Committee meeting, adequate notice of such a date, together with the resolutions to be considered, will be provided to all members.

MEDICARE VIOLATIONS

At the AMA Annual Meeting in Atlantic City last June, reference was made to violations of the Medicare Law by officers or employees of the federal government. All such instances should be fully documented, if they occur, and reported to the Faculty office.

Once received, they will be referred to the Faculty's legal counsel for opinion as to whether or not the documented claim affords a reasonable basis for belief that there has been a violation of Section 1801, which provides that no federal employee shall interfere with the practice of medicine. If such is the case, they will then be forwarded to the AMA for action by its Legal Research Department.

MARYLAND MEDICAL POLITICAL ACTION COMMITTEE

Nearly 200 physicians and their wives heard words of wisdom from Congressman Robert H. Michel during the Faculty's Ocean City meeting in September. The Congressman spoke on Why Professional Persons Should Become Involved in Politics.

This luncheon gave added impetus to the Maryland Medical Political Action group in its activities to involve Maryland physicians in political activity.

NATIONAL HEALTH SURVEY

Adolescents aged 12 through 17 years will be examined during November and December as part of the U. S. National Health Survey. It will be conducted November 21 through December 14 and will be sponsored by the USPHS. Additional information can be obtained from the Faculty office.

MONONUCLEOSIS-LIKE CONDITIONS

A study of infectious mononucleosis, infectious lymphocytosis and related diseases is being undertaken by NIH. Areas of investigation include the virologic, hematologic and immunologic manifestations of these disease syndromes.

Full details can be obtained through the Faculty office for physicians who may wish to refer patients for these studies.

PRINCIPAL NURSING HOME PHYSICIAN GROUP

Raymond T. Benack, M.D., Silver Spring, has been elected President of the Maryland Association of Nursing Home Physicians. Other officers include, Abraham A. Silver, M.D., Baltimore, Vice-President; Allan H. Macht, M.D., Baltimore, Treasurer; and J. Raymond Gladue, M.D., Baltimore, Secretary.

On the Executive Committee are Harold V. Harbold, M.D., Baltimore, Charles H. Williams, M.D., Reisterstown, and Harvey S. Feuerman, M.D., Baltimore.

NEWS NOTES

Adrian Sanchez, M.D., Baltimore, has been named a Diplomate of the American Board of Anesthesiology.

James D. Drinkard, M.D., of Sheppard and Enoch Pratt Hospital, has been named to the Board of Directors of the Maryland Criminal Justice Commission.

Augusto J. Esquibel, M.D., College Park, has been named Assistant to the Director for International Programs at the National Institute of Mental Health. Dr. Esquibel was formerly chairman of the Faculty's Committee on Emotional Health.

Jacob H. Conn, M.D., Assistant Professor of Psychiatry at Johns Hopkins, spoke on The Treatment of Behavior Problems in the Child Patient, recently, in Philadelphia.

The Month in Washington

The American Medical Association strongly opposed a suggestion that doctors' fees under medicare be based on Blue Shield schedules.

The suggestion was made to *AMA* officials while they were testifying before the Senate Finance Committee on the House-approved social security bill which includes amendments to the medicare and medicaid programs. Samuel R. Sherman, MD, San Francisco, chairman of the *AMA's* Council on Legislative Activities, said there would be heavy opposition from the medical profession to any change from the present usual-and-customary fees.

Milford O. Rouse, MD, president of the *AMA*, gave general approval to the bill passed by the House which, he points out, incorporated a number of changes recommended by the *AMA*. He said further substantive changes better could await the knowledge that one or two more years of experience would bring. However, he urged that consideration then be given to major changes in Medicare Plan B which covers physicians' services.

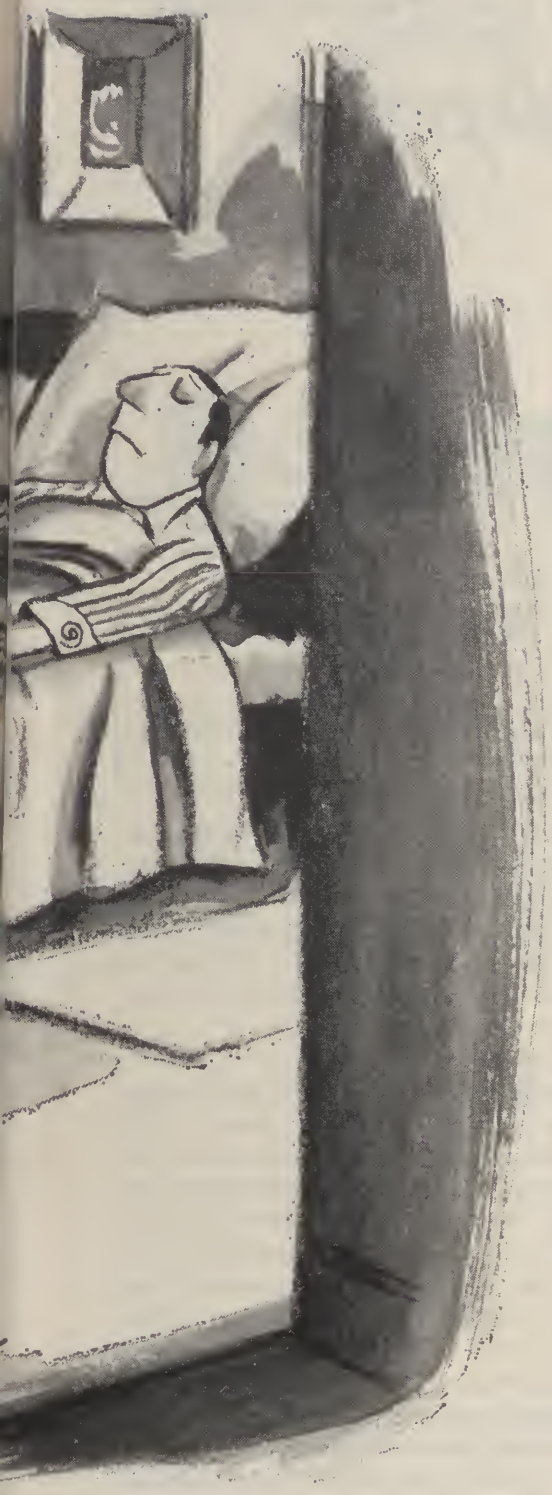
"We believe it is possible for the Congress, the medical profession and others interested in the subject to develop a new mechanism for delivering medical care to people over 65 that would be consistent with existing private sector mechanisms," Dr. Rouse said.

". . . the Congress realizes it has an open-end program with rising and perhaps uncontrollable costs. We believe that it is possible, and would be eminently practical, to devise another approach that could solve problems which beset Part B. One possibility, for example, might be to substitute for the Part B program a subsidy to all eligible persons, to be used for the purchase of private health insurance. Such an approach could have many advantages.

"The eligible over-65 patient would have a qualified private insurance program of his choice, at no greater expense than he has under the Part B Medicare program; carriers would have a greater responsibility for their own performance with an opportunity to exercise initiative; the physician would continue to deal with his over-65 patient in every respect in the same way as he did before the patient's birthday; and the Congress would have a program with defined costs, and one which would offer the nation a comparison of mechanisms in use to meet the problems of financing health care of the elderly."

Other points in the AMA testimony included:

Beginning with the provisions of Title 18 (Medicare), the (House) bill does not place the disabled of all ages under Medicare, as had been proposed earlier. We think the House acted wisely in establishing instead, a special Advisory Council to study the problems related to the inclusion of this group and to study the costs involved.



In addition to the present method of payment for physician's services, the (House) bill provides two new options: either the physician can submit his itemized bill directly to the carrier, in which case payment of 80% of the reasonable charge would be made to him, providing the full charges does not exceed the reasonable charge, or to the patient at his direction; or the patient may submit the itemized bill and be paid 80% of the reasonable charge. From the program's inception, the *AMA* has urged that the payment be permitted on the basis of an itemized statement of charges.

Outpatient hospital diagnostic services would be transferred to Part B of Title 18 and be subject to the deductible and coinsurance features. This is in keeping with our recommendation to the House Ways and Means Committee that outpatient services be included under Part B, and so remove the administrative difficulty of distinguishing between therapeutic and diagnostic services.

The bill eliminates both the requirement for initial physician certification for hospitalization of Medicare patients and the requirement for physician certification for outpatient hospital services. The *AMA* recommended the elimination of initial certification and the subsequent recertification. We continue to recommend the addition of this second step to eliminate the requirement of any certification, since any need in this regard will be satisfied by the work of the medical review or utilization

"George wants to know if it's okay to take his cold medicine now, Doctor, instead of seven o'clock?"

The long-continued action of Novahistine LP should help you both get a good night's sleep. Two tablets in the morning and two in the evening will usually provide round-the-clock relief by helping clear congested air passages for freer breathing. Novahistine LP also helps restore normal mucus secretion and ciliary activity—normal physiologic defenses against infection of the respiratory tract. Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

NOVAHISTINE® LP

DOW **PITMAN-MOORE** Division of The Dow Chemical Company, Indianapolis

review committee.

We believe that physicians, having been brought under Social Security, should be accorded the same privilege and opportunity for reaching a fully insured status as was accorded other professional groups when they were included in the program. Accordingly, we urge this Committee to consider the adoption for physicians of an "alternative insured status" similar to that permitted by the amendments of 1954 and 1956 which brought into the program many new groups of people and professional self-employed persons, including lawyers. Further, we urge this Committee to consider amendments that would "drop out" an appropriate number of years for physicians to make their eligibility for cash benefits both equitable and realistic.

We must oppose the drug legislation offered before this Committee as amendments to H.R. 12080. We would suggest that rather than to enact such legislation it would be worthwhile at this time to study in depth, all the economic and therapeutic factors which enter into the use of prescription drugs.

The federal government has stepped up its campaign against cigarette smoking with the issuance of a new report and the appointment of a Lung Cancer Task Force.

A second Public Health Service report on the subject summarizes three and one-half years of research and study into the health dangers of smoking. The Department of Health, Education and Welfare said the report confirms and strengthens the conclusions of a 1964 report. The second report provides new technical data on the relationship of smoking to cardiovascular, chronic bronchopulmonary disease, cancer and other conditions.

Cigarette smokers have substantially higher rates of death and disability than their nonsmoking counterparts in the population. This means that cigarette smokers tend to die at earlier ages and experience more days of disability than comparable nonsmokers.

A substantial portion of earlier deaths and excess disability would not have occurred if those affected had never smoked.

If it were not for cigarette smoking, practically none of the earlier deaths from lung cancer would have occurred; nor a substantial portion of the earlier deaths from chronic bronchopulmonary diseases (commonly diagnosed as chronic bronchitis or pulmonary emphysema or both); nor a portion of the earlier deaths of cardiovascular origin. Excess disability from chronic pulmonary and cardiovascular diseases would also be less.

Cessation or appreciable reduction of cigarette smoking could delay or avert a substantial portion of deaths which occur from lung cancer, a substantial portion of the earlier deaths and excess disability from chronic bronchopulmonary diseases, and a portion of the earlier deaths and excess disability of cardiovascular origin.

Kenneth M. Endicott, MD, director of the National Cancer Institute, is chariman of the Lung Cancer Task Force made up of 10 physicians and scientists.

Dr. Endicott said that the group will concentrate on research for the development of a less hazardous cigarette, prevention of occupational cancer due to exposure of workers to cancer-causing substances in their working environment, and improvement of the present low lung cancer cure rate of five per cent.

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

The Executive Committee at its September 7, 1967, meeting took the following actions:

1. Heard a presentation from representatives of the Division of Vocational Rehabilitation, State Department of Education, with respect to its program for the Comprehensive Rehabilitation Center to be located on the grounds of Montebello Hospital.

2. Heard a presentation in connection with a proposed Retirement program for Faculty members under the Keogh law and recommended that the Council consider adoption at a special meeting called for that purpose.

3. Found no conflict in the by laws of the Association of Nursing Home Physicians which read, in part, " . . . set up standards of medical care acceptable to the Association . . ." The association is composed entirely of physicians and is dedicated to the objectives of seeing that nursing home patients receive the highest quality of care.

4. Approved changes in salary ranges of various job classifications, as recommended by a personnal study.

5. Authorized the Faculty's delegates to the *AMA* sessions to establish a hospitality suite at these meetings.

6. Approved a policy that employees would be honored on retirement on an individual basis, but in any event no recognition would be given for persons serving under five years.

7. Received information that a study was being undertaken in connection with Faculty space requirements for office and library for use in any future building or alteration plans.

8. Received information that the Internal Revenue Service had checked the meeting registration for those persons on the 1966 cruise convention and found no fault with the records maintained.

9. Expressed no objection to local health offices having MEDIC equipment installed, provided there was no additional charge to the Faculty's educational fund.

10. Endorsed appointment of the following physicians to the Medical Advisory Board, Department of Motor Vehicles:

C. James Duke, MD, Silver Spring, Physiatrist

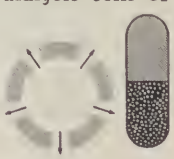
Frederick P. Pokrass, MD, Sykesville, Psychiatrist

11. Selected John M. Dennis, MD, as the Faculty's nominee for appointment to the Advisory Committee to the Maryland Medical Assistance Program.

12. Authorized the annual donation of $250.00 to the Student *AMA*, University of Maryland Chapter; and suggested that this group might wish to make an annual report to the Faculty's House of Delegates as to its activities.

13. Receive information on problems being encountered by physicians with a few insurance carriers who are refusing to make payment of Usual Customary and Reasonable fees under Workmen's Compensation Insurance programs; and heard that legal action was being contemplated.

14. Received information with respect to a



Unique Nitrospan micro-dialysis process* adds an important dimension–TIME–to nitroglycerin therapy

Helps decrease frequency and severity of attacks; often increases exercise tolerance. Decreases need for sublingual nitroglycerin, increases patient confidence. Smooth, continuous release independent of gastrointestinal functions reduces headache and other side effects that might result from peak concentrations of tablet or intermittent-release preparations.

Indication and Dosage: For prophylactic use only in angina pectoris, 1 capsule every 12 hours. **Precautions:** For prophylaxis only, not for relief of acute anginal attacks. Tolerance to nitrites may develop on long-continued use. **Contraindications:** Idiosyncrasy to nitroglycerin, and early myocardial infarction. **Side Effects:** With use of nitrites, transient headache, postural hypotension, nausea and vomiting may occur. Overdoses may cause flushing, dizziness, tachycardia, headache and syncope.

***The micro-dialysis cell.** Nitrospan's timed-release mechanism is different from those usually employed in sustained-action capsules, which rely on unpredictable digestive processes. The nitroglycerin in Nitrospan capsules is contained within hundreds of dialysis cells of controlled permeability. The contents of each micro-dialysis cell are released by diffusion rather than disintegration, at a continuous rate independent of gastrointestinal action. Only the presence of fluid is required.

NEW from USV

NITROSPAN®

CAPSULES

brand of **nitroglycerin** 2.5 mg. in micro-dialysis cells

For a starter supply of NITROSPAN, write: USV PHARMACEUTICAL CORPORATION, 800 Second Avenue, New York, N.Y. 10017

specific problem in Prince George's County in connection with the "corporate practice of medicine."

15. Authorized the Council Chairman and Executive Secretary to meet with the Governor's Aide on Health, Welfare and Human Relations in connection with certain areas of difficulty with the State Health Department.

16. Heard that a Chiropractor had instituted suit against a physician in connection with a so-called "restraint of trade" action on a Workmen's Compensation case.

The Council met on September 7, 1967, and took the following action:

1. Adopted the minutes of Council and Executive Committee meetings.

2. Approved the financial statement and dedicated fund statement through July 31, 1967.

3. Ratified physicians' defense for various physicians requesting it.

4. Heard that two cases had been closed; one with a verdict in favor of the physicians, now on appeal; and another settled for $1,450.

5. Reaffirmed action taken at the June Council meeting denying physicians defense for a member who had failed to pay his 1967 dues by January 31.

6. Recommended Emeritus membership to the House of Delegates for various individuals at the request of their component societies.

7. Disapproved of a recommendation that would have established legislation requiring laboratories to report positive serologies and positive Tbc identifications to the state or local health department, but permitted the health department to follow up such contacts only after obtaining permission of the physician.

8. Approved the following recommendation of the Liaison Committee:

"Approval of the policy that Prescription blanks printed for physicians after January 1, 1968, *not* contain *printed* information indicating refills."

9. Adopted the following recommendations of the Liaison Committee in connection with X-ray programs offered by local and state departments:

An educational program should be directed at private practitioners in an effort to influence their referring private patients to Radiologists rather than to Health Clinics, particularly when payment is being made by a third party with greater and greater frequency.

If a pregnant woman under the care of a private obstetrician is in need of a chest x-ray, then she should be referred to a private Radiologist.

Industry requiring a preemployment chest x-ray should be encouraged to contract with a private Radiologist whenever possible. The Health Department and the Maryland Tuberculosis Association should discourage the use of their facilities by industry for preemployment x-rays where it is felt that such an arrangement with a private Radiologist is feasible.

In this connection, the Council also undertook to advise the Faculty's Occupational Health Committee and the Maryland Thoracic Society of this action; with the suggestion that Industry adopt such a policy and that the Thoracic Society consider recommending similar policies to the Maryland Tuberculosis Association.

10. Adopted the following recommendation which came through the Membership Committee:

"An appropriate recognition at the time of their death be made of members or other deserving individuals who have worked on behalf of the medical profession. The determination as to the extent of the financial cost of such tribute, and the determination as to the qualifications for such tribute should be left to the discretion of the Executive Committee."

11. Rejected the following recommendation which came from the Membership Committee:

"The Membership Committee recommends to Council that, in the Faculty's routine letter sent to widows on the death of a Faculty member, an offer be made to underwrite the cost of Blue Cross and Blue Shield health insurance for the widow, provided her financial circumstances warrant it. It is understood that such an offer, if not taken advantage of initially, would be made available at any time in the future, should circumstances change. Funds are available for this from the Cordell Fund."

12. Received an information report that the Membership Committee was still studying the question of admission of Osteopaths to membership; and also a policy that could give

guidance to the same question with respect to hospital medical staffs.

13. Received for information the report of the Subcommittee on Child Welfare on Education Programs for Pregnant Girls. This has been adopted by the State Department of Education.

14. Adopted the report of the Ad Hoc Committee to study the Abortion Law, as amended. This is summarized on page of this is sue of the Journal.

15. Approved holding a special Council meeting on Thursday, October 5, to discuss and adopt a proposed Retirement program for Faculty members under the Keogh law.

★★★★★★★★★★★★

LICENSE REVOCATIONS, SUSPENSIONS AND PROBATIONS

The Board of Medical Examiners has advised that the following license revocations have been ordered, effective on the dates shown:

Revocation:

Jesse Williams II, MD, Revoked April 20, 1967. Convicted of the crime of manslaughter, 1st degree, by the Supreme Court of the State of New York, County of New York.

Matthew M. Cox, MD, Revoked April 20, 1967. Convicted of violation of Section 11163, of the Health and Safety Code of California, a statute regulating narcotics, by the Supreme Court of California.

Suspension:

Miller Maurice Evans, MD, Suspended on June 6, 1967, pending restoration of his Virginia Medical license.

Probation:

Clay Henry Johnson, MD, placed on probation subject to continuation of his probation by the Board of Medical Examiners of Louisiana, further action contingent on the actions of the Boards of Louisiana or Texas.

***MEDICARE APPLICATIONS ACCEPTED**

Report on Protocol on Registered Nurse Responsibilities and Duties as Related to Medical Practice Act

Discussion took place on procedures now performed by nurses and the desirability of their being in scope of practice of medicine and still being practiced by registered nurses, under the order of a licensed, registered physician who assumes full responsibility for the act. Specific permissions and restrictions may be made by the local medical staff in each hospital in the state. Generally, if the act performed by the registered nurse is basically mechanical, not requiring the exercise of medical judgment, and is done by order of or supervision by a physician, it is legal.

The following suggestions were made on the items listed, provided by the Maryland Nurses Association:

1. **Initiation of external cardiopulmonary resuscitation and artificial respiration (mouth-to-mouth or mouth-to-nose)**

This would be done as a first-aid measure, and any person adequately trained and accepted as qualified to do it would normally proceed with such action. Nurses should have a training program for the persons who perform this service. They should also be taught protective measures in training to prevent contracting a disease such as tuberculosis, syphilis or meningitis.

2. **Administration of investigational drugs**

This would be done on orders of a physician, with permission of the patient (consent form), and approval of the medical advisory committee or board at the hospitals.

3. **Administration of subcutaneous infusions**

Approved administration by nurse, with orders of a physician.

4. **Vena puncture**

Approved administration by nurse, with orders of a physician.

5. **Administration of intravenous a) Fluids, b) Blood, c) Medications, d) Medications added to fluids**

Approved administration by Intensive Care Unit IV or Fluid Team; blood given with physician, preferably a pathologist, supervision.

6. **Removal of inter-cath (indwelling intravenous catheter)**

Approved administration by nurse.

7. **Deep intratracheal suction**

No, should be anesthesiologist or anesthetist under the direction of anesthesiologist.

8. **Administration of anesthesia during labor**

No, should be anesthesiologist or anesthetist under the direction of anesthesiologist.

9. **Vaginal examination during labor**

Approved on order of physician.

10. **Rectal examination during labor**

Approved on order of physician.

11. **Removal of sutures**

Approved on order of physician.

12. **Suture of minor lacerations**

No—unqualified.

13. **Exchange fluids in peritoneal dialysis**

Qualified yes.

14. **Performance of tracheotomy**

No—unqualified.

15. **Insertion of gastric tubes**

Approved.

16. **"Milking" chest tubes to keep them open**

Approved.

17. **Interpretation of electrocardiograms**

No—unqualified.

18. **Substitute for the pharmacist in his absence**

"The night nurse supervisor is authorized to utilize the services of the pharmacy under the following conditions:

1. The pharmacist must provide an emergency pharmaceutical kit containing drugs necessary for the peculiar or particular needs of the hospital from the time the pharmacist leaves the hospital until he returns.
2. An appropriate record shall be kept in the pharmacy which the nurse shall sign, showing the name of the drug withdrawn, the exact amount of each dose, and the total

---

Adopted by the Council, June 17, 1965, revised Feb. 15, 1966.

amount of each drug withdrawn.

3. For any drug not included in the emergency pharmaceutical kit, the pharmacist should be called and should provide emergency service in the procurement and the dispensing of the drug required."

19 **Application of pressure bandages to control hemorrhage**

Approved.

20. **Operation of intermittent positive pressure machine**

Approved, if properly trained.

Joint Statement on the Role of the Registered Nurse in the Care of the Patient with Cardiovascular Diseases in Coronary Care or Intensive Care Units

It has been demonstrated in recent years that patients can achieve a significant reduction in mortality from myocardial infarction. This has been made possible by the establishment of special units for the care of these patients. The general term used throughout the country for this type of unit is "Coronary Care Unit."

The basis in which this concept is derived is recognition that intensive observation and immediate recognition of the patient's changes in cardiac arrhythmia are essential. These changes take place so quickly that life-saving therapy must be instituted immediately if it is to be effective.

This statement is prepared in order to promote this life-saving kind of care, yet give some protection to the physician, nurse and hospital on a legal basis. The above-named groups (Med-Chi Faculty and Maryland Nurses Association) recognize the propriety of registered nurses using monitoring, defibrillating and resusciatative equipment. In addition, under certain conditions it is appropriate for registered nurses to institute life-saving corrective measures—if the licensed physician is not immediately available and if all other conditions below are adhered to:

1. The Registered Nurse must have had a special and intensive course of instruction in the above techniques and have the knowledge necessary for her to perform these

Adopted June 8, 1967.

duties safely.

2. Registered Nurses may be allowed to perform these procedures in line with policies carefully stated and voted on by the medical group responsible for the care of patients in the specific hospital.
3. These techniques should be carried out only by licensed professional nurses who are working in Coronary Care Units or in Intensive Care Units.
4. Only nurses who have demonstrated that they are capable of performing these tasks may be designated to do so.

Nurses should be informed that no statement of policy by professional organizations or by an employing agency can relieve the individual nurse of responsibility for his or her own acts. A statement of policy will not provide immunity from legal action if the nurse is negligent. A policy statement will give the nurse support by setting forth recommended policy which responsible professional groups suggests for appropriate practice and sound procedure.

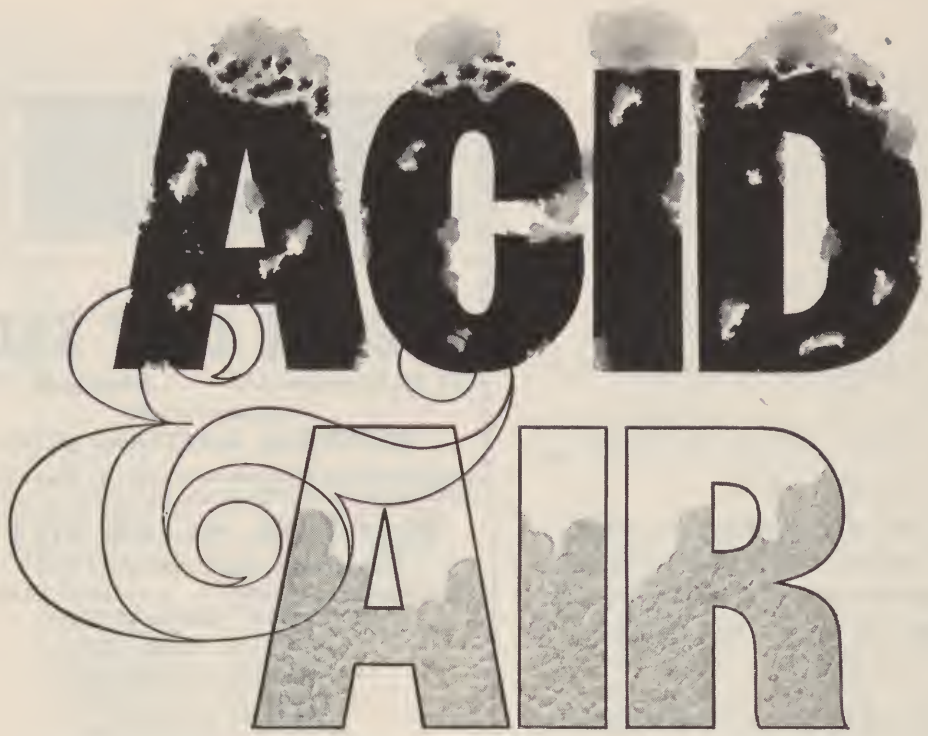
Statement on Closed Chest Cardiac Resuscitation and Artificial Respiration by The Registered Professional Nurse*

When available, a physician is responsible for the treatment of cardiac arrest. If he is not present he should be summoned immediately and, upon arrival, responsibility for treatment rests with him.

It is recognized that in hospitals, and elsewhere, emergencies may occur in which performance of closed chest cardiac resuscitation and artificial respiration appear to be indicated; that in these emergencies physicians may not be immediately available; and that a delay beyond a period of 3 to 5 minutes in administering closed chest cardiac resuscitation and artificial respiration to a patient may mean either permanent brain damage or death.



University and other hospitals have already established as common practice that appropriately trained registered nurses are authorized to perform closed chest cardiac resuscitation and artficial respiration as emergency procedures until such time as a physician arrives to assume responsibility for treatment. It is essential that a hospital assign a physician for this important duty, particularly in view of the medicolegal aspects of this responsibility.

Because in emergency situations closed chest cardiac resuscitation and artificial respiration constitute life saving, humanitaran acts, we support the role of the properly trained registered nurse in performing the above under the following circumstances:

1. The apparent need for closed chest cardiac resuscitation and artificial respiration.
2. The absence of a physician.
3. The nurse is licensed as a registered nurse by the Maryland State Board of Examiners of Nurses.
4. The nurse has been instructed in closed

Approved by the Board of Directors, Maryland Nurses Association, January 24, 1966.

Approved by the Executive Committee, Medical & Chirurgical Faculty of the State of Maryland, February 17, 1966.

DUAL PROBLEM IN PEPTIC ULCER

Relief of hyperacidity is still a primary goal in the treatment of peptic ulcer. And antacids are the most widely used means of achieving this relief. But antacids alone cannot influence the distention and bloating which so often add to ulcer distress.

THIS IS WHY MYLANTA® PROVIDES:

the two most widely used antacids—magnesium and aluminum hydroxides—to help secure rapid acid neutralization with little chance of laxation or constipation;

PLUS

the defoaming action of simethicone—to help relieve the painful gas symptoms which often accompany peptic ulcer.

Mylanta®

antacid therapy plus an added benefit

nonfatiguing flavor/smooth pleasant texture; both assure patient cooperation during long-term therapy.

Stuart Division of/ ATLAS CHEMICAL INDUSTRIES, INC. / Pasadena, Calif.

chest cardiac resuscitation and artificial respiration by a qualified physician or nurse instructor as outlined in the pamphlet entitled, "Cardio-Pulmonary Resuscitation, A Manual for Instructors," published by the Heart Association of Maryland.

5. That the employing agency i.e., hospital, industrial clinic, visiting nurse service, etc. state in its policies that these procedures may be carried out by a properly trained registered nurse and under what circumstances.
6. That there are no physicians' orders contrary to the carrying out of such procedures.

We further recommend the following:

1. That closed chest cardiac resuscitation and artificial respiration instruction and practice be included in the curriculum of all diploma, associate degree and baccalaureate degree programs for nurses.
2. That all practicing registered nurses be encouraged to take basic training in closed chest cardiac resuscitation and artificial resperiodic refresher training.
   periodic refresher trining.
3. That particular emphasis on training in this regard of head nurses and nursing supervisors in charge of nursing units in hospitals be encouraged.
4. That hospitals and other organizations, which furnish nursing care, have available and on appropriate display, instructive placards on closed chest cardiac resuscitation and artificial respiration.

*This statement was prepared for registered nurses and is not intended to limit training of other personnel. The Heart Association of Maryland is willing to lend assistance in teaching and training programs.

Statements on Intravenous Administration of Fluids, Blood, Medications by Professional Registered Nurses Practicing in Maryland

Nurses should be informed that no statement of policy by professional organizations or by an employing agency can relieve the individual nurse of responsibility for his or her own acts. A statement of policy will not provide immunity from legal action if the nurse is negligent. A policy statement will give the nurse support by setting forth recommended policy which responsible professional groups suggest for appropriate practice and sound procedure.

Development of Policies

It is suggested that hospitals or agencies desiring that professional registered nurses administer intravenous fluids, blood and medications, use the following recommendations as guides in developing written policies:

It is recognized that final decision in any interpretation of a law is in the jurisdiction of the courts.

Approved by the Board of Directors, Maryland Nurses Association, January 24, 1966.

Approved by the Executive Committee, Medical & Chirurgical Faculty of the State of Maryland, February 17, 1966.

Fluids and Medications

The procedure and specific fluid must be ordered in writing and signed by a licensed physician.

Wherever the professional registered nurse is working, the medical, nursing and administrative staffs should establish written policies which clearly and specifically state the conditions under which the professional registered nurse may administer intravenous fluids.

The following shall be included in the written policies:

1. The specific requirement for instruction and supervised practice.
2. A requirement that the administration of intravenous fluids and medications by professional registered nurses be performed under medical supervision.
3. A requirement that a current roster of nurses who have had sufficient supervised practice and instruction and who have demonstrated satisfactory ability to perform the procedure be included.
4. A current list of specific solutions which a

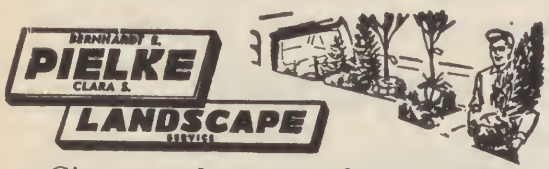
professional registered nurse may administer and of specific drugs which he or she may add to the solution. This list should be reviewed and revised at designated intervals.

5. Provision of continuing inservice education.

Transfusions

The above policies should apply to transfusions of whole blood and/or blood derivatives. In those situations where whole blood or blood derivatives must be administered by a nurse, it is imperative that the nurse work directly under medical supervision, preferably the hospital pathologist or physician who has been appointed in charge of the blood bank.

Explanation of Terms



Supervised practice and instruction: It is not feasible to construct one specific instructional pattern for use in the many varied existing agencies. Instruction should be based on a formal course which teaches the principles of intravenous therapy and provides enough supervised practice to insure the development of sufficient skill for safe performance of the procedure.

Professional registered nurse: A graduate of a professional school of nursing, currently registered by the Maryland State Board of Examiners of Nurses.

Intravenous administration: Introduction into a vein where the procedure involves vena puncture by needle but does not involve incision into or incision to reach a vein.

Medical supervision: A physician is immediately available.

one step ahead

Times change and classic lobar pneumonia is rare. Your next pneumonia patient may have an atypical clinical picture and perhaps a pathogen in his sputum such as *H. influenzae* or *Mycoplasma pneumoniae* (Eaton Agent), which is believed to be responsible for one out of every five cases of pneumonia. That's why it makes sense to keep one step ahead—and prescribe the *true* broad-spectrum antimicrobial activity of DECLOMYCIN.

With DECLOMYCIN, you get effective action against *both H. influenzae* and *Mycoplasma pneumoniae*, plus prolonged high levels of antibiotic activity in the blood and the lung tissue. You're one step ahead with...

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

For a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill.

For common and unusual pneumonias

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

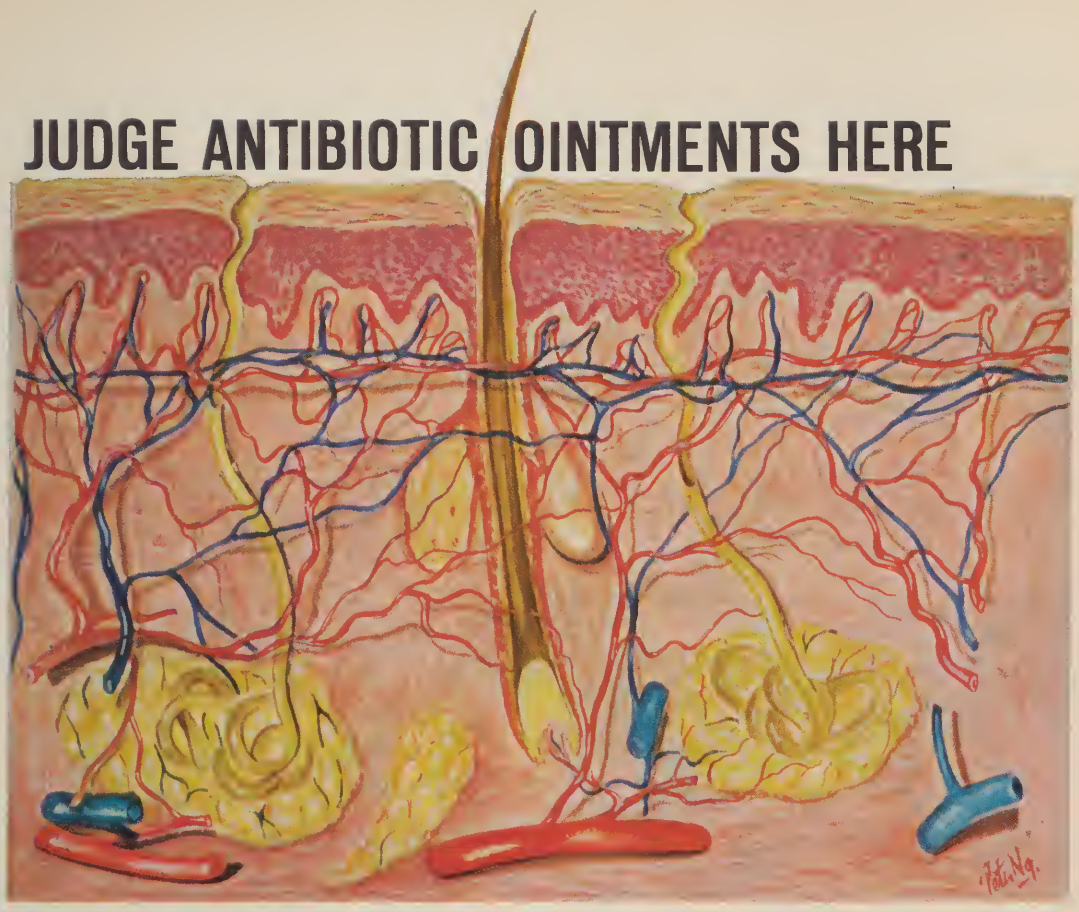
Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes. A rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth — dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.



Capsules: 150 mg; **Tablets:** film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

JUDGE ANTIBIOTIC OINTMENTS HERE

Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

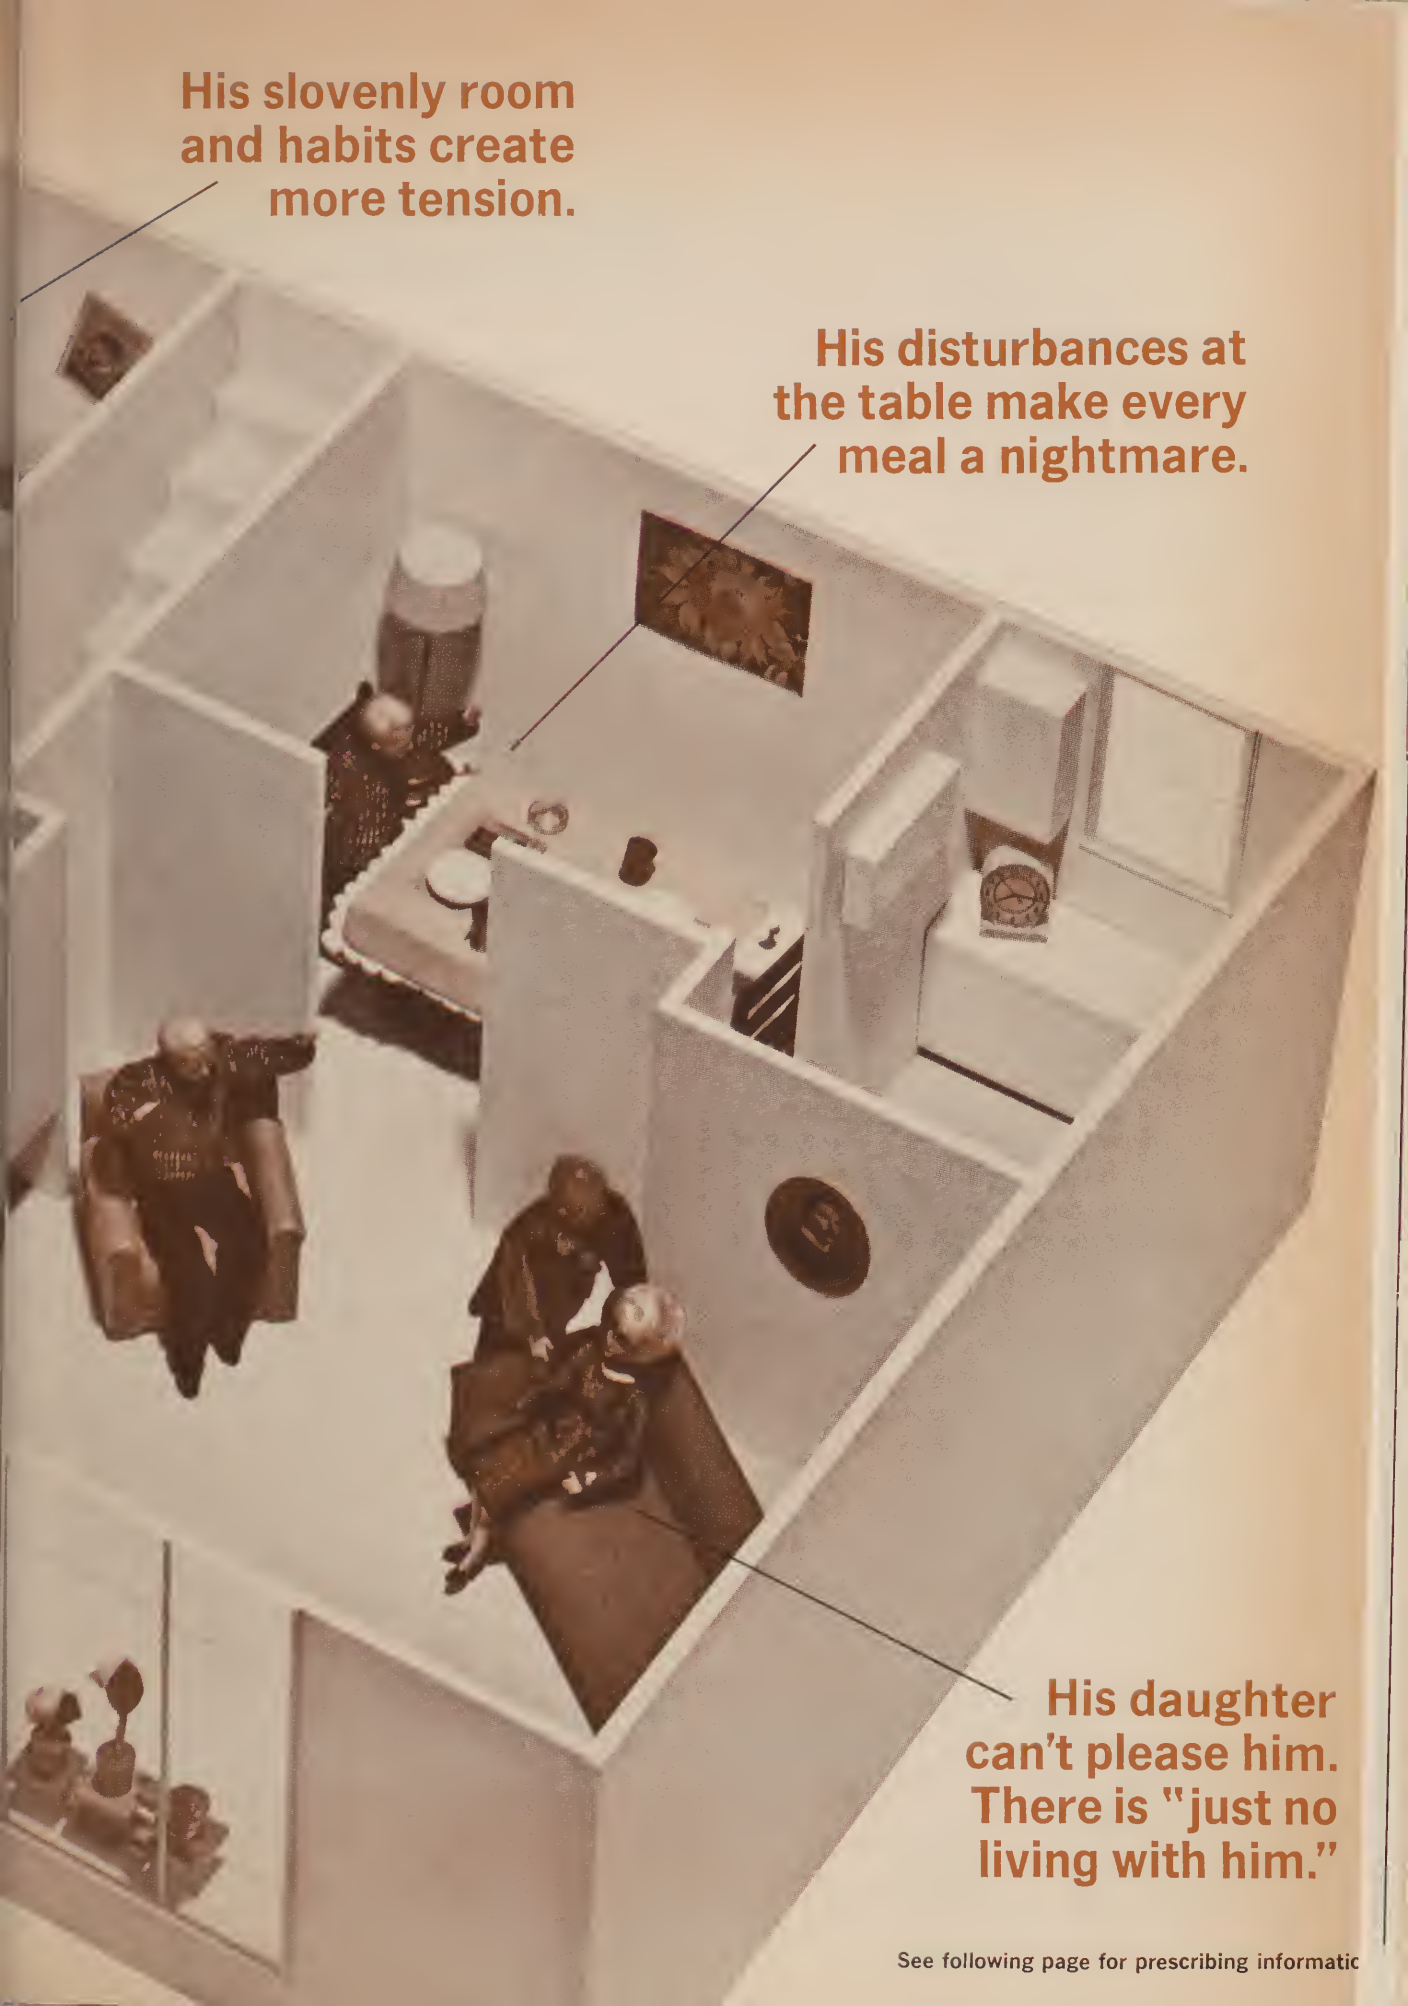
When the agitated geriatric disrupts the home...



His teen-age granddaughter won't invite friends home because of his outbursts.

for moderate to severe anxiety

Mellaril® (thioridazine) 25 mg. t.i.d.

SANDOZ

See following page for prescribing informatic

When the agitated geriatric disrupts the home...

Anxiety that *seriously interferes* with the individual's performance at work, at home, or in the community may be regarded as *moderate to severe* in degree.

Mellaril often recommends itself to the treatment of moderate to severe anxiety because it

- helps control the most frequent symptoms: marked tension, agitation, apprehension, restlessness, hypermotility
- often alleviates anxiety-induced somatic complaints
- frequently helps strengthen emotional resources
- helps the patient maintain realistic contact with environment, closer harmony with family

Thus, when you consider the anxiety moderate to severe... consider Mellaril.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.

Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.

Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.

Before prescribing, see package insert for full product information.

for moderate to severe anxiety

Mellaril®
(thioridazine)
25 mg. t.i.d.

SANDOZ

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

RICHMOND, VIRGINIA 23217
Manufacturers of ethical pharmaceuticals since 1856

EDITORIAL

Sports medicine gives physicians a chance to apply their special competences to fields of energetic fun and competition.

Sports now involve people of all ages and both sexes in physically stressful and physiologically demanding activities. Our patients can often afford sports equipment with which they must train constantly if they are to use it safely. Self-contained underwater breathing apparatus (SCUBA), parachutes and skis are only three examples. Youths and adults travel widely to follow their dearest sports and, in the process, expose themselves to unknown diseases and unfamiliar medical care systems.

Closer to home we have the regular and organized sports activities of secondary schools where special hazards exist for our own adolescents. Although young children and college students face definite sports dangers, both of these groups are somewhat better protected by either the lesser demands on the younger ones, or the larger professional staffs which surround and support the older. But almost all of the caretakers of the adolescent athlete– parent, trainer, physician even—have paid him relatively little attention.

Faculty members with concern for the health of our youthful athletes have started to give medical support to them and their coaches and trainers. Component societies in Montgomery and Washington counties have conducted seminars on the medical aspects of sports and, most recently, one was co-sponsored by the Faculty and the Catonsville Community College. With emphasis on prevention and on early recognition of injuries, these conferences supply knowledge and experience, support a coach who has no school physician and protect eager athletes who are new to competition. Team physicians learn the fine points of field diagnosis in team sports, the choice and fitting of safety equipment, player fitness and physical conditioning, and how to refine and improve his professional skills to further sportsmedicine.

Leaders in high school sports, knowing them to be highly competitive and dangerous, call to us physicians for the help which only we can give. But simple attendance at a football game or other contact sport is not enough. Each sport, each team has its own vulnerable spots which the team physician should know well if he is to be effective. The Faculty and its Subcommittee on the Medical Aspects of Sports can advise or consult with team physicians, send them free pamphlets on preparticipation medical examinations, and loan books on sports and athletic injuries from its library.

Physicians who enjoy sports and youth (and who doesn't!) will find that he has much help and encouragement from his colleagues, from trainers at the schools, from concerned parents—and from a fine bunch of strong kids who need him badly. Please, won't you sign on as a "Team Doc?"

HEAT ADAPTATION AND INJURY IN FOOTBALL PLAYERS

HERMAN C. MAGANZINI, M.D., F.A.C.P.
Team Physician
Richard Montgomery High School
Rockville, Maryland

Although deaths among high school and college football players in this country are rare, a few do occur each year. Most of these are accidental and basically not preventible (assuming the usual precautions of adequate equipment, training, etc.). Unfortunately, some of the deaths are due to heat stroke, and these must be considered preventible. From 1960 to 1963 thirty deaths among high school football players were reported and of these five 16% were attributed to heat stroke[1] and therefore presumably preventible. For the 1966 season one of 26 high school football fatalities was due to heat stroke[2]. Certainly many of the late summer and early fall practices and games, in most areas of Maryland are carried on in conditions of temperature and humidity which could be dangerous for the unprepared athlete.

It is the purpose of this paper to present the physiologic problem and hopefully to suggest certain prophylactic measures so that no such preventible tragedies occur in the State of Maryland.

PHYSIOLOGY

Heat Production: Of all the energy expended during strenuous physical exercise, approximately 25% generates productive work. The other 75% raises the body temperature. This can cause the central body (core) temperature to be elevated 4 F or more (rectal temperature of 104+F) unless this heat can be properly dissipated.

Heat Dissipation: Heat is lost from the body by one or more of the following four methods: *Radiation*, the loss of heat to objects of surrounding air which is cooler than the body, accounts for approximately 50% of the loss. *Convection*, which requires some air movement, accounts for about 15%. *Evaporation* from the skin and lungs under normal circumstances, accounts for approximately 30%. *Warming* of the inspired air and heating of food and water intake, accounts for the last 5%. Obviously all of these methods of heat loss, except for evaporation, assume that the environment is cooler than the body. Also implied is the absence of insulating clothing and the presence of convection currents of air. The percentage losses outlined are approximated only if the ambient temperature is below 80 F. Above

Presented at Seminar on the Medical Aspects of Sports, August 14, 1967.

this, evaporation plays an increasingly important role, until at an air temperature of approximately 95 F all modalities, except evaporation of sweat, cease to be significant. This must now account for 100% of any heat loss. In addition to the importance of air temperature, it becomes obvious that the rate of sweat evaporation is inversely proportional to the environmental humidity. The higher the humidity the less evaporation can take place and therefore the less heat can be dissipated by this means. Likewise it can be seen that the amount and type of clothing will influence not only the amount of work necessary to accomplish a given task but also the amount of evaporation which will be allowed.

ACCLIMATIZATION TO HEAT

It has been demonstrated repeatedly that individuals can be trained to better tolerate strenuous exertion in a hot and humid environment. Much of this investigation has been done in the gold mines of South Africa[5] where wet bulb temperatures of 80 F or more constitute the normal working environment. Similar work has also been done by the military in this country[6] and all results are in agreement. This training in the heat causes increased circulation to the skin and dilatation of the skin blood vessels followed by an increase in the blood volume, primarily the extracellular fluid. There is also an increased ability to sweat and to produce larger volumes of dilute sweat for a given amount of work. The same degree of exertion produces less of a rise in body temperature and pulse rate compared to the unacclimatized individual.

These changes allow the person to perform stenuous tasks in high environmental temperature and humidity, without suffering the heat injury which would occur were he not so acclimatized. It has been shown that this adaptation requires that exercise be carried on in the heat. This can be of short duration, perhaps as short as one hour a day, but cannot consist only of exposure to or rest in the heat. This alone will not allow acclimatization to take place and strenuous physical exertion must in fact be carried out in the hot environment. It implies additionally, adequate salt and water intake to replace the losses incurred by sweating as well as to allow expansion of the extracellular fluid volume.

By this method acclimatization to heat begins after several days and is approximately 80% complete in five to seven days. After two weeks of training it is virtually complete.[3,5] It should be noted however that this acclimatization can be lost. In fact approximately 50% is lost after one week with almost none remaining after two weeks.[7] This means that an individual not exercising in the heat for two weeks would require complete retraining prior to taking part again without heat illness.

Obesity and Conditioning: The state of conditioning and training of the individual seems to play a part in the ease with which he adapts to severe exercise in the heat. Piwonka and his associates at Indiana University[8] tested distance runners in April, 1963 who had not been exposed to heat since the previous summer and who should have lost any previous heat acclimatization. The authors postulated that the daily strenuous exertion of running caused frequent changes in the central body temperature with involvement of the temperature regulating responses of sweating and cutaneous blood flow which "preacclimatized" the runners. They could however be acclimatized to a higher degree and were so, beyond that which others not so physically trained, could reach.[9]

It has been observed that obese individuals acclimatize poorly to heat and may have difficulty in becoming acclimatized at all.

THE FOOTBALL PLAYER'S PROBLEM

Many if not most areas of Maryland have the conditions of heat and humidity during late August and September which could cause and have caused heat illness, injury and death among football players. These athletes are susceptible to heat injury for this sport requires extreme exertion. The uniform which they wear has been shown to increase the work load for a given task 70% above that of the same task, performed by the same individual, in a light cloth "scrub" suit.[4] When fully dressed with helmet, shoulder pads and other equipment there is little area exposed for the essential evaporation of sweat.

Many of the boys are overweight and may not be in condition at the end of summer. In this regard it should be noted that of the nine deaths from heat stroke reported in American football from 1956 to 1963 all of the players were considered large for their age and all were interior linemen.[4] Again, demonstrating the fact that some

football players may not be in condition and certainly not heat acclimatized at the beginning of football practice, it was noted that of these same deaths five occurred on the first day and two on the second day of fall practice.

THE PREVENTION OF HEAT INJURY

Conditioning: All proposed football candidates should be encouraged by their coaches to start individual training two to four weeks prior to the first organized practice session. This can probably best be done by running. It has been suggested that these boys start with running 220 followed by 440, 880 and three-quarter of a mile and finally be able to run one mile in the heat prior to the first practice. This might accomplish the preacclimatization of training and if performed faithfully in the hot weather, true heat acclimatization as well.

Salt and Water: Once the practice sessions have in fact started, the candidates must be allowed free access to water on both the practice and game field. Frequent breaks must be provided to allow water to be taken in amounts of at least four to six ounces per hour but more may be necessary. This can be given as ice water or as a salt solution of approximately 0.1%. The addition of lemon juice seems to mask the salt taste. Some of these lemon-salt solutions are commercially available but such a solution can be prepared by dissolving one teaspoonful of salt in six quarts of water and adding lemons to taste. Alternately, four teaspoonfuls of salt and six lemons can be added to one bucket of ice water.[10] They must be encouraged to take at least six to 12 salt tablets per day especially during the weeks of acclimatization, in addition to the heavy salting of food. These tablets need not be taken on the practice field but considering the frequent reluctance, it would be worthwhile to see that several are taken before and after practice to insure the intake of at least this amount. It is most important to increase and replace the salt stores of the body on a day to day basis by all available means.

There has been some evidence presented that over-hydration, before exertion in the heat, may be beneficial in preventing the heat problems.[11] It would perhaps be wise to allow free access to water while suiting up and in fact encourage the taking of six to 12 ounces of fluid during this time.

Clothing: Light weight uniforms must be used during this time of the year. They should consist of short sleeved, light weight, loose fitting jerseys without football stockings. Even less clothing than this (see Tables 1 and 2) should be used if the conditions of temperature and humidity dictate. Under no circumstances should rubber suits be allowed. They have no place in weight loss or conditioning and can only cause an excessive loss of fluid with rise in body temperature. Both predispose to heat injury and one death has been reported with the use of a rubber suit, on a day when the wet bulb temperature was only 64 F.[4] Shirts should be changed when soaked during practice and if possible, dry jerseys should be available on game days to be changed at half-time in this type of hot weather. The wet shirt close to the body forms a blanket which allows none of the essential evaporation and again predisposes to heat injury.

An important preventive measure, which should be adopted if at all possible, is the daily weighing of all candidates before and after practice. The serious heat syndromes are caused primarily by severe dehydration. This excessive loss of fluid can be appreciated prior to the occurrence of any symptoms by careful weighing. The average weight loss in a conditioned athlete will be about five pounds per practice, most of which will be regained by the next day. Any boy approaching a ten pound weight loss must be observed very carefully for this represents a fluid loss of approximately five liters. It must be insisted that he increase his intake of water on the field as well as his intake of salt tablets at home and during the day. He must be observed for the early signs of heat exhaustion. As heat acclimatization is reached, the daily weight loss will decrease as well, and therefore it can serve as an index of adaptation. As previously mentioned, the overweight or poorly conditioned individual must be watched more closely than others and these boys especially should be weighed carefully before and after practice.

Practice Schedule: On days of extreme heat and humidity practices could be held before 10 am or after 6 pm, the coolest parts of the day. The temperature and humidity should be determined daily prior to the start of each session and most logically it would be best to measure them on the

actual playing field. This is best done with a "sling psychrometer" which is relatively inexpensive and which measures both temperature and relative humidity. If this is not feasible then a telephone call to the nearest airport or weather station would give the general local conditions and might be sufficient. Suggested practice schedules and clothing are listed in Tables 1 and 2. The wet bulb temperatures of Table 2 can be directly determined from the psychrometer.

Stimulants: and certain weight reducing drugs have been responsible for deaths in athletes and should be forbidden.[1]

TABLE 1
SUGGESTED PRACTICE SCHEDULE*

Temperature	Humidity	Activities
Less than 80 F.		No restrictions.
80 to 90 F	Less than 70%	Watch carefully.
80 to 90 F	More than 70%	Ten minutes rest each hr. Change T - shirts when wet
90 to 100 F	Less than 70%	Observe carefully
90 to 100 F	More than 70%	Discontinue practice or very short program in shorts and T-shirts
More than 100 F	Regardless	

*Modified from Murphy, R. J. (1)

HEAT ILLNESS AND INJURY

A clue to the athlete suffering heat illness is the loss of mental accuracy and alertness as well as the onset of awkwardness and lethargy. Fatigue caused by strenuous exertion is manifested by a decrease in activity whereas heat symptoms are those of poor intellectual performance.

Heat Cramps: Muscular cramps most commonly in the calves of the legs (gastrocnemius) are minor symptoms. These are usually due to inadequate salt intake and seem to be worse during games rather than practice, perhaps because of the excessive sweating sustained under emotional stress. The best treatment is prevention by means of adequate salt and water intake as well as acclimatization. When they do occur, firm pressure over the area of the cramp will usually relieve the spasm. Some dilute salt solution should be administered. The athlete may return to play but should be watched for the onset of more serious heat symptoms.

TABLE 2
SUGGESTED PRACTICE SCHEDULE
(WET BULB TEMP.)*

Temperature (wet bulb)	Activities
Less than 60 F	No precaution necessary.
61 to 65 F	Alert observation especially the considerable weight losers.
66 to 70 F	Adequate salt and water intake on the field and alert observation.
71 to 75 F	Rest period every thirty minutes in addition to the above.
76 F and higher	Postpone practice or shorts and light T-shirt workout only.

*From Murphy, R. J. and Ashe, W. F. (4)

Heat Exhaustion: This is characterized by weakness, fatigue, faintness, and excessive perspiration with a cool skin. The breathing becomes rapid but the body temperature is usually normal or only slightly elevated. Nausea, vomiting and restlessness may occur. This is a more serious sign of heat injury and should be treated by the removal of as much clothing and equipment as possible. The athlete should be placed at rest and cooled rapidly with fans or ice packs and dilute salt water administered. He should also be watched carefully for decreasing perspiration and increasing body temperature. This athlete should not be allowed to play further.

Heat Stoke: This is a *life threatening emergency* and must be dealt with promptly. In addition to the weakness and faintness there is headache, confusion and ultimately coma. The skin is hot and dry with the absence of sweat and the body temperature rises rapidly. Primary treatment is the rapid lowering of body temperature by removal of clothing and equipment, ice tubs, cold

clothes, fans, etc. Immediate hospitalization is essential to avoid permanent damage or death.

SUMMARY

The time available for adequate preparation prior to the start of the football schedule is relatively short. This places great pressures on coaches and players alike to proceed with vigorous, daily training regardless of weather conditions. Heat injury, however, is preventible and the precautions outlined will allow maximum preparation with little loss of practice time, minimum loss of players from heat disability and above all no loss of life from heat stroke. These precautions are:

CONDITIONING: Encourage the athletes to train in the heat prior to the start of regular practice sessions.

WATER: There must be free access to water before and during practices and games, ie. actually present on the field.

SALT: Insist on adequate intake of at least six to twelve tablets per day and more for the heavy weight losers.

TEMPERATURE AND HUMIDITY: Check it daily prior to practice and schedule the gear, type and hour of practice accordingly.

WEIGHT LOSS: Check it for each session with special attention to the losers of ten pounds or more.

OTHER: No stimulants or rubber suits allowed.

HEAT ILLNESS: Know the symptoms and emergency treatment being especially aware of loss of alertness and accuracy.

★★

FIELD DECISIONS—DIAGNOSIS IN FOOTBALL

G. OVERTON HIMMELWRIGHT, MD
Fort Hill High School
Cumberland, Maryland

Several thousand boys in the state of Maryland are gathering on the turf for fall football practice. Some of them will be experienced, and some will be green kids, who are not in shape; but with desire and "guts," who with all their tape and pads will try to defy the laws of nature and sooner or later someone is going to get hurt.

Because of this calculated risk, there is the evolution of a new medical specialty—*"Medical Sports Medicine."* This new medical specialty has not reached the majority of physicians who care for athlete, who should be a part of the team, but lay the responsibility upon coaches and team trainers.

Why is it important to consider sports injuries as something special? Are these injuries any different from any other injury seen in the ordinary, every day practice of medicine? The answer is no, but the patient is different. The boy who sprains his ankle or pulls a tendon will eventually return to action and expose himself again. We are dealing with boys who for the most part have pride and motivation demanding a complete recovery and want it as soon as possible.

With the constant threat of mal-practice being placed upon the heads of schools, coaches and physicians; and with the popular belief that football is becoming more brutal, instead of realizing it is getting more scientific and tougher, the more knowledge one has to have, in the prevention and treatment of athletic injuries.

I feel that the most important and the toughest decisions in all athletic medicine are usually those made on the field at the time of play. It is bad enough at practice and scrimmage, but when the pressure of the clock, players, coaches, the "Monday Morning Quarterbacks," and most important the boys parents, are involved and feels like pushing the "Panic Button."

I know that everyone would like to have a rigid set of rules to follow which is impossible, but I have set down some considerations which I have followed for the past 13 years. It was not until O'Donoghue wrote his book, "Treatment of Injuries to Athletes" in 1962 that the team physician had any real guide line to follow, except from experience. I will try to outline my experiences pertaining to decisions made on the football field. For the first year football coaches and first year team physicians, there is an old football adage which states, "When your territory is in doubt—PUNT!" Get the player off the field as soon as possible, call the team doctor/or get the player into the hospital where he can be examined more thoroughly.

GENERAL CONSIDERATIONS

Knowing the boys is the first step in making a diagnosis and is of some help in making a decision. For example, when asked how he is, and he states, "I am OK, Coach, but how did the fans take it," you know the capabilities of the boy. Boys in general have a high threshold of pain, those that have a low threshold who gets a "snag

Presented at Seminar on the Medical Aspects of Sports, August 14, 1967.

nail" and after their bandaide is applied will be through for the game.

I feel very strongly on one point. The team physician or trainer should know the fundamentals of the sport in which he is participating. Each sport has its peculiar injuries. I also like to have some knowledge of the plays, both offense and defense. I try to attend all staff meetings of the coaches in order to learn the codes and series of plays, and I am always within ear shot of the coach on the playing field following him up and down the line observing his signals so that I might have some knowledge of what my team will be attempting to execute out on the field. I feel that the team physician should have some knowledge of the Rule Book. Rules have been made with the knowledge that injuries do occur, and some rules are made specifically for the prevention of sports injuries. Occasionally, not being aware of the rules can get one into trouble. I had one such occasion this past fall when an official was going to give me a 5 yard penalty for delay of the game, and I questioned him vehemently, but he won. During a time out called by the opposing team, I went out to check a boy whose nose had been broken earlier in the game and he had suffered some bleeding. After I had checked him, the official came over and stated that the boy had to take one play out. This I questioned. But—the rule book states, *if a team official or attendant assists a player in an official manner because of an injury, the player must be removed from the game for one play.* I caused our team to lose its star halfback for one offense play which we were starting on our own 10 yard line.

Be alert is the next consideration. I watch the field of play very closely. I am very happy when all my boys get up and go back into the huddle. I watch that long pass, or that 60 yard punt, but in the mean time, I am looking down field to see if any of those red and white jerseys are not up on their feet.

As stated above, I try to watch and make sure no one is down. If you see an injury happen, one has about half of the situation under control. If one sees a boy get hit or clipped in the knee or back, see him arm tackle, or use his arm as a flipper in blocking, one has a working diagnosis. Likewise, it is very embarassing to have the Coach tell me or one of the players that one of the team is down without my knowledge, especially, when the team is about ready to huddle. This also makes a big hit with the fans as well as the parents.

One must develop what my Coach terms "peripheral vision." One must be able to see all 22 players and not only the ball carrier. As a matter of fact, someone should be responsible for watching the entire field for every play. If there is a team trainer he should do it, or if a student trainer, he should be given some responsibility for observation of the field and players, as well as the team doctor. Don't trust the "Bench Doctor." This is the doctor who very willingly comes to care for the team as it is his night in rotation to be on call, but really watches the game like any other fan. We need this help from the medical profession, but remember, if he is not the Team's "Family" Doctor, he will not know what to expect on the play or the player. Make sure this is delegated to someone who will assume the entire responsibility.

As I have stated previously, there will be multiple pressures, from the clock, players, fans, family and coaches. But, one must remain "Cool."

The team itself also has a responsibility concerning an injury. Once the bench has been notified, or has recognized that an injury has occurred, instruct the team to keep away from the injured player. First of all, if there is blood or a twisted foot on the ankle, there may be several players instead of one to give first aid to. I insist that the team goes right back to the huddle and leave the decisions to me. Foremost, the injured player doesn't need sympathy now as it may be the wrong kind at this point.

I carry with me onto the field sterile pads, some plain bandaids, and scissors. I also have with me a little bag which I carry at all times. This bag contains: Tongue Forceps, Nasal Tube, Tongue Depressor, and an Oral Screw. It is better to have these items along than to have a boy knocked semi-conscious and have your fingers chewed up. On the bench I have a complete field kit which contains everything possible to meet an emergency situation. I also, have what we call our "Sissy Bag" with extra braces, splints, foam rubber, felt and tape, so that we are ready to make any type of protective devices needed to treat or protect an injury from further damage.

One of the most difficult taks confronting coaches and team physicians, will be how to recognize the exceptional serious injury. These

players are all fired up, hot, sweaty, muscles are tight, and have protective pads and tape as well as foam rubber and felt on almost every conceivable area of their body. Fortunately, approximately 95-97% of all injuries are of a minor nature, and the serious injury is rare. But, it is the rare one you get *penalized for* if it is *fumbled*. It is important that someone be present who will be able to rule out the exceptional one and who is prepared to handle the more common or less serious injuries. It is important that coaches or trainers sit down with team physicians to discuss these problems.

I have discussed previously some of the team's responsibility to injuries. I feel it is equally important that the entire squad should and must be aware of the fact that each injury deserves attention. An injured player is not much use to himself and is quite a disadvantage to the team. We make it a point that the Quarterback or Defense Captain is responsible to see that no one on the squad who is incapable of giving 100% effort, with full speed be permitted to continue playing. All the Quarterback or the Captain of Defense has to do is before he goes into the huddle, is to step aside, raise his arm, and point to the player and we pull him out of the lineup for evaluation.

PRIMARY CONSIDERATIONS ON THE SIDE LINE

As soon as an injury has occurred, get out onto the field as quickly as possible. In fact, I have gone out sometimes before the whistle has sounded, especially if I see the play and the injury has happened in our back field and the play is much further ahead. While I am getting out onto the field I hope to have some idea of what has happened. I worry whether or not it is a major or minor injury. Can I keep the boy playing, and will it be possible to keep him safely in the game without being re-injured.

A MUST for each team is a stretcher which is quickly available and not kept under the stands or in the locker room. Designate someone, either the Student Trainer or the Team Manager, to always have the stretcher close to the bench for practice as well as game time. Each school should have a set of "Pneumontic Splints," the type that you zipper and then blow up over the part that is injured.

I am slow to use a stretcher, as I feel that it is a psychological disadvantage to my team and a psychological advantage to the opponent team, especially if it is one of my stars that is hurt. However, this does not mean that I don't use a stretcher when the need is present, but I don't feel that it is necessary to move every injury off the field with a stretcher. *Never*, take a player from the field with his head "bobbling" and rolling or with his feet dragging. Always, use the stretcher in these cases.

PRIMARY CONSIDERATIONS AFTER GETTING ON TO THE FIELD

Never straddle an injured boy as one may end up as an injury oneself; and try to make a quick and accurate interpretation of the injury. Unloosen the chin strap of the helmet. If your player is conscious and he can talk with you, about 90% of your problem has been solved, at which time remove his mouthpiece, and put it away for safe keeping. Ask the boy what happened to him. He can tell one the history, and where he hurts, and then go on from there. If he is dazed or stunned, is his condition due to blood loss, or head injury? How do I know if he is confused or dazed? I use the technique of asking where he is, what team he is playing, his number, position on the team and what the last play was, what play was called and who he was "keying." At that moment I am not worried about his remembering the date, what he had for supper or who the President of the United States is. Use the language of his environment.

Is he having labored or difficult breathing while talking? Is he bleeding and does he have a laceration? Does he appear shocky, pale, clammy, or more than usually listless.

Next, I observe, and try to work with him for the length of the time out. I try to avoid a long drawn out discussion. However, a decision should be brief and as quick as possible. Generally, an official will be within ear shot and will permit this time out. The player is going to have to sit one play out anyway so take the time to make a final decision on the side line.

Once I have decided to permit the boy to get up, I generally ask him if he can make it off the field along with help from the student trainers. I generally tell him that his parents and fans are

looking on and if he doesn't feel that he can go off without help to tell me. Quite often, however, I make this decision for him. I always get the boy up slowly, let him sit up first before standing. If I am going to use the ambulance, I just stand up, face the ambulance and hold my right hand up in the air. This must be worked out with the ambulance crew.

There are times when there may be doubts as what to do on the field, and how to transport the player and what to do once a conclusion has been reached as to the type of injury.

SPECIFIC CONSIDERATIONS

Head Injuries

The player in general will be sprawled out on the ground. I usually attempt to turn the player on his back to examine him, unless he can tell me his back or neck bother him. If he is conscious with a headache, I go through the routine of finding out if he has any numbness or tingling in his extremities.

If he is conscious, but apparently stunned, I go through the routine discussed previously concerning his number, etc. I may give him a few "whiffs" of an Ammonia Cap at this time making sure not to get too close to his nose. If he does not respond after a few seconds, take him off on a stretcher. However, if he is unconscious, he might have multiple injuries. At this point I check his breathing, and examine him for mud in his nostrils, mouth, and ears. At the same time checking whether or not he has blood in these areas. Remember, blood coming from an ear is a serious and grave injury. Also take a look at the pupils of the eyes, and if they are not equal in size, this is real trouble. Remove this individual as soon as possible from the field, right into the ambulance.

Check to see if he has swallowed his tongue. Look in the mouth and if you do not see the tip of the tongue, but only a pink mass, this individual has swallowed his tongue. Use your fingers or a tongue forceps and pull out the tongue.

It may be that his jaws are locked and it will be necessary to use the oral screw to unlock the muscle spasms which will hold the mouth shut and jaws together. Get his mouth open and get right onto the tongue. Here is also the time to insert the nasal tube down the nose in hopes that it will give the boy an airway in back of the tongue. Always check the back of the throat after establishing an open oral passageway. For this reason no football player should be permitted to chew gum or have anything foreign in his mouth except the tooth protector, in the event he is knocked out, the foreign substance may be thrown back and lodge in the throat, cutting off the air.

Remember, the time element is only 3-4 minutes; and if not accomplished, the player will turn blue-purple. I have with me on the field a do-it-yourself-kit for a tracheotomy, a special needle which can be purchased with instruction for performing this emergency procedure. I have not had the experience of having to use one of these. But, I am ready if need be. This is a freak accident, but a 79¢ oral screw and a tongue depressor is a small price to pay for saving a life.

Your rule should always be that the team physician or some physician should be the determining factor when a player returns to the line up following a head injury.

Neck and Back Injuries

Injuries to the neck and back can be of a very severe nature. Fortunately, most of the time your player is conscious. He may say he has pins and needles going down his arms or legs which is always an indication of a severe injury. If it is a neck injury, I immediately ask him to raise both hands over his head and then ask him to grip my index and middle fingers in his hands as hard as he can. In this way one can check for weakness which can result from a severe neck injury. Occasionally the players tackle with the side of their neck and shoulder, and be suffering from a lateral-flexion neck injury which may not be serious.

I always ask the player to raise his legs straight up when he complains of back injury. If he can do this, he probably doesn't have a serious back injury to the spinal cord. Occasionally we see temporary muscle spasm that will release in just a few seconds.

Now for the helmet. As stated above, on most players if they are conscious, I remove the helmet. However, if one feels the neck is involved in a serious injury, leave the helmet on. Another point to remember is this. A helmet doesn't come off like an ordinary hat, and it doesn't screw off. Whoever is responsible for the Injury Program and all team members should be taught to take a

helmet off properly. It should be released from the ears and tilted off.

With a neck or back injury, I use 5 people to remove the player from the field onto the stretcher. It is of great value here to have an ambulance crew that have been trained in neck and back injuries. Four persons, two on each side lift simultaneously, with the 5th person at the head of the stretcher holding the head and neck very securely and straight.

What does one do on the practice field when no doctor is around? Make the player as comfortable as possible, leave the helmet on, and place two hand dummies along side of the head and call the ambulance and doctor immediately. The ambulance phone number as well as the doctor's phone number should always be on the wall just above the phone which is used for emergencies. Then call the player's parents.

FRACTURES

Although fractures are a common football injury, these are not the major problems. Fortunately, most of them are evident. If a deformity is observed about an extremity, face or nose, it is a fracture until proven otherwise. Always splint the extremity. If it is an arm, the player may walk off the field. If lower extremity, use the stretcher even though the player states he can bear weight. Fig. 5

UPPER EXTREMITY INJURIES

a. If the player is on his feet and can't raise his arm above his head, one must rule out a fracture of the arm, collar bone, or separated shoulder (A-C Separation).

b. If the player holds his arm out away from his body with the forearm flexed slightly and splints the forearm with his good arm, this is a dislocated shoulder until proven otherwise. On closer examination, one would also note that the deltoid bulge is also flat. Fig. 4

c. If the player comes out holding his arm and states he has pain over his shoulder, and he has pain on any effort to distract the joint, or if when one takes the arm and pulls down and then tries to place the arm in marked abduction (pull away from the body), the rule of thumb is that of a separated shoulder, or severe sprain of the Acromio-Clavicular Ligament until proven otherwise. Or if the step sign of the shoulder is observed a diagnosis can be made. Fig. 1, 2 and 3

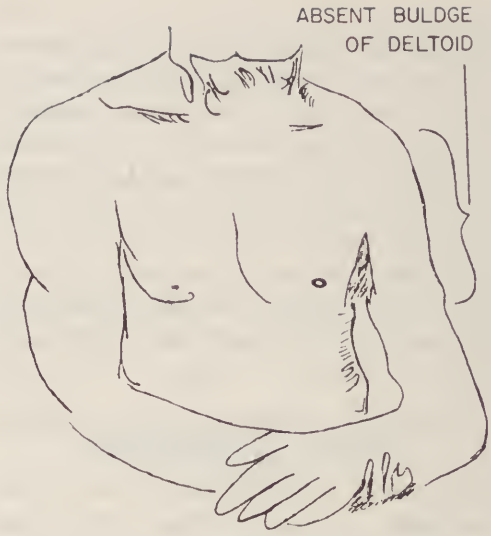

Figure 1
Dislocated shoulder. The arm is held away from the side, the flat deltoid muscle.

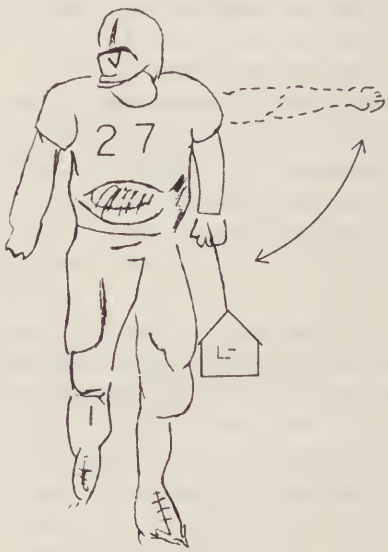

Figure 2 ←

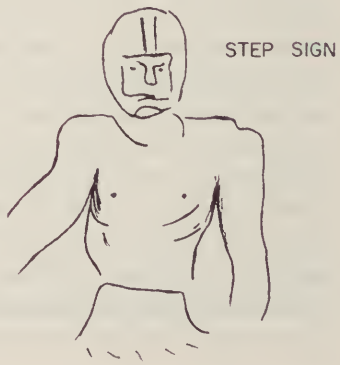

Figure 3 →

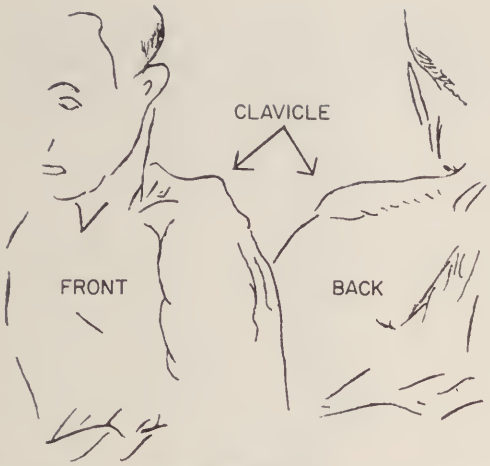

Figure 4
Step sign. Shows the upward displacement of the outer end of the clavicle in complete Acromio-clavicular separation.

Figure 5
Fractured hip. Shortening of the affected leg, with marked external rotation. Player cannot move hip.

Figure 6
Dislocated hip. Thigh flexed, adducted and internally rotated.

LOWER EXTREMITY INJURIES

HIP

a. If the player complains of pain in his hip, check the alignment of both legs. If one leg seems shorter than the other and is rotated outward, this is a fractured hip until proven otherwise. Remove on a stretcher. Fig. 5-6.

b. If the player complains of pain in his hip, both legs appear equal in alignment and the player has trouble raising his leg and swinging it outward. Check for a hip pointer.

c. Always ask where it hurts. Feel this area as you may be able to detect a deformity. Fig. 7.

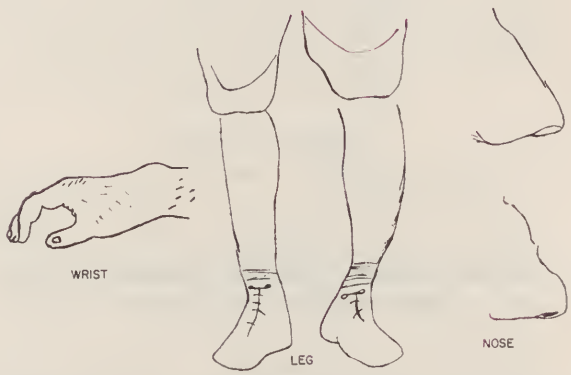

Figure 7
Possible areas where deformities may be detected.

KNEES AND ANKLES PROBLEMS

The most common areas that are injured on the field of severe nature are those of the knees and ankles. The knee injury is probably the most serious of all athletic injuries, excluding the head. Knee injuries in the high school and college athlete are just about as common as the ankle injury. The coach should not be responsible for the final decision as to return of play for a player with a knee injury. The biggest decision a coach has to make is how to transport the boy from the field.

KNEE

a. Quickly check the position of the foot and leg with the uninjured one, as there may be a hip injury with referred pain to the knee. If the play was observed the diagnosis is easier. There may be a deformity in which the entire leg below the knee is twisted completely around.

b. Check the position of the knee cap and feel it. If it gives or cracks under your fingers, there may be a fracture until proven otherwise.

c. Next check the full range of motion of the knee. If the knee is locked (Slipped knee or the ligaments. Fig. 8.

d. Rule of thumb: If the player has severe tenderness at the mid joint of the knee, there are possibilities of an injured cartilage. Fig. 9

e. Rule of thumb: If the player has severe tenderness with marked limitation of motion above or below the midjoint space, then there may be a tear or sprain of one of the collateral player will tell you he felt it go out of place) you are dealing with torn cartilage—Menisus. Fig. 10.

f. Most knee cases will involve the medial or inside wall of the knee joint. Always use a stretcher.

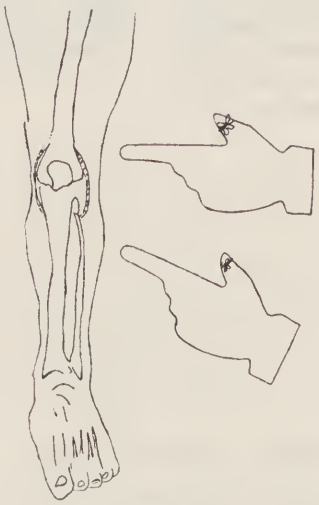

Figure 8
Collateral Ligament. Severe tenderness directly above or below the mid-joint.

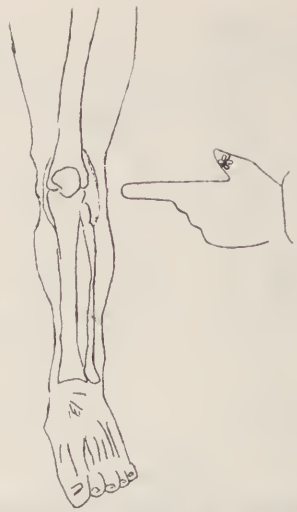

Figure 9
Cartilage Injury. Severe tenderness at the mid-joint space.

Figure 10
Marked limitation of motion above or below the mid-joint space may mean a tear or sprain.

g. If the player doesn't have or present any of the above signs, has good range of motion, no swelling, help him off the field and further evaluate him on the side line.

h. Another rule of thumb: Immediate swelling over the top of the knee or just below the knee cap is a traumatic bursitis.

ANKLE

a. Ankle problems are a continuous hazard. Again the biggest decision is that of transporting the player off the field, as these injuries range from mild strains, sprains to ligament tears to fractures.

b. Check for the anatomical alignment of both feet. If a deformity of the foot is observed, use the stretcher.

If there is no deformity, remove the shoe. Cut the laces, don't untie the shoe. Keep the foot straight as possible, and give some support to the leg, ankle, heel, and foot as the shoe is being removed.

c. Rule of thumb: Put pressure on both ankle bones, (Malleoli), simultaneously, and check as to the alignment of the bone, a deformity, as well as tenderness, swelling and a possible fracture.

1. Pain above the ankle bone (Malleoli) is a potential fracture. Fig. 11
2. Pain below the bone or right on top of the foot is a potential sprain. Fig. 12

Figure 11
Pain or pressure directly above the ankle bone (malleolus) means potential fracture.

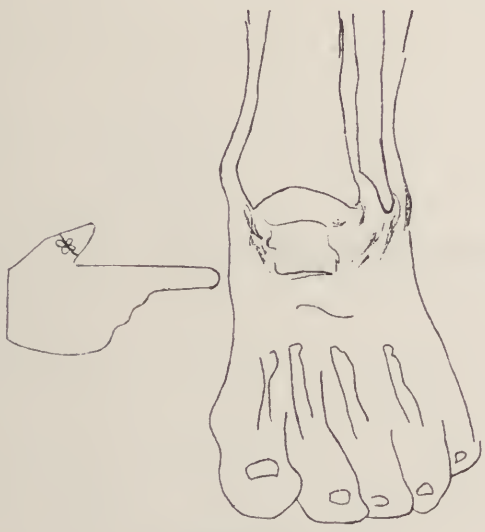

Figure 12
Pain or pressure directly below the ankle bone, and/or directly on top of the foot means a potential sprain.

SOFT TISSUE INJURIES

The less severe type of condition met on the field is that of soft tissue injury. Whether these be bruises, strains, or lacerations, for the most part, they are very minor conditions, and generally can be patched up and the player can go back into the game. There should be a "Varsity First Aid Kit" on the side lines; and if there is a team doctor, he can work right along the bench.

a. Nose bleed: One of the most common bleeding problems will be the nose. I have found the most convenient method used borrowed from Ken Rawlinson, Head Trainer at the University of Oklahoma, is the use of a Tampax. Cut a triangular wedge from this; insert it into the nose, and one has an excellent tampon for hemorrhage of the nasal membrane.

b. Lacerations: The most important step is that of stopping the bleeding. On the field I generally use a gauze pad saturated with Cramer's *Nitrotan* and apply pressure. In my opinion if the cut is not too deep and the bleeding can be controlled with a pressure dressing, I permit the player to go back on the field and then if necessary take him to the office and suture him after the game. The only decision which has to be made is whether or not the laceration will become deeper or extend if there is recurrent injury to the area.

MUSCLE INJURIES

Muscle injuries involve all different types of things. The player will mostly come out and say, "Doc, I've pulled a muscle and can't run, or every time I run I get a cramp in the front or back of my leg." This will either be a strain of the Hamstring or Quadricep muscles, or may be a "shin spint" or a "charlie horse." The latter always occurs, however, with the history of the injured part being "hit" on the affected area, with the result of swelling and pain or "Monkey Lump."

a. Muscle pull: The typical reaction of a muscle pull, which is actually separated muscle fibers, is that the player has the sensation of someone hitting him or kicking him in that area of injury. Quite often the player has never had contact and was open field running.

One can place a mild stretch on the muscle which will produce pain at the site of the muscle fiber separation. One should check the muscle and make it work or contract against mild resistance

and make sure no muscle power is lost. If it is, then use the stretcher to remove the player from the field.

RULE OF THUMB FOR TREATING INJURIES ON THE FIELD

Ninety percent of all injuries on the field will be contusions, bumps, bruises, and muscle pulls. A simple contusion or bruise is an injury in which the force or impact is transmitted through the skin to the underlying tissue with sufficient intensity to disrupt the walls of small blood vessels and to cause interstitial bleeding, increased transudation of plasma, and lymph into tissue spaces; thus, giving edema (swelling). nature immediately builds a protective wall about the injury area which is made up of body substance known as protein. This wall protects the injury, but also impedes the removal of blood, debris, and edema from the area. This wall is felt to be responsible for some of the pain in the area of the injury; and if not removed, will prolong recovery.

It is, therefore, the responsibility of the Coach, Trainer or Physician to try to immediately control the edema. This can be done by applying ice or one of the prepared "cold paks," elevating the area, if an extremity, and applying a pressure wrap. Paul C. Trickett MD, of the Tulane University, New Orleans, Louisiana, uses the word *ICE* as a reminder as how to treat. *I* = Ice, *C* = Compression and *E* = Elevation.

At Fort Hill High School, I use another adjunct in treatment of injuries on the field and that is the use of Papase(R),* a proteolytic enzyme. For the Coach or Trainer, proteolytic means the ability to break down proteins. Therefore, for the non-medical person, *PAPASE* is a proteolytic enzyme which breaks down the "Protein Wall" or barrier about the injury and permits nature to absorb the debris, edema, and blood; therefore, shortening the recovery period, permitting earlier ambulation, and decreasing pain. This drug must be prescribed by the team physician, but after using as many as 3,000 tablets a year with our team, I feel it is so safe that it can be kept on the side line, to be given to a player as soon as an injury occurs.

I sincerely hope that this summary of the steps which I take in trying to make Field Decisions and Diagnosis on the football field, will provide some practical approaches when these decisions are faced in the next few months.

HEAD AND NECK INJURIES IN ATHLETES

NEAL I. ARONSON, M.D.
Assistant Professor
of Neurological Surgery
The Johns Hopkins Hospital

Dr. Richard Schneider, chief of neurosurgery at Ann Arbor, has been interested in football injuries for a long time. He has published some interesting statistics. If anyone wants the references I will be glad to furnish them.

On the other hand there are some who have made the point that the face mask for instance, one of the recent acqusitions in football, may actually, while it is protective to the face, the nose, and the jaw, be detrimental to the neck. It has been shown experimentally that the further the face mask protrudes in front of the face the more of a lever arm it constitutes, in the event a player is struck with an upward blow in the face mask, it causes about double the amount of force that would ordinarily be generated by a blow on the jaw. In other words, if a man has his head in the extended position and he's struck on the face mask from the front, he gets about a hundred pounds or more of force transmitted to the upper cervical spine, and then if he has a relatively small head and a large helmet on, the back part of the helmet can catch him in the suboccipital region and create enough strain so that under severe circumstances a fracture dislocation of the cervical spine might occur. This is an area I believe that needs further scientific investigation.

Another traumatic factor perhaps is the helmet itself. With the advent of very hard plastic helmets there has been some suspicion that there is transmission of force to the skull, directly from the helmet, whereas in the older days the softer helmets caused the force to be dissipated. It is interesting to note that you do not have to produce a direct blow to the head in order to produce internal injury to blood vessels and brain and it would seem again that if some way could be developed to cause a spreading of the force rather than a direct head-on propagation from the helmet to the skull, this would be helpful.

I realize that there is a webbing inside the helmet but it does not seem to dissipate the force as well as ideally we would like it to do, and some intelligent engineer will have to work on this problem which is beyond the scope of the doctor's training to really investigate.

In one type of research, transducers are being placed into helmets during actual games in order to find out how much force is transmitted to the head through the modern hard plastic helmet.

Another thing that you have read about I am sure in the newspapers recently, and is of some importance in reference to head and neck injuries is the habit of "spearing" or "butting" an op-

Presented at Seminar on the Medical Aspects of Sports, August 14, 1967.

ponent. It seems that Dr. Schneider did an investigation of this and found that in the western colleges they teach this as a standard operating procedure in football. He finds, when he analyzes his data of serious and fatal injuries to the head and neck of which there are quite a few every year, that there seems to be a direct correlation between this type of tackling and serious injuries to the ncek and head. A recent plea has been made which was published in the *JAMA* that this type of tackling be abandoned in football and that it actually be penalized. I think I would have to agree with that conclusion.

I will begin by reviewing a little anatomy of the head and neck and then go on to discuss some of the symptoms of different types of head and neck injuries. Before doing so I think I would like to make the general plea that when a patient has a head or neck injury whether he complains merely of headache or dizziness or whether he complains of pain or stiffness of the neck, pain down the upper arm, extremities, numbness, or what have you, that the trainer think in terms of appropriate consultation before allowing the palyer to resume competition. These conditions are a little more subtle and more difficult to diagnose and are potentially more dangerous than simple sprains, strains, bumps and hematomas, bruises, and simple extremity fractures.

If a person has an injury to the neck, the simplest form is a sprain and this can be produced usually by sudden flexion or extension of the head particularly if the head is partially rotated when the force of the blow is sustained.

Football is a dangerous sport. There is no question about that, and as we get larger and larger antagonists in the game especially in the professional ranks, the amount of force that is brought to bear on the player becomes extreme. Therefore it is important to stress that people who are in this type of activity be first of all highly conditioned athletes and take regular calisthenics to keep their muscles in the best possible state of tone. That in itself is as important a preventative of injury as I know.

And secondly a man has to learn how to run. If a man for instance, is the ball carrier it has been shown that the safest running position is with his head in neutral position, perhaps flexed slightly at the waist but not flexed or extended at the region of the neck or with his head turned markedly to one side or the other. Naturally it is impossible even when rushing not to look for the hole in the line to get through but a man should train himself so that when he is actually getting into the opposing tacklers that his head return to normal alignment and that he maintain his muscles in a state of tension. There are some arguments concerning the danger of keeping the muscles tense when being tackled. It may actually provoke the fracture of long bones or extremity bones but it difinitely protects the spine. I think that highly developed back and abdominal muscles and neck muscles will prevent injury to this area of the anatomy. Keeping the head from being turned markedly to one side or the other, extended or flexed, will also prevent this type of injury as much as it is possible to do.

If there is an injury, the simplest form of injury I mentioned is a sprain and this is merely a tearing of a muscle or the ligamentous attachment of a muscle and it produces stiffness, tenderness, and some swelling locally, unassociated with any neurological symptoms. This is treated by the trainer usually with heat, usually moist heat, muscle relaxants, and rest. Rest is extremely important. Immobilization in the collar is usually not necessary for simple strains.

Occasionally when there is an injury to the neck it may be accompanied by neurological symptoms or signs and this becomes a more serious injury. For instance, the patient may complain of sudden numbness in one or both arms or his lower extremities, or he may demonstrate some weakness in the distribution of his muscles. If this is transient one can assume that the patient has merely had what we call contusion of the spinal cord. But in order for a contusion to occur there has to have been enough tearing of important ligaments arund the vertebrae to allow one vertebra to slip slightly on another or subluxate.

Now such a patient should be examined by a specialist either in orthopedics or neurosurgery and have X-rays made of the cervical spine. This is extremely important. I don't think any patient who has a neurological symptom should ever merely be treated conservatively and sent back to his duties without having films made and a consultation. I would think that if there is any persistence of symptoms such as in the case of Paul Hornung that the man should not be sent back into the lineup with one of these balloon collars

appended to his uniform but should be kept out of competition for the rest of the season. I feel that this is a potentially very serious type of injury.

We rarely, see more serious injuries to the cervical spine where there is an actual fracture and one vertebra is displaced upon another. Such a patient usually has clearcut neurological problems in addition to an extremely painful stiff neck which he is unable to move. If a patient is injured in this region of his anatomy and is lying on the football field complaining of severe pain in his neck, numbness, or inability to move his extremities, he should be moved only with the utmost caution by skilled personnel. At least five or six people should put him on a stretcher and his head should be maintained in slight traction at the time that it is done and then he should not be moved again until he is brought directly to a specialist with X-ray facilities.

Fortunately, it is very hard to produce an injury of the intervertebral disc in a normal young person. Disc injuries do occur in football but are much more common as you get into the older age groups. The men who have been in professional ball for several years and are getting up into their mid thirties are the ones that are most subject to disc injuries because a normal disc in a healthy young person is actually stronger than the bone which surrounds it. It has been shown experimentally that if you take a spine and place it in a vise, (the normal spine of a young person who has died for instance, in an automobile accident or some other cause), and put pressure on the longitudinal axis of that spine you will fracture a vertebra before you will rupture a disc.

There are some people who are subject to early disc degeneration and these people usually give the clue of having had either neck ache or backache intermittently rather early in life. People who have postural problems or people who complain of having had backache in the past, of sciatica in the case of lumbar disc, that is, pain going down the leg or pain into the region of the shoulder blade or down the arm should be seen by a specialist and probably X-rayed before they are considered to be candidates for a football squad.

Disc injuries as I mentioned are rare but we have seen an occasional disc protrusion or rupture due to a sporting injury and the treatment will depend upon the severity. The milder cases are treated by traction and immobilization in a collar followed by a period of physiotherapy. More severe cases are treated by surgical intervention. It is possible for a professional athlete or for a college player to go back after a disc excision. I would not advise it after a neck or cervical disc excision but lumbar disc injuries have resulted in sufficiently good recovery following surgical removal so that these individuals may return to active sports. One of my colleagues here in town, operated on a quarterback from Notre Dame about five or six years ago and he went back the following year and had a very productive season.

The reason for this is that it is safer to operate in the lumbar region because the spinal cord has terminated several inches above where the lumbar disc injury occurs, so that even if there were a recurrence due to a second injury it would not be of serious neurological consequence whereas on the other hand with a cervical disc you have the spinal cord to contend with and a recurrent injury to the neck could result in permanent paralysis, as the physicians at the Mayo Clinic advised Paul Hornung before he retired this year.

Sudden extension injuries or flexion injuries of the neck especially as I mentioned with the head slightly rotated produced the type of sheering force that could produce a fracture dislocation and a potential injury to the spinal cord or vertabral artery. The latter structure runs in a tunnel of bone in the cervical spine.

While on this subject I will mention injuries to the carotid artery. These are the large arteries in the front of the neck, that do not run in bone but do supply the major portion of the blood to the cerebral hemispheres or upper portion of the brain. We know of a few instances of young people developing a traumatic thrombosis of the carotid artery by a direct karate type chop blow to the neck, and the neck of course, is always to be protected. Again, fouling of an opponent should always be avoided and a man should learn to run so that the front of his neck is in a protected position. The large shoulder guards that are worn today plus the proper position of the neck will tend to prevent an injury to the carotid artery.

Here is an example in Figure I of the injury that can be caused by hyperextension of the neck with sudden blow to a face mask. This is a fracture dislocation of (45) the upper cervical region, potentially a fatal injury.

Figure 1
Note the severe fracture dislocation in the lower cervical region, and how this vertebra has slid forward on the other.

Here is a severe fracture-dislocation in the lower cervical region. Note that this vertebra has slipped forward on the other. This patient of course was quadriplegic. This was not a football injury. The man was paralyzed at the moment of impact (I believe this was a diving accident, a very common cause of this type of injury) in all four extremities and was rushed to the hospital and immediately put in skeletal traction which is where we put the so-called "ice tongs" in the skull in order to reduce this fracture and put it back into normal position. Later when the spine was examined surgically the spinal cord was found to be torn which if course meant that the patient would not recover any useful function. It is very rare to see this type of injury as a result of football, but it does occur.

According to a recent survey, head and neck injuries constitute only a very small percentage of football injuries but they account for about 80% of the deaths, so you realize that we are talking about a very important and critical portion of the anatomy.

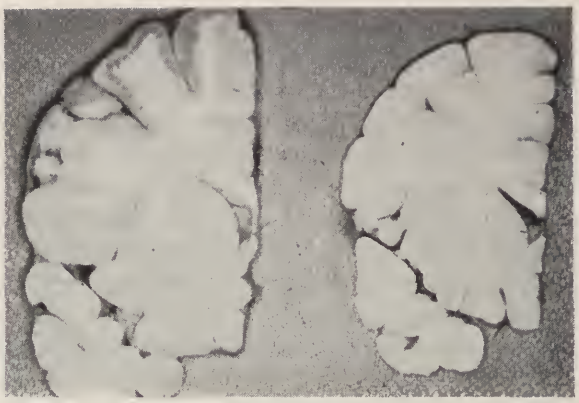

Figure 2
A section of the brain at autopsy showing cerebral edema. The left side indicates the portion most severely swollen.

Here in Figure 2 is brain which is swollen. This is a section of the brain at autopsy due to what we call cerebral edema, the result of a severe concussion. The left side indicates the portion that is most severely swollen. This is due to a collection of fluid which comes out of the capillaries and fills up the intercellular spaces of the brain.

Here in Figure 3 is a brain that has actual hemorrhage in it. This is referred to as a cerebral contusion. Note the little hemorrhages under the cerebral cortex in this autopsy specimen, and also the little petechial hemorrhages around the blood vessels.

Figure 3
A hemorrhage brain. An autopsy specimen showing the hemorrhages under the cerebral cortex.

Again it is interesting to note, that the sandlot player who does not have proper equipment would be the man you would think most subject to injuries of this magnitude, but this does not prove to be correct. Looking at the statistics you will find that the most severe injuries of the head and neck occur in the professional athlete, and I think this is directly related to the force at which these men hit and their body weight. They are now getting up into the behemoth size weighing 275 to 300 pounds and can hit with the force of a frieght train. The college athlete is second on the list. The high school athlete actually has one of the lowest rates of severe injury of this kind and I believe it is because they play a cleaner game even though they may not have as much finesse as a professional and because of the fact that we are dealing for the most part with men of more average body weight and size.

Let us turn to head injury for just a moment, I haven't discussed that in any detail. There are several gradations of head injury.

The first and most common thing that you will observe on the football field is the man who is just slightly dazed as the result of a play. If this lasts only for a few seconds and he immediately comes back to his senses I see no reason why this man should not be allowed to continue in the game provided he has no other complaints. But if the man becomes confused, and we have seen this on many occasions, he should be taken out of the game and be sent for a specialist's examination within a reasonable period of time.

In order to make the diagnosis of cerebral concussion which is (aside from scalp lacorations and abrasions and contusions) the first type of brain or head injury that we have to take into consideration, it is necessary to dicit a history of unconsciousness and a period of retrograde amnesia. This means that the individual was definitely "out" even if it was only for a few seconds, that he has difficulty remembering what transpired just prior to the time he was hit, or his memory may be entirely foggy for the period just before and just after the time that the play was run. A man who has had a concussion should be taken out of the game and regardless of how well he says he feels he should be examined by a specialists.

A man who complains, following a head injury, of persistent headache, or dizziness, of ringing in the ears, or shows confusion, falls into this category and requires further elucidation. In addition to taking a history and doing a careful neurological examination I think an electroencephalogram is worthwhile. This can show us subtle degrees of brain injury.

Here is an example in Figure 4 of an electroencephalogram showing slow-wave activity over the left side of the brain in a person who sustained unilateral hemorrage and edema following a blow to the head. In less severe injuries more subtle changes can be seen.

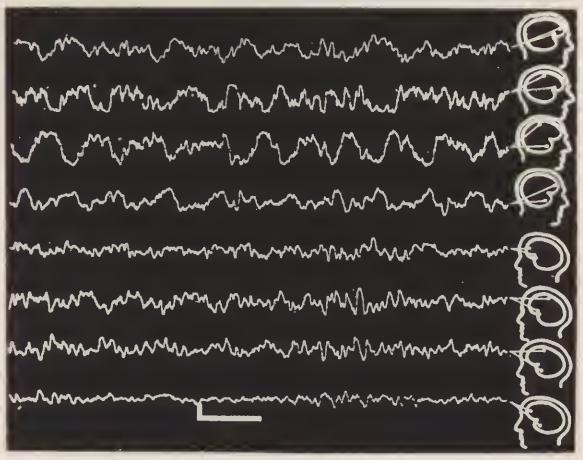

Figure 4

Now I think a man who has been seriously enough injured to produce changes in the electroencephalogram probably should be kept out of action for the rest of the season because there is a statistical chance that such a man might get late complications such as convulsive disorder or epilepsy as a result of a bad enough contusion of the brain. It is true that this rarely occurs but I think that one has to respect the brain as a very sensitive organ which is easily damaged and if the individual has shown unconsciousness, retrograde amnesia, perhaps some minor neurological changes, persistent dizziness, ringing in the ears, confusion, or anything like that, plus some irregularity in electroencephalogram, that man is entitled to be out of action for the rest of that season in my opinion.

Now the next type of brain injury I would like to mention is more severe and fortunately quite rare: is extradural hematoma. This is usually due to usually a fracture through the squamous portion of the temporal bone.

It is a well-known fact that blows to the temple are potentially fatal and this is the explanation (although there are other reasons). When the bone is fractured in this area—and usually this type of injury can only occur when the helmet has come off or when for some reason the man hasn't worn one and then receives a direct blow to the side of the head—the middle meningeal artery which is the artery that supplies the covering of the brain, the dura, can be torn because this artery runs through the bone before it gets to the brain and it runs through the bone precisely in this region, the temporal squamosa.

This of course, bleeds vigorously when it is torn because it carries arterial blood. Arterial blood is circulated under a much higher pressure than venous blood and therefore a collection of arterial blood develops over the membrane which surrounds the brain and creates pressure on the brain.

The characteristic picture of this injury is that the patient complains of excruciating headache after an initial period of unconsciousness and then gradually begins to lose consciousness again. Accompanying this there is is weakness usually of the opposite side of the body. And there may be dilatation of the pupil on the side of the injury due to pressure on the oculomotor nerve, which runs past the area involved to go on the eye.

This combination of findings constitutes a neurosurgical emergency. Six such cases were reported over a five-year period which was reviewed by Dr. Schneider in 1964 and five of them died. Theoretically, most if not all of these could be saved by early surgical intervention and that is why, if a man shows progressive changes of severe excruciating headache following a head injury he should immediately be taken to a specialist.

The next type of injury I would like to mention is the so-called subdural hematoma which is a hemorrhage beneath the membrane surrounding the brain but still outside the brain.

There was a time when we thought that injuries of this kind mainly occurred in infants or in aged people and especially in alcoholics. The reason for the latter is in early youth and late in life the brain tends to be smaller than the skull and there is more than a potential space in which bleeding can occur. However even young adults can develop subdural hematoma and in this survey conducted by Dr. Schneider which I previously alluded to, it was the most potent and most frequent serious brain injury that was seen in football players. They had some 65 cases of subdural hematoma with an appallingly high mortality rate. One of the reasons that the mortality rate was high in this group was because the acute subdural hematoma often had some arterial bleeding associated with it. The chronic subdural hematoma, the symptoms of which come on gradually over a period of a couple of weeks, is usually due to venous bleeding. Veins of course carry blood under low pressure and they tend to bleed only until they are tamponaded by their own outpouring of blood and then the bleeding stops, whereas arterial bleeding will go on more rapidly and more extensively. On the other hand, many of the subdural hematomas discovered were probably in the subacute or chronic category and these patients too could have been saved with appropriate and early diagnosis. Many of them were. But invariably some are lost.

The commonest reason for this is that in many communities specialized services are not available and this is a field in which only the neurosurgeon can participate because there is no other field that consists in dealing with diseases of the brain per se in a surgical sense. The general surgeon however who goes through a good program has had some experience in rotating through the neurosurgical training and should have the ability at least to diagnose and in some instances even to drill small openings which we call trephinations to relieve the acute pressure of subdural bleeding. Unfortunately, not all general surgeons have had such training.

If a man has a severe head injury he should be transported as soon as the local doctor feels his condition will permit to where specialized care is available. There are many diagnostic tests and tools that are available in large medical cents to facilitate the diagnosis of these conditions without doing exploratory surgery. In most instances it will be found that the man does not have such a severe injury but it is much better to err on the side of safety than to overlook an injury which might later prove to be fatal. In subacute or chronic subdural hemaloma the situation is less urgent. The patient may seem a little woozy and groggy and be confused just as though he had a simple concussion and then feel fine for several

days, but a week or so later he may start suffering from headache and periods of somnolence, ability to concentrate and may then begin to show some weakness on one or both sides of his body or some double vision When these symptoms have their advent it is the time to immediately seek consultation.

Occasionally, a man will die suddenly after a blow on the head. Some of these deaths are due to massive hemorrhage from a ruptured aneurysm. This is a congenital abnormality which weekend a blood vessel in the brain. according to an autopsy survey this is one of the rarest causes, as is brain tumor, of sudden death due to head injury. The majority of them are due to garden variety type of head injuries most of which are theoretically if not actually treatable by proper diagnostic studies and early surgical intervention.

Skull fracture itself, which I mentioned before, does not necessarily have to be a very serious type of injury but it is indicative of the force of the blow which the individual sustained and it indicates the necessity of a careful observation of that patient for complications such as intracranial bleeding. Many types of skull fracture are simple: they are not depressed; they are not comminuted; they are not compounded. In other words, there is no indriving of dirt because there is no overlying laceration in the majority of instances and they are not pushed into a position where they create pressure on the brain. These may just be treated by simply watching the patient until they heal. I would think that a man who has had a skull fracture, regardless of how simple it might be in its appearance, should be out of action for the rest of that year.

★★★

SOFT TISSUE INJURIES OF THE KNEE AND ANKLE

G. EDWARD REAHL, JR., M.D.
Baltimore, Maryland

We are entering the time of year when the hazards of the lower extremtiy seem to be more acute. Winter sports such as football, ice hockey, soccer and skiing present a particular risk to the lower extremity and particularly the knee and the ankle.

During the process of evolution the knee was not well designed and certainly not for the more popular winter sports. It is the articulation of the two and strongest bones in the body, namely, the femur and the tibit. A third bone, the patella, is the largest sesamoid bone in the body. The fibula, is not involved in the joint itself.

Because the femur is well rounded on its end and articulates with the tibia which is flat, it does not take much mechanical sense to realize that the strength of the joint does not come from the actual articulation of the bones. To compensate for this it is surrounded by large and strong muscles and strong ligaments. There are two menisci which are anchored on the tibia and aid in deepening the contour of the tibia for the bony femoral condyle. Motion of this joint is primarily flexion and extension although there is a small rotary component in the knee.

Briefly, the strength and stability about the knee is related to the anterior muscle group, the quadriceps, a posterior group, the hamstrings and the surrounding ligaments. While both muscle groups are quite important, the anterior or quadriceps groups are the most important particularly, the vastus medialis which has the function of maintaining the final 15 degrees of extension.

SLIDE—the ligaments are the medial and the mlateral ligaments; the anterior and posterior cruciate ligaments; and the posterior ligament which is actually a thickening of the ligament behind the knee.

These ligaments, particularly the medial collateral ligament and the anterior cruciate ligament, are the ones which are most often injured and they are quite often coupled with injuries to the medical meniscus around the knee.

Presented at Seminar on the Medical Aspects of Sports, August 14, 1967.

An injury of the extensor mechanism such as a direct blow or kick about the muscular attachment can cause varying degrees of effiusion and if a tendon is taut a complete rupture may occur.

This usually occurs just above the patella in Figure 1. It may occur also below the patella but this injury is not too common in football or other sports. We are ruling ut fractures f the patella which this shows.

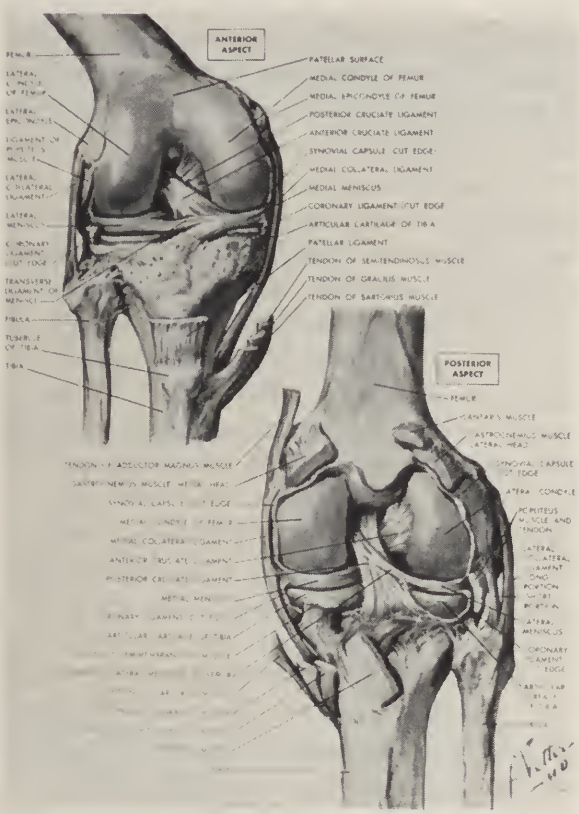

Figure 1

A simple hematoma is usually best treated by ice bags, compression dressing and quadiceps drill the active contraction and relaxation of the quadriceps. Larger hematomas may have to be aspirated. In later stages the hematoma is best treated by heat. A complete rupture of the quadriceps mechanism, must be treated by immediate surgery.

The patella is an integral part of the extensor mechanism and it may be dislocated by a direct

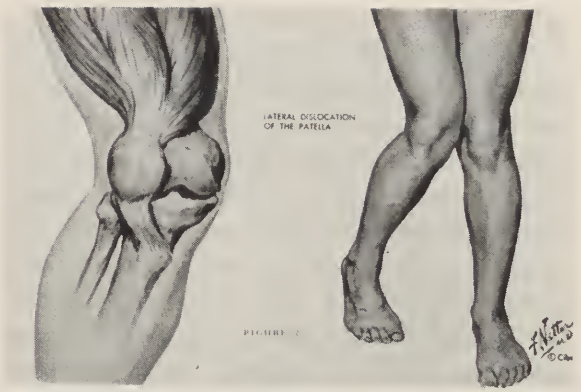

Figure 2

blow medially. The patella is dislocated laterally and this is the typical position as shown in Figure 2. Quite often a football player or an athlete will say, "My knee comes out of place," and diagnosis of a dislocated knee is made. To dislocate a knee would take a tremendous blow and I doubt if we would see this under game circumstances. It is a dangerous and devastating injury.

A dislocation of the patella would also be uncommon. What is actually being indicated —is usually an intrinsic problem in the joint itself, usually one of the menisci being damaged. When the patella is dislocated laterally one may forget a very important point. That is in order for the patella to be dislocated, the entire extensor mechanism on the medial side has to be completely torn. This does not mean that it needs immediate surgery because reduction and casting is adequate but this is a serious soft tissue injury. Reduction and immobilization is necessary. There is a tendency to experience a recurrence of this but it is not nearly as high as the tendency that recurs in a shoulder dislocation in the same age group.

Overlying the patella is the prepatellar bursa which is usually injured by direct blows. Knee pads are of minimal value in preventing this injury. This prepatellar bursitis is usually diagnosed because the swelling is anterior to the patella, under the skin. It is more commonly known as housemaid's knee, however it does occur on the football field.

The important point of this prepatellar bursitis is its differentiation from a true synovitis. the latter effusion is below the patella so that one can

Ballot the Patella ie. it seems to float.

The area is much more diffuse as opposed to the prepatellar bursitis which is usually localized and appears like a cyst on top of the patella.

Many injuries to the structures of the knee usually result in some form of synovitis. It is rapidly followed by a decreased quadriceps tone. In an acute injury, swelling must be differentiated between a simple acute synovitis and a hemarthrosis. The latter is usually the result of a severe injury and is usually a sign of complete ligamentous tear or an intra-articular fracture. It is quite rapid in onset and the knee becomes quite tense and, if untreated, quite warm.

If after an injury the swelling is rapidly manifested within the first few minutes to a half an hour then hemarthrosis, is the most likely diagnosis. In any case the knee should be aspirated. This gives important information not only to whether or not blood is present in the joint but more important if bone marrow is present in the blood.

The significance of bone marrow in the blood is indicative of an intra-articular fracture whether it is shown on the X-ray or not. In other words if the aspirated blood contains fatty particles of bone marrow, a fracture is present and X-rays many times miss these fractures complete 4%.

In addition, the aspiration not only gives valuable diagnostic aid but it also releases the pressure on the knee and aids in the patient becoming much more comfortable.

The most common ligament injured is the medial collateral ligament. Injury is caused by a forced abduction strain of the knee. In football it represents or results from a tackle when the knee is struck from the lateral or outer aspect. External rotation can rupture some of the anterior fibers of the liagment and it may be partially or completely torn. Complete tears are usually at the femoral attachment, next, near the joint line, and least common, at the tibia. Diagnosis is made from the mechanism of the injury and the points of tenderness along the ligaments. In a complete rupture the gap may be felt, although swelling may mask this. Stress X-rays are obtained by stabilizing the femur and applying an abduction force to the tibier. This may demonstrate an abnormal amount of separation of the medial joint line. It is best to use local anesthesia when attempting this test.

Minor sprains usually require only minimal immobilization and active quadriceps drill. Major sprains may herald a complex injury which may include the serious so-called unhappy triad. This is a rupture of the medial collateral ligament, the anterior cruciate igament, and a torn medial meniscus. If there is a complete tear of a major ligament then it is best handled by immediate sprains may herald a complex injury which surgery. Plaster immobilization following surgery is required and quadriceps exercises started as soon as possible.

Occasionally one sees an accumulation of calcium or even bone at the proximal or upper end of the medial collateral ligament. This most probably is due to a recurrent strain and is known as Pellegrini-Stieda disease. It is frequently a symptomatic, but, if after an acute injury there is joint tenderness it is treated as a soft tissue injury and protective weight-bearing, physical therapy, and quadriceps drill are usually satisfactory.

The cruciate ligaments, anterior and posterior, are usually ruptured after a marked displacement of the tibia on the femur and an isolated rupture of these ligaments is uncommon. The anterior cruciate is usually associated with injury to the medial collateral ligament, medial meniscus, or both. It may be avulsed after a forced hyperextension of the knee, and its rupture usually causes the forward gliding of the tibia on the femur when the knee is flexed at 90° and stabilizing the ankle. The tibia moved back and forth. If there is more than minimal motion it is known as a positive drawer sign, It is fraught with some difficulties becouse there is an intricate relationship between the curciate ligaments particularly the anterior, and the quadriceps mechanism and Quite often if a patient has poor quadriceps tone, there may be anterior laxity without ligament rupture. When both ligaments are ruptured there is a wide excursion in the anterior-posterior area.

In all injuries to the cruciate ligaments a he-

marthrosis is present. In former years it was felt that plaster immobilization was adequate for treatment, however. It is now generally accepted that these injuries should be treated by immediate surgery.

A sprain of the knee is caused by an abnormal stress on a ligament. Forced motion beyond the normal limit will result in some degree of injury to the ligament which is primarily involved. This motion may be in any direction. In a classic athletic injury of the knee the foot is fixed on the ground and the rotated inward and the tibia outward as the knee is forced. This stress is primarily to the medical collateral figament and the meniscus. When the foot is forced into external rotation, the stress is exerted against the medial collateral ligament. The superficial layer takes the strain first and as the outward rotation carries further more layers of the ligament are finally torn. The force then reaches deeper to the ligament around the medial meniscus which is then detached and finally it can be continued till it tears the anterior cruciate ligament. The injury may stop at any point in this progression of events.

In a similar manner, the reverse mechanism places stress on the lateral collateral ligaments, next the lateral cartilage, and again the anterior and posterior cruciate ligament. It might also be mentioned that a tear of the medial collateral ligament may or may not involve the posterior ligament of the knee which is also important in stability, but a tear of the lateral collateral ligament almost always carries a certain amount of tear of the posterior ligament and is quite a serious injury. Hyperextension, throws an initial tension on the posterior ligament of the joint followed by stress against the posterior cruciate and posterior part of the collateral ligaments.

In a mild ligament injury there has been some tear of the ligament fibers but the strength has not been particularly impaired. In this case prolonged treatment is not necessary and immediate application of a pressure dressing and an ice pack and possibly the use of ethyl chloride may be valuable. Local anesthesia may be injected into the area to reduce pain and spasm but once injected a player must not be allowed to resume playing that day.

Moderate ligament sprain means that the ligament has been partially torn. Its strength is impaired to a greater or lesser degree depending upon the number of fibers torn. There is usually more swelling and there may be a hematoma formation which can be aspirated. The use of ice, local compression, and plaster immobilization is necessary.

In severe ligamentous damage the immediate disability is usually severe. Local swelling is very rapid and there is usually a hemarthrosis and diffuse infiltration of blood throughout tissues about the knee. Stress X-rays show abnormal motion. Instability is the single confirmation finding. Increased abduction of the tibia with it in complete extension means that there has been a medial collateral and posterior ligament tear. This type of injury, should be treated with immeidate surgery.

Meniscus injuries. Figure 3. This injury frequently accompanies a ligamentous sprain. There is a medial and lateral meniscus. The medial meniscus is C-shaped and the lateral meniscus is shaped almost like an O. The attachment of the medial meniscus is firm to the tibia and the medial collateral ligament and allows little motion with the result that it is more easily torn. Injuries may occur anywhere along the meniscus, either longitudinally or transversely. A longitudinal tear may be large enough to allow the medial fragment to be displace medially and surround the femoral condyle causing the knee to lock and make complete extension impossible. If the tear is complete, the medial fragment is extruded into the intercondylar notch and complete extension is then possible.

If a tear is in the attachment of the ligament it heal but if it is in the substanc of the meniscus it will not. It is virtually impossible to determine whether there is a torn medial meniscus in an acute injury unless it is frankly locked. The lateral meniscus is much freer in the joint and particularly at the posterior portion, and is less vulnerable to an injury. Chronic overflexion which is the result of squatting for prolonged periods may cause damage to this meniscus. The ultimate treatment for a torn medial or lateral meniscus is usually excision.

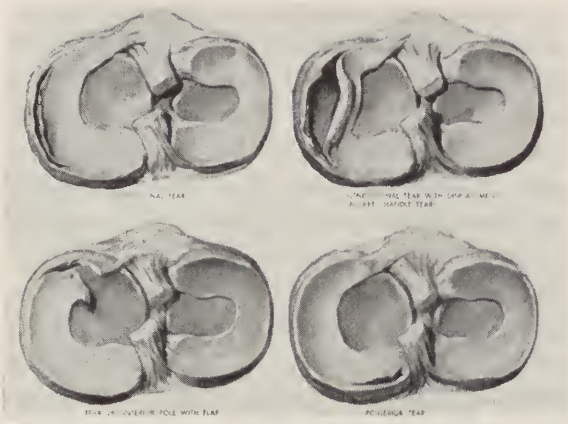

Figure 3

Injuries of the ankle constitute one of the most common conditions encountered in the injuries to an athlete. Many ankle injuries are treated too casually. Figure 4 shows the multiplicity of ligaments about the ankle and this, is the inner or medial aspect. The large ligament which attaches

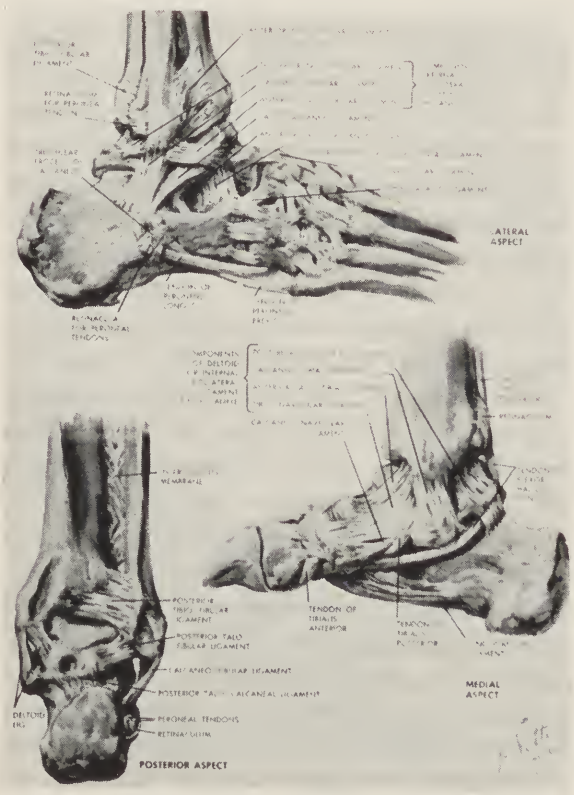

Figure 4

the tibia to the various bones in the foot goes under the collective name of the deltoid ligament. On the lateral or outer aspect there is a fan-shaped—three fan-shaped ligaments which also add stability to the outer aspect. In addition, back posteriorly, there are strong ligaments which go between the tibia and the fibula and these are both anterior and posterior. In addition there is also an interosseous membrane that is a thick tough scar-like tissue between the bones and at its very end it is even thickened more to form an interosseous ligament. And there are tendons which pass anteriorly and posteriorly.

The ankle may be thought of in terms of a ring. The bony structures of the tibia, fibula, talus and the oscalcis, and their ligamentous attachments complete the ring and in order to have any disruption of the ankle, at least two parts of the ring have to be broken. If any one part is broken, the ankle is quite stable, but if there are two parts broken instability results.

The ankle is a hinge joint with very little lateral motion. It is externally rotated about 15 to 20 degrees in dorsi—plantar flexion. The ankle actually only moves basically in two planes: dorsiflexion and plantar flexion. Inversion and eversion is from the subtalar joint. Functionally the ankle and subtalar joint can be considered as a universal joint. The ankle and subtalar joint strictly speaking is not, universal but functionally it can be moved in a complete circle.

Basically there are two motions in the foot: pronation and supination, pronation being an eversion type movement, supination being an inversion type movement. As such, these are the two basic types of injuries. The ligaments may also be stretched by forced plantar flexion or dorsiflexion but these are not particularly common.

The most common ankle joint injury a sprain due to a supination or inversion type of injury The sprain involves stretching of a ew fibers but with a normal amount of joint stability. Dislocation indicates major ligament damage and joint instability. Diagnosis must exclude a fracture.

Sprains of the lateral ligaments of the ankle vary in location and intensity with location being

of lesser importance. The severity of symptoms or signs influences the type of treatment. A mild sprain may be treated with strapping or an elastic support or injections with local anesthesia with or without Cortisone. Normal use is to be encouraged as soon as possible but, if injected, this does not mean returning to the game. The more severe sprain is often accompanied by a marked swelling and spasm. Treatment of the edema or swelling is most important and ice, initially, a compression dressing, preferably sponge rubber, rest, and elevation is best. This may or may not be followed by a short leg walking cast.

When the supination injury progresses the ligaments rupture and a temporary dislocation or subluxation results. It usually shows marked instability, and again stress X-rays are most helpful. The swelling is treated and, and this point, there seems to be a controversy as to what is best to do. Some feel that immediate repair is mandatory. Unfortunately, in this particular area, a fresh ligamentous injury about the ankle is very difficult to suture and I feel that probably casting for about six weeks or so is better.

The pronation or eversion types of injury are not very common. They are usually associated with other ligamentous injuries and fractures. Stress X-rays are helpful but occasionally a defect can be felt. The treatment is closed reduction and cast although surgery may be necessary particularly if the deltoid ligament, is entrapped between the malleolus and talus.

The muscles and the tendons may also be injured. The more common ones are a ruptured plantaris tendon, a rupture of the Achilles tendon, and subluxation of the peroneal tendon.

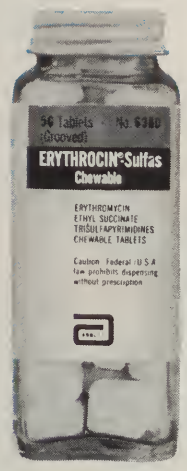
The plantaris tendon is really a vestigial type of tendon. It has a very small muscle belly, and it has a tendon which runs the entire length of the leg from the knee to the os calcis. It is not too frequently injured in football. It is more commonly injured by forced dorsiflexion of the foot it is frequently described as being kicked or the feeling of a golf ball striking the back of the calf. This usually is a rupture of the plantaris tendon. It is usually more confused on the football field or in contact sports with an actual tear or partial rupture of the muscle belly if the gastrocnemius.

A torn Achilles tendon is not particularly common but does occur and can end a football career. Immediate repair best.

Subluxation of the peroneal tendon is usually related to ligamentous injury about the outer side of the ankle. This is best treated by a cast and after the cast has been removed the patient should be encouraged to do muscle strengthing exercises. Many times this will be satisfactory enough to allow return to their former sports without too much difficulty. In rare cases surgery is necessary.

The most important part, of course, is prevention. Good conditioning and good equipment are fundamental. Strapping a normal knee is not necessary although it may be of limited benefit in a knee that has already been injured.

Strapping of the ankle however, should be mandatory not only for games but for practice sessions.



I have tried to outline some of the more common injuries about the knee and ankle. Prevention is the key word but if an injury does occur, accurate diagnosis and early treatment must be carried out.

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

A Building Block approach to treating hypertension

With these three therapeutic building blocks you can create a once-a-day regimen to fit almost any degree of hypertension. See the following pages for details . . .

Consider starting your hypertensives on this basic thiazide

A single daily dose of Enduron provides sodium excretion around the clock

Enduron is a true 24-hour single-dose thiazide. Its sodium excretion is not squeezed into an abrupt peak during the first several hours. It is well-sustained in a plateau-like effect—with little reduction for the first 12 hours, and decline thereafter only gradual.

Potassium loss, by contrast, is low. It reaches an early minor peak, then subsides rapidly. Moreover, since dosage is but once a day, there is but one daily peak of potassium loss. As with all thiazides, however, dietary potassium supplementation should also be considered, especially in long or intensive therapy.

Use Enduron as an ideal starting therapy in mild hypertension. Use it too, as a basic therapeutic building block with which other agents can be joined, for managing your more resistant hypertensives.

Once a day, every day

ENDURON®
METHYCLOTHIAZIDE

DAILY DOSAGE RANGE	Minimum	Usual	Intermediate	Maximum
	2.5 mg. tablet	5 mg. tablet	7.5 mg.	10 mg.

See Brief Summary on final page of advertisement.

To build added response, shift to Enduronyl

The deserpidine component adds enhanced antihypertensive activity

The rauwolfia component of Enduronyl is deserpidine (Harmonyl®), a purified crystalline alkaloid supplied only by Abbott. It augments Enduron with its own antihypertensive and tranquilizing action.

Thus the combined clinical effect of these two therapeutic building blocks in Enduronyl is greater than can ordinarily be achieved with either alone.

To add flexibility, Enduronyl comes in two strengths: regular and Forte. Both provide 5 mg. of Enduron. The variation is where most helpful: in the deserpidine. The tablets are scored, and give a surprisingly wide and economical choice of once-a-day doses (see below).

Choose Enduronyl for your patients in the broad range of mild to moderate hypertension. Patient acceptance is excellent!

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 MG. WITH DESERPIDINE 0.25 MG.

ENDURONYL FORTE

METHYCLOTHIAZIDE 5 MG. WITH DESERPIDINE 0.5 MG.

	Minimum	Usual	Intermediate	Maximum
DAILY DOSAGE RANGE	2.5 mg. methyclothiazide 0.125 mg. deserpidine	5 mg. methyclothiazide 0.25 mg. deserpidine	7.5 mg. methyclothiazide 0.375 mg. deserpidine	10 mg. methyclothiazide 0.5 mg. deserpidine
DAILY DOSAGE RANGE	2.5 mg. methyclothiazide 0.25 mg. deserpidine	5 mg. methyclothiazide 0.5 mg. deserpidine	7.5 mg. methyclothiazide 0.75 mg. deserpidine	10 mg. methyclothiazide 1 mg. deserpidine

707075-R

Eutonyl affords a different kind of basic therapy for moderate to severe cases

Effect tied to reduced peripheral vascular resistance; no central depressant action

Eutonyl is a unique nonhydrazine agent. It is reported to act by reducing peripheral vascular resistance.[1,2]

In clinical trials, significant reductions in mean blood pressure were seen in 84% of patients studied—all were moderate to severe cases. Eutonyl lowers diastolic in proportion to systolic, and in about half of the cases studied, reductions in the sitting and recumbent positions were nearly as great as in the standing position.

Most important: There is no central depressant action. In fact, some patients reported an *increased* sense of well being.

Here, then, is a highly effective *basic treatment* for moderate to severe cases—and one that will not hamper your patient with lethargy or drowsiness while on treatment.

Once a day, every day

EUTONYL®
PARGYLINE HYDROCHLORIDE

DAILY DOSAGE RANGE	Minimum	Usual starting	Intermediate	Maximum
	10 mg. tablet	25 mg. tablet	50 mg. tablet or as needed	200 mg.

See Brief Summary on final page of advertisement.

Eutron adds thiazide for enhanced therapy with milder side effects

Only a 7/4 mm. span between standing and recumbent pressures in clinical trials—reduced chance of orthostatic hypotension

The combining of Eutonyl and Enduron in Eutron permits a significantly greater antihypertensive effect than with either agent used alone. This in turn may allow therapeutic success with lesser dosage—and correspondingly milder side effects.

A significant finding in clinical trials was the drug's action in lowering blood pressure to *nearly equal levels in all body positions.* Total average spread between standing and recumbent readings (after treatment) was only 7/4 mm. Hg.

Thus, in your moderate to severe cases, Eutron affords a usually smooth course of therapy, often with reduced likelihood of orthostatic effects. (The usual precautions against rising suddenly, of course, will always apply.) And, because of the thiazide component, Eutron may be used in the presence of congestive heart failure.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 MG.
WITH METHYCLOTHIAZIDE 5 MG.

DAILY DOSAGE RANGE	Minimum	Usual starting	Intermediate	Maximum
	12.5 mg. pargyline hydrochloride and 2.5 mg. methyclothiazide	25 mg. pargyline hydrochloride and 5 mg. methyclothiazide	37.5 mg. pargyline hydrochloride and 7.5 mg. methyclothiazide	50 mg. pargyline hydrochloride and 10 mg. methyclothiazide

See Brief Summary on final page of advertisement.

707075-R

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Enduron is used to control edema and mild to moderate hypertension; also used with other drugs for hypertension. Enduronyl is used in mild to moderately severe hypertension; when used with Enduronyl, more potent agents can be given at reduced dosage to minimize undesirable side effects.

Contraindications: Neither Enduron nor Enduronyl should be used in severe renal disease (except nephrosis) or shutdown; in severe hepatic disease or impending hepatic coma; in patients sensitive to thiazides. Hepatic coma has been reported as a result of hypokalemia in patients receiving thiazides.

Enduronyl is contraindicated in patients with severe mental depression and suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity reactions in patients with a history of allergy or asthma. If added potassium intake is indicated, dietary supplementation is recommended. Enteric-coated potassium tablets should be reserved for cautious use only when adequate dietary supplementation is not practical because those tablets may induce serious or fatal small bowel lesions consisting of stenosis with or without ulceration. These small bowel lesions have caused obstruction, hemorrhage and perforation frequently requiring surgery. Medication should be discontinued immediately if abdominal pain, distension, nausea, vomiting or GI bleeding occurs.

Precautions: Use thiazides with caution in severe renal dysfunction, impaired hepatic function, or progressive liver disease. In surgical patients, thiazides may reduce the response to vasopressors and increase the response to tubocurarine. Use thiazides with caution in pregnancy (bone marrow depression, thrombocytopenia, or altered carbohydrate metabolism have been reported in certain newborn infants). Also reported have been: blood dyscrasias including thrombocytopenia with purpura, agranulocytosis and aplastic anemia; elevations of BUN, serum uric acid, or blood sugar. Symptomatic gout may be induced. Antihypertensive response may be enhanced following sympathectomy.

Use Enduronyl with caution in patients with a history of peptic ulcer, as rauwolfias may increase gastric secretion. Discontinue at the first sign of mental depression. Rauwolfia alkaloids may increase hypotensive effects of surgery or anesthesia, and should be discontinued two weeks prior. They also lower the convulsive threshold and shorten seizure latency. In epilepsy, dosage adjustment of anticonvulsant medication may be necessary. Alcohol, barbiturates, or narcotics may potentiate action of deserpidine.

Adverse Reactions: During intensive or prolonged therapy, guard against hypochloremic alkalosis and hypokalemia (especially the latter if patient is on digitalis). All patients should be observed for signs of hyponatremia ("low-salt" syndrome). Reported thiazide reactions include: anorexia, nausea, vomiting, diarrhea, headache, skin rash, dizziness, paresthesia, weakness, photosensitivity, jaundice, and pancreatitis.

Reported rauwolfia reactions include: nasal stuffiness, nausea, weight gain, diarrhea, aggravation of peptic ulcer, epistaxis, skin eruption, and reduction of libido and potency. Excessive drowsiness, fatigue, weakness, and nightmares may signal early signs of mental depression.

EUTONYL® | EUTRON™

PARGYLINE HYDROCHLORIDE

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications: For treatment of patients with moderate to severe hypertension, especially those with severe diastolic hypertension. Not recommended for patients with mild or labile hypertension amenable to therapy with sedatives and/or thiazide diuretics alone. It is desirable to establish the dosage of Eutron by administering component drugs separately.

TM-Trademark.

Contraindications: Pheochromocytoma, advanced renal disease, increasing renal dysfunction, paranoid schizophrenia and hyperthyroidism. Hepatic coma has been reported as consequence of hypokalemia with thiazide therapy. Until further experience is gained not recommended for patients with malignant hypertension, children under 12, or pregnant patients.

Concomitant use of the following is contraindicated: other monoamine oxidase inhibitors; parenteral forms of reserpine or guanethidine; sympathomimetic drugs; foods high in tyramine such as cheese; imipramine and amitriptyline, or similar antidepressants; methyldopa. 2 week interval should separate therapy and use of these agents.

Methyclothiazide is contraindicated in patients with known sensitivity to thiazides.

Warnings: Pargyline hydrochloride is a monoamine oxidase inhibitor. Warn patients against eating cheese, and using alcohol, proprietary drugs or other medication without the knowledge of the physician. When indicated, alcohol, narcotics (meperidine should be avoided), antihistamines, barbiturates, chloral hydrate, and other hypnotics, sedatives, tranquilizers, or caffeine, may be used cautiously in reduced dosage. In emergency surgery ¼ to ⅓ the usual dose of narcotics, analgesics, and other premedications should be used avoiding parenteral administration where possible. Carefully adjust dose of anesthetics to response of patient. Withdraw pargyline two weeks before elective surgery.

Warn patients about the possibility of postural hypotension. Those with angina or coronary artery disease should not increase physical activity with an improvement in well being. Pargyline may lower blood sugar.

Avoid use of enteric-coated potassium tablets, as these may induce serious or fatal small-bowel lesions consisting of stenosis with or without ulceration. These small-bowel lesions have caused obstruction, hemorrhage and perforation frequently requiring surgery. Medication should be discontinued immediately if abdominal pain, distension, nausea, vomiting or GI bleeding occurs. These products contain no added potassium salts and if added potassium intake is desired, dietary supplementation is recommended. Coated potassium tablets should be reserved for cautious use when adequate dietary supplementation is impractical. In patients with a history of allergy or asthma the possibility of sensitivity reactions should be considered.

Precautions: Measure blood pressure while patient is standing to determine antihypertensive effect. Use with caution in hyperactive or hyperexcitable persons. Such persons may show increased restlessness and agitation. Withdraw drug during acute febrile illness. Watch patients with impaired renal function for increasing drug effects or elevation of BUN and other evidence of progressive renal failure; withdraw drug if such alterations persist and progress. Use with caution in patients with liver disease. As with all new drugs, complete blood counts, urinalyses, and liver function tests should be performed periodically. With prolonged therapy, examine patients for change in color perception, visual fields and fundi. Also reported have been: blood dyscrasias including thrombocytopenia with purpura, agranulocytosis and aplastic anemia; elevations of BUN, serum uric acid, or blood sugar. Symptomatic gout may be induced. In surgical patients thiazides may reduce response to vasopressors and increase response to tubocurarine.

Adverse Reactions: Pargyline may be associated with orthostatic hypotension. Mild constipation, slight edema, dry mouth, sweating, increased appetite, arthralgia, nausea and vomiting, headache, insomnia, difficulty in micturition, nightmares, impotence, delayed ejaculation, rash, and purpura have been encountered with pargyline. Hyperexcitability, increased neuromuscular activity (muscle twitching) and other extrapyramidal symptoms have been reported in a few patients with reduced cardiac reserve.

During intensive or prolonged therapy, guard against hypochloremic alkalosis and hypokalemia (especially the latter if patient is on digitalis). Observe all patients for signs of hyponatremia ("low salt" syndrome).

Reported thiazide reactions also include anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, and pancreatitis. Nocturia has been observed with the combination.

A breakthrough in the control of pain

Talwin®

brand of

pentazocine

(as lactate)

**a potent injectable non-narcotic—
may be used in place of morphine
and other narcotic analgesics**

A breakthrough in the control of pain

Talwin®

brand of

pentazocine

(as lactate)

a potent injectable non-narcotic—may be used in place of morphine and other narcotic analgesics

Talwin 30 mg. relieves pain usually as quickly and effectively as morphine 10 mg.*

whatever the intensity of the pain

whatever the cause of the pain

whatever the site† of the pain

whatever the chronicity of the pain

whatever the age†† of the patient

without the liability of narcotics

without the development of tolerance on prolonged use

with less risk of severe respiratory depression than with morphine

with less constipation

with less urinary retention

Clinical experience of more than 150 investigators with over 12,000 patients given varying dosages of Talwin shows that this potent injectable analgesic is not a narcotic.

Talwin has less risk of severe respiratory depression, urinary retention, and constipation than morphine—a great boon for postsurgical patients.

Talwin produces less nausea, vomiting and diaphoresis than meperidine.

Constipation and urinary retention are seldom a problem with Talwin.

Very rarely do hallucinations or disorientation occur (0.1% each).

No significant hepatic, renal, hematopoietic or neurologic disturbances have been reported.

Talwin is well tolerated even by the aged or very ill patients.

Used during active labor, its tolerance by the mother and newborn is comparable to meperidine's. As with all new drugs, Talwin should be used with caution in pregnant women and in women delivering premature infants.

Tolerance to the analgesic effect of Talwin has not developed with prolonged use.

Talwin gives significant relief of pain in from 15 to 20 minutes following I.M. or S.C. injection.

Talwin relieves pain usually for 3 hours or longer with a single injection; however, the duration may sometimes be less than with morphine.

*Its duration of action may sometimes be less than that of morphine.

†Should not be used for patients with increased intracranial pressure, head injury or pathologic brain conditions.

††Until sufficient experience is gained, Talwin should not be administered to children under 12 years of

86 per cent of medical and surgical patients obtained excellent to good relief with Talwin 30 mg. administered

Talwin

brand of pentazocine (as lactate)

used for pain of all types

Talwin has a wide range of usefulness in surgery

Talwin relieves pain as quickly as morphine

A comparison of Talwin 30 mg. and morphine 10 mg. I.M. in controlling postoperative pain*

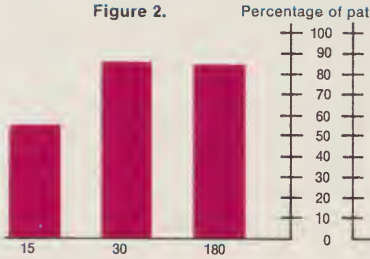

Figure 1.

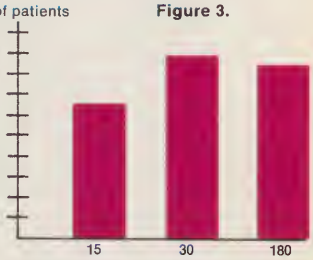
Talwin 30 mg. proved equivalent to morphine 10 mg. in overall analgesic efficacy. During the early post-medication period (up to 40 minutes after drug injection), Talwin was superior in effect to morphine.

After observation periods ranging from 40 to 180 minutes there was no difference between the drugs in their effect on intensity. There were 141 and 119 complete patient records for Talwin and morphine, respectively, in this double-blind study. Other clinical investigators, studying duration, state that relief with Talwin may be obtained for up to three hours or longer, a period sometimes less than morphine's.



Talwin is as effective for severe pain (Fig. 2)† as for moderate pain (Fig. 3)†

Figure 2.

Per cent excellent to good relief of severe pain obtained with 30 mg. Talwin in 218 postoperative patients

Figure 3.

Per cent excellent to good relief of moderate pain obtained with 30 mg. Talwin in 203 postoperative patients

Talwin does not require a narcotics prescription or narcotics records

The World Health Organization Expert Committee on Dependence-Producing Drugs concluded that "...there was no need at this time for narcotics control of pentazocine [Talwin] internationally or nationally."‡

A breakthrough in the control of pain

Talwin®

brand of

pentazocine

(as lactate)

a potent injectable non-narcotic — may be used in place of morphine and other narcotic analgesics

Contraindications: *Increased Intracranial Pressure, Head Injury, or Pathologic Brain Conditions in which clouding of sensorium is undesirable.* Talwin (brand of pentazocine) should not be administered in these cases, since drug-induced sedation, dizziness, nausea, or respiratory depression could be misleading.

Precautions: *Pregnancy.* No teratogenic or embryotoxic effects attributable to the use of Talwin have been seen in extensive reproductive studies in animals; however, like all new drugs, Talwin should be given with caution to pregnant women. A large number of patients in labor have received the drug with no adverse reactions other than those that occur with commonly used strong analgesics. However, as with other strong analgesics, Talwin should be used with caution in women delivering premature infants.

Ambulatory Patients. Since sedation, dizziness, and occasional euphoria have been noted, ambulatory patients should be warned not to operate machinery, drive cars, or unnecessarily expose themselves to hazards.

Certain Respiratory Conditions. The possibility that Talwin (brand of pentazocine) may cause respiratory depression should be considered in treatment of patients with bronchial asthma. Talwin should be administered only with caution and in low dosage to patients with respiratory depression (e.g., from other medication, uremia, or severe infection), obstructive respiratory conditions, or cyanosis.

Patients Dependent on Narcotics. Because Talwin is a narcotic-antagonist, patients dependent on narcotics and receiving Talwin may occasionally experience certain withdrawal symptoms. Talwin should be given with special caution to such patients. It has been observed that some patients previously given narcotic-analgesics for one month or longer had mild withdrawal symptoms when the drug was replaced with the analgesic, Talwin. After a short period of adjustment the subjects were usually able and willing to continue taking Talwin, and relief of pain was satisfactory.

Nonaddicted Patients Receiving Narcotics. Symptoms believed to be indicative of antagonism to the opiate may be observed rarely with administration of Talwin to patients receiving opiates for a short time. Intolerance or untoward reactions are seldom observed after administration of Talwin to patients who have received single doses or who have had limited exposure to narcotics.

Impaired Renal or Hepatic Function. Although laboratory tests have not indicated that Talwin (brand of pentazocine) causes or increases renal or hepatic impairment, the drug should be administered with caution to patients with such impairment. Extensive liver disease appears to predispose to greater side effects (e.g., marked apprehension, anxiety, dizziness, sleepiness) from the usual clinical dose, and may be the result of decreased metabolism of the drug by the liver.

Myocardial Infarction. As with all drugs, Talwin (brand of pentazocine) should be used with caution in patients with myocardial infarction who have nausea or vomiting.

Biliary Surgery. Until further experience is gained with the effects of Talwin on the sphincter of Oddi, the drug should be used with caution in patients about to undergo surgery of the biliary tract.

Adverse Effects: Talwin is relatively free from the undesirable side effects associated with morphine, such as constipation, urinary retention, or severe respiratory depression. Furthermore, Talwin produces less nausea, vomiting, and diaphoresis than meperidine.

In over 12,000 patients who received Talwin intramuscularly, subcutaneously, or intravenously, nausea, the most frequent adverse effect, occurred in approximately 5.0 per cent. In decreasing order of occurrence were vertigo, dizziness or lightheadedness; vomiting; and euphoria. Respiratory depression was reported as an adverse reaction in 1.0 per cent.

The incidence of each of the other adverse effects was well below 1.0 per cent: constipation, circulatory depression, diaphoresis, urinary retention, alteration in mood (nervousness, apprehension, depression, floating feeling), hypertension, sting on injection, headache, dry mouth, flushed skin including plethora, altered uterine contractions during labor, dermatitis including pruritus, dreams, paresthesia, and dyspnea occurred rarely after administration of Talwin (brand of pentazocine). Furthermore, each of the following adverse reactions occurred in less than 0.1 per cent: tachycardia, visual disturbance (blurred vision, diplopia and nystagmus), hallucinations, disorientation, weakness or faintness, muscle tremor, chills, allergic reactions including edema of the face, taste alteration, insomnia, diarrhea, cramps, and miosis; laryngospasm in one patient.

Talwin has not produced severe respiratory embarrassment in adults (never apnea), even with large amounts. A small number of newborn infants whose mothers received Talwin during labor had transient apnea. The incidence of temporary diminution in the rate or strength of uterine contractions is low after administration of Talwin, similar to that following meperidine hydrochloride. (In reporting no interference with normal labor in patients receiving Talwin, one investigator further stated that the drug may increase uterine activity.) Generally, no significant fetal heart rate change occurs.

Laboratory tests of blood and of liver and kidney functions have revealed no significant abnormalities. A minimum and probably insignificant increase in the per cent of eosinophils in peripheral blood counts and bone marrow occurred occasionally.

Talwin is well tolerated by patients with diabetes mellitus, and no changes in insulin requirements have been observed.

Dosage and Administration: *Adults, Excluding Patients in Labor.* Average recommended single parenteral dose is 30 mg., by intramuscular, subcutaneous, or intravenous route; may be repeated every three to four hours. Pain has been relieved in most patients with not more than three doses daily. Infrequently, selected patients have received single doses as high as 60 mg.

Patients in Labor. A single, intramuscular 30 mg. dose has been most commonly administered. An intravenous 20 mg. dose has given adequate pain relief to some patients in labor when contractions become regular, and this dose may be given two or three times at two- to three-hour intervals, as needed.

Children Under 12 Years of Age. Since clinical experience in children under twelve years of age is limited, the use of Talwin (brand of pentazocine) in this age group is not recommended.

Duration of Therapy. Patients with chronic pain who received Talwin for prolonged periods (e.g., over 300 days) experienced no withdrawal symptoms even when administration was stopped abruptly; furthermore, there was no tolerance to the analgesic effect.

CAUTION. Talwin should not be mixed in the same syringe with soluble barbiturates because precipitation will occur.

Treatment of Overdosage or Respiratory Depression. Talwin has not produced apnea or severe respiratory embarrassment in adults, even in large doses. Occasionally, however, moderate respiratory depression may occur. Means of maintaining proper oxygenation should be available in case of overdosage or respiratory depression, and methylphenidate (Ritalin®) should be administered parenterally. The usual narcotic-antagonists, such as nalorphine, are not effective respiratory stimulants for depression due to Talwin.

How Supplied: Ampuls of 1 ml., containing Talwin® (pentazocine) as lactate equivalent to 30 mg. base and 2.8 mg. sodium chloride, in Water for Injection. **Boxes of 10, 25, and 100.**

Multiple dose vials of 10 ml., each 1 ml. containing Talwin® (pentazocine) as lactate equivalent to 30 mg. base, 2 mg. acetone sodium bisulfite, 1.5 mg. sodium chloride, and 1 mg. methylparaben as preservative, in Water for Injection. **Boxes of 1.**

The pH of Talwin solutions is adjusted between 4 and 5 with lactic acid and sodium hydroxide.

PRINTED IN U.S.A. ISSUED AUGUST, 1967 11035M1

New view of an oral contraceptive at work

Although suppression of ovulation remains the primary mode of action of oral contraceptives, newer knowledge indicates that products like Norinyl-1—a combination of both low-dosage progestogen and estrogen for the full treatment cycle—may provide multiple action that helps explain their unexcelled record of contraceptive effectiveness. This report explores the possible secondary protective mechanisms offered by combined hormonal administration.

Accumulating evidence has indicated that sparse, highly viscous cervical mucus has a possible adverse effect on the motility and survival of spermatozoa.

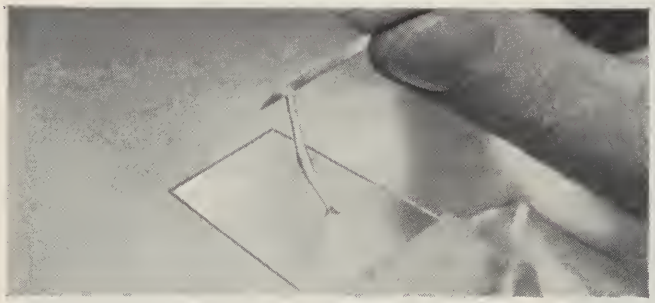
The estrogen-opposing progestational ingredient of Norinyl-1 (norethindrone 1 mg. with mestranol 0.05 mg.) changes the usual mid-cycle picture of a thin, watery cervical mucus. The result—a built-in barrier that appears to inhibit sperm from reaching the ovum should one be released. The inset in the adjoining photograph shows immobile spermatozoa as they appear in cervical mucus taken from a patient treated with Norinyl-1.

See last page for contraindications, precautions, side effects and dosage.

How the estrogen-opposing action of Norinyl-1 creates cervical mucus that may be hostile to sperm penetration

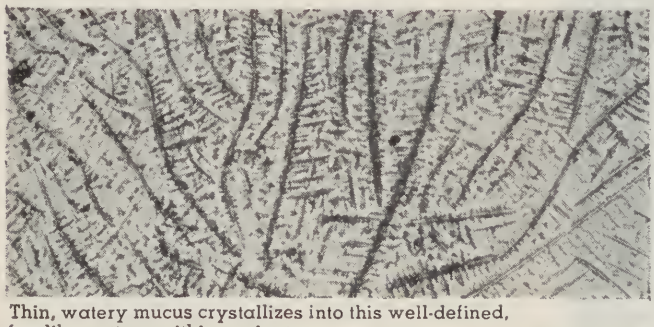
Normally, estrogen activity during the fertile midcycle stimulates the production of a profuse and watery cervical mucus that permits maximum sperm motility and promotes penetration.

But what happens when Norinyl-1 is administered? Its potent progestogen, norethindrone, opposes estrogen stimulation of cervical mucus. Consequently, the amount of mucus decreases and its viscosity increases. This results in a sparse but thick mucus barrier that appears to diminish the vitality of the sperm and to impair its powers of penetration.



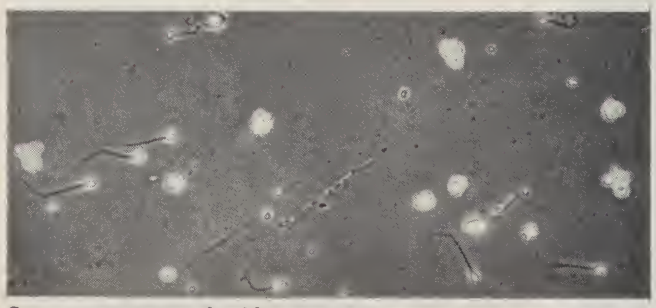
The role of viscous cervical mucus as a secondary action of Norinyl-1

In a report on 89 patients taking this medication,* cervical mucus obtained from cycle day 5 to cycle day 29 appeared scant and thick and exhibited little or no Spinnbarkeit.



In the opinion of this investigator, the effect on cervical mucus may be sufficient to prevent conception.

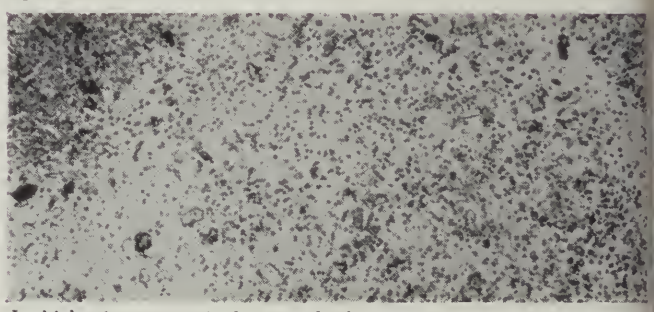
*Cohen, M. R.: Symposium: Mechanisms of Action of Low Dosage Oral Contraceptive, Yale University Medical Center, New Haven, Conn., April 6, 1967.



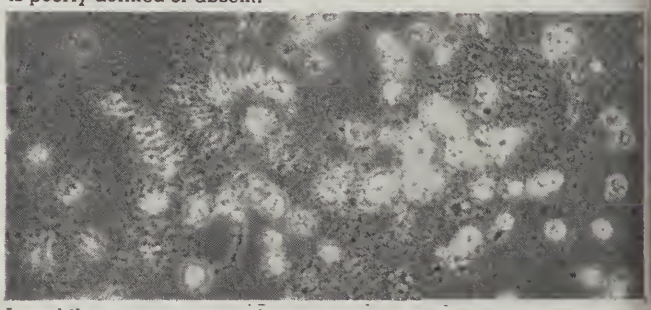
Normal cervical mucus at midcycle in untreated patient is known to permit sperm motility... promote sperm penetration.

Cervical mucus is thin and watery with a stretchability (Spinnbarkeit) of 15 to 20 cm.

Thin, watery mucus crystallizes into this well-defined, fernlike pattern within a minute.



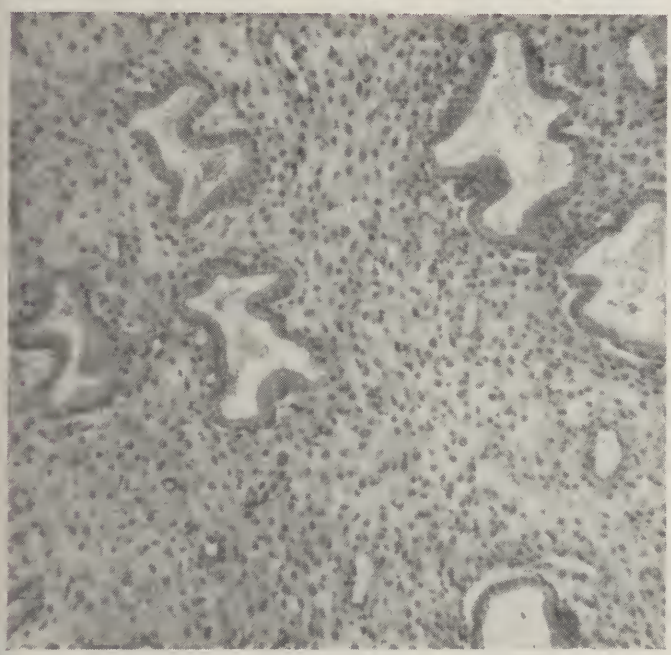
Spermatozoa appear healthy, are active and freemoving.



Viscous cervical mucus at midcycle produced by Norinyl-1 appears to impair sperm vitality... inhibit penetration.

Cervical mucus is scanty, thick and viscous. Spinnbarkeit is 1 cm. or less.

In thick, viscous cervical mucus the fern pattern is poorly defined or absent.

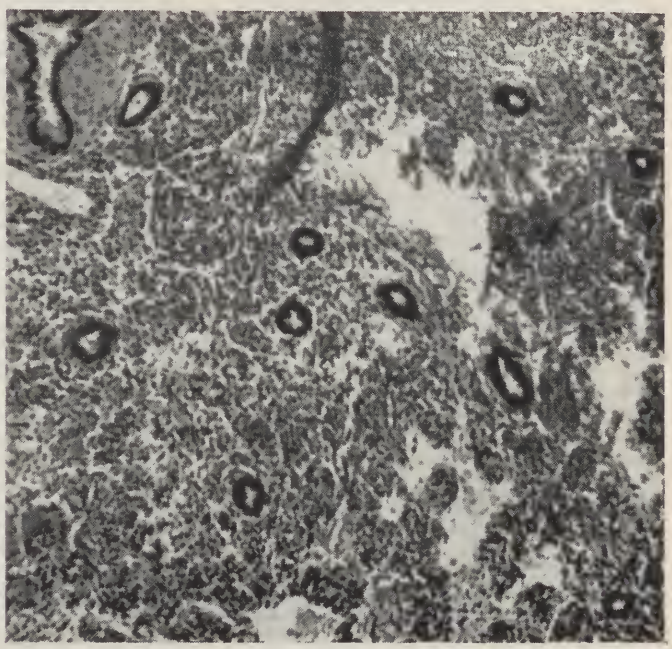


Immobile spermatozoa as they appear in cervical mucus taken from a patient treated with Norinyl-1.

How Norinyl-1 alters normal endometrial responses—another possible protective mechanism

Let us suppose that an ovum is released—as occurs in an occasional, rare case—and somehow a sperm succeeds in penetrating the cervical mucus barrier. Should this come about, one additional action of Norinyl-1 may protect the patient from unwanted pregnancy. The theory is that progestogen intake makes endometrial tissue unreceptive to implantation.

Endometrium of untreated patient



Normally, the endometrium progresses through a proliferative phase stimulated by estrogen and a secretory phase stimulated by progesterone. During the secretory phase the endometrium is receptive to the fertilized ovum.

Endometrium produced by Norinyl-1

When Norinyl-1 is administered its progestogen component—norethindrone—accelerates the secretory phase and suppresses glandular and vascular development.

See last page for contraindications, precautions, side effects and dosage.

new Norinyl-1® tablets

(norethindrone 1mg. c mestranol 0.05mg.)

for multiple contraceptive action

effective fertility control on half the previous dosage

maintains ratio of the established norethindrone/mestranol combination

lower cost

new Norinyl®-1 tablets

(norethindrone 1mg. c̄ mestranol 0.05mg.)

Reduction of oral contraceptive dosage to lowest effective levels has become a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now available in a new strength in which *both* norethindrone and mestranol are reduced 50 percent. Studies show that Norinyl-1 achieves fertility control with only 1.05 mg. of combined progestogen and estrogen per tablet.

Norethindrone was first reported for use as a progestational agent in human beings in 1955. Norethindrone 2 mg. with mestranol 0.1 mg., as an oral contraceptive, is currently in use by over 2,000,000 women. Clinical experience now establishes that Norinyl-1 also amply meets the criteria of reliability and safety.*

*Symposium on Low-Dosage Oral Contraception, Palo Alto, Calif., July 15, 1965.

PRESCRIBING INFORMATION

Contraindications: 1. Patients with thrombophlebitis or with a history of thrombophlebitis or pulmonary embolism. 2. Liver dysfunction or disease. 3. Patients with known or suspected carcinoma of the breast or genital organs. 4. Undiagnosed vaginal bleeding.

Warnings: 1. Discontinue medication pending examination if there is sudden partial or complete loss of vision or if there is a sudden onset of proptosis, diplopia, or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. 2. Since the safety of Norinyl-1 in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. 3. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this dose to the infant has not been determined.

Precautions: 1. The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. 2. Endocrine and possibly liver function tests may be affected by treatment with Norinyl-1. Therefore, if such tests are abnormal in a patient taking Norinyl-1, it is recommended that they be repeated after the drug has been withdrawn for 2 months. 3. Under the influence of estrogen-progestogen preparations, preexisting uterine fibroids may increase in size. 4. Because these agents may cause some degree of fluid retention, conditions that may be influenced by this factor, such as epilepsy, migraine, asthma, cardiac, or renal dysfunction, require careful observation. 5. Although a cause and effect relationship has not been established, Norinyl-1 should be used with caution in patients with a history of cerebrovascular accident. 6. In relation to breakthrough bleeding, as in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. 7. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. 8. Any possible influence of prolonged Norinyl-1 therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. 9. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Norinyl-1 therapy. 10. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. A cause and effect relationship has not been demonstrated. 11. Because of the effects of estrogens on epiphyseal closure, Norinyl-1 should be used judiciously in young patients in whom bone growth is not complete. 12. The age of the patient constitutes no absolute limiting factor, although treatment with Norinyl-1 may mask the onset of the climacteric. 13. The pathologist should be advised of Norinyl-1 therapy when relevant specimens are submitted.

Side Effects: The following adverse reactions have been observed with varying incidence in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms, breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma, breast changes (tenderness, enlargement and secretion), loss of scalp hair, change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately postpartum, cholestatic jaundice, erythema multiforme, erythema nodosum, hemorrhagic eruption, migraine, rash (allergic), itching, rise in blood pressure in susceptible individuals, mental depression.

The following occurrences have been observed in users of oral contraceptives. A cause and effect relationship has not been established: thrombophlebitis, pulmonary embolism, neurooocular lesions.

The following laboratory results may be altered by the use of oral contraceptives: increased bromsulphalein retention and other hepatic function tests, coagulation tests (increase in prothrombin, factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metapyrone test, pregnanediol determination.

Other side effects reported to have occurred in association with use of this drug are dizziness, hirsutism, pains in legs, back, chest and abdomen, dysuria, drowsiness, vaginal discharge, libido increased and decreased, eruptions, hypermenorrhea, hypomenorrhea, increased appetite, G.U. infections, varicose veins, abdominal fullness, acne, headache, nervousness, allergies, blurred vision, pain in eyes, and itching in eyes. *For complete clinical data, see package insert.*

Dosage and Administration: 1. One tablet of Norinyl-1 is administered orally for 20 days beginning on day 5 of the menstrual cycle. (Count day 1 of the cycle as the first day of menstrual bleeding.) Repeat this dosage schedule for each cycle. 2. If no menstrual period occurs after a cycle of treatment (20 tablets) in which patient adhered to the schedule, the patient must be instructed to resume taking the Norinyl-1 tablets 7 days after the previous 20-day course was completed. For example, if the last pill of a previous cycle had been taken on a Sunday, then a new cycle of treatment should begin on the following Sunday. 3. In the postpartum woman, it is recommended that the first cycle of treatment should begin on day 5 of the first menstrual cycle. However, Norinyl-1 should not be administered during lactation.

Availability: Norinyl-1 (norethindrone 1 mg. with mestranol 0.05 mg.)—Dispensers of 20 and 60 and bottles of 250 tablets.

SYNTEX LABORATORIES INC., PALO ALTO, CALIF.

SEMIANNUAL MEETING
September 8, 1967

REPORTS

To the House of Delegates

DELEGATES TO THE AMERICAN MEDICAL ASSOCIATION

Mr. President and Members of the House of Delegates:

Your three delegates and alternate delegates attended all of the House sessions of the American Medical Association House of Delegates meetings in Atlantic City. Commencing on Sunday, June 18, the meetings ran through Thursday afternoon, June 22. Following the House session, various Reference Committee meetings to discuss the business matters before the House were held. All of those delegates and alternates present, as well as the Executive Secretary, attended assigned sessions and reported the general tenor of the discussions at these sessions.

It is important for all physicians to recognize, realize and take advantage of their opportunity to appear at Reference Committee meetings to speak on any subject in which they are interested.

The most important and widely attended sessions of the Reference Committees were those devoted to the action on Therapeutic Abortions as well as the AMA's Disability Insurance program.

Your delegates are pleased to report that in nearly all instances of items to come before the AMA House, that our own society already had taken action on the matters or had the question under discussion within various Faculty Committees. We are happy that the physicians of Maryland can consider themselves in the vanguard of the important decisions being made today that will affect the practice of medicine in future years.

A complete report of the House actions follows:

Actions of the House

Of the 10 reports from councils considered by the House, all were adopted in their presented form except two from the Council on Medical Service which were amended and adopted. Of the 18 Board of Trustees reports, 13 were adopted as presented; two were amended and adopted; two were accepted for information; and one was referred back to the Board along with state resolutions on the same subject.

Therapeutic Abortion

One subject that has generated interest not only in the profession but among legislatures and the public is therapeutic abortion.

The House updated the Association's 1871 policy on the subject which, according to the Reference Committee report which was adopted, was not only antiquated but lacked even the rudiments of adequate safeguards to prevent abuse. The updated policy, the House agreed, is in keeping with modern scientific knowledge, contains necessary safeguards and permits the physician to exercise his personal conscience and medical judgment in the best interest of his patient, over-riding objectives in any medical decision.

The following was established as policy of the American Medical Association:

". . . Recognizing that there are many physicians who, on moral or religious grounds, oppose therapeutic abortion under any circumstances, the American Medical Association is opposed to induced abortion except when:

(1) There is documented medical evidence that continuance of the pregnancy may threaten the health or life of the mother, or

(2) There is documented medical evidence that the infant may be born with incapacitating physical deformity or mental deficiency, or

(3) There is documented medical evidence that continuance of a pregnancy, resulting from legally established statutory or forcible rape or incest may constitute a threat to the mental or physical health of the patient;

(4) Two other physicians chosen because of their recognized professional competence have examined the patient and have concurred in writing; and

(5) The procedure is performed in a hospital acredited by the Joint Commission on Accreditation of Hospitals.

"It is to be considered consistent with the principles of ethics of the American Medical Association for physicians to provide medical information to State Legislatures in their consideration of revision and/or the development of new legislation regarding therapeutic abortion."

Health Care Cost

"Today . . . the ability of the physician to serve his patient is being handicapped by the rapidly rising prices of the various components of health care." That is a statement from the Board of Trustees report adopted by the House with the provision that it be widely disseminated for study and evaluation as to its applicability in local areas.

"Indeed," the report continued, "if the price of health care continues to outrun slower increases in consumers' income, the problem of medical indigency will assume alarming proportions."

Basic problems in the over-all design of the nation's health care system, as shown in the adopted report, include inadequate numbers of new physicians and shortages of other individuals trained to function as part of the health care team; the present organization and management of the nation's hospitals, with respect to their "privilege of automatically translating all higher costs into higher prices" which "must now be questioned;" diagnostic and therapeutic care outside of a hospital; and legislation in the health field.

A number of actions were taken to outline possible solutions to the problems of higher health care costs. One important one was the adoption of a progress report on strengthening and improving voluntary health insurance programs, submitted by the Council on Medical Service. The House accepted the Council's statements that it would "continue to study the scope and patterns of benefits, public demands for coverage, the performance of health insurance and prepayment programs and accumulation of data for future use;" and that the Council would "proceed to develop guiding principles for health insurance and prepayment programs."

As further efforts in this direction, the House referred to the Board and to the Council on Medical Service a resolution that the AMA "consult with insurers in an effort to change their policy of insurance coverage so that payment can be made for diagnostic procedures and minor surgery performed in the physicians' office and/or in the hospital out-patient department;" adopted a resolution that the Association petition congress to remove the restriction on first-dollar deduction from income tax laws for health care expenditures; and adopted the over-all policy that "physicians . . . continue to do everything possible to help the public conserve its health care dollars."

Government Health Programs

As might be expected, a great many reports and resolutions dealt directly or indirectly with the Association's relationships with government and with the multitude of government programs existing or proposed in the health field.

The House re-affirmed Association policy that "The medical profession has long and consistently held to two basic positions concerning personal health care and its financing: that no one should go without needed care because of inability to pay, and that responsibility for payment rests first on the individual himself and then, to the extent that he is unable to pay, on his family, the community, the county, the state, and, to the extent that lesser levels of government are unable to finance the care, the federal government."

Regarding the Title XIX program, the House made it policy that "the medical profession should now take a firm stand in support of the Title XIX approach in improving the health and the delivery of health care services to the needy of the nation."

Recommendations adopted by the House are that the medical profession take a strong stand in support of implementation of Title XIX "while still seeking such changes in the federal legislation and/or regulations as will improve this program; that it urge organized medicine to take a leading role in formulating and directing Title XIX programs at the state and local level . . . and that it incorporate in such planning the use of existing voluntary mechanisms and private insurance carriers, wherever feasible, utilizing the usual and customary fee principle, thus bringing within the mainstream of present medical care systems the provision of quality health care for all Americans."

Appalachian regional health programs were the subject of a number of resolutions and the House adopted the following guidelines for setting up any such programs: (1) demonstrated need for the proposed project; (2) local control; (3) participation of a significant proportion of local physicians in planning and development of the project; (4) the operation of any regional, area or county health service facility shall not infringe upon the private practice of medicine; (5) all health services, whether preventive, prophylactic or therapeutic, shall be rendered at a cost to the patient commensurate with the social and economic status of the patient; (6) there shall be adequate medical representation on all national, state and local bodies having supervision or jurisdiction in the development and/or operation of such health service facilities; (7) these health service projects shall in no way be developed, operated or influenced in any manner which could lead to a government-controlled system of medical practice.

More generally, in connection with any and all government medical care programs, guidelines were adopted by the House:

"The medical profession in any community is best represented by the local medical society and its officers. They should be consulted initially, and during the process of planning of any and all projects for the care of the sick and the preservation of health."

In proposing any new facility, "It shall be first determined that existing facilities are so inadequate that only a completely new facility will provide a solution.

"The responsibility for the health needs of a community basically resides at the community level, and all the local resources . . . shall be examined before the community accepts government monies.

"If it is deemed advisable to operate a government-financed facility in a community, it shall in no way be binding upon a physician to refer his patients there; to coerce a physician to service the facility; and this facility must in no way infringe upon the private practice of medicine.

"These projects should not be developed or operated in such a manner as to establish a precedent that could lead to a governmental controlled medical care system in this country."

Physician Control Over Collection and Disbursement of Professional Fees

In adopting a report of the Council on Medical Service regarding collection and disbursement of professional fees, the House reaffirmed past action and provided clear, consistent policy statements reflected in these thoughts which are elaborated in the full report:

1. It is proper for the physician to establish the fee he charges to any patient for professional service rendered, with the recognition that a duly constituted committee of his peers may appropriately review and pass upon the equity and justice of his charge.
2. It is proper for third party agencies to make payment of professional medical fees for patients.
3. It is proper for a physician to work with other physicians in a team approach to the provision of medical service, recognizing that each is entitled to compensation according to the value of his services and that charges attributable to each physician's service shall be made clear to the patient.
4. It is proper for a physician who provides personal supervision and direction for a physician-in-training to charge for the professional medical service rendered.
5. A physician should not enter into a contract or agreement with a hospital whereby the hospital acts as the agent for him unless it is with the consent of the physician and of the medical staff.
6. Physicians, collectively in hospitals, may properly establish special medical staff funds, wholly under their own control, which they may support as they see fit, disburse as they may agree.
7. Fees for professional medical services are properly paid only to the responsible physicians and may not be appropriated by any other person or agency.
8. The physician is the sole arbiter as to the ways he may dispose of his professional income, without duress, consistent with the laws of the land and the Principles of Medical Ethics of this Association.

Millis Commission and Commission on Research

Because the contents of the Millis Commission report (Citizens Commission on Graduate Medical Education) relate so specifically to the roles of the Councils on Medical Education and Medical Service, the two councils have assumed responsibility for assembling critiques and information. At a later date, they will bring to the Board, and subsequently to the House, recommendations for implementation of parts or the whole of the report. The House urged all interested members of the Associa-

tion or groups to submit comments, suggestions or recommendations for consideration by the two councils.

With respect to the Commission on Research, the Board has established a Committee on Research to review reports on the subject from the Councils on Medical Education and Medical Service; refer portions of the report to other councils and committees; and confer with those groups in addition to receiving their reports.

Again, the House urged any interested individuals and groups to forward comments and suggestions to the Executive Vice President for transmittal to the committee.

Medicine and Osteopathy

The House adopted the following recommendations of the Board regarding the medical profession's relationships with osteopathy:

1. Authorize the Board of Trustees to begin promptly negotiations directed toward beginning official change of schools of osteopathy to schools of medicine. (It is understood that from the American Medical Association funds will be required to conduct these negotiations, and assistance in identifying and securing additional funds from other sources to support efforts toward changing the schools.)

2. Authorize the Council on Medical Education to undertake negotiations to establish means by which selected students with proven satisfactory scholastic ability in schools of osteopathy may be considered by schools of medicine for transfer into medical school classes.

The primary issue in the relationship of medicine and osteopathy, as recognized by the House, seems to be not that of cultism as opposed to science. Rather the issue appears to be one level of medical education and practice as opposed to another and lower level of education and practice. The extensive and growing licensure of osteopathic physicians for the unrestricted practice of medicine and the nature of osteopathic education strongly indicate that time alone will resolve shortly the problem of cultism in relation to osteopathy.

Medical Manpower

The House accepted for information a report from the Board which pointed out that "The production of well qualified physicians in adequate numbers is necessary to meet effectively both social and economic demands for health care." It reviewed some of the activities of the Committee on Health Manpower and concluded that "The AMA should continue to study the effect of new roles for health personnel and new interrelationships and interdependencies between health professionals, as well as the impact of innovative concepts on the organizational structure evolving in the general system of health care delivery. . . .

"In any event, our resolve should always be as it is now: to use the best tested and most forward looking measures to provide excellent health care for all of our citizens through an ample number of able, educated and highly skilled physicians."

The House also referred to the Board, for consideration by the committee, a resolution that "deliberations include strong emphasis on sound ways of accelerating medical education in all its phases, including post-MD and graduate education, and of increasing the supply of physicians in all categories."

In addition, the House adopted reports calling for revision of the Essentials of Approved Residencies in radiology, obstetrics and gynecology; adopted a resolution calling for the promotion of better practices in inhalation therapy; and adopted a resolution that the AMA reaffirm its support of all forms of nursing education: that hospitals which conduct diploma schools of nursing be commended; that such hospitals be urged to continue their schools and increase enrollment; and that the AMA take appropriate action in consultation with professional nurses' associations and the American Hospital Association to encourage increasing enrollment in diploma schools and at the same time improve educational standards.

Committee on Planning and Development

At the June, 1966, convention of the House, the Board announced the appointment of a committee to study planning and development techniques within the Association. The report of the committee was received and the Board submitted its final report to the House at this convention.

The Board voted to (1) establish a permanent Committee on Planning and Development and (2) select seven active members of the AMA as members. The following charges were established for the committee:

1. Study and make recommendations concerning the long-range objectives of the Association and the resources, programs and organizational structure by which the Association attempts to reach them.

2. Serve as a focal point for the planning activities of the Association and stimulate and coordinate planning activities throughout the organization.

3. Study, or cause to be studied, medicine and the environment in which the Association must function and transmit the conclusions of these studies to the Board.

In the report adopted by the House, the Board earnestly solicited nominations to the committee from delegates, constituents associations, component societies and other interested groups and individuals.

Two resolutions on the subject were referred to the Board.

It is noteworthy that in his report to the House, President Rouse stated that "We now have an established Committee on Planning and Development at the AMA level. I hope that every county and state association will likewise make use of a comparable committee, to plan wisely and develop properly the policies and programs needed in the decades ahead—far beyond just the next year."

Members' Disability Insurance Program

The House adopted the report of the Reference Committee on this subject, and referred to the Board a number of resolutions pertaining to it.

The committee's report, as adopted, recommended that the House authorize the Board to make every effort to continue the AMA Members Group Disability Insurance Program with the same premium-benefit structure. It also recommended the following guidelines to aid the Board in negotiating and executing the necessary contracts and in the future operation of the program:

1. The contract should provide ample assurance that disability claimants will be treated equitably and justly.

2. The carrier should guarantee benefits and premiums for a period of at least five years in order to assure the stability of the program.

3. Promotional literature should be approved in advance by the Board or its designee. All measures within the bounds of dignity and ethics should be utilized to promote the program.

4. A continuous ongoing review of the entire program should be maintained. The insured and other members should be made

aware that such a review may reveal in the future the necessity for a revision of the program at the end of the five-year period.

5. Information regarding the operation of the program, its financial aspects and the processing of claims should be available to the Board for review at any time.

6. An AMA Disability Insurance Review Committee should be continued and should provide a mechanism for claims review.

Political Action

Several resolutions were offered to the House questioning whether the administration of government programs is truly carrying out the intent of Congress in its passage of laws. They were combined by the House into one resolution stating "That if legislation is introduced to investigate the activities of the Department of HEW and its executive personnel who are concerned with health matters to determine if the intent of Congress is being carried out, the American Medical Association will provide to such an investigation any information that its Board and councils may secure in these matters."

The resolution also pointed out that since the most effective method to preserve the private practice of medicine is to elect proper officials at all levels of government, "the American Medical Association urges that physicians, as individuals, redouble their efforts in political activities."

It was also resolved that the Association "continue and expand its efforts to inform our membership of its activities to represent them, particularly before the Congress and the federal agencies."

The House also adopted a resolution "That medical societies be urged to investigate, document and report to the Law Division . . . all violations of Public Law 89-97 by officers or employees of the federal government" and that "a status report be provided to this House at the 1967 Clinical Convention."

The House also reaffirmed the Association's opposition to S. 260 (the Hart Bill) and its support of direct billing under Part B of medicare on the basis of a physician's itemized statement of charges.

The House supported AMPAC and the state PAC orgainzations by adopting a resolution recognizing "that leadership at all levels of medicine should make individual commitment to state PAC-AMPAC membership and local PAC programs, wherever this is legally possible."

Generic Prescribing

A resolution combining several state resolutions was adopted by the House, asserting "that the AMA again reaffirm its policy that physicians should be free to use either the generic or the brand names in prescribing drugs for their patients; and encourage physicians to supplement medical judgments with cost considerations in making this choice."

Other Actions

During the convention, the House welcomed 15 physicians who have served in the Volunteer Physicians for Vietnam program; conducted a memorial service for 27 members of the House and/or officers of the Association who had died since the 1965 Annual Convention; heard a report on AMPAC from Blair J. Henningsgaard, MD, chairman of the AMPAC Board; heard a report on AMA-ERF from Immediate Past President James Z. Appel, MD, President of AMA-ERF; permitted a representative from the Oregon Woman's Auxiliary to introduce to the House the "Doctor's Wife," a new rose developed by the Oregon auxiliary; and heard a talk by David Kindig, president of the Student American Medical Association.

Adopted many other resolutions, including these:

Amending the bylaws so that recipients of the Distinguished Service Award and the Citation of a Layman for Distinguished Service will be nominated at the Clinical Convention and the presentations will be made at the next Annual Convention.

Confirming that there is nothing in the military officers' oath that conflicts in any way wiith the ethics of the medical profession.

Noting that a double standard of policy often exists between so-called "hospital-based specialists" and other types of practitioners with respect to hospital staff appointments and endorsing "the principle of a single standard with respect to staff appointments among all physicians having equivalent credentials in all hospital departments and services as a means of assuring maximum freedom of choice of physicians by patients, and of consultants by staff members."

Requesting the JCAH to "encourage . . . the acceptance, wherever possible, of physicians elected or appointed by the medical staff to the Board of Trustees with full voting rights as the most effective form of liaison between the medical staff and hospital governing authorities."

Opposing the establishiment of a racial quota system for hospitals.

Encouraging farm equipment manufacturers to establish standards for basic overturn protective frames and crush-resistant cabs.

Reaffirming the Association's policy regarding tobacco and health and promising vigorous continuation of its measures for corrective action.

Urging that disposable hypodermic syringes be thrown away in such a way as to prevent their possible re-use.

Encouraging state associations to inform state legislators of the need to re-examine existing "battered child" laws so child abuse is to be reported by physicians as well as medically oriented social services.

Supporting continued research and control measures for venereal disease.

Reaffirming the Association's opposition to requirements for certification and re-certification.

Stating the Association's continuing concern for the prevention of death and injury from burns by "stepping up its education campaign to make the public more aware of the dangers inherent in flammable fabrics and other related flammable materials" and resolving that "the AMA cooperate with other voluntary associations in the furtherance of this program."

Finally, the House welcomed as its guests at the opening session the winners of the AMA's top awards at the 18th International Science Fair, held in San Francisco. They were Susan T. Bertrand, New Albany, Ind., whose exhibit was "Electrophoretic Analysis of Blood Serum;" and Stephen R. Igo, Winterset, Iowa, with an exhibit showing the design, construction and operation of a small, synchronous intrathoracic auxiliary ventricle. Both winning exhibits were on display during the convention.

BYLAWS COMMITTEE

Mr. President and Members of the House of Delegates:

The Bylaws Committee recommends the following changes in the Bylaws:

Explanation: In order that the Bylaws accurately reflect the procedures followed wherein the Faculty collects most of the Component Society dues, the following amendment is submitted.

Amend Article III, Section 1, by adding: "if they are not being collected through the facilities of the Faculty by agreement between the Faculty and the Component Society:"

OLD

Section 1. On or before January 31 each year, the Secretary of each component society shall forward to the Secretary of the Faculty (1) a complete roster of members during the preceding year with their addresses, noting any change in membership by death, removal or otherwise, and listed according to the type of membership held, (2) a list of the component societies' officers and (3) a list of the delegates and alternates to the House of Delegates. The Secretary shall also forward the following per capita annual dues:

(a) *FOR ACTIVE MEMBERS:* $25.00 for the first year in private practice; $35. for the second year in private practice; $75. annually thereafter.

(b) *FOR ASSOCIATE MEMBERS:* $25.00 for those described in Article II, Section 2 (1) (2) and (5); $10.00 for those described in Article II, Section 2 (3) and (4); and $5.00 for those described in Article II, Section 2 (6) and (7).

(c) *FOR AFFILIATE MEMBERS:* $15.00 for those described in Article II, Sections 2 (1) and (2).

(d) All other classes of membership shall not be required to pay dues.

NEW

(CAPS portion to be added)

Section 1. On or before January 31 each year, the Secretary of each component society shall forward to the Secretary of the Faculty (1) a complete roster of members during the preceding year with their addresses, noting any change in membership by death, removal or otherwise, and listed according to the type of membership held, (2) a list of the component societies' officers and (3) a list of the delegates and alternates to the House of Delegates. The Secretary shall also forward the following per capita annual dues IF THEY ARE NOT BEING COLLECTED THROUGH THE FACILITIES OF THE FACULTY BY AGREEMENT BETWEEN THE FACULTY AND THE COMPONENT SOCIETY:

(a) *FOR ACTIVE MEMBERS:* $25.00 for the first year in private practice; $35. for the second year in private practice; $75. annually thereafter.

(b) *FOR ASSOCIATE MEMBERS:* $25.00 for those described in Article II, Section 2 (1) (2) and (5); $10.00 for those described in Article II, Section 2 (3) and (4); and $5.00 for those described in Article II, Section 2 (6) and (7).

(c) *FOR AFFILIATE MEMBERS:* $15.00 for those described in Article II, Sections 2 (1) and (2).

(d) All other classes of membership shall not be required to pay dues.

Explanation: Resolutions dealing with insignificant matters have been submitted quite frequently in the past. In order to ensure that the House of Delegates time is used to the best advantage, the following Bylaw amendment is proposed.

Amend Article VI, Section 4, by adding, "provided, however, that a resolution introduced by an individual member must have the endorsement of his Component Society."

OLD

Section 4. All resolutions involving questions of Faculty policy which will be presented to the House of Delegates for action shall be filed with the Executive Secretary and sent to all delegates with the call for the session, provided that by a two-thirds vote the House of Delegates may agree to consider any policy resolution without prior notice. No such resolution shall be accepted by the Executive Secretary which is not sponsored by a member or component society of the Faculty, the Council or committees of the Faculty.

NEW

(CAPS portion to be added)

Section 4. All resolutions involving questions of Faculty policy which will be presented to the House of Delegates for action shall be filed with the Executive Secretary and sent to all delegates with the call for the session, provided that by a two-thirds vote the House of Delegates may agree to consider any policy resolution without prior notice. No such resolution shall be accepted by the Executive Secretary which is not sponsored by a member or component society of the Faculty, the Council or Committee of the Faculty, PROVIDED, HOWEVER, THAT A RESOLUTION INTRODUCED BY AN INDIVIDUAL MEMBER MUST HAVE THE ENDORSEMENT OF HIS COMPONENT SOCIETY.

Explanation: Over the years, Committee functions have been changed as programs become obsolete and new ones come into existence. All of the following amendments are offered as housekeeping provisions to the Bylaws. All of the Committees have been consulted and are in basic agreement with these amendments.

Amend Article XI, Section 1. by striking out the entire section.

OLD

Section 1. AN AMERICAN MEDICAL EDUCATION AND RESEARCH FOUNDATION COMMITTEE of at least five members shall cooperate with the American Medical Education and Research Foundation. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the Committee with the approval of the President.

Amend Article XI, Section 4, by striking out the entire section and substituting the following new section:

Section 4. A Medical Economics Committee of at least five members shall serve as a *Review Committee* for health insurance and other third party payors to determine equitable and just fees for procedures performed and for which such carriers are responsible. It may only act on the request of the carrier or patient involved, and after the medical service has been rendered. It shall not determine the legal rights or benefits under such policies. It shall also be empowered to investigate, within the responsibilities and charges designated in these bylaws, areas of economic benefits for members of the Faculty. It shall receive the report of the Faculty's officially approved Professional Liability Program and shall prepare and present an educational program to physicians in this regard. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the Committee with the approval of the president. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but no vote.

OLD

(Italicized portions to be deleted)

Section 4. AN ECONOMICS COMMITTEE of at least five members shall serve in an advisory capacity for the Medicare Program; conduct a continuing investigaion regarding group insurance on a State-wide basis and confer with insurance carriers concerning insurance problems relating to specialties such as radiology, pathology and anesthesiology. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote.

NEW

(CAPS portion to be added)

Section 4. A MEDICAL ECONOMICS COMMITTEE OF AT LEAST FIVE MEMBERS SHALL SERVE AS A *REVIEW COMMITTEE* FOR HEALTH INSURANCE AND OTHER THIRD PARTY PAYORS TO DETERMINE EQUITABLE AND JUST FEES FOR PROCEDURES PERFORMED AND FOR WHICH SUCH CARRIERS ARE RESPONSIBLE. IT MAY ONLY ACT ON THE REQUEST OF THE CARRIER OR PATIENT INVOLVED, AND AFTER THE MEDICAL SERVICE HAS BEEN RENDERED. IT SHALL NOT DETERMINE THE LEGAL RIGHTS OR BENEFITS UNDER SUCH POLICIES. IT SHALL ALSO BE EMPOWERED TO INVESTIGATE, WITHIN THE RESPONSIBILITIES AND CHARGES DESIGNATED IN THESE BYLAWS, AREAS OF ECONOMIC BENEFITS FOR MEMBERS OF THE FACULTY. IT SHALL RECEIVE THE REPORT OF THE FACULTY'S OFFICIALLY APPROVED PROFESSIONAL LIABILITY PROGRAM AND SHALL PREPARE AND PRESENT AN EDUCATIONAL PROGRAM TO PHYSICIANS IN THIS REGARD. ITS CHAIRMAN SHALL BE APPOINTED BY THE PRESIDENT AND SAID CHAIRMAN SHALL APPOINT THE OTHER MEMBERS OF THE COMMITTEE

WITH THE APPROVAL OF THE PRESIDENT. THE BALTIMORE CITY DENTAL SOCIETY SHALL HAVE THE RIGHT TO ELECT ONE ASSOCIATE MEMBER OF THE COMMITTEE WITH VOICE BUT NO VOTE.

Amend Article XI, Section 5, by striking out the words, "and Business Manager."

OLD

(Italicized portions to be deleted)

Section 5. There shall be an *EDITORIAL BOARD* composed of the Editor *and Business Manager of the Maryland State Medical Journal* and six members, two of whom shall be appointed by the President each year for a three-year term.

NEW

(CAPS portion to be added)

Section 5. There shall be an *EDITORIAL BOARD* composed of the Editor of the *Maryland State Medical Journal* and six members, two of whom shall be appointed by the President each year for a three-year term.

Amend Article XI, Section 7, by striking out,
"A Fee Schedule Committee to consider and advise the Faculty on all questions relating to Fee Schedules shall be composed of" and substituting:

Section 7. "A Professional Medical Services Committee shall consider and advise the Faculty on all matters relating to the professional services provided to the public by members of the Faculty. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty. It shall make available facts, data and opinions with respect to timely and adequate rendition of medical care to the public; to investigate matters pertaining to the economics of medical practice and where related, social aspects of medical care; it shall study means for the distribution of medical service to the public consistent with the principles adopted by the Faculty's House of Delegates and the AMA's House of Delegates. It shall be composed of. . . ."

OLD

(Italicized portions to be deleted)

Section 7. *A FEE SCHEDULE COMMITTEE to consider and advise the Faculty on all questions relating to fee schedules shall be composed of* (1) a chairman appointed by the President, (2) five members of the Faculty selected by the President, (3) one general practitioner from each councilor district selected by the President from among a group composed of one nominee elected by each component society and (4) one representative selected by each state-wide specialty group which desires

NEW

(CAPS portion to be added)

Section 7. A PROFESSIONAL MEDICAL SERVICES COMMITTEE SHALL CONSIDER AND ADVISE THE FACULTY ON ALL MATTERS RELATING TO THE PROFESSIONAL SERVICES PROVIDED TO THE PUBLIC BY MEMBERS OF THE FACULTY. IT SHALL NOT CONFLICT IN ANY WAY WITH CHARGES MADE IN THESE BYLAWS TO OTHER COMMITTEES OF THE FACULTY. IT SHALL MAKE AVAILABLE FACTS, DATA AND OPINIONS WITH representation. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote.

RESPECT TO TIMELY AND ADEQUATE RENDITION OF MEDICAL CARE TO THE PUBLIC; TO INVESTIGATE MATTERS PERTAINING TO THE ECONOMICS OF MEDICAL PRACTICE AND WHERE RELATED, SOCIAL ASPECTS OF MEDICAL CARE; IT SHALL STUDY MEANS FOR THE DISTRIBUTION OF MEDICAL SERVICE TO THE PUBLIC CONSISTENT WITH THE PRINCIPLES ADOPTED BY THE FACULTY'S HOUSE OF DELEGATES AND THE AMA'S HOUSE OF DELEGATES. IT SHALL BE COMPOSED OF (1) a chairman appointed by the President, (2) five members of the Faculty selected by the President, (3) one general practitioner from each councilor district selected by the President from among a group composed of one nominee elected by each component society and (4) one representative selected by each state-wide specialty group which desires representation. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote.

Amend Article XI, Section 11, by striking out the following:

Section 11. "A Liaison Committee of at least ten members shall provide from among its membership such liaison as is required on the following subjects: Veterans medical care, accreditation of hospitals, adoption and vocational rehabilitation, and to the follwing organizations: Bureau of Old Age and Survivor's Insurance, State Department of Health and Maryland Pharmaceutical Association."

and substituting the following:

Section 11. "A Liaison Committee of at least ten members shall provide from among its membership such liaison as is required with other professional organizations, such as but not limited to: Maryland Nurses Association, Maryland Pharmaceutical Association, State Department of Health, all specialty medical organizations in the state. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty."

OLD

(Italicized portions to be deleted)

Section 11. *A LIAISON COMMITTEE of at least ten members shall provide from among its membership such liaison as is required on the following subjects: Veterans medical care, accreditation of hospitals, adoption and vocational rehabilitation; and to the following organizations: Bureau of Old Age and Survivors Insurance, State Department of Health and Maryland Pharmaceutical Association.* Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote.

NEW

(CAPS portion to be added)

Section 11. A LIAISON COMMITTEE OF AT LEAST TEN MEMBERS SHALL PROVIDE FROM AMONG ITS MEMBERSHIP SUCH LIAISON AS IS REQUIRED WITH OTHER PROFESSIONAL ORGANIZATIONS, SUCH AS BUT NOT LIMITED TO: MARYLAND NURSES ASSOCIATION, MARYLAND PHARMACEUTICAL ASSOCIATION, STATE DEPARTMENT OF HEALTH, ALL SPECIALTY MEDICAL ORGANIZATIONS IN THE STATE. IT SHALL NOT CONFLICT IN ANY WAY WITH CHARGES MADE IN THESE BYLAWS TO OTHER COMMITTEES OF THE FACULTY. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote.

Amend Article XI, Section 13, by striking out the second sentence as follows:

"This Committee shall meet with labor unions, professional organizations and others interested in improving the quality of medical care, for discussion and consideration of questions of mutual interest in this area."

OLD

(Italicized portions to be deleted)

Section 13. *A MEDIATION COMMITTEE* composed of the five most recent living Immediate Past Presidents, the Chairman of the Council, and not more than five additional members appointed by the President shall hear and determine all grievances or complaints involving or growing out of the practice of medicine as provided by these bylaws and mediate all problems involving or growing out of the practice of medicine. *This committee shall meet with labor unions, professional organizations and others interested in improving the quality of medical care, for discussion and consideration of questions of mutual interest in this area.* The chairman shall be appointed by the President. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote in all committee deliberations except those relating to grievances or complaints.

NEW

(CAPS portion to be added)

Section 13. *A MEDIATION COMMITTEE* composed of the five most recent living Immediate Past Presidents, the Chairman of the Council, and not more than five additional members appointed by the President shall hear and determine all grievances or complaints involving or growing out of the practice of medicine as provided by these bylaws and mediate all problems involving or growing out of the practice of medicine. The chairman shall be appointed by the President. The Baltimore City Dental Society shall have the right to elect one associate member of the committee with voice but without vote in all com-

mittee deliberations except those relating to grievances or complaints.

Amend Article XI, Section 18, by striking out the second sentence which reads: "It shall serve in an advisory capacity to the State Accident Fund."

OLD

(Italicized portions to be deleted)

Section 18. *AN OCCUPATIONAL HEALTH COMMITTEE* of at least five members shall study and report as it deems advisable upon occupational disease programs and health programs in industry. *It shall serve in an advisory capacity to the State Accident Fund.* Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President.

NEW

(CAPS portion to be added)

Section 18. *AN OCCUPATIONAL HEALTH COMMITTEE* of at least five members shall study and report as it deems advisable upon occupational disease programs and health programs in industry. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President.

Amend Article XI, Section 20, by striking out the following:

". . . subjects, among others: diabetes, geriatrics, maternal and child welfare, pelvic cancer, rural health, tuberculosis, prevention of automotive highway disasters, regulations relating to hospital licensing, immunizations and alcoholism."

and insert the following:

". . . postgraduate educational programs, any health topic or subject that is of general interest to Faculty members, all phases of medical education, public health matters and all aspects of preventive medicine and health maintenance. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty."

OLD

(Italicized portions to be deleted)

Section 20. *A COMMITTEE ON POSTGRADUATE EDUCATION, PREVENTIVE MEDICINE AND PUBLIC HEALTH* of at least eight members shall consider and advise upon the following *subjects, among others: Diabetes, geriatrics, maternal and child welfare, pelvic cancer, rural health, tuberculosis, prevention of automotive highway disasters, regulations relating to hospital licensing, immunizations and alcoholism.* Its chairman shall be appointed by the President and said chairman shall appoint the other members of the committee with the approval of the President.

NEW

(CAPS portion to be added)

Section 20. *A COMMITTEE ON POSTGRADUATE EDUCATION, PREVENTIVE MEDICINE AND PUBLIC HEALTH* of at least eight members shall consider and advise upon the following POSTGRADUATE EDUCATIONAL PROGRAMS, ANY HEALTH TOPIC OR SUBJECT THAT IS OF GENERAL INTEREST TO FACULTY MEMBERS, ALL PHASES OF MEDICAL EDUCATION, PUBLIC HEALTH MATTERS AND ALL ASPECTS OF PREVENTIVE MEDICINE AND HEALTH MAINTENANCE. IT SHALL NOT CONFLICT IN ANY WAY WITH CHARGES MADE IN THESE BYLAWS TO OTHER COMMITTEES OF THE FACULTY."

These changes in the Bylaws, insofar as the committee name and charges shall take effect on the date of the adoption. It is understood that the committee composition will not necessarily change until the date of the Annual Meeting when such committee appointments normally expire.

The following amendment is offered because of incorrect wording that has been in the Bylaws since 1962. This will correct this long-standing error.

Amend Article XIII, Section 3, in the second section by striking out the word "Council" where it first appears in that sentence and inserting the word "Committee."

OLD

(Italicized portions to be deleted)

Section 3. The Committee's findings and recommendations in the form of resolutions shall be filed with the Council for consideration and action, provided that the Committee may, of its own motion, refer the matter to the Board of Medical Examiners. Any party aggrieved by the action of the *Council* may, within 30 days of such action, file an appeal in writing with the Council which shall hear the appeal on the record allowing only such additional evidence as is newly discovered.

NEW

(CAPS portion to be added)

Section 3. The Committee's findings and recommendations in the form of resolutions shall be filed with the Council for consideration and action, provided that the Committee may, of its own motion, refer the matter to the Board of Medical Examiners. Any party aggrieved by the action of the COMMITTEE may, within 30 days of such action, file an appeal in writing with the Council which shall hear the appeal on the record allowing only such additional evidence as is newly discovered.

Respectively submitted,
CHARLES F. O'DONNELL, MD, *Chairman*
ROBERT VANL. CAMPBELL, MD
ARTHUR T. KEEFE, JR., MD
EDMOND J. MCDONNELL, MD

LIAISON COMMITTEE PROPOSED PHYSICIAN/PHARMACIST CODE OF COOPERATION

Mr. President and Members of the House of Delegates:

Preamble

Acknowledging that the practice of medicine and pharmacy needs the combined services of both groups, this Code of Cooperation is hereby adopted as a declaration of principles of conduct for the two professions to follow. It is clearly understood that local laws, regulations and Codes of Ethics of both professions clearly take precedence over these principles of conduct.

It is the hope of the two professions that the adoption of this Code of Cooperation will result in an improved understanding and closer relationship between the professions of medicine and pharmacy in the interest of better health care.

Physician

The American Medical Association's Code of Ethics states, in part:

"It is not unethical for a physician to prescribe or supply drugs, remedies or appliances as long as there is no exploitation of the patient."

Notwithstanding this statement, the Medical and Chirurgical Faculty of the State of Maryland believes that drug dispensing by physicians should be discouraged if adequate pharmaceutical service is available. A physician's professional source of income should be from the services he renders to his patients, and only from this source.

Physicians collectively, through the Medical and Chirurgical Faculty, recognize the following:

1. A patient should be permitted the free choice of his pharmacy, just as he should be permitted free choice of physician.
2. Physicians should not advise a patient as to the charge for professional pharmaceutical service.
3. The physician should cooperate with a pharmacist by specifying the number of times a prescription is to be refilled, and by making himself available to the pharmacist to determine whether or not his original orders should be altered after the original number of refills has been obtained. A prescription should never be marked for a refill contrary to current laws or regulations.
4. Physicians may, at their own discretion, indicate on the prescription order they write, that the prescription label include the name of the drug ingredients, as well as any other information deemed necessary. This is an individual decision and one that will depend upon the expert judgment of the physician based on the patient as an individual. (House of Delegates 5/64).
5. Physicians should not dispose of drug samples to pharmacists for any consideration, either direct or indirect. The use of drug samples in a physician's practice should be done in a manner that recognizes the position of the pharmacist in his role as a provider of drugs to the public. It is the responsibility of the physician to dispose of any undesired drug samples only through destruction, disposition to charitable organizations or through the approved program of the Woman's Auxiliary of the local medical societies. In no event should such drug samples be disposed of in a manner that would permit their falling into the hands of unauthorized persons.
6. Physicians should not enter into any rental, ownership or financial agreements or any other activity with pharmacists that would directly or indirectly affect the prescribing of medication by a physician in favor of a particular pharmacy or pharmacies.
7. The patient is always entitled to a written prescription It is recognized, however, that it is permissible for a phsician to prescribe by telephone to pharmacists of the patient's choice rather than writing prescriptions out individually.
8. Sale of drug samples either to patients or others, which have been given free to physicians is to be condemned. In general, complimentary drugs should be used only as starter doses. (Council, 11/21/61)
9. Mail order prescriptions are condemned, as this method of handling vital prescription matters would seem sharply at variance with the detailed, personal, professional care so essential to the safe distribution of prescription drugs. (House of Delegates, 9/14/62)
10. The use of prescription blanks imprinted with the name of a pharmacist, pharmacists or pharmacy is specifically prohibited by law.
11. Physicians are free to use either the generic or brand name in prescribing drugs for their patients. However, physicians should consult with the pharmacist as a member of the medical team in order to assure that the patient is properly served by being provided with medication of the highest quality.
12. Physicians should not write prescription orders in "code."
13. Physicians' bills should include only those charges for professional services rendered by him or under his supervision.
14. When prescription blanks are not imprinted with a physician's name, his name and degree should be printed or typed legibly below his signature.

Pharmacists

Recognizing that pharmacists and physicians must work as a team, the pharmacists, through the Maryland Pharmaceutical Association—the state professional pharmaceutical society—hereby adopt the following principles: It is understood that the foregoing principles for physicians, insofar as they affect the profession of pharmacy are also subscribed to by the profession of pharmacy. It is also understood that some of these principles are present-

ly incorporated in Federal and State laws and regulations as standards and requirements for pharmacy practice.

Pharmacy recognizes the inestimable value of the professional pharmacist to the health team, encourages him to fulfill completely the professional requirements of his calling, and desires that he decrease his activities in commercial enterprises which presently may be associated with but are not and should not be related to the practice of pharmacy.

1. Pharmacists, as well as physicians, are obligated to serve the public whenever their services are needed. On nights, Sundays and Holidays prescription services should be readily available in cases of emergency.
2. The pharmacist should never diagnose or prescribe, even at the insistence of the patient but should refer those needing medical attention to a physician of the patient's choice.
3. The sale of proprietary products and home remedies that have been approved by the Federal Food and Drug Administration for over-the-counter sale for self-medication shall not be considered counter prescribing by the pharmacist.
4. In an emergency, or preceding arrival of the physician, the pharmacist will render such emergency treatment as is indicated by his training, experience, scientific knowledge and good judgment.
5. If there is any question in the pharmacist's mind regarding the ingredients or labelling instructions of a prescription order, possible error or safety of the drug, he should privately and tactfully consult the physician before making changes and never discuss it with, or in the presence of, the patient.
6. There should be no substitution of ingredients by the pharmacist, and he should follow the prescriber's directions in the refilling of prescription orders. If no refilling instructions are contained on the original prescription, the pharmacist should not, in accordance with law, refill such prescriptions without the authority of the prescriber.
7. The pharmacist should not discuss the composition of a prescription or its therapeutic effects with the patient except when in the best interest of the patient he finds it necessary to identify or differentiate medication. When such questions arise he should tactfully suggest that the prescriber is the proper person with whom such matters should be discussed.
8. The pharmacist shall be responsible for providing a comprehensive supply of drugs on which the physician may draw by prescription order for the treatment of his patient and serve as a source of information on new drugs and their combinations in order that the physician and his patient may have the advantage of the latest pharmaceutical developments.

General

Neither physicians nor pharmacists should approach each other with respect to the completion of illegal arrangements such as pharmacists working as an employee of a physician. Prarmacists shall not engage in, and physician's shall not accept, advertising of a pharmacy in a physician's office or wating room.

The physician has a responsibility to make clear to the patient that even though a specific drug may be expensive, it is the best therapeutic agent he feels can be administered in treating the condition of the patient. Pharmacists, in turn, should not comment on the efficacy of the drug prescribed or of a substitute drug.

Publicity in connection with professional activities of either pharmacists or physicians should be cleared through the appropriate professional group. In all cases, news or feature stories affecting both professions should be developed cooperatively by the two groups.

AD HOC COMMITTEE TO CONSIDER CHANGES IN THE MEDICAL PRACTICE ACT

(Accepted and Referred to House of Delegates for Adoption)

Mr. President and Members of the House of Delegates:

The Commission on Medical Discipline of Maryland, hereby established and hereafter referred to in this Chapter as the Commission, shall consist of the following persons:

Dean of the Johns Hopkins University School of Medicine
Dean of the University of Maryland School of Medicine
The President of the Medical and Chirurgical Faculty of the State of Maryland.
The Immediate Past-President of the Medical and Chirurgical Faculty of the State of Maryland
The President-elect of the Medical and Chirurgical Faculty of the State of Maryland
Two Practicing Physicians appointed by the Governor of the State of Maryland from a list submitted by the Medical and Chirurgical Faculty of the State of Maryland
The Chief Medical Examiner of the State of Maryland
The President of the Board of Medical Examiners of the State of Maryland

Seven of the nine members of the Commission shall constitute a quorum for the transaction of all business.

The Commission may establish and maintain an office within this State and shall make, adopt and promulgate rules and regulations for its own government and for the proper supervision and control of the professional conduct of all persons under its jurisdiction, not inconsistent with the laws of this State or of the United States.

There shall always be nine members and no person shall serve in a dual capacity. In the event of such occurrence, the Governor may designate a practicing physician from a list submitted by the Medical and Chirurgical Faculty.

Terms of Office: The terms of office for appointees shall be for three years or until his successor is duly elected, appointed or qualified. Terms of office shall be from the 1st of July each year, except when the initial appointments are made; such appointment will be for staggered terms so as to provide for continuity on the Commission.

Reports: The Commission shall make annual reports to the Governor and to the Medical and Chirurgical Faculty of the State of Maryland.

Removal of Members: Any member of the Commission may be removed by the Governor for neglect of duty, misconduct or malfeasance or misfeasance in office.

Compensation: Members of the Commission may be reimbursed for actual expenses incurred in connection with their official duties with the Commission.

Duties and Obligations: The Commission shall refer any cases coming to its attention to the appropriate Committee of the Medical and Chirurgical Faculty of the State of Maryland for investigation and report. The report shall contain such recommendations as the investigation reveals might be necessary for adequate disciplinary procedures. Such recommendations will then be considered by the Commission which will take whatever action it deems appropriate.

The Medical and Chirurgical Faculty of the State of Maryland may initiate action by virtue of information coming to its attention from its own members or through any other source, such cases being handled in the same manner as though they had been referred to it by the Commission.

Power and Duties: The Commission shall have the power to revoke or suspend the license of or place on probation any licensed physician in the State of Maryland, for any of the causes listed below as unprofessional conduct, but such action shall not be limited to these causes:

1. Failure or refusal of a physician, without adequate cause, to render, or to arrange to have another physician render, necessary medical attention to any patient under his immediate care.
2. Rendering professional services to a patient if the physician is intoxicated or under the influence of narcotic drugs.
3. Having been found by a court of competent jurisdiction (within or without the State) to have exercised in the Practice of Medicine undue influence on a patient for financial gain.
4. Promotion by a physician of the sale of drugs, devices, appliances or goods provided for a patient in such a manner as to exploit the patient for financial gain of the physician.
5. Immoral conduct of a physician in his practice as a physician.
6. Willfully making and filing false reports or records, in his practice as a physician.
7. Willful omission to file or record, or willfully impeding or obstructing a filing or recording, or inducing another person to omit to file or record medical reports required by law.
8. Failure to furnish details of a patient's medical record to succeeding physicians or hospital upon proper request.
9. Solicitation of professional patronage by agents or persons, or profiting from the acts of those representing themselves to be agents of the licensed physician.
10. Division of fees, or agreeing to split or divide the fees received for professional services with any person for bringing to or referring a patient.
11. Accepting rebates or kickbacks, in any form whatsoever, for referral of patients.
12. Advertising professional superiority or the performance of professional services in a superior manner.
13. Willful misrepresentation in treatments.
14. Practicing medicine with an unlicensed physician except in an accredited preceptorship or residency training program; or aiding, abetting such unlicensed person in the practice of medicine.
15. Gross and willful and continued overcharging for professional services; including filing of false statements for collection of fees for which services are not rendered.
16. Offering, undertaking or agreeing to cure or treat disease by a secret method, procedure, treatment or medicine.
17. Revocation of license by any other state or territory for any cause whatsoever.
18. Professional or Mental Incompetency.

Legal Advisor: The Commission shall have the authority to hire professional legal advice and shall not be restricted to the use of the Attorney-General's office for such legal advice.

Immunity from Suit: All persons acting as members of authorized committees of the Medical and Chirurgical Faculty of the State of Maryland or as the Commission shall be immune from suit in any action, at law or equity, based upon any disciplinary proceedings or other official acts in the furtherance hereof and performed in good faith.

Subpoena: The Commission shall have the power to issue subpoenas and administer oaths in connection with any investigation, hearing or proceeding.

Certificate of revocation or suspension—Reprimand. If a majority of the members of the Commission vote in favor of finding the accused guilty of unprofessional conduct as specified in the charges, the Commission shall prepare written findings of fact and may thereafter prepare and file in the office of the Board of Medical Examiners a certificate or order of revocation, suspension or reprimand in which case a copy therof shall be served upon the accused.

Dismissal of charges—Exoneration. If the license holder is found not guilty, or if less than a majority of the members vote for a finding of guilty, the Commission shall forthwith order a dismissal of the charges and the exoneration of the accused.

Revocation or suspension of license—Stay pending review. The filing by the Commission in the office of the Board of Medical Examiners of a certificate or order of revocation or suspension, after due notice, hearing and findings in accordance with the procedure specified in this chapter, certifying that any holder of a license has been found guilty of unprofessional conduct by the Commission shall constitute a revocation or suspension of the license to practice medicine and surgery in this state in accordance with the terms and conditions imposed by the Commission and embodied in the certificate or order of revocation or suspension. If the licensee seeks judicial review of the Commission's decision pursuant to the provisions of this chapter, such revocation or the period of such suspension shall be stayed and shall not be effective or commence to run until final judgment has been entered in any proceeding instituted under the provisions of this chapter and the licensee's judicial remedies exhausted hereunder.

Contents of certificate—Recording. The certificate or order of revocation or suspension shall contain a brief and concise statement of the ground or grounds upon which the certificate or order is based and the specific terms and conditions of such revocation or suspension, and shall be retained as a permanent record by the Board of Medical Examiners as well as by the Commission.

Issuance of license after revocation or suspension. The Board of Medical Examiners shall not issue any license or any renewal thereof to any person whose license has

been revoked or suspended by the Commission except in conformity with the terms and conditions of the certificate or the order of revocation or suspension, or in conformity with any order of reinstatement issued by the Commission or in accordance with the final judgment in any proceeding for review.

Appeal from decision of Commission. Any person whose license has been revoked or suspended by the Commission shall have the right to a judicial review of the Commission's decision. Such review shall be initiated by serving on the Commission a notice of appeal within thirty days after the filing of the certificate or order of revocation or suspension in the office of the Board of Medical Examiners.

MEDICOLEGAL COMMITTEE

Mr. President and Members of the House of Delegates:

The Medicolegal Committee presents the following amendment to the Medicolegal Code of Cooperation:

AMEND THE FIRST SENTENCE OF PARAGRAPH TWO OF THE MEDICOLEGAL CODE OF COOPERATION TO READ:

The patient, or his attorney, upon written request, when accompanied by a signed authorization from the patient shall be entitled to a prompt report from an attending physician, diagnosis and prognosis, but (not including) NEED NOT INCLUDE an evaluation of disability in Workmen's Compensation Cases."

SELECT COMMITTEE ON FREE CHOICE, CLOSED PANEL AND HOSPITAL PROVISION OF MEDICAL SERVICES

Mr. President and Members of the House of Delegates:

The charge to this Committee is explained fully by its title. It was formed by the Council on June 9, 1966. It has had four meetings. The paucity of meetings was because of lack of adequate available information in connection with the proposals of the Johns Hopkins Medical Institutions to establish a medical program in the new community of Columbia City.

Previous Actions

The House of Delegates on September 18, 1959, adopted the report of the Faculty's Economics Committee. This report carried the statement as follows:

"Be it hereby Resolved, That the Medical and Chirurgical Faculty of Maryland goes on record as disapproving the concept of 'Closed Panel Practice of Medicine', when the patients themselves contribute by payment of premiums, assessments, dues or in any financial manner (whatever it may be called) and

"Be it further Resolved, That the Medical and Chirurgical Faculty stands committed to the concept of Freedom of Choice of Physician, and

"Be it further Resolved, By this action the Medical and Chirurgical Faculty stands opposed to any form of Closed Panel Practice of Medicine, where the patient is contributing financially to its support, and

"Be it further Resolved, that the Medical and Chirurgical Faculty will not approve any prepaid insurance plan to which the patient contributes unless the Freedom of Choice of Physician is included."

In Dallas, Texas, in December 1959, the AMA House of Delegates reaffirmed the following statement:

1. "The American Medical Association believes that free choice of physician is the right of every individual and one which he should be free to exercise as he chooses."

2. "Each individual should be accorded the privilege to select and change his physician at will or *to select his preferred system of medical care*, and the American Medical Association vigorously supports the right of the individual to choose between these alternatives."

However, in order to clarify and strengthen its position on the issue of freedom of choice of physician, the House also adopted this additional statement which was submitted as a substitute amendment on the floor of the House:

3. "Lest there be any misinterpretation, we state unequivocally that the American Medical Association firmly subscribes to freedom of choice of physician and free competition among physicians as being prerequisites to optimal medical care. The benefits of any system which provides medical care must be judged on the degree to which it allows of, or abridges, such freedom of choice and such competition."

It is to be noted that this is slightly at variance with the position of the Faculty. Namely, that the patient may "select his preferred system of medical care."

Committee Activity

The Committee addressed itself to all current "closed panel" types of operation in this State, as well as any future types that were being planned. It sent a letter to all of these groups:

Group Health Insurance
Leisure World
Baltimore Transit
Eastern Industrial Clinic
Central Medical Center
Eastpoint Medical Center

requesting an opportunity to visit with them and discuss the procedures under which they operated as well as see, first-hand, the type of care that was being given to participants in their program. Replies were received from the Leisure World, Inc., which operates a medical facility at Olney, Maryland; and from the Eastern Industrial Clinic, Inc., Baltimore. Both accepted the suggestion of the Committee and offered examination of their operations without question. The Group Health of Washington, D.C. provided us with extensive printed literature and also offered to meet with Committee members to expand on the literature or answer any questions the Committee might have to ask. The Committee elected not to visit with such representatives because of its location in Washington, D.C., determining that it was outside of the Committee's jurisdiction, even though it served some Maryland residents.

No acceptances were received to our requests from the remainder of this list even though replies were expedited by registered mail, return receipt requested. We can only assume that they are not willing to have the quality of care and services offered open to examination by their peers.

The questionnaire used in the examination of the two operations visited was patterned after one used by the AMA's Commission on Medical Care Plans in 1958. This study led to the action of the AMA's House of Delegates in June, 1959, and reaffirmation of this action in December 1959. Both of the groups examined scored high and the Committee representatives are of the opinion that high-quality medical care is rendered to the recipients of services under these plans and that they fall well within the ethical requirements as laid down by the Faculty, as well as the American Medical Association.

Until such time as an opportunity to visit the remaining groups is made available to examine their operations first-hand, the Committee can only assume, as stated above, that the quality of care and services offered cannot be evaluated because of the lack of willingness on the part of the party or parties in charge of these operations.

Columbia Health Plan

As mentioned before, the paucity of meetings of the Committee was because of lack of available information on this proposed program to be operated through the facilities of the Johns Hopkins Medical Institutions.

It was not until May 10, 1967, that a copy of the proposal was received by the Faculty, although it is understood from personal comments as well as items in the press that the study and conclusions had been reached some time before by those responsible for the "feasibility study."

Basically, the report auggests that the following recommendations be adopted:

1. That the primary objectives of the project are: a demonstration of the delivery of comprehensive health services, research in health care, and the training of health personnel.
2. That the prepaid plan for comprehensive health care services be developed at Columbia for a population group of up to 100,000 persons, and offered to residents of the Columbia area on a voluntary participation basis.
3. That the primary physician concept in rendering comprehensive services be established at Columbia along with the development of such other specialty support as may be required either at Columbia or on the Baltimore campus, and further recognizing that properly trained and qualified physicians in primary contact with the patient deserve an academic and financial standing commensurate with those of other practicing specialists.
4. That the physicians and staff at Columbia be afforded full rank and privileges of full-time members of the faculty and staff of The Johns Hopkins University School of Medicine and The Johns Hopkins Hospital, with remuneration and fringe benefits to be determined by the Columbia health plan.
5. That fiscal self-sufficiency and responsibility be adopted for the project by the formal incorporation of a health plan at Columbia under whose jurisdiction health services would be provided by a medical group and a hospital on a site to be selected at a later date.
6. That the development of a satellite relationship of the Columbia project to The Johns Hopkins Medical Institutions be defined and developed, recognizing first, the need for a high degree of local autonomy of operations at Columbia under broad policies and standards of The Johns Hopkins Medical Institutions and second, the goal of producing as near as possible a self-sufficient community health demonstration facility at local level.
7. That The Johns Hopkins Medical Institutions recognize and accept a service responsibility on the Baltimore campus for such specialty, consultation, laboratory, X-ray, and beds and ancillary services to Columbia as may be defined to supplement comprehensive health services at Columbia.
8. That, in view of the fact that acute hospital facilities are not available in Howard County, the Columbia health plan give consideration to offering acute bed facilities to those local physicians who are interested and qualified to render such hospital care until such time that other facilities or arrangements are available.

An additional report prepared by the "Ad Hoc Committee on Community Medicine," composed of the Chiefs of the various departments at the Johns Hopkins Medical Institutions, made the following recommendations:

(1) That an affirmative decision be made to proceed with the development of the Columbia Project conditional upon the ability to finance the Project without a drain upon the resources of the Medical Institutions and without competition for potential Johns Hopkins capital funds.

(2) That, concurrently, steps be taken to develop more fully Comprehensive Health Care for appropriate areas of East Baltimore.

(3) That the administrative authorities of the Medical School and Hospital be requested to proceed forwith to implement the foregoing decisions.

Because of lack of adequate information we are placed in the position of making certain assumptions. The proposal would provide community services in Columbia City and the surrounding area. Physicians would provide these services from local clinics still to be erected. These physicians would be on a salary basis, employed either through The Hopkins or the Columbia Health Plan. They would be available on a 24-hour basis to those persons who participate in the program. The physicians who are practicing independently now or in the future would continue to do as they have in the past. Persons would join the plan on "a voluntary participation basis." This concept falls within that adopted by the American Medical Association in December 1959. However, it is not clear as to how the plan would be financed, nor how much the annual premium would be.

In the initial discussion of the proposal, it was stated that the cost would be around $500. or $600. per family, per year. In our present economy most employers pay all or part of the Health Insurance premiums of its employees. This is usually done on a "group" basis. No indication is given in the Hopkins proposal as to how an employer would make payments to a separate health care program for some of his employees. Would any balance not paid by the subscriber or employer be underwritten by a Foundation, the Federal Government or some other type of organization who was willing to subsidize a new program on an experimental basis?

Besides subsidization, the question is raised as to the types of family who would be willing and anxious to enroll in such a program with such a high cost for premiums. It is possible that the person who has a large family or the person who is currently suffering from lengthy or multiple illnesses might be the only ones willing to pay this premium.

The plan also proposes that, pending the completion of hospital facilities in Columbia, the patients would utilize the services available at the John Hopkins Hospital for things such as X-ray, laboratory, consultation, etc. This pre-supposes the willingness of the patient to travel from Columbia, past several outstanding facilities with similar services, all the way to the Johns Hopkins Hospital. It also pre-supposes the patients willingness to travel to

Baltimore when he may well be Washington-oriented. In addition. it precludes the opportunity for the patient to select his own consultant or service facility.

In the areas of availability of such facilities, there now does not exist sufficient beds for private patients at the Johns Hopkins Hospital. In addition, the outpatient facilities are already overburdened. In this case, the Johns Hopkins Hospital is adding another load to already overtaxed services.

Within the medical staff of the institution, itself, there is dissent because private physicians are now unable to obtain beds for their private patients. St. Agnes Hospital already operating a brand-new facility of some 396 beds, in adding a new service facility. This institution now provides complete, modern and excellent facilities for all the health needs of the area it serves.

It is well-known that individuals like to have a family physician, a person to whom they can turn in time of their medical needs. Under the proposal as advanced, it is our understanding that individuals designated as "primary physician" will be rotated to 'The Hopkins Medical Institutions,' from time to time, in order that they can participate in a continuing education program. How the patients of these physicians will accept this concept is not known. Will they resent the fact that they are "turned over" to another physician with whom they may or may not be compatible?

In the maternity programs operated by the Baltimore City Health Department great emphasis is placed on the necessity for the patient to see the same obstetrician each time she visits the clinic. This has resulted in considerable improvement in the return visits made by the patient. We do not believe that this concept can be ignored.

Many of the homeowners in Columbia City may be tranferred to other parts of the country. Many others living there will be renting appartments; indeed some already are. How do these people transfer to other health programs when they are forced to leave Columbia . . . do they have to go through another "waiting period" for prexisting conditions and for obstetrical benefits?

It is assumed that these points have been dismissed as "administrative details," and that the writers of both reports on Columbia have established certain principles to follow, letting the "administrative details take care of themselves."

Specific Comments on the Report

1. That the primary objectives of the project are: a demonstration of the delivery of comprehensive health services, research in health care, and the training of health personnel.

Comment: The delivery of comprehensive health services has been demonstrated in many places throughout the country. There is no particular need for any additional demonstrations of this type of service. Research in health care has been under way for many years and there is no pressing need for the expenditure of additional governmental or foundation funds to perpetuate something that has already been studied at great length. The training of scarce health personnel can best be accomplished where there are adequate facilities and supervision for it, namely, in medical institutions.

2. That the prepaid plan for comprehensive health care services be developed at Columbia for a population group of up to 100,000 persons, and offered to residents of the Columbia area on a voluntary participation basis.

Comment: We do not believe that, without costly subsidization, this type of program, offered to a group of residents on a "voluntary" basis can be self-supporting. We do not believe, either, that many of those living in Columbia will be able to persuade their employers of the necessity of separating them from other employees so as to pay a portion of the costs of their health care, as it is currently being done by most industries today.

3. That the primary physician concept in rendering comprehensive services be established at Columbia along with the development of such other specialty support as may be required either at Columbia or on the Baltimore Campus, and further recognizing that properly trained and qualified physicians in primary contact with the patient deserves an academic and financial standing commensurate with those of other practicing specialists.

Comment: We do not believe the distance from The Johns Hopkins Hospital will lend itself to easy consultations, referrals, or other use of the facilities there. There are closer referral facilities; as well as modern, up-to-date hospital beds nearby and we do not believe that the additional overcrowding of hospital beds and diagnostic facilities at The Johns Hopkins Hospital will work to the advantage of the patient, the hospital or to the profession.

4. That the physicians and staff at Columbia be afforded full rank and privileges of full-time members of the faculty and staff of The Johns Hopkins University School of Medicine and The Johns Hopkins Hospital, with remuneration and fringe benefits to be determined by the Columbia health plan.

No Comment.

5. That fiscal self-sufficiency and responsibility be adopted for the project by the formal incorporation of a health plan at Columbia under whose jurisdiction health services would be provided by a medical group and a hospital on a site to be selected at a later date.

Comment: We believe that subsidization is necessary for any such proposal as this. We do not believe, because existing facilities and plans are currently available, that governmental or foundation funds should be used for the subsidization of a program of this nature.

6. That the development of a satellite relationship of the Columbia project to The Johns Hopkins Medical Institutions be defined and developed, recognizing firest, the need for a high degree of local autonomy of operations at Columbia under broad policies and standards of The Johns Hopkins Medical Institutions and second, the goal of producing as near as possible a self-sufficient community health demonstration facility at local level.

No Comment.

7. That The Johns Hopkins Medical Institutions recognize and accept a service responsibility on the Baltimore campus for such specialty, consultation, laboratory, X-ray, and beds and ancillary services to Columbia as may be defined to supplement comprehensive health services at Columbia.

Comment: We do not believe that overcrowding of already existing facilities is of any benefit to the public, the patient, the hospital or the profession.

8. That, in view of the fact that acute hospital facilities are not available in Howard County, the Columbia health plan give consideration to offering acute bed facilities to those local physcians who are interested and qualified to render such hospital care until such time that other facilities or arrangements are available.

Comment: We presume this refers to local physicians already practicing in Howard County. We do not believe that such physicians are anxious or willing to face the lengthy journey to The Johns Hopkins Hospital to see or visit their patients there, especially when adequate, up-to-date facilities are already available to them much closer than Hopkins.

We do believe, however, that the upgrading of the physical facilities at The Johns Hopkins Hospital are long overdue. While the hospital has assumed the medical responsibilities for those individuals in its general area, these responsibilities are not being discharged as effectively as they might. The Federal Government, under Title II of the Medicare Act, has provided some $1,200,000 to assist the Hopkins in this area. Much more needs to be done.

We believe that The Johns Hopkins Medical Institutions should bend its efforts to improvement of its facilities and plant so as to better serve those patients it is now serving. In addition, we believe that to attempt the development of a "Prepaid Group Practice Comprehensive Health Services at Columbia" would strain the resources available to The Johns Hopkins Medical Institutions and dilute the efforts now being made to provide first-class, high quality medical care to those individuals it is now serving and those it should provide services for in the East Baltimore area.

The Committee, therefore, recommends reaffirmation of the policies adopted by the House of Delegates in September 1959, and in the policy adopted by the AMA House of Delegates in December 1959.

REFERENCE COMMITTEE REPORT

House of Delegates, Medical and Chirurgical Faculty of the State of Maryland
Semiannual Meeting, September 1967

Mr. President and Members of the House of Delegates:

Your Reference Committee met on Wednesday, August 23, 1967, to consider the one resolution introduced before July 15, 1967, the established deadline for introduction of resolutions. Members of the Faculty were notified of the meeting date of the Committee through the Executive Secretary's Newsletter in the July issue of the Maryland State Medical Journal. In addition, all members of the Faculty were notified in a letter, along with other information, under the date of August 2, 1967.

RESOLUTION 18/67

Submitted on:	May 26, 1967
Introduced by:	Prince George's County Medical Society
Subject:	Authorizing the seeking of enabling legislation to require compulsory membership in a component medical society of the Faculty in order to maintain high professional and ethical standards incident to the right and privilege of practicing medicine in Maryland

Whereas, Dynamic changes have taken place affecting the private practice of medicine by special privilege groups such as large corporations, insurance companies and trade unions, and
Whereas, The traditional physician-patient relationship is being threatened by various mass medical plans, and
Whereas, Organized medicine is being blamed and accused for the errors and shortcomings of mass medical plans, and
Whereas, Organized medicine is presently without the power to control said mass medical-care plans, now, therefore, be it
Resolved, That the Medical and Chirurgical Faculty of the State of Maryland seek enabling legislation to require compulsory membership in a component medical society of the Medical and Chirurgical Faculty in order to maintain high professional and ethical standards incident to the right and privilege of practicing medicine in the State of Maryland.

This resolution is identical to one introduced and discussed at the 1959 Annual Meeting. The Reference Committee Report contained remarks which are as valid today as they were in 1959. We believe they are worth repeating.

"This resolution raises moral and ethical problems which must not be treated lightly. Any move in our Society toward this goal must be taken only after the most careful thought relative to the legal and moral issues involved. Precedent should be investigated; the help of our own and the AMA legal department should be elicited; providing we can settle in our own minds affirmatively this one basic question, 'Should we attempt to legislate out of the practice of medicine a certain minority of physicians who differ with the rest of us about these basic problems?'

"The resolution being considered is vague as to what 'errors and shortcomings' and 'mass medical plans' specifically mean. The line cannot be clearly drawn, in some instances, between what is acceptable and not acceptable to us. As the matter now stands some honest differences in opinion do occur. The A.M.A. is now attempting to revamp and modernize sit own opinion by polling component societies in regards to these matters.*

"Would we not, in effect, be establishing a closed shop union; the very thing for which we criticize organized labor? Proponents of the resolution would state we must fight fire with fire and present a solid front to other organizations. Opponents would ask, do the means justify the end?

"The adoption, or disapproval of this resolution, must not be hasty or ill-advised."

*In Dallas, Texas, in December 1959, the AMA House of Delegates reaffirmed the following statement:

> 1. "The American Medical Association believes that free choice of physician is the right of every individual and one which he should be free to exercise as he chooses."
> 2. "Each individual should be accorded the privilege to select and change his physician at will or to select his preferred system of medical care, and the American Medical Association vigorously supports the right of the individual to choose between these alternatives."
>
> However, in order to clarify and strengthen its position on the issue of freedom of choice of physician, the House also adopted this additional statement which was submitted as a substitute amendment on the floor of the House:
>
> 3. "Lest there be any misinterpretation, we state unequivocally that the American Medical Association firmly subscribes to freedom of choice of physician and free competition among physicians as being prerequisites to optimal medical care. The benefits of any system which provides medical care must be judged on the degree to which it allows of, or abridges, such freedom of choice and such competition."

The Reference Committee at that time recommended that action be deferred on this resolution for further discussion, legal advice and precedent to be obtained with the results of these findings to be sent to each component society. The House of Delegates, however, voted that this be referred to the Policy and Planning Committee, for a report to be made to the Semiannual Session.

Following this, the Policy and Planning Committee met in June, 1959, considered this matter and recommended the following motion to the House of Delegates:

"That the House of Delegates, through the Council, reject the Prince George's County resolution as written; and that the Faculty work for legislation which would require the Medical and Chirurgical Faculty approval of all non-profit health plans or any changes thereto, before they can become effective."

This recommendation was adopted by the House of Delegates, after endorsement by the Council.

It is interesting to note that the Maryland Bar Association has recently had this problem under study. In 1966, at its Annual Session, it endorsed the principle of a requirement that attorneys be a member of the State Bar Association before being permitted to practice law in Maryland. Appropriate legislation was introduced at the 1967 session of the General Assembly. It passed the Senate but was held in the House Judiciary Committee for further study by the Legislative Council, which is currently taking place. It is understood that the objections to this proposal rise not from compulsory membership but from a requirement in the legislation that the Maryland Court of Appeals would act, in a sense, as the governing body of the State Bar Association. The Legislature apparently felt the profession should govern itself. The unified bar is not new. It exists in 27 states and two possessions.

Our investigation further reveals that the United States Supreme Court has held that such type of compulsory membership is constitutional.

The Membership Committee of the Faculty considered Resolution 1S/67, at its meeting on Wednesday, August 16, 1967, and after due consideration felt that the proposal as submitted was premature at this time and that the Commission on Medical Discipline will answer some of the reasons put forth for the adoption of Resolution 1S/67.

A majority of those present at the Reference Committee hearing spoke in opposition to the Resolution.

While the Faculty's House of Delegates has under consideration proposed changes in the Medical Practice Act, as recommended by the Ad Hoc Committee to Consider Changes in the Medical Practice Act, all of which would provide stronger disciplinary powers over both members and non-members of the Faculty than now exist, there remains much to be done.

The Committee favors the principle of the Resolved but finds the various Whereases somewhat confusing. Because of this, the Reference Committee, therefore, recommends that Resolution 1S/67 be postponed indefinitely, with the hope that at some future date a resolution with a similar objective will be introduced.

Your Reference Committee wishes to thank those who helped in its deliberations and to the staff who assisted in the preparation of this report.

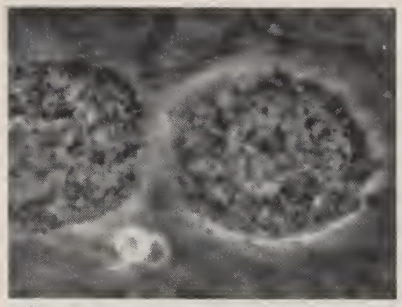
INFLAMMATION:
A cellular fight for life

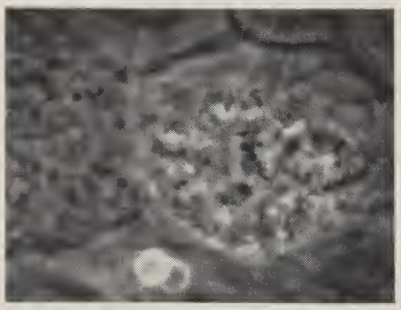
A SYNTEX REPORT based on recently developed hypotheses about topical corticosteroids, including the cellular theories of inflammation by Thomas F. Dougherty, Ph.D., University of Utah.

You are looking at a fibroblast fighting for life. This cell—one of the most common found in connective tissue—has literally been poisoned by cytotoxins released from other cells that have ruptured. Soon, if the abnormal activity of this fibroblast does not cease, it, too, will rupture and die—one more casualty in the inflammatory wave of destruction precipitated by injury.

Until a short time ago no one had ever witnessed such a scene at the cellular level. Now, through advanced cinemicrographic techniques, it is possible to view and photograph the inflammatory process as produced experimentally in living animal tissue. This method permits new insight into the mechanism of inflammation and the role of corticosteroids in therapeutic management. Equally important, these techniques shed new light on factors that may make one corticosteroid more effective than another—factors that can be correlated with other chemical, biologic, and clinical parameters.



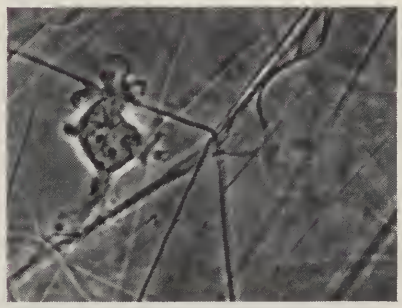
Visual evidence of how corticosteroids influence the inflammatory reaction



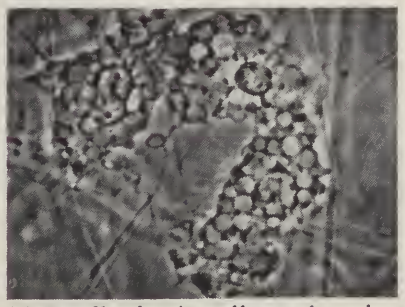
Working with phase-contrast cinemicrography on living animal tissue, Doctors Thomas F. Dougherty and David Berliner of the University of Utah College of Medicine have actually filmed cellular events that occur during the inflammatory reaction. This remarkable study* and additional work by these investigators, as well as by others, have established a new theoretical biologic basis for the antiinflammatory effect of the corticosteroids. (It must be noted that other theories, such as the lysosome or so-called "suicide bag" theory, have been postulated, although it is quite likely that there are more similarities than differences among the various theoretical models.)

The inflammatory wave of destruction

In this investigation an injurious injection of gelatin is used to set off an inflammatory reaction in living mouse tissue. What follows is a wave of destructive cellular activity that comprises the inflammatory response to injury. Mast cells (which contain heparin, serotonin and histamine) take up water, swell and rupture, releasing their contents, which are toxic outside the mast cell wall. These toxins, in turn, cause disintegration of other cells (such as fibroblasts) and the release of additional toxic material. Capillaries, too, take up water and leak unformed blood elements, causing edema. And polymorphonuclears, lymphocytes and perithelial cells invade the inflamed site. As a result of all these changes, the cellular environment reaches a state of turmoil.

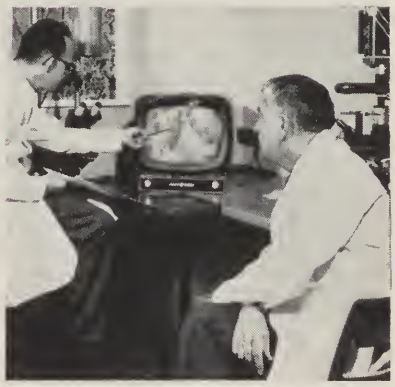


Phase-contrast microscopy showing mast cell before injury.



Mast cell (after injury) has broken up and released cytotoxins.

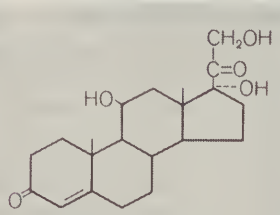
How corticosteroids change the picture



Corticosteroids appear to virtually stop the abnormal cellular activity that constitutes the inflammatory reaction. This permits the body's natural resources to clear up the inflamed area and repair the damaged tissue. This interpretation is supported by the fact that when the injurious gelatin solution is injected simultaneously with a corticosteroid – Synalar (fluocinolone acetonide) – the inflammatory pattern simply does not develop.

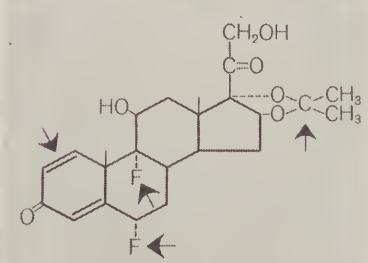
Fibroblast in high state of activity, much distorted.

Mast cells showing effects of corticosteroid action: cells are normal in size, shape and activity.



In summarizing his study Doctor Dougherty states: "...we also feel this work may explain why one corticosteroid helps a patient more rapidly and effectively than another. If it does, it is because one corticosteroid is the fastest, most effective inhibitor of the series of inflammatory events at the tissue level."

A New View of Corticosteroid Action in Inflammatory Dermatoses, a film based on this study, is now available from your Syntex representative.

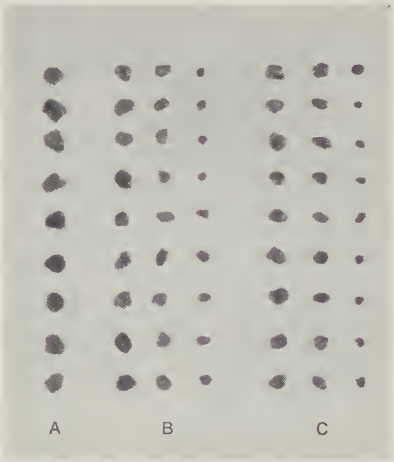


See last page for contraindications, precautions, side effects and dosage.

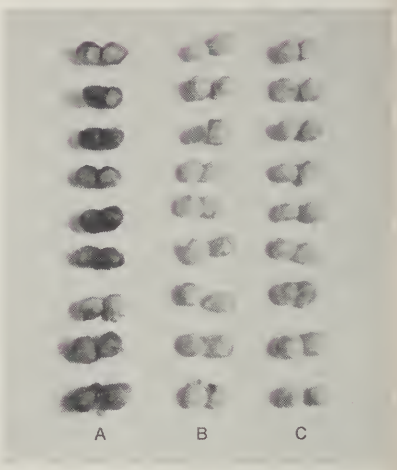
How advances in chemical design have achieved greater steroid potency

The chemical modification of corticosteroid molecules from the advent of hydrocortisone to the development of Synalar (fluocinolone acetonide) is a prime example of how biochemists can "design" to increase therapeutic activity and minimize undesirable side actions. Below, for example, we see the important changes that were made in reference to the hydrocortisone molecule to produce fluocinolone acetonide, one of the most active of all topical corticosteroids. As a result, a 0.01% preparation of Synalar (fluocinolone acetonide) has been reported to do the work of a 1% hydrocortisone product containing 100 times more cortiscosteroid. And it can often do it more effectively.

Hydrocortisone



Fluocinolone Acetonide (Synalar)



- *a double bond between carbons 1 and 2*
- *fluorine substitutions at* both *the 6-α, and the 9-α positions*
- *the addition of the acetonide at the 16-α, 17-α positions, thus providing one of the most potent topical corticosteroids available.*

How bioassay tests are used to "predict" therapeutic potential

Biologic assays are another tool used by researchers to help establish the relative activity of corticosteroids. To date no single method of assaying corticosteroid activity has emerged as the ideal "yardstick" for predicting therapeutic potential. Taken together, however, these methods have proved useful. When such tests are run on various corticosteroids, a definite order of corticosteroid activity becomes evident. Compounds with the highest order of activity may be expected to merit clinical trial to establish their high therapeutic potential. When assayed by these methods, fluocinolone acetonide (Synalar) emerges as one of the most active topical corticosteroids, milligram for milligram, available for clinical application today.

THE THYMUS INVOLUTION ASSAY[1-4] is run on adrenalectomized rats. The sizes of the glands are measured, and the degree of involution caused by the steroid is determined as an indication of its potency. In the above photo, the comparative involution of thymus glands achieved with hydrocortisone and Synalar (fluocinolone acetonide) is shown. Untreated controls (A) show normal size. Group B—injected with 1, 2 and 4 mg. of hydrocortisone—show progressively smaller thymuses as does Group C—injected with fluocinolone acetonide—but with only 1/500th the dose of hydrocortisone.

THE ANTIGRANULOMA ASSAY[1-4] also utilizes adrenalectomized rats. Granulomas are induced by subcutaneous implantation of cotton pellets on either side of the thorax. The degree of granuloma inhibition achieved by a steroid reflects its potency. The above photo shows the inhibition of granuloma formation achieved with hydrocortisone and Synalar (fluocinolone acetonide). Untreated controls (A) show large, red granulomas adhering to the pellets. Group B, receiving hydrocortisone and Group C, receiving fluocinolone acetonide, show little, if any, granuloma formation. Fluocinolone acetonide produced the same effect as hydrocortisone with only 1/500th the dose. This assay, as well as the thymus involution assay, measures systemic rather than topical corticosteroid activity. Nevertheless, results by these methods correlate well with other assays and with the milligram potencies of topical steroids in current clinical use.

Worldwide clinical experience confirms the predictable therapeutic potential of Synalar

It is particularly gratifying that the promise of the advanced chemical design and high order of bioassay activity of Synalar (fluocinolone acetonide) has been confirmed by widespread therapeutic application. Indeed, the impressive clinical response rate of Synalar has been documented in no fewer than 232 papers from 22 countries.

Representative Clinical Results with Synalar*

Efficacy Documented in over 4,000 Patients

Condition	Number of Publications	Number of Patients	Significant Improvement†
Contact Dermatitis	27	750	713
Eczematous Dermatitis	21	472	409
Seborrheic Dermatitis	18	442	426
Atopic Dermatitis	24	460	426
Psoriasis	36	1,699	1,510
Neurodermatitis	18	351	324
Total	144	4,174	3,808

*Complete bibliography on request.

†Expressed by the authors as excellent, very good, good, complete remission of inflammation, etc.

PRESCRIBING INFORMATION

For initiation of therapy: Cream 0.025%, 5 and 15 Gm. tubes, 425 Gm. jars; *for emollient effect:* Ointment 0.025%, 15 Gm. tubes; *for maintenance therapy:* Cream 0.01%, 15 and 45 Gm. tubes, 120 Gm. jars; *for intertriginous or hairy sites:* Solution 0.01%, 20 cc. and 60 cc. plastic squeeze bottles; *for infected inflammatory dermatoses:* Neo-Synalar® Cream (0.025% fluocinolone acetonide, neomycin sulfate, equivalent to 0.35% neomycin base), 5 and 15 Gm. tubes.

CONTRAINDICATIONS: Tuberculous, fungal, and most viral lesions of the skin, (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. PRECAUTIONS: Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. Prolonged use of any antibiotic may result in overgrowth of nonsusceptible organisms; if this occurs, appropriate therapy should be instituted. When severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. SIDE EFFECTS: Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. The neomycin in Neo-Synalar Cream rarely produces allergic reactions.

BUSINESS SESSIONS

SEPTEMBER 8, 1967

SEMIANNUAL MEETING

MINUTES

The 258th meeting, semiannual session, of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was called to order at 9:35 a.m., Friday, September 8, 1967, at Ocean City, Maryland, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance. The asterisk indicates an alternate delegate:

Doctors: Manning W. Alden, Council; Robert G. Angle, Montgomery County; Timothy D. Baker, Baltimore City; *Charles Bagley, III, Wicomico County; John G. Ball, Montgomery County; Edward M. Barczak, Baltimore City; Richard D. Bauer, Council; J. Howard Beard, Council; Harry McBrine Beck, Baltimore City; M. McKendree Boyer, Past President; *Donald L. Bucy, Montgomery County; *Albert E. Bunker, Dorchester County; Wendell J. Burkett, Kent County; Read N. Calvert, Montgomery County; Douglas G. Carroll, Baltimore City; Robert G. Chambers, Baltimore City; *Katherine A. Chapman, Montgomery County; Henry V. Chase, Council; *Shirley R. Clinton, Baltimore City; Archie R. Cohen, Council; H. Douglas Cooper, Wicomico; Worth B. Daniels, Baltimore City; Melvin B. Davis, Baltimore County; John B. De Hoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; J. Sheldon Eastland, Council; William Carl Ebeling, Council; *Max R. English, Baltimore City; Vincent J. Fiocco, Carroll County; Russell S. Fisher, Council; *William E. Gilmore, Baltimore City; *Paul F. Guerin, Baltimore City; William B. Hagan, Council; William G. Helfrich, Baltimore City; Thomas F. Herbert, Howard County; Philip W. Heuman, Harford County; Frederick M. Johnson, Charles County; Ferd E. Kadan, Baltimore City; James R. Karns, Baltimore City; Lauriston L. Keown, Baltimore City; Robert C. Kimberly, Council; Howard F. Kinnamon, Past President; Edward L. J. Krieg, Baltimore County; Henry P. Laughlin, Council; C. Rodney Layton, Queen Anne's County; Herbert H. Leighton, Garrett County; *Leon Levitsky, Prince George's County; Norman Levin, Baltimore City; William J. McClafferty, Baltimore City; *Charles B. Marek, Baltimore City; Karl F. Mech, Council; B. Martin Middleton, Council; *Benjamin S. Miller, Prince George's County; John E. Miller, Baltimore City; Donald W. Mintzer, Baltimore City; Frank K. Morris, Board of Medical Examiners; Frederick E. Musser, Prince George's County; *James J. Nolan, Baltimore City; Clayton Norton, Anne Arundel County; Charles F. O'Donnell, Council; Hilary T. O'Herlihy, Anne Arundel County; A. Austin Pearre, Past President; William A. Pillsbury, Jr., Council; *Carolyn S. Pincock, Montgomery County; Belden R. Reap, Sr., Montgomery County; J. Morris Reese, Council; Guy M. Reeser, Jr., Talbot County; Thomas R. Reid, Frederick County; *James A. Roberts, Montgomery County; Donald J. Roop, Council; Salvador Rossello, Baltimore City; Edwin Ruzicka, Talbot County; Emmanuel Schimunek, Baltimore City; Arthur G. Siwinski, Council; Thaddeus C. Siwinski, Baltimore County; R. Kennedy Skipton, Prince George's County; Aaron C. Sollod, Baltimore City; William G. Speed, III, Council; Omar D. Sprecher, Jr., Washington County; Martin E. Strobel, Baltimore County; E. L. Suarez-Murias, Baltimore City; Francis J. Townsend, Jr., Council; Harry R. Trapnell, Caroline County; Thomas E. Van Metre, Jr., Baltimore City; Merton T. Waite, Anne Arundel County; Emerson C. Walden, Baltimore City; Hugh W. Ward, Calvert County; *Howard N. Weeks, Washington County; J. Arthur Weinberg, Council; William C. Weintraub, Prince George's County; Lawrence R. Wharton, Jr., Baltimore City; Charles H. Williams, Baltimore County; Donald O. Wood, Baltimore County; Arthur O. Wooddy, Council; Charles E. Wright, Frederick County; John D. Young, Jr., Baltimore City; and Raymond M. Yow, Council.

Present also for the meeting were staff personnel.

INVOCATION

The invocation was given by Donald W. Mintzer, MD, Chairman of the Faculty's Subcommittee on Medicine and Religion.

The President made certain announcements with regard to the conduct of business at the session.

INTRODUCTION OF NEW DELEGATES

The President introduced the following new delegates who were present for their first session:

J. Howard Beard, MD, Second Vice-President
Arthur G. Siwinski, MD, President-elect
William G. Speed, III, MD, Council
Francis J. Townsend, MD, Third Vice-President

MINUTES

The minutes of the April 19 and April 21, 1967 meetings respectively of the House of Delegates, annual session, having been distributed to the members, and having been approved by the Executive Committee, were presented to the House for information.

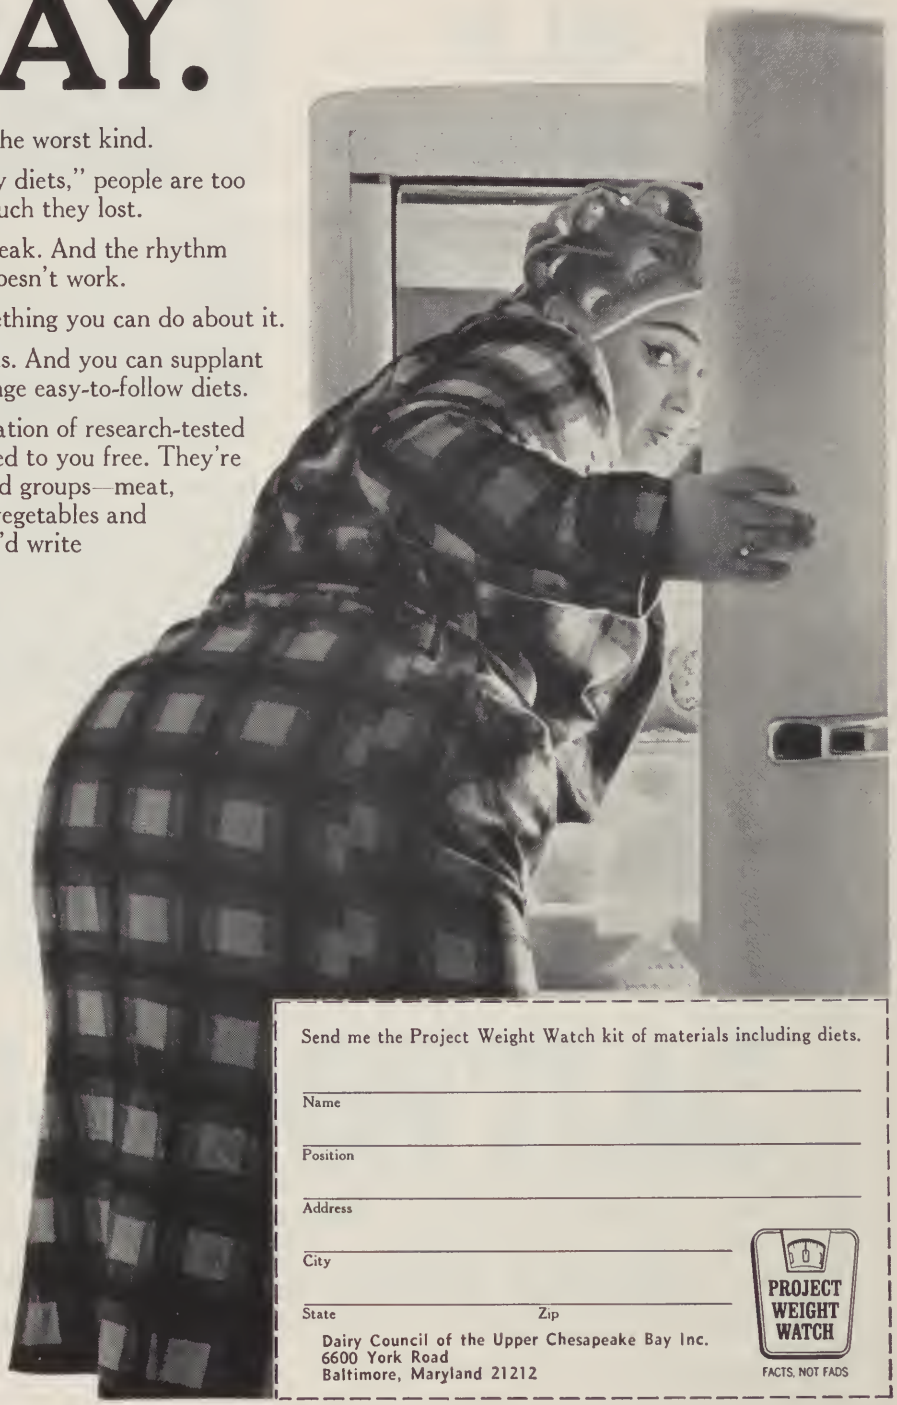
MEDICOLEGAL COMMITTEE REPORT

Howard F. Kinnamon, Chairman of the Medicolegal Committee for 1966-67, on its behalf, moved adoption of the following amendment to the Medicolegal Code of

BREAK A DIET CYCLE, TODAY.

On-again, off-again dieting is the worst kind.

On the 8th day of most "7-day diets," people are too busy eating to tell you how much they lost.



It's just that week diets are weak. And the rhythm method of girth control just doesn't work.

As a professional, there's something you can do about it.

You can replace fads with facts. And you can supplant short-term plans with long-range easy-to-follow diets.

That's what prompted preparation of research-tested scientific diets which are offered to you free. They're a realistic balance of the 4 food groups—meat, bread and cereals, fruits and vegetables and dairy foods. They're diets you'd write yourself if you had the time.

Send for them. Fasts are slow ways to lose weight.

Send me the Project Weight Watch kit of materials including diets.

PROJECT WEIGHT WATCH

FACTS, NOT FADS

Cooperation, such amendment having already been adopted by the Baltimore City Bar Association and the Maryland State Bar Association, which was adopted, after debate:

Amend the first sentence of paragraph 2 of the Medico-legal Code of Cooperation by substituting for it the following new sentence:

The patient, or his attorney, upon written request, when accompanied by a signed authorization from the patient shall be entitled to a prompt report from the attending physician containing the history, physical condition, diagnosis, and prognosis, but need not include an evaluation of disability in Workmen's Compensation Cases.

FACULTY DELEGATES TO THE AMA REPORT

The report of the Faculty's Delegates to the American Medical Association was filed. Russell S. Fisher, MD, acting on behalf of the Delegates, once again urged members to appear before Reference Committee meetings of the AMA House of Delegates to make their personal views known on any subject under discussion in the Committee.

PHYSICIAN/PHARMACIST CODE OF COOPERATION

William L. Stewart, MD, Liaison Committee Chairman, on behalf of the Committee moved adoption of the Physician/Pharmacist Code of Cooperation, which, after debate, was unanimously adopted.

BYLAWS COMMITTEE REPORT

Dr. O'Donnell, Bylaws Committee Chairman, on its behalf, moved the adoption of the following Bylaw amendments which, after debate, were adopted in each case by more than the required two-thirds vote:

(a) Amend Article III, Section 1, by adding:

"if they are not being collected through the facilities of the Faculty by the agreement between the Faculty and the Component Society."

(b) Amend Article VI, Section 4, by adding:

"Provided, however, that a resolution introduced by an individual member must have the endorsement of either one-third of the membership of his Component Society, or 30 members of his Component Society, whichever is smaller."

(c) Amend Article XI, Section 1, by striking out the entire section.

(d) Amend Article XI, Section 4, by striking out the entire section and substituting the following new section:

Section 4: A Medical Economics Committee of at least five members shall serve as a *Review Committee* for health insurance and other third party payors to determine equitable and just fees for procedures performed and for which such carriers are responsible. It may only act on the request of the carrier or patient or physician involved, and after the medical service has been rendered. It shall not determine the legal rights or benefits under such policies. It shall also be empowered to investigate, within the responsibilities and charges designated in these bylaws, areas of economic benefits for members of the Faculty. It shall receive the report of the Faculty's officially approved Professional Liability Program and shall prepare and present an educational program to physicians in this regard. Its chairman shall be appointed by the President and said chairman shall appoint the other members of the Committee with the approval of the President. The Baltimore City Dental Society shall have the right to elect one associate member of the Committee with voice but no vote.

(e) Amend Article XI, Section 5, by striking out the words, "and Business Manager"

(f) Amend Article XI, Section 7, by striking out "A Fee Schedule Committee to consider and advise the Faculty on all questions relating to Fee Schedules shall

be composed of"

and substituting:

Section 7: "A Professional Medical Services Committee shall consider and advise the Faculty on all matters relating to the professional services provided to the public by members of the Faculty. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty. It shall make available facts, data and opinions with respect to timely and adequate rendition of medical care to the public; to investigate matters pertaining to the economics of medical practice and where related, social aspects of medical care; it shall study means for the distribution of medical service to the public consistent with the principles adopted by the Faculty's House of Delegates and the AMA's House of Delegates. It shall be composed of . . ."

(g) Amend Article XI, Section 11, by striking out the following:

Section 11: "A Liaison Committee of at least ten members shall provide from among its membership such liaison as is required on the following subjects: Veterans medical care, accreditation of hospitals, adoption and vocational rehabilitation, and to the following organizations: Bureau of Old Age and Survivor's Insurance, State Department of Health and Maryland Pharmaceutical Association."

and substituting the following:

Section 11: "A Liaison Committee of at least ten members shall provide from among its membership such liaison as is required with other professional organizations, such as but not limited to: Maryland Nurses Association, Maryland Pharmaceutical Association, State Department of Health, all specialty medical organizations in the state. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty."

(h) Amend Article XI, Section 13, by striking out the second sentence as follows:

Section 13: "This Committee shall meet with labor unions, professional organizations and others interested in improving the quality of medical care, for discussion and consideration of questions of mutual interest in this area."

(i) Amend Article XI, Section 18, by striking out the second sentence which reads:

Section 18: "It shall serve in an advisory capacity to the State Accident Fund."

(j) Amend Article XI, Section 20, by striking out the following:

Section 20: ". . . subjects, among others: diabetes, geriatrics, maternal and child welfare, pelvic cancer, rural health, tuberculosis, prevention of automotive highway disasters, regulations relating to hospital licensing, immunizations and alcoholism."

and insert the following:

Section 20: ". . . postgraduate educational programs, any health topic or subject that is of general interest to Faculty members, all phases of medical education, public health matters and all aspects of preventive medicine and health maintenance. It shall not conflict in any way with charges made in these bylaws to other committees of the Faculty."

(k) Amend Article XIII, Section 3, in the second section, by striking out the word "Council" where it first appears in that sentence and inserting the word, "Committee."

EMERITUS MEMBERSHIP

On motion of the Chairman of the Council, the following members who had received the recommendation af the Council, were elected to Emeritus Membership:

Alexis M. Bagusin, MD, Baltimore City
E. Ross Davies, MD, Baltimore City
Earl E. Broadrup, MD, Allegany County
Arthur I. Fink, MD, Baltimore City

He leaves to make an urgent call But doesn't use the phone at all

Parepectolin for quick relief of acute diarrhea
...soothes colicky pain with paregoric
...consolidates fluid stools with pectin
...adsorbs irritants with kaolin, and protects intestinal mucosa.

Whether it's a 24-hour "bug", a food problem, or simply nervousness and anxiety, Parepectolin will bring the diarrhea under control until etiology can be determined. In some cases, Parepectolin may be all the therapy necessary.

Parepectolin®

Each fluid ounce of creamy white suspension contains:
Paregoric (equivalent) ..... (1.0 dram) 3.7 ml.
Contains opium (¼ grain) 15 mg. per fluid ounce.

COMMISSION ON MEDICAL DISCIPLINE AD HOC COMMITTEE TO CONSIDER CHANGES IN THE MEDICAL PRACTICE ACT

John M. Dennis, MD, Chairman of the Ad Hoc Committee to consider changes in the Medical Practice Act, moved on behalf of the Committee that the report as presented be adopted. After lengthy debate, and while an amendment was pending to strike out "commission" and insert "Board of Medical Examiners" wherever it appears, a motion was made which, after debate and amendment, was adopted as follows:

"That the Report be recommitted to the same Ad Hoc Committee for further study in consultation with the Board of Medical Examiners so as to reconcile the differing views."

The President announced that, in accord with the views of the House, that a special meeting of the House of Delegates would be called under Article VI, Section 2, of the Bylaws in time for preparation and introduction of legislation for the 1968 state legislature.

REPORT OF THE SELECT COMMITTEE ON FREE CHOICE, CLOSED PANEL AND HOSPITAL PROVISION OF MEDICAL SERVICES

Dr. Middleton, on behalf of the Select Committee on Free Choice, Closed Panel and Hospital Provision of Medical Services, moved adoption of the following resolution; which was unanimously adopted:

Resolved, That the House of Delegates reaffirm its policies adopted on September 18, 1959, and the policy adopted by the House of Delegates of the American Medical Association in December, 1959, disapproving the concept of closed panel practice of medicine when the patient contributes financially to its support as an abridgement of the patient's freedom of choice of a physician."

REFERENCE COMMITTEE REPORT

Dr. DeLawter, on behalf of the Reference Committee, moved that Resolution 1S/67 be postponed indefinitely. After debate, the Resolution, the text of which follows, was postponed indefinitely:

Whereas, Dynamic changes have taken place affecting the private practice of medicine by special privilege groups such as large corporations, insurance companies and trade unions, and

Whereas, The traditional physician-patient relationship is being threatened by various mass medical plans, and

Whereas, Organized medicine is being blamed and accused for the errors and shortcomings of mass medical plans, and

Whereas, Organized medicine is presently without the power to control said mass medical care plans, now, therefore, be it

Resolved, That the Medcial and Chirurgical Faculty of the State of Maryland seek enabling legislation to require compulsory membership in a component medical society of the Medical and Chirurgical Faculty in order to maintain high professional and ethical standards incident to the right and privilege of practicing medicine in the State of Maryland.

ADJOURNMENT

Due to the lateness of the hour, those speakers who had announcements to make deferred to the wish of the House of Delegates which voted unanimously to adjourn, *sine die,* at 12:15 p.m.

SIX WEEKS OF FREE VACATION PLUS:

everything a jewel of a Tropical Island can offer

. . . AND A CASH PROFIT

Wishful thinking? Not by an island-site. St. Croix—Virgin Islands to be exact. On this lush, tropical and most cosmopolitan of Caribbean islands we have built, and are now expanding, Estate Questa Verde, a beautiful Apartment-Hotel complex. Apartments are for sale furnished or unfurnished. These can be retained for private use year-round or can be turned over to our Hotel Plan for rental to vacationers. Starting with the 1968 season you can reserve two weeks each winter, four weeks each summer for your own use, free, while drawing up to $9,500.00 profit. Total principal and interest* plus taxes and furniture replacement allowance come to $4,116.00 leaving an anticipated net profit of $5,384.00. Good enough? It could be better if you give up your own vacation time. But then, who would want to give up six weeks of trade winds and tropical fragrance?

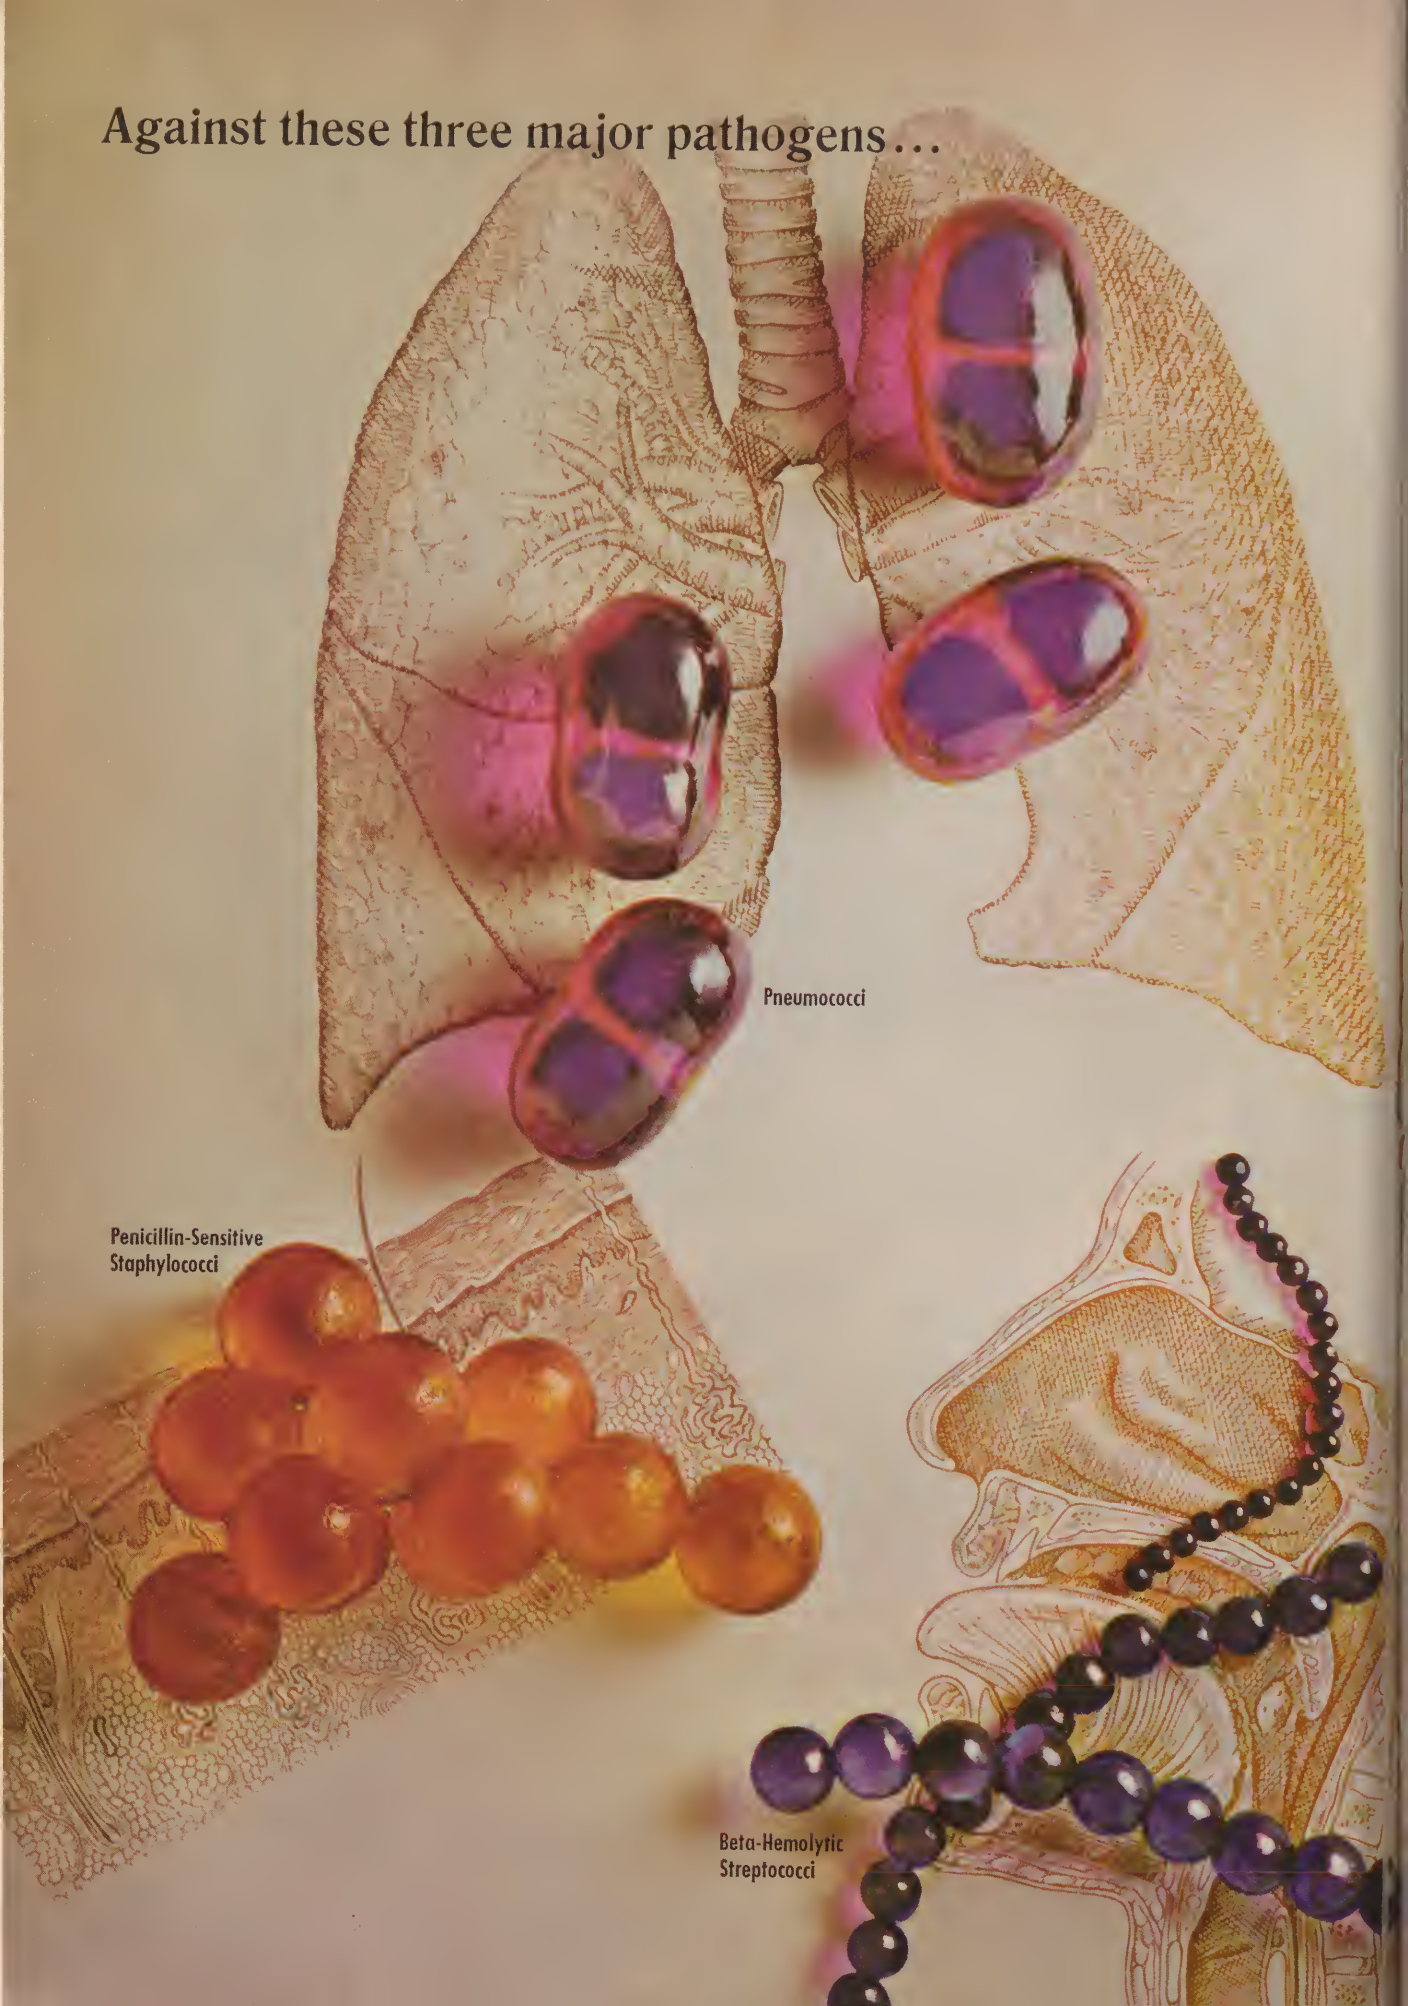
ADDRESS_____

Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.



One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:

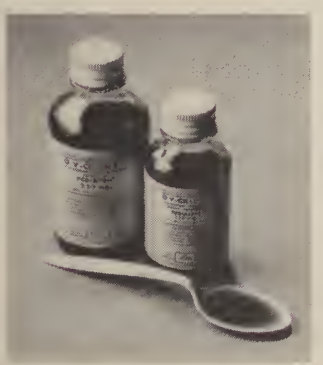
Against these three major pathogens...



V-Cillin K® provides dependable oral antibacterial therapy

because it combines a high degree of activity...

V-Cillin K has been shown to be effective in the treatment of streptococcus and pneumococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy in patients with a history of rheumatic fever or congenital heart disease.

with high blood levels, even when taken with food

V-Cillin K is stable in acid and immediately soluble. High serum levels, therefore, are reached rapidly. Because it is acid stable, V-Cillin K is well absorbed even when taken close to mealtime. These desirable properties help make V-Cillin K a dependable penicillin for oral use.

V-Cillin K® Lilly 701297

Potassium Phenoxymethyl Penicillin

Now available: V-Cillin K®, Pediatric, for Oral Solution, 250 mg. (400,000 units) per 5 cc. of solution.

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Warnings: In rare instances, the use of penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin and in those with bronchial asthma or other allergies. Resuscitative drugs should be readily available for emergency administration. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for relief of immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with high parenteral dosage schedules, frequent evaluation of the renal and hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory studies (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrowth of pencillin-insensitive organisms. In such cases, its administration should be discontinued, and appropriate measures should be taken.

Adverse Reactions: Although serious allergic reactions are much less common with administration of oral penicillin than with intramuscular forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it does possess a significant index of sensitization. The following hypersensitivity reactions associated with the use of penicillin have been reported: skin rashes ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; and reactions resembling serum sickness, including chills, fever, edema, arthralgia, and prostration. Severe and often fatal anaphylaxis has occurred (see Warnings). Hemolytic anemia, leukopenia, thrombocytopenia, and nephropathy are rarely observed side-effects and are usually associated with high parenteral dosage.

Administration and Dosage: For Tablets V-Cillin K and for V-Cillin K, Pediatric, the usual dosage ranges from 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants, the daily dosage may be 50 mg. per Kg. of body weight divided into three doses.

Beta-hemolytic streptococcus infections without associated bacteremia may be treated with 200,000 to 400,0000 units three times a day. Therapy should be continued for a minimum of ten days to prevent development of rheumatic fever and/or other serious complications. Dosage for routine streptococcus prophylaxis in patients with a history of rheumatic fever or congenital heart disease may be 200,000 units once or twice daily. When such patients undergo tonsillectomy, tooth extraction, or other minor surgery, the prophylactic dose should be 500,000 units every six hours given two days prior to surgery and for two days postoperatively. If oral medication is not feasible on the day of surgery, parenteral therapy should be considered. Mild to moderately severe pneumococcus pneumonia has been treated effectively with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be given every six to eight hours in conjunction with indicated surgical procedures.

For gonorrhea in males, 500 mg. (800,000 units) every four hours for three doses may be employed; in females, 500 mg. every four hours for six doses are recommended. Refractory infections generally respond to a second treatment three to four days following completion of the first. Treatment of gonorrhea with severe complications should be individualized, with prolonged and intensive treatment. Patients with a suspected lesion of syphilis should have a dark-field examination before receiving penicillin and monthly serologic tests for a minimum of three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units), in bottles of 50 and 100; and 250 mg. (400,0000 units) and 500 mg. (800,000 units), in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) per 5 cc. of solution, in 40, 80, and 150-cc.-size packages. [032067]

"Man's best friend" in wintertime diarrheas

In winter "flu" and viral gastroenteritis, Donnagel (4 oz. size!) can bring aid and comfort to sufferers from both diarrhea and its discomforts because it contains kaolin and pectin *plus* belladonna alkaloids (as in Donnatal®). Donnagel treats the whole diarrhea problem. Available on your prescription or recommendation.

For acute, non-specific diarrheas **Donnagel® -PG** (Donnagel with paregoric equivalent). Donnagel formula plus powdered opium, USP, 24.0 mg. (equivalent to paregoric 6 ml.) (warning: may be habit forming). Alcohol, 5%.

All the antidiarrheal benefits of paregoric without the unpleasant taste. Real banana flavor makes it acceptable, even to children. See product literature before prescribing.

CLEAR THE TRACT!
ROBITUSSIN®

THERE'S A FORMULATION FOR EVERY COUGHING NEED

All the Robitussins contain glyceryl guaiacolate, the outstanding expectorant agent that greatly increases the output of lower respiratory tract fluid. Increased RTF volume exerts a demulcent effect on the tracheo-bronchial mucosa, promotes ciliary action, and makes thick, inspissated mucus less viscid and easier to raise.

For coughs of colds and "flu"
ROBITUSSIN®
Each 5 cc. contains:
Glyceryl guaiacolate . . . . . 100 mg.
Alcohol, 3.5%

For unproductive allergic coughs
ROBITUSSIN® A-C
Each 5 cc. contains:
Glyceryl guaiacolate . . . . . 100 mg.
Pheniramine maleate . . . . . 7.5 mg.
Codeine phosphate . . . . . 10.0 mg.
(warning: may be habit forming)
Alcohol, 3.5%

Non-narcotic for 6-8 hour cough control
ROBITUSSIN®-DM
Each 5 cc. contains:
Glyceryl guaiacolate . . . . . 100 mg.
Dextromethorphan hydrobromide . 15.0 mg.
Alcohol, 1.4%

New! Clears sinuses and nasal stuffiness as it relieves cough
ROBITUSSIN®-PE
Each 5 cc. contains:
Glyceryl guaiacolate . . . . . 100 mg.
Phenylephrine hydrochloride . . . 10.0 mg.
Alcohol, 1.4%

A·H·ROBINS

when bursitis hits a 280-lb. tackle, hit back with Butazolidin alka

Indications: Osteoarthritis, rheumatoid arthritis, rheumatoid spondylitis, psoriatic arthritis, acute gout, painful shoulder (peritendinitis, capsulitis, bursitis and acute arthritis of that joint), acute superficial thrombophlebitis.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of Butazolidin alka are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make regular blood counts. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ul-

For 280-lb. tackles—or 108-lb. housewives—Butazolidin alka can hasten recovery from the agonizing pain of shoulder bursitis.

It's not for every patient. Check carefully the Contraindications, Warning and Precautions shown below.

And adverse reactions may occur. The most common are nausea, edema and rash. Rarely, agranulocytosis has been reported. All adverse reactions are listed below, too.

Play-for-pay or workaday patients—when they come up with shoulder bursitis and your clinical judgment indicates Butazolidin alka—go with it.

And watch the comeback.

cer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Mild drug rashes frequently subside with reduction of dosage. However, rash accompanied by fever or other systemic reactions usually requires withholding medication. Purpuric rash has also been reported. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, or a generalized allergic reaction similar to serum sickness may occur and require permanent withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been.reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur. 6509-V(B)R2

Butazolidin® alka

Capsules

100 mg. phenylbutazone
100 mg. dried aluminum hydroxide gel
150 mg. magnesium trisilicate
1.25 mg. homatropine methylbromide

Dosage in painful shoulder: Initial: 3 to 6 capsules daily in 3 or 4 equal doses. Trial period: 1 week. Maintenance dosage should not exceed 4 capsules daily; response is often achieved with 1 or 2 capsules daily.

MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

OCTOBER, 1967

Semi-Annual Meeting—Ocean City

The Maryland Association of Medical Assistants held its semi-annual meeting at the Ship's Cafe, Ocean City, Maryland on Saturday, September 9, 1967. Mrs. Nell Chaney, newly installed as President of the association presided. Mrs. Chaney is secretary to Socrates Kendros, MD, Director of Medical Education at Church Home and Hospital.

Registration began at 10:00 a.m. followed by the business meeting and lunch. An educational seminar was presented in the afternoon. Mrs. William B. Stone, President of the Woman's Auxiliary of the Medical and Chirurgical Faculty, welcomed all in attendance and spoke on the possibilities for liaison between the Medical Assistants and the Woman's Auxiliary, which so far has been neglected. Raymond M. Atkins MD, instructor in Clinical Anatomy at the University of Maryland and Chairman of the Emergency Room Department and Assistant Director of Medical Education at Church Home and Hospital, spoke on Emergency Room Care and Medico-Legal Problems. This was followed by a film on The Doctor Defendant, which was of great value to the medical assistant who must constantly be on guard against possible legal entanglements for herself and her employer. Mr. Thomas F. Horton, Marketing Manager for Ocean Research and Engineering Center, Westinghouse Corporation concluded the seminar with Oceanography And Undersea Exploration, a discussion of tremendous current interest, having to do with such science fiction subjects as undersea laboratories, minisubs, etc.

Raymond M. Atkins, MD, on left, and Jack M. Zimmerman, MD, on right.

Cocktail hour was at 6:30 at the Ship's Cafe, followed by the banquet at 7:30 p.m. The invocation was given by Reverend Thomas Subock, Methodist Minister of the Baltimore Conference, who resides near Annapolis, Maryland. Reverend Subock is the husband of one of the members of the Medical Assistants Association.

Jack M. Zimmerman, MD, Chief of Surgery at Church Home and Hospital and Associate Professor of Surgery at The Johns Hopkins Hospital was Master of Ceremonies.

DIARRHEA

CANTIL®
(mepenzolate bromide)

LAKESIDE

Diarrhea, one of the most vexing symptoms of common G. I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth, blurring of vision, constipation, nausea, vomiting, bloating and dizziness may occur but are usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy — withhold in glaucoma. Contraindicated in patients sensitive to phenobarbital and/or Cantil (mepenzolate bromide); in toxic megacolon, obstruction of G. I. or G. U. tract.

SUPPLIED: CANTIL (mepenzolate bromide) — 25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL — containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

STATE OF MARYLAND

Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

Kurt Gorwitz, ScD, Statistics Director

The Hospitalized Adolescent

Last year more than 400 children between the ages of 12 and 17 were under care in Maryland's state mental hospitals. This is equal to one out of every 1,000 Maryland residents in this age group.

The following table shows the distribution of resident patients in this age group (as of July 1, 1966) by diagnosis, age and length of hospitalization. Half were diagnosed as transient situational personality disturbances, one out of six as psychotic and one out of ten as personality disorders. Although most were recent admissions, a number had been under continuous inpatient care for extended time periods.

The adolescents in state mental hospitals represent only a small proportion of those seen in psychiatric facilities. Data available through the Maryland Psychiatric Case Register indicate that 11.9 percent of all admissions 10-17 years of age were to state hospitals, 6.3 percent to other inpatient facilities, 56.1 percent to county operated clinics and 25.6 to other community centers. However, they do represent a major portion of those receiving treatment since many of the adolescent admissions to outpatient facilities are seen only for testing, evaluation and diagnosis.

AGE AND LENGTH OF HOSPITALIZATION	REPORTED DIAGNOSIS				
	TOTAL	PSYCHOTIC DISORDERS	PERSONALITY DISORDERS	TRANSIENT SITUATIONAL PERSONALITY DISTURBANCES	ALL OTHERS

A study released in 1962 indicated a minimum need for 500 residential beds for children—a number far in excess of the then available resources. Privately operated facilities, such as Linwood, Child Study Center and Christ Child Institute, have a current capacity of 45. The Department, in addition to its Institute For Children whcih now has 85 patients (most are less than 12 years of age), now has separate units for adolescents with a combined capacity of 66 at the Crownsville and Spring Grove hospitals. The former has also established a day care program for a small number of disturbed children from one county (Anne Arundel). However, because of this shortage the majority of adolescents continue to be treated on the same wards with adult patients—a policy which is not believed to be conducive to the recovery of either group. Efforts to remedy this chronic deficiency must involve additional construction and staffing, both in state hospitals and in other facilities, as well as the close coordination of services with schools and all other present and proposed community resources.

Learn To Do Your Part In The Prevention Of Disease

Accidental Poisonings in Baltimore City

In the first six months of this year, a total of 1,870 cases of accidental poisoning have been reported to the Baltimore City Health Department. At the present rate of these accidents, 1967's total reported accidental poisonings could reach the 4,000 mark.

This information is from a compilation of reported accidental poisoning cases in the city just released by Mr. Jacque G. Ayd, Director of the City Health Department's Bureau of Food Control. The reports are collected from 20 sources that treat accidental poisoning cases in the city, including 14 hospital emergency rooms, 3 comprehensive pediatric care centers and 3 pediatric clinics.

A breakdown of causative agents shows internal medicines leading the list with 1,235 cases and aspirin the most often misused medicine with 545 cases. Household chemicals were responsible for 230 cases.

By far the age group most often poisoned was from birth to 5 years of age with 1,205 cases, indicating that one important key to the reduction of poisoning accidents lies in more strict parental control of the activities of the preschooler.

It is suggested that physicians should urge parents to use extreme care in the handling and storage of all household poisons especially internal medicines while children are too young to know the danger of overdoses and misuse. A safe practice is to keep such products under lock and key when not in use at least until the child is of school age.

This statistical report is made possible through a new poison control ledger system instituted through the joint efforts of the Baltimore City Health Department, the Maryland Poison Information Center, and the hospitals of the city. Its use has also provided the Bureau of Public Health Nursing with repeater cases for accident prevention follow-up.

New Coordinator for VD

Mr. John Supinski of the US Public Health Service has been assigned as Coordinator of VD Projects in the Baltimore City Health Department.

Under the supervision of James E. Peterman MD, Director of the Bureau of Communicable Diseases, Mr. Supinski will administer case-finding and information and education projects for the Division of Venereal Diseases. In this post he has replaced Mr. Lawrence E. Posey who has been assigned to Regional Office III of the National Communicable Disease Center, Charlottesville, Virginia.

From a continuing study on nasal congestion . . .

timed to work while your patient does

A study being conducted by the Department of Otolaryngology, Greater Baltimore Medical Center is stockpiling evidence that points to the fast action and prolonged relief effected by Triaminic in the treatment of nasal congestion.

Begun in March 1966, the study to date has encompassed 85 patients with common nasal disorders—and measured their response to recommended doses of Triaminic tablets.

Timed to release its oral nasal decongestant and two antihistamines within 8 hours, Triaminic was found to effect partial or complete relief in better than 82% of the subjects treated. Clearing nasal obstruction. Reducing turbinate swelling. Making breathing easier.

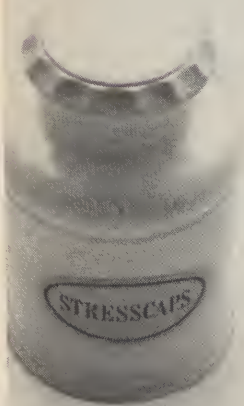
It's a comforting thing to know that Triaminic *really* works.

Triaminic® *timed-release tablets*

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride .....50mg. Pyrilamine maleate.....25mg. Pheniramine maleate.....25mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets.



Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

DORSEY LABORATORIES • *a division of The Wander Company* • **LINCOLN, NEBRASKA** 68501

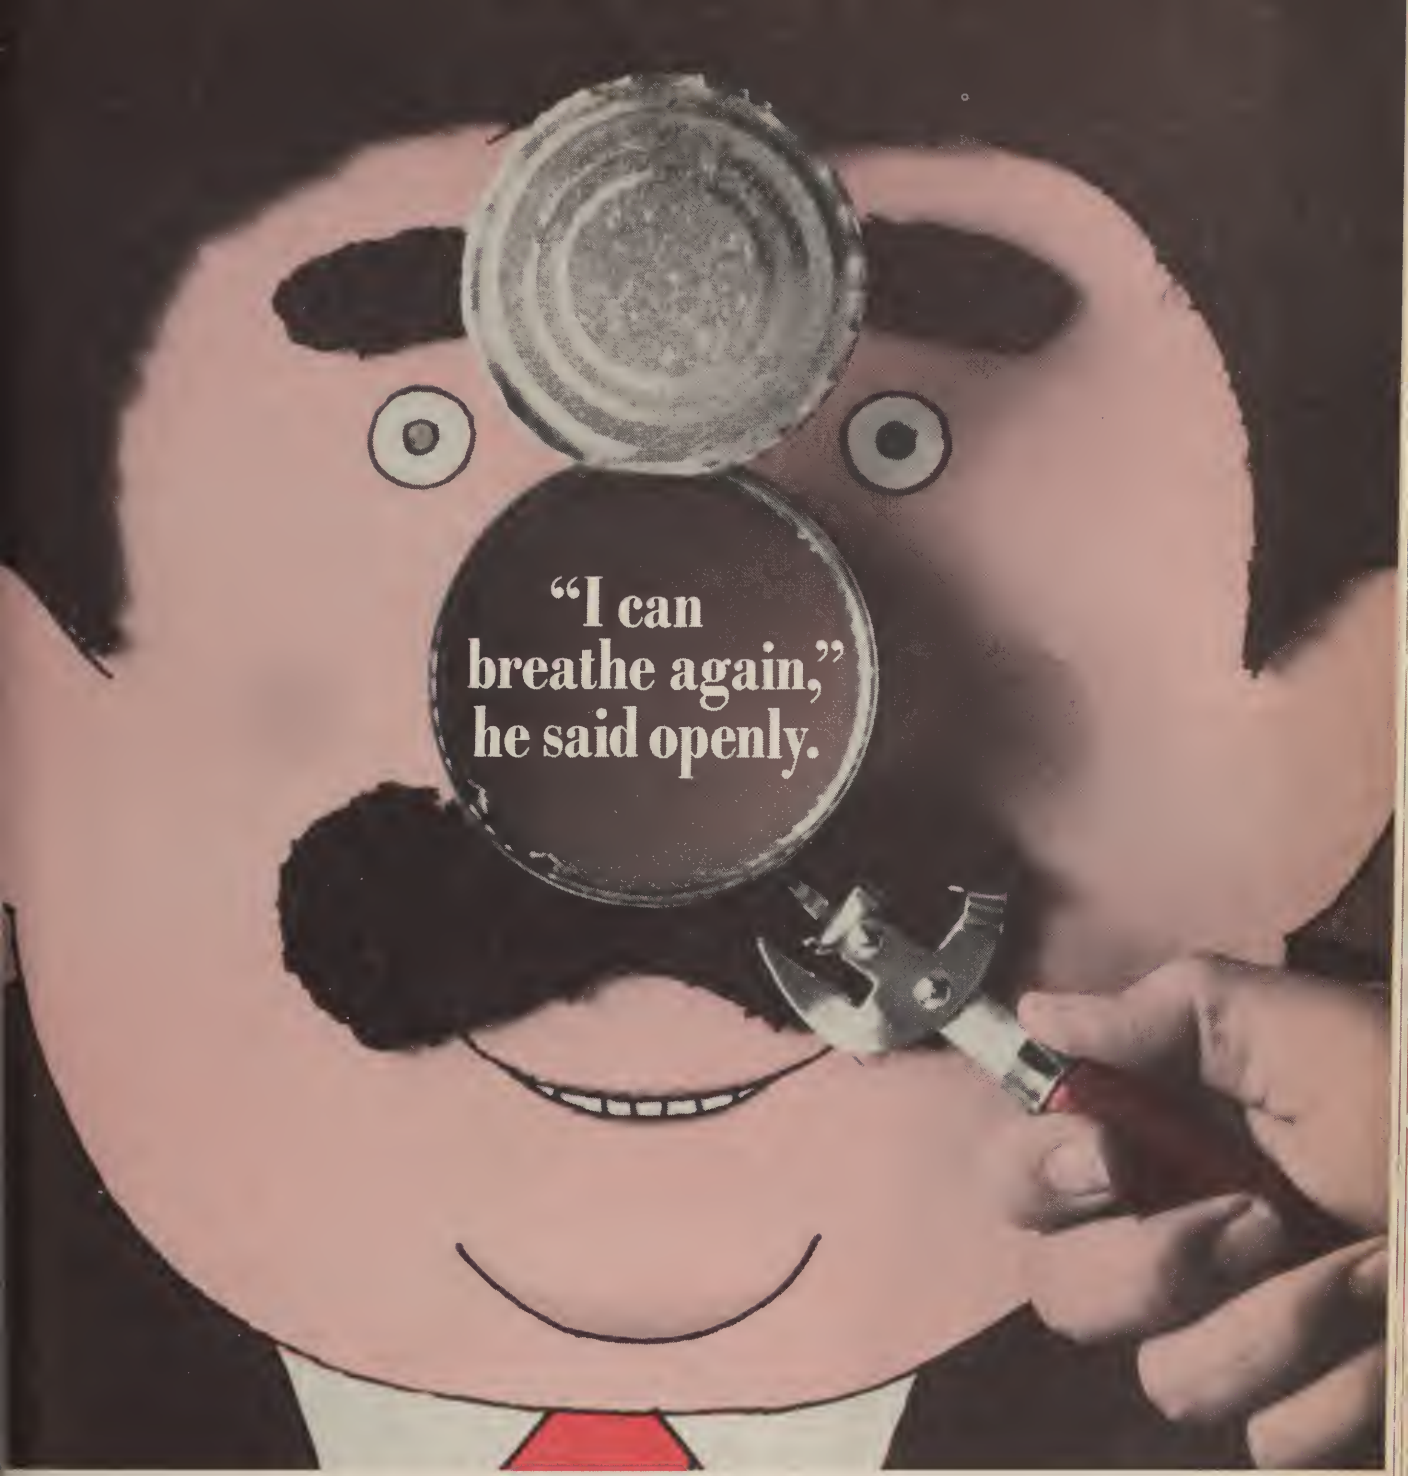
following infection

B and C vitamins are therapy: STRESSCAPS B and C vitamins in therapeutic amounts...help the body mobilize defenses during convalescence...aid response to primary therapy. The patient with a severe infection, and many others undergoing physiologic stress, may benefit from STRESSCAPS capsules.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY



Each capsule contains:	
Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

Dimetapp® Extentabs®

(Dimetane® [brompheniramine maleate], 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)

up to 10-12 hours clear breathing on one tablet

It's clear—Dimetapp lets your "stuffed-up" patients breathe easy again. Each hard-working Extentab brings welcome relief from the stuffiness, drip and congestion of upper respiratory conditions for up to 10-12 hours. Yet, patients seldom experience drowsiness or overstimulation. Its key to success is the Dimetapp formula: Dimetane (brompheniramine maleate)—along with phenylephrine and phenylpropanolamine, two time-tested decongestants. They get the job done...in a hurry.

Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy. **Precautions:** Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension. **Side Effects:** Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered. **Dosage:** 1 Extentab morning and evening. **Supplied:** Bottles of 100 and 500.

A. H. ROBINS COMPANY, Richmond, Virginia 23220

A·H·ROBINS

Preludin® phenmetrazine hydrochloride

For complete details,
please see full
Prescribing Information.

helps keep calories at arm's length

Preludin is indicated only as an anorectic agent in the treatment of obesity. It may be used in simple obesity and in obesity complicated by diabetes, moderate hypertension, or pregnancy. For use in pregnancy, see Warning.

Dosage: One 25 mg. tablet b.i.d. or t.i.d. Or one 75 mg. Endurets® prolonged-action tablet a day, taken by midmorning.
Contraindications: Severe coronary artery disease, hyperthyroidism, severe hypertension, nervous instability, and agitated prepsychotic states. Do not use with other CNS stimulants, including MAO inhibitors.

Warning: Do not use during first trimester of pregnancy unless potential benefits outweigh possible risks. There have been clinical reports of congenital malformation, but causal relationship has not been proved. Animal teratogenic studies have been inconclusive.
Precautions: Use with caution in moderate hypertension and cardiac decompensation. Cases involving abuse of or dependence on phenmetrazine hydrochloride have been reported. In general, these cases were characterized by excessive consumption of the drug for its central stimulant effect, and have resulted in a psychotic illness manifested by restlessness, mood or behavior changes, hallucinations, or delusions. Do not exceed recommended dosage.
Side Effects: Dryness or unpleasant taste in the mouth, urticaria, overstimulation, insomnia, urinary frequency or nocturia, dizziness, nausea, or headache. (B)R46-560-A

even in ulcerative colitis...

characterized by:
—diarrhea, cramps, tenesmus
—bloody, mucoid, purulent stools

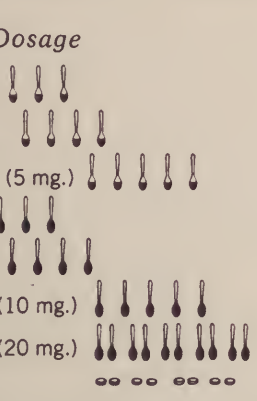
LOMOTIL® tablets/liquid

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride . . . . 2.5 mg.
(Warning: May be habit forming)
atropine sulfate . . . . . 0.025 mg.

controls diarrhea

In six published studies[1-6] detailed results are given on the use of Lomotil in 111 patients with chronic ulcerative colitis. They show that Lomotil gave satisfactory to "excellent" control of diarrhea in more than two-thirds of these patients. As the disorder advances and destroys bowel musculature, the motility-lowering action of Lomotil, understandably, has less effect.

The successful use of Lomotil in a disorder as exceedingly difficult to treat as moderate ulcerative colitis emphasizes again its unsurpassed antidiarrheal effectiveness in these more common conditions:



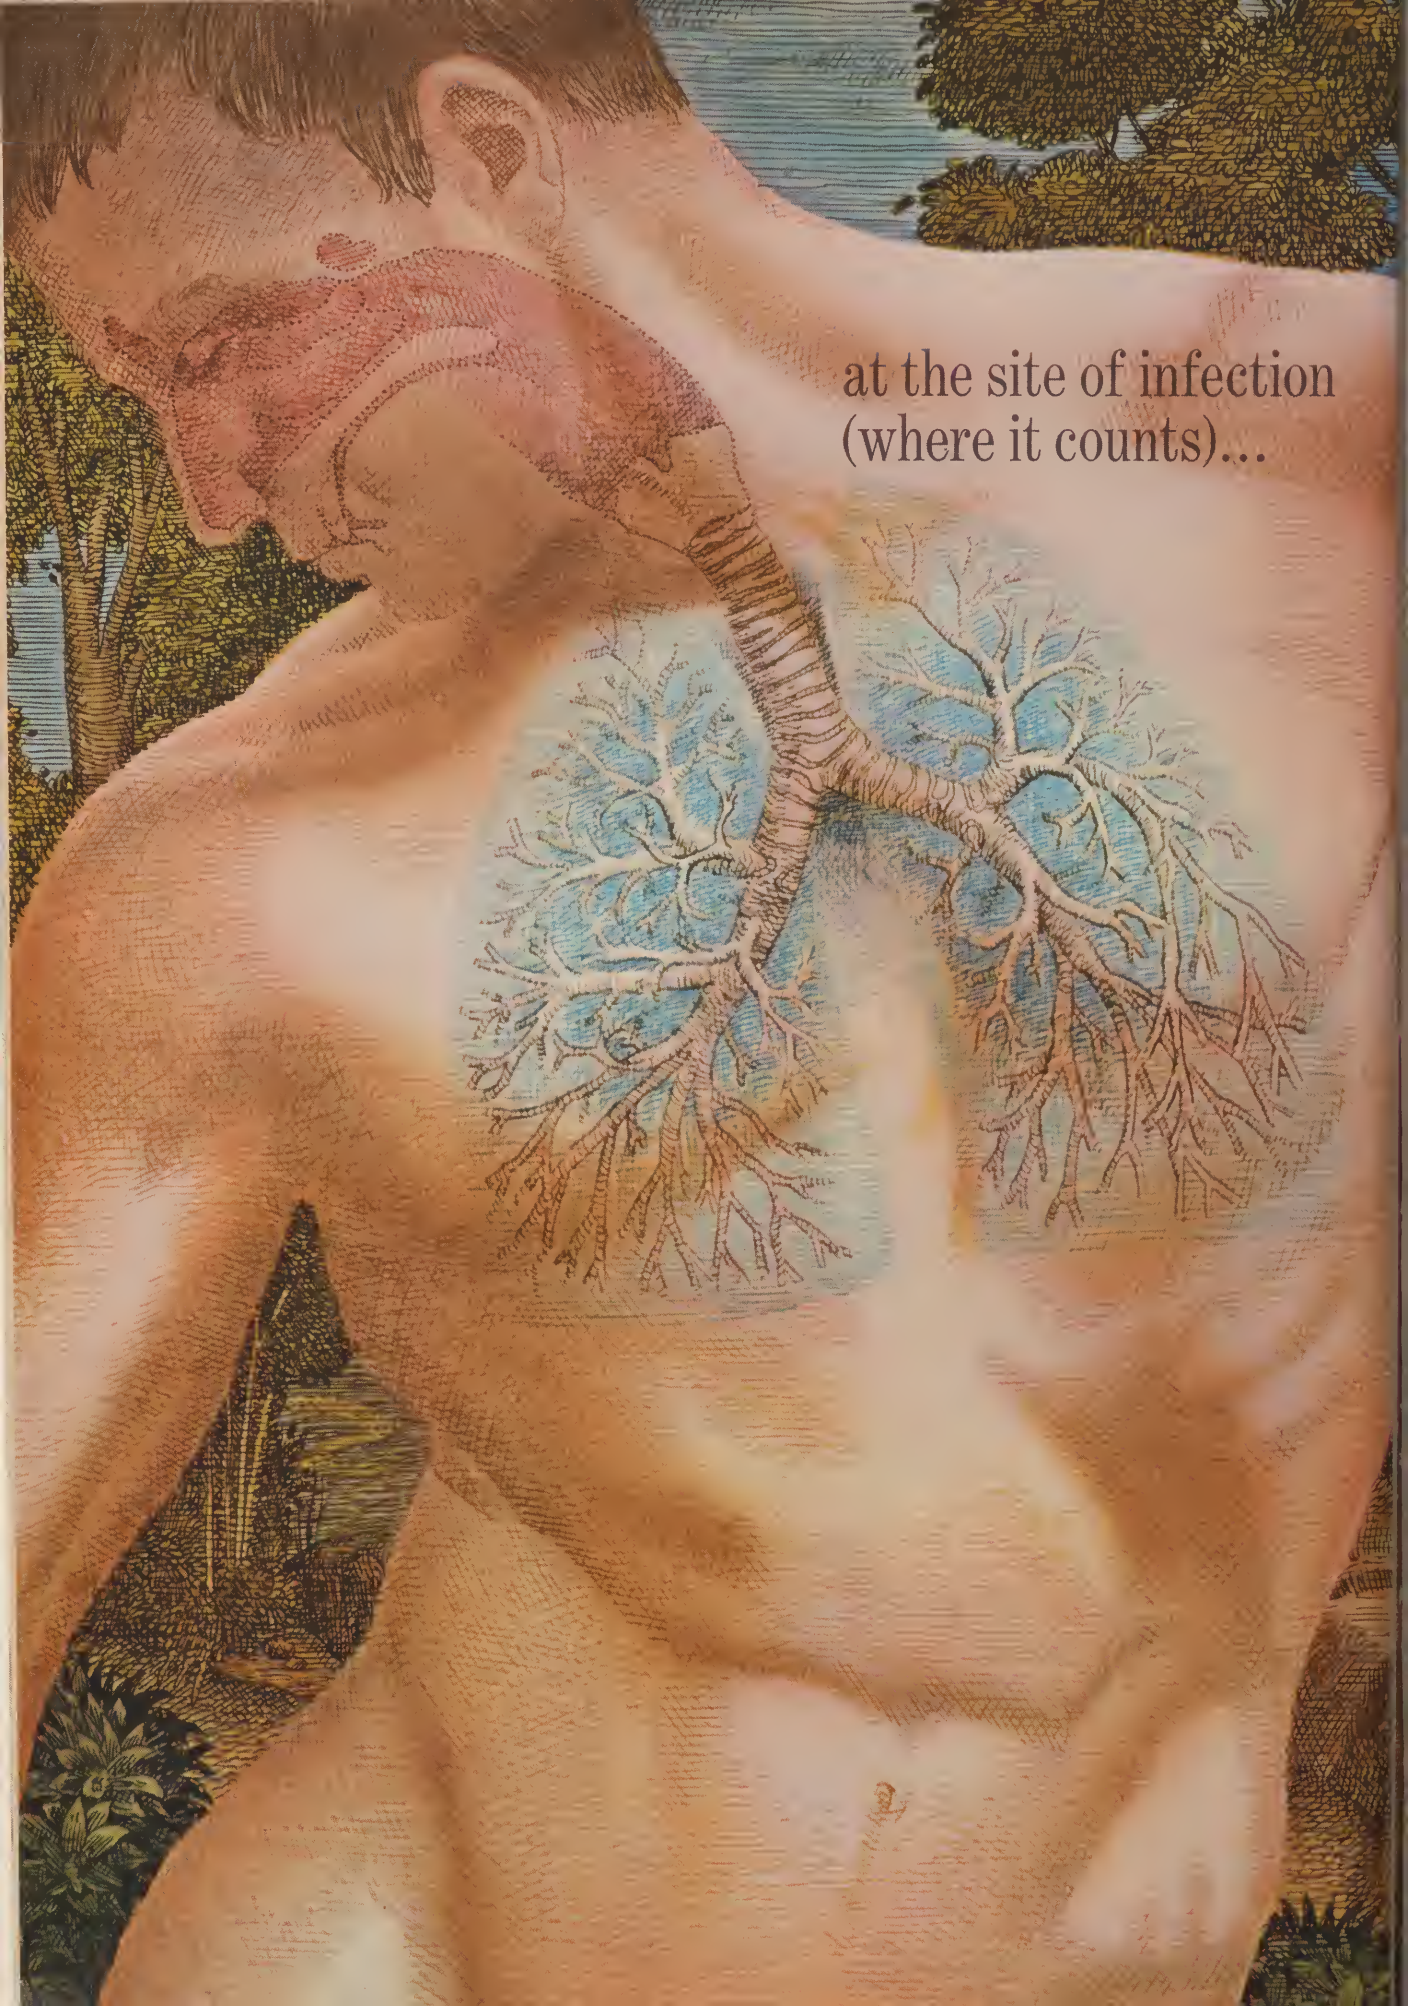
- **Gastroenteritis**
- **Acute infections**
- **Spastic colon**
- **Drug induced diarrhea**
- **Functional hypermotility**

For correct therapeutic effect
Rx correct therapeutic dosage

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are:

Children: Total Daily Dosage

3-6 mo. . . ½ tsp.*t.i.d. (3 mg.)
6-12 mo. . ½ tsp. q.i.d. (4 mg.)
1-2 yr. . . . ½ tsp. 5 times daily (5 mg.)
2-5 yr. . . . 1 tsp. t.i.d. (6 mg.)
5-8 yr. . . . 1 tsp. q.i.d. (8 mg.)
8-12 yr. . . 1 tsp. 5 times daily (10 mg.)
Adults: 2 tsp. 5 times daily (20 mg.) or 2 tablets q.i.d.



*Based on 4 cc. per teaspoonful.
Maintenance dosage may be as low as one-fourth the initial daily dosage.

Precautions: Lomotil is a federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded, and medication should be kept out of reach of children. Should accidental overdosage occur signs may include severe respiratory depression, flushing, lethargy or coma, hypotonic reflexes, nystagmus, pinpoint pupils and tachycardia. Lomotil should be used with caution in patients with impaired liver function or those taking addicting drugs or barbiturates.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of the extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

SEARLE *Research in the Service of Medicine*

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

Now available:
New! Ready-mixed Ilosone Liquid 125! (Contains erythromycin estolate equivalent to 125 mg. erythromycin base per 5-cc. teaspoonful.)

700970

Ilosone®
Erythromycin Estolate

Lilly

(See next page for prescribing information.)

Ilosone®/ the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have also been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with pre-existing liver disease or dysfunction.

Adverse Reactions: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have developed in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly, usually within forty-eight hours, if the drug is readministered to sensitive patients. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared to be definitely related to use of the drug, laboratory findings were characterized by increased direct-reacting bilirubin, elevated alkaline phosphatase levels, negative or weakly positive cephalin flocculation and thymol turbidity tests, elevated serum glutamic oxalacetic transaminase levels, peripheral eosinophilia, and normal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has not been reported in other patients taking prolonged courses of the medication. Patients with chronic infection have been given 1 to to 2 Gm. of the drug daily for periods of two to six months, and patients with rheumatic fever have taken prophylactic doses of 0.5 Gm. daily for two years without difficulty. In one group of 144 patients who received the drug daily for two years, no jaundice was noted. It was of interest that members of six of these patients' families, who were not taking the drug, had episodes of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels were determined in a group of fifty-four adults and children who took 250 mg. of Ilosone daily for an average of sixteen months as rheumatic fever prophylaxis. The results were compared with those of a similar group of forty-four patients who received penicillin. There were no cases of jaundice in either group. Elevation of SGPT and serum alkaline phosphatase levels during the course of treatment was observed in one patient treated with Ilosone and in two patients treated with penicillin. Seven other patients in the group receiving Ilosone and four others in the penicillin group showed elevations in one of the tests at some time during administration of the drugs.

Very satisfactory therapeutic results, without toxicity, were reported in 102 pediatric patients who received short-term (ten-day) courses of Ilosone in the treatment of streptococcus infections. Results of liver function tests in these patients were comparable to those in a similar control group who had received penicillin.

Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of individuals as a result of a local stimulating effect of the medication on the alimentary tract; however, the normal intestinal gram-negative bacterial flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Pulvules®, Ilosone Liquid 125, Ilosone, 125, for Oral Suspension, Ilosone Drops, Ilosone Chewable Tablets.

For infants and for children under twenty-five pounds of body weight, the usual dosage is 5 mg. per pound every six hours; for children twenty-five to fifty pounds, 125 mg. every six hours. (Tablets Ilosone Chewable should be chewed or crushed and swallowed with water.)

For adults and for children over fifty pounds, the usual dosage of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythromycin therapy should be considered.

In the treatment of syphilis, the recommended total dosage is 20 to 30 Gm. given in divided doses for a period of ten to fifteen days. Close follow-up of the patient is necessary since erythromycin drugs have not had adequate evaluation in all stages of syphilis. Examinations of spinal fluid are recommended as part of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days are recommended. In the treatment of gonorrhea, patients with a suspected lesion of syphilis should have a dark-field examination before receiving antibiotics, and monthly serologic tests should be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 250 mg. (equivalent to base), in bottles of 24 and 100.

Ilosone Liquid 125, Oral Suspension, U.S.P., 125 mg. (equivalent to base) per 5-cc. teaspoonful, in 60-cc. and pint-size packages.

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equivalent to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size packages.

Ilosone Drops, 5 mg. (equivalent to base) per drop, in 10-cc.-size packages, with dropper calibrated at 25 and 50 mg.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to base), in bottles of 50. [032767]

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

Highlights

FREE POLIO VACCINE FOR PRESCHOOL CHILDREN

Free trivalent oral polio vaccine (Sabin) is available through local health departments for administration to preschool children. Like the measles vaccine, the material is furnished to the State without cost, through the Federal Immunization Act. Physicians must certify that the vaccine is used for children under school age.

RUBELLA TEST PART OF PREGNANCY BLOOD SEROLOGY

Rubella, a reportable disease but one that often escapes detection, can cause serious damage to a fetus in its first trimester of development, and to a lesser degree in the second trimester. Physicians who suspect their pregnant patients may have, or have recently been exposed to, rubella may submit paired sera of blood samples (taken 14 to 21 days apart) to the Central Laboratory at 16 East 23rd Street, Baltimore 21218. A rise in antibody titre during the interim period indicates active infection. The first specimen should be drawn preferably within two or three days after symptoms appear or exposure to rubella occurs. Instructions for handling and mailing tubes may be obtained from local health departments. Complete details will be published in a forthcoming issue of the Journal.

RUBELLA WARNING GIVEN

John A. Grant, MD, Chief of the School Health Section of the Division of Maternal and Child Health, expects to visit the county medical societies this fall showing slides of rubella damaged children.

Chief concern is for that group born between Jan. 1, 1964, and March 31, 1965, whose mothers may have been exposed to rubella in the early months of pregnancy, during the epidemic of 1963-64. Preliminary studies suggest that possibly as many as 6000 children throughout the state may have suffered some birth handicap.

Clinical evidence of rubella damage most commonly is exhibited in failure to thrive or by the presence of one or more typical congenital anomalies such as heart defects, defects in vision or hearing, defects in other internal organs, and mental retardation. Positive laboratory findings will confirm the diagnosis.

MEDICAL STUDENTS COMPLETE SUMMER PROJECTS

Twenty medical students from the University of Maryland, Johns Hopkins, Yale University and Howard University medical schools, presented summaries of their summer projects in public health at the 15th Annual Public Health Seminar. The purpose of the student program is to assist future physicians to participate effectively in community health programs and to encourage cooperative efforts in preventive medical programs between private practitioners and local health personnel. Four dental students from the University of Maryland Dental School also participated in the summer program.

BALTIMORE COUNTY

About 150 members of the Baltimore County Medical Association and their wives enjoyed the Annual Crab Feast of the Association held at Duffy's Restaurant on August 16, 1967. The Annual Crab Feast is a highlight in the year of the Association and the members are guests of the Association.

* * * * *

The membership approved a proposal that an appropriately engraved plaque be presented to each Past President of the Association. These placques will be presented at our Annual Meeting in December, which will be held at the Tail of the Fox.

* * * * *

The membership also approved a motion that five dollars per paid up member be presented to the Woman's Auxiliary for their projects.

The October meeting of the Association will be held at the Sparrows Point Country Club, the November meeting at the Greater Baltimore Medical Center with a seminar entitled "Common Eye Problems as seen by all Physicians," and the December meeting, with election of officers, will be held at the Tail of the Fox.

FILM EXPOSES HEALTH FRAUDS

Secret cures, "persecution by the medical profession," and other gambits of quackery are exposed in a 28-minute film, "The Health Fraud Racket," available from the Health Department film library. It is suitable for general audiences from junior high through adult level.

EMERGENCY HEALTH SERVICES SUBJECT OF SEMINAR

The respective roles of dentists, nurses, pharmacists and veterinarians during a national emergency were recently discussed and defined at a Professions Training Seminar sponsored by the Health Department, the Maryland Nurses' Association, the Maryland League for Nursing, the Maryland Dental Association, and the Maryland State Pharmaceutical Association.

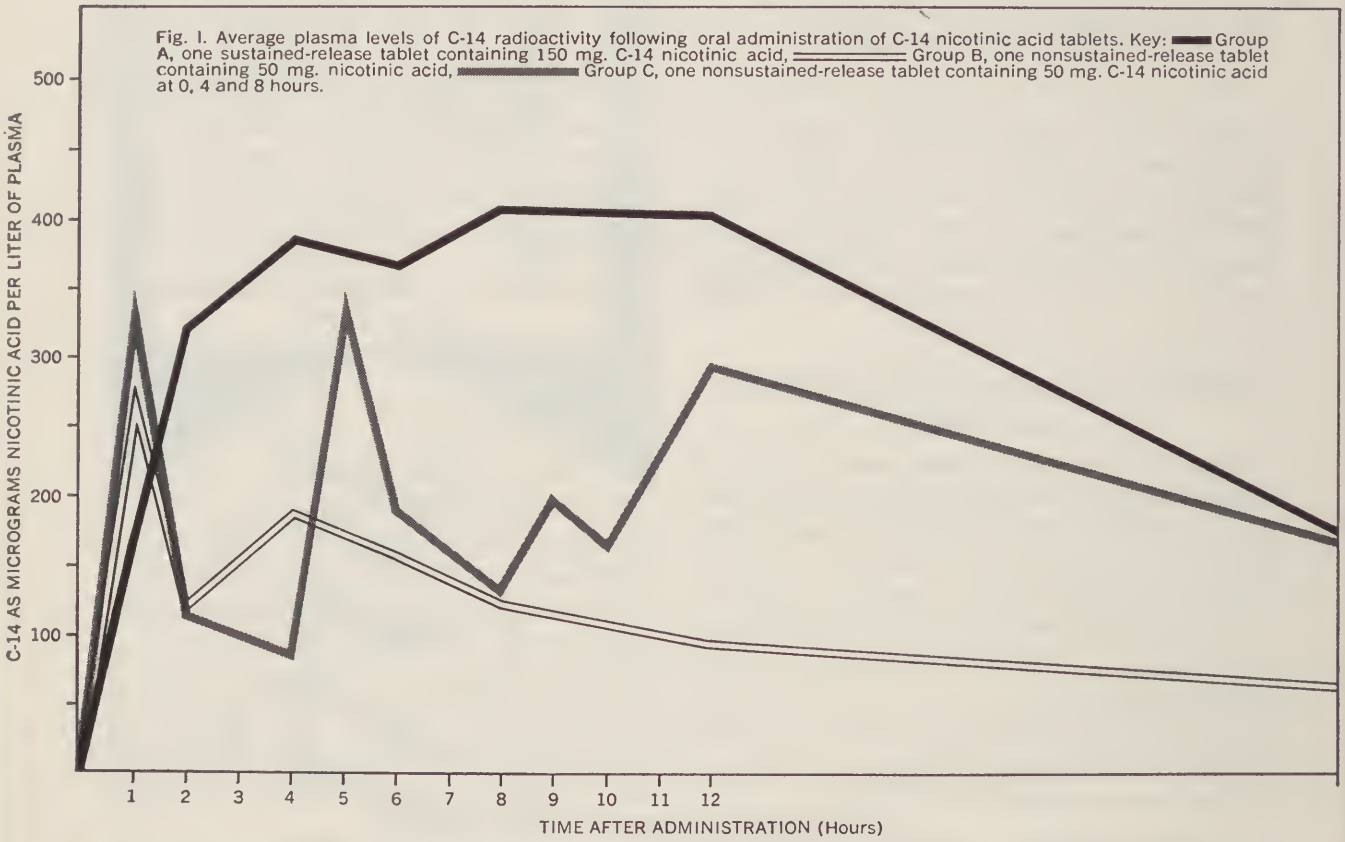
STATE-WIDE X-RAY MACHINE TESTING IN PROGRESS

Antiquated or faulty radiographic equipment presents emission hazards both to the operator and the patient. The Division of Radiological Health has established an inspection schedule which will permit routine state-wide testing of X-ray equipment at approximate two-year intervals. However, anyone in doubt about the safety of his equipment may call for an inspection at any time. Improper conditions may often be corrected "on the spot," according to Robert E. Corcoran, Acting Division Chief.

Technicians should be reminded to stand well behind the protective barrier when making exposures. When using dental, mobile, portable and other equipment without a barrier, the operator must stand out of the useful beam, and as far from the patient as possible. This may be accomplished by use of an electrical supply cord sufficiently long to permit the operator to step out of the room during the exposure. Those using conventional fluoroscopic equipment should "dark adapt" in a darkened room or with red goggles for a *minimum* of 10 minutes prior to the fluoroscopic examination to permit use of a beam of lower intensity than would otherwise be required, and assuring a minimum exposure dose for floruoscopist and patient.

SANITATION CONTROL PROGRAM HIGHLY RATED

The Maryland Shellfish Sanitation control program, a joint responsibility of the Health Department's Division of Food and Milk and the Department of Chesapeake Bay Affairs, has received an overall rating of 96.2 points out of a possible 100 in an evaluation made by the United States Public Health Service. Further efforts will be made to seek out sources of pollution and correct conditions before closing of waters to shellfishing becomes necessary, to study the effects of time and temperature on harvested shellfish, to ensure code dating by packers, and to require certification by the State of all shellfish boats and handlers.



SANITARY TECHNOLOGY COURSES ESTABLISHED

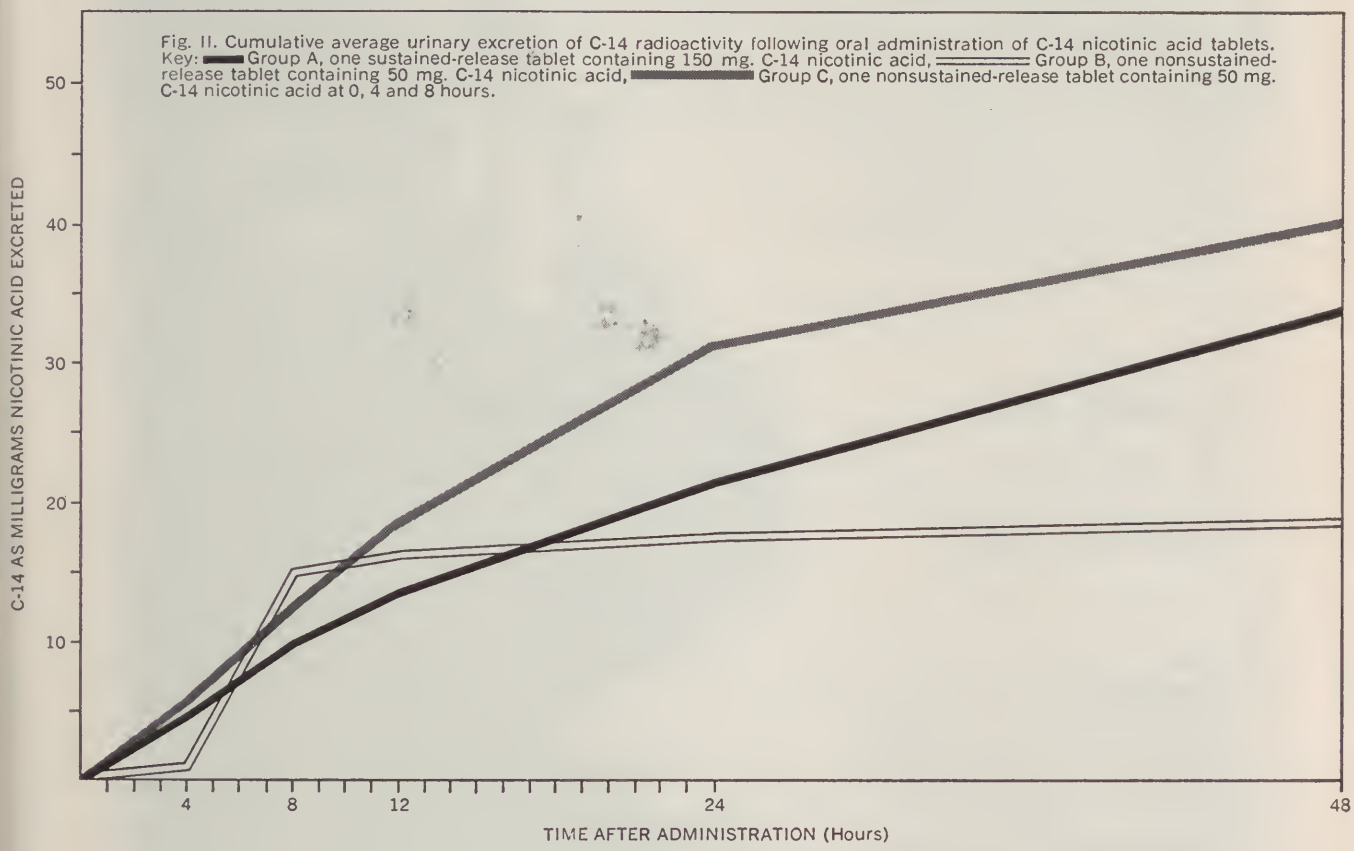
Maryland Senate Bill 136, providing for the training and certification of water and wastewater treatment plant operators, has been implemented with the establishment of courses in elementary sanitary technology at four junior colleges—Hagerstown Junior College, Community College of Baltimore, the Charles County Junior College, and Chesapeake College. Successful completion of the course will enable registrants to qualify more easily for certification by a nine-man board appointed by the Governor. The curriculum was designed by the Division of Water and Sewerage, one of whose staff will serve as a member and secretary of the board.

4,000,000 POPULATION FORECAST BY 1971

If present trends continue, a total state population of four million is anticipated in another four years. As of July 1, 1966, the Division of Biostatistics estimated the total population at 3,615,750, about 515,000 more than the census of April 1, 1960. An increase of 123,000 over the estimated 1,965,960 persons now residing in the Baltimore metropolitan area (which includes the counties of Baltimore, Anne Arundel, Carroll, Harford and Howard) is anticipated by 1971. A gain of 230,000 for a total of 1,220,200 is projected for the two counties in the metropolitan Washington area (Montgomery and Prince George's).

Sustained circulatory, respirator
and cerebral stimulation for th

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

THE PREGNANT CARDIAC PATIENT

CHRIS PAPADOPOULOS, MD
Chief of Cardiology
South Baltimore General Hospital

The internist and the cardiologist are not infrequently called upon to care for a pregnant cardiac patient. Knowledge of the particular problems that pregnancy creates for the heart and circulation is therefore essential. The incidence of heart disease in pregnant women varied in different studies between 1 and 7%. The most common heart disease in pregnancy is rheumatic which accounts for 80 to 90% of the cases. Congenital cardiovascular lesions occur in 1.5 to 5%; whereas hypertensive, syphilitic, and other types of heart disease are observed only occasionally.

To appreciate the effects of pregnancy upon pre-existing heart disease one must understand the circulatory adjustments which occur during normal pregnancy. (a) The oxygen consumption increases between 15 and 25%. (b) The cardiac output increases progressively up to the 28th or 30th week at which time it is usually 30 to 50% above normal. In the last 8 to 10 weeks of pregnancy there is a moderate fall in the cardiac output. The augmented cardiac output is due to acceleration of the pulse rate and increase of the output. (c) The work of the heart per beat an and per minute is increased by as much as the cardiac output. There is progressive acceleration of the circulatory speed from the 3rd to the 9th month of pregnancy. It diminishes moderately in the last weeks before term. (e). There is a progressive rise in blood and plasma volume beginning about the 13th week of pregnancy reaching a maximum around the 32nd week and diminishing thereafter. The total body water increases progressively and there is a tendency to retain sodium.

The circulatory adaptions in pregnancy are designed to satisfy increased metabolic demands of an enlarged uterus and its contents. Clinical observations suggest that structural changes occur in the walls of the maternal blood vessels. Spider angiomas may appear early in pregnancy. The majority of ruptures of aneurysms of the splenic artery occur during pregnancy and the growth of preexisting arteriovenous fistulas has been reported during pregnancy. Labor is relatively well tolerated as compared with the prolonged strain of pregnancy. Labor is associated with slight tachycardia, a moderate and transient elevation in arterial blood pressure and a corresponding increase in the work of the heart. Soon after labor there is an initial increase in blood volume due to emptying of the uterine sinuses. The highest incidence of heart failure coincides with the peak of the

circulatory load during pregnancy. Heart failure beginning during or immediately following delivery is infrequent.

Cardiac Manifestations in Pregnancy

A pregnant woman may present dyspnea, which may be due to increased respiratory effort to ventilate the deflated lungs of pregnancy or due to an abnormal subjective response to the hyperventilation and hypocapnia. She may present hypotension and syncope when she lies on her back because of the obstruction of the inferior vena cava and diminution of the venous return by the enlarged uterus. Edema of the legs develops in about 25% of the non-cardiac pregnant women especially during the last two months of pregnancy. That edema is not due to heart failure may be detected from the absence of venous engorgement of the cervical veins and from the normal venous pressure in the upper half of the body. The heart sounds may be accentuated and slight tachycardia is usually present. The patient with a normal heart may develop systolic murmurs. In the last few months of pregnancy one may hear a systolic bruit that originates in branches of the mammary artery and a continuous murmur that originates in the veins of the breast. Radiographic and electrocardiographic evidence of elevation and rotation of the normal heart due to pressure upward from the enlarging uterus accompanies normal pregnancy.

A careful history and physical examination is essential in diagnosing organic heart disease in pregnancy. Diastolic murmurs should be considered as evidence of heart disease unless proven otherwise. A machinery-like murmur will suggest the diagnosis of patent ductus arteriosus. Coarctation of the aorta may be suggested by the presence of hypertension and the absence of poor femoral artery pulsations. Fluoroscopic examination and an EKG may give the first clue of heart disease.

The physician has also to detect the presence of heart failure. Noticeable dyspnea, unexplained cough, or breathlessness awakening the patient from sleep should attract the attention toward this diagnosis. Relief of the dyspnea and the cough following extreme restriction of salt and one or two injections of Mercurial diuretics is a valuable diagnostic test to confirm the diagnosis of heart failure. In the presence of pulmonary congestion due to left-sided heart failure there is usually a reduction in vital capacity. Prolongation of the circulation time is also a valuable indication for the presence of failure. Of course, there is no difficulty if the patient has the complete clinical picture of heart failure.

Prognosis

With increasing knowledge and attention to the problems of the cardiac patient the mortality rate during pregnancy has been reduced. In recent reports the incidence of maternal deaths due to heart disease is 1% or less. The most common and serious complication of pregnancy in cardiac patients is congestive heart failure. Another is subacute bacterial endocarditis. Pregnancy and labor have been successful in many patients with congenital heart disease. The functional capacity of the heart and the presence or absence of cyanosis and heart failure are important determining factors in the outlook for pregnancy and labor in women with congenital cardiac lesions. There are many reports of pregnancies in patients with coarctation of the aorta and although the course may be uneventful, complications have been reported. Cases of coronary occlusion and acute myocardial infarction followed by pregnancy with successful termination have been reported. An increased fetal mortality has been noted with symptomatic heart disease in pregnancy.

Management

The main point in the treatment of the cardiac patient during her pregnancy is the prevention and control of heart failure. Cardiac patients should enter the hospital one to two weeks before the expected date of delivery for proper appraisal of the cardiac status, for planning of delivery procedure, and for the institution of treatment of incipient heart failure, if necessary. If heart failure has already developed, hospitalization may be necessary for an extended period of time before delivery. The changes in cardiac output and plasma volume during pregnancy can be limited by sodium restriction and the use of diuretics without jeopardizing fetal health. Disorders of the heart beat should be corrected. Quinidine or Procaine Amide may be administered without any additional risk because of pregnancy. Anemia should be avoided by the use of iron supplements

and if present, should be corrected. If there is any evidence of failure, the patient should be digitalized. Maternal heart disease is not an indication for premature delivery or Cesarean section. If, however, there is heart failure early in pregnancy (first three months) the patient should be aborted by dilatation and curettage after treatment to control the heart failure. The strain of labor should be minimized and the competent administration of anesthesia is very important. Most writers agree that non-operative management of the cardiac patient is preferred and that surgical intervention should be reserved for those patients with proven mitral stenosis who show progressive cardiac disability especially in the first two trimesters of pregnancy and which cannot be controlled medically. Surgical treatment for congenital heart disease is seldom necessary during pregnancy. Pregnancy in patients who have had previous cardiac surgical treatment must be evaluated on an individual basis.

In summary, pregnancy creates slightly more risk for the well compensated cardiac patient than the normal woman. The patient whose outlook is relatively unfavorable (patients who are in class 3 or 4 of the New York Heart Association Classification or those with a history of heart failure and atrial fibrillation) should be impressed with the increased maternal and especially fetal mortality. If pregnancy occurs, cardiac supervision and adherence to prophylactic and therapeutic regimen is necessary.

MARYLAND WAMCF HYGEIA FILIAE

OCTOBER 1967

MRS. HARRY L. BERMAN, Editor

"TEAM MATES"

Richard T. Binford, MD, was one of four children born to Quaker parents, residing in Greenbow, N. C. where his father, Raymond Binford, MD, was president of Guilford College. Dr. Binford grew up on the campus and attended Westtown Preparatory School for three years graduating from Guildford College. He then joined the University of North Carolina School of Library Science and after working in the field for four years he enrolled in Duke Medical School. Later he served his internship at Baltimore City Hospital where, he met his wife, Christine. He then acquired a Fellowship to The Johns Hopkins Hospital and worked in the Preventive Medicine Department.

He has practiced in Hagerstown since 1950 except for a three year period, two of which were spent in Atlanta, Ga in the VSPHS and one year in gastroenterology in Philadelphia at the University of Pennsylvania Hospital.

They are the parents of two girls, 18 and 16 and two boys, 14 and 11 years old. Dr. Binford is a stamp collector, and enjoys tennis, reading and music.

Mrs. Christine Binford attended public school in Wilkes-Barre, Penna. and graduated from Cedar Crest College in Allentown, Penna. where she majored in dietetics. Her internship was spent at the University of Pennsylvania Graduate Hospital. After working in Flushing, N. Y. she came to Baltimore City Hospital, and where, following a year of courtship, the Binfords were married. Christine still practices dietetics on a small scale and finds the time to serve as the Chairman of the Hospitality Committee of the Woman's Auxiliary to the Washington County Medical Society.

* * * * *

Dr. and Mrs. E. Gordon Grau

Formerly in private practice, E. Gordon Grau MD, is now the president of the Baltimore County Medical Association. While in private practice in the Loch Raven, Towson area, Dr. Grau was on the resident staff of Sheppard and Enoch Pratt Hospital. Dr. Grau is a graduate of Loyola College and the University of Maryland School of Medicine. In addition to the Baltimore County Medical Association he is a member of the Southern Medical Association, and an associate member of the Maryland and American Psychiatric Associations.

Mrs. Gordon Grau is a graduate of Notre Dame College of Maryland and is this year's Chairman on Legislation for the Woman's Auxiliary of Baltimore County Medical Society.

Why Vascular Specialists Prescribe JOBST Supports

The JOBST VENOUS PRESSURE GRADIENT support is fitted by precise measurements to the contour of the affected limb of the individual patient and exerts precise hydrostatic counter pressures. JOBST supports represent an advanced clinical method of treatment known and accepted by most vascular specialists as the *treatment of choice* for leg ulcers, varicose veins, stasis dermatitis, postmastectomy lymphedema, post phlebitis syndrome, post-fracture, post-operative and injury edema. Trained experts will measure and fit your patients for you at JOBST Service Centers, Suite 200, 818 Eighteenth Street N.W., Washington, Phone 298-5530. Or Suite 415, Medical Arts Bldg., 101 West Read Street, Baltimore, Phone 539-0560.

®

© JOBST, 1966

JOBST offers a complete range of custom-made support garments for the treatment of venous insufficiency and management of lymphedema.

Scoliosis. Part II.

THE MANAGEMENT AND TREATMENT OF SCOLIOSIS

T. H. MORGAN, MD, FRCS (Eng.)
Division of Orthopaedic Surgery
University of Maryland Hospital

Non Progressive Scoliosis

Postural scoliosis is treated by physiotherapy, particular attention being given to posterior spinal exercises. It is usually more satisfactory for the child to be supervised in a physiotherapy department until the muscle tone is adequate to maintain correct posture.

Secondary scoliosis is treated by correcting the cause where possible—minor degrees of inequality in the leg length should be compensated for by shoe raises. In gross discrepancies of leg length, corrective surgery is normally justified.

Progressive Scoliosis

General Principles. In the treatment of progressive scoliosis, we are faced with differing problems depending on the age of the patient. With a patient seen for the first time at or after maturity, the problem is to decide if the symptomatology is sufficiently severe to necessitate treatment, and if so, what treatment should be given.

In the growing child, the problem is more complex. For besides treating deformity already present, our prime concern should be preventing the development of further deformity, especially in those patients in whom we suspect that the ultimate deformity will be of sufficient severity to cause disability. It is, therefore, important to recognize the curves with a bad prognosis, and those that are relatively benign.

As stated previously, the factors that determine the prognosis of a curve are:

1. Etiology
2. Curve pattern
3. Age at which deterioration starts
4. Rate of progression.

The etiology and curve pattern can, in the majority of patients, be identified from a single clinical and radiologicai examination, but the rate of deterioration and the age at which it starts, can only be determined by repeated examinations at regular intervals. Because of this, all patients with spinal curvature should be examined by an orthopaedic surgeon as soon as it is noticed, and the patient should be followed regularly at three monthly intervals until growth has ceased; the progress of the curve being assessed by clinical and radiological examination. A convenient method of estimating the progress of a curve is by graphic analysis. The measurement of the major curve, as determined radiologically is plotted against the age of the patient, and a progression graph constructed; this shows the rate of deterioration, and what is more important, alterations in

that rate are easily observed.

With experience in the interpretation of these graphs, it is, in many cases, possible to predict the ultimate major curve measurement, and thus, to some extent, the prognosis.

Methods of Treatment of Progressive Scoliosis

1. Physiotherapy
2. Appliances
3. Surgical procedures

Physiotherapy

Exercises have a definite place in the treatment of structural scoliosis, but it is important to appreciate their limitations, there being little evidence to suggest that they will halt or even diminish the rate of progression in a developing curve, and in the mature patient, though general posture may be improved, permanent correction of the curve cannot be effected. Breathing exercises directed towards increasing the vital capacity should be given, especially in those patients with significant thoracic deformity.

In later life when pain due to degenerative arthritis is present, other forms of physiotherapy, eg ultra sound and short-wave diathermy may be of benefit.

Appliances

Numerous types of jackets have been devised to effect the mechanical prevention or correction of the curvature. In the majority of these, the principle is to apply pressure to the prominent ribs on the convex side of the curve. On theoretical grounds, it would seem unlikely that much correction of the spine can be obtained by pressure on the malleable ribs of a growing child even if the skin would tolerate much pressure—furthermore it is of the greatest importance to maintain rib motility. For these reasons, the use of this type of brace should be discouraged.

Braces which aim at distraction of the spine, eg the Milwaukee Brace, are found to be more satisfactory.

Moulded leather jackets which maintain rather than correct are of value in unstable paralytic curves, and in selected severe cases of all etiologies in later life, when pain is the predominant symptom.

Surgical Procedures

Of the many surgical procedures devised by this and earlier generations of orthopaedic surgeons,

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 Stymie.

If you, too, need a good printer, let's communicate!

posterior spine fusion appears to be the most valuable operation, and in the majority of patients the mechanical corrections of the curvature is desirable prior to fusion, and this best effected by the Turnbuckle or Risser Jacket.

By this technique, in certain selected cases, the curvature can be considerably improved, and much of that improvement maintained by spinal grafting.

During the past decade the results of spine fusion have been improved, and to some extent, the procedure simplified by the use of Harrington's Rods—though the basic underlying principles of a solid fusion in the corrected position still apply.

This form of treatment is, however, lengthy and tedious to the patient, and as a secondary, but nevertheless important, consideration, it is very costly. It is, therefore, important that it should be reserved for those patients in whom the symptomatology is sufficiently severe to necessitate treatment and in whom the expected improvement is sufficient to make it justifiable.

In patients in whom posterior spine fusion has been performed at an early age in an attempt to stop or limit the progression of a developing curve, the results have been, in the majority of cases, disappointing, as the curves, despite apparent adequate fusion, tend to progress while growth continues.

For this reason, surgery should be withheld until toward the end of the growth period, usually between the ages of 13 and 15 years, although amongst different patients there is considerable natural variation. Thus a progressing scoliosis in a growing child can be one of the most distressing conditions in orthopaedic surgery as one may be obliged to wait until the deformity has almost fully developed before intervening with surgery. Because of this, in recent years procedures such as spinal osteotomy, epiphysiodesis of vertebral bodies, and anterior spine fusion have been performed, but in many instances the results have been discouraging. At present time, there seems to be little alternative to correction and fusion which produces, gratifying results particularly with late onset idiopathic curve and unstable curves of paralytic origin, but it will be appreviated that the selection of suitable cases requires considerable care, and the management considerable skill; for this reason, this form of treatment should only be carried out at specialized orthopaedic clinics.

TWO GOOD REASONS FOR STARTING A KEOGH RETIREMENT PLAN NOW

1. Immediate Tax Savings

A self-employed individual can set up a plan for his retirement and deduct 50 per cent of his contribution from taxable income up to a maximum of $1,250 as well as receive a 100% deduction for contributions for his employees. The tax savings a self-employed in a 48% tax bracket can NOW enjoy with a qualified Keogh Plan are illustrated below.

TAX SAVINGS NOW AVAILABLE

	Without a Keogh Plan	With a Keogh Plan
Self-employed's Contribution	$2,500	$2,500
Taxable Amount	2,500	1,250
Tax	1,200	600
Tax Savings	0	$ 600

By starting a Keogh Plan now, a self-employed can realize a 50% tax savings on his contributions this year—and in 1968, his contributions will be 100% DEDUCTIBLE!

2. Greater return at retirement

Call or write for the arithmetic of your age.

THE 'BLUE CHIP' COMPANY THAT'S LOW IN COST, TOO

when he just can't sleep

Tuinal®

One-Half Sodium Amobarbital and
One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules®

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal is indicated for prompt and moderately long-acting hypnosis. It is not suitable for continuous daytime sedation.

Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Overdosage: C.N.S. depression. Symptoms—Depression of respiration and of superficial and deep reflexes, slight constriction of the pupils (in severe poisoning, dilation), decreased urine formation, lowered body temperature, coma. Treatment—Symptomatic and supportive (gastric lavage; intravenous fluids; maintenance of blood pressure, body temperature, and adequate respiration). Dialysis may speed removal of barbiturates from body fluids.

Dosage: 50-200 mg. (¾-3 grains) at bedtime.

DORSEY Season

A journal within a journal published quarterly in the interests of better medicine by Dorsey Laboratories, a division of The Wander Company, Lincoln, Nebraska. Address communications to Raymond C. Pogge, M.D., Director of Medicine.

this issue: smog, smaze or smust...

Smog, smaze or smust...effects of air pollution on upper respiratory tract

Nathan Flaxman, M.D., Diplomate, American Board of Internal Medicine, Chicago, Illinois

In Los Angeles it is *smog* (smoke and fog). In New York City *smaze* (smoke and haze). In El Paso *smust* (smoke and dust). The original factor was smoke plus such natural phenomena as fog, haze and dust, but air pollution has mushroomed from a smoke problem in our industrial cities into a major economic, esthetic and public health problem that affects practically every American locality and citizen.[1,2] Respiratory disease, of course, is by far the most costly effect of air pollution, for contaminated air can aggravate our illnesses, deplete our strength and shorten our life span.[1]

The greatest problem in dealing with solid wastes is that they are not quickly returned to dust. To aid the decomposing process, the great bulk of such waste is burned, polluting our air in the process.[3] Dr. Jack McKee of the California Institute of Technology[4] has calculated that in Los Angeles County, which has more than six million people, about three pounds of gaseous wastes per person per day (on a dry-weight basis) enter the atmosphere. This is twice as much as solid refuse disposal and six times as much as the contaminants in waste water. It is estimated that in New York City, 730 pounds of pollutants, a little over half the size of a compact two-door sedan of foreign make, is annually thrown into the air for each man, woman and child in the city.[5]

Air pollution is an evident factor, not only in the common cold and upper respiratory disease, but also in chronic bronchitis,[2] pulmonary emphysema,[6] bronchial asthma,[7] pneumonitis and lung cancer.[8] Its effect on the incidence of pulmonary tuberculosis is unproved,[9] although it is conceivable that the presence of various materials polluting the air might do this. A siege of smog in Denver, the "mile high city," in December 1965 was accompanied by respiratory infection that doubled normal absentee rates in schools, factories and city government.[10]

While air pollution is only one factor, it has become important in the causes of most of the afflictions of the respiratory tract. This has been shown not only by the Denver occurrence, but also by detailed study[2] of respiratory illness in a small group of 313 men

from October 1962 to May 1963 when there were 202 episodes involving the upper respiratory tract. The attack rate of illness was related in time to increased concentration of both smoke and sulphur dioxide in the atmosphere of the district in which the men lived.

Other factors often mentioned, include exposure to those who have colds, exposure to extreme changes of temperature, allergy and bacterial infection. However, when low individual resistance due to lack of rest, overwork, fatigue, improper or unbalanced diet, previous illness and emotional stress are included as causes, we enter the realm of somewhat obscure relationships. Much more emphasis can be placed on the role of polluted air.

The symptoms, signs and complications of involvement of the upper respiratory tract, especially the common cold, are the same regardless of the causative factor. Swelling of the lining of the nose, the scratchy dry throat, the discharge from the nose at first watery then thicker, discolored and more tenacious, the eyes tearing, and frequent sneezing are all part of the Number 1 human ailment. Concurrent or residual sinusitis when mucus is trapped there, middle ear involvement due to interference with drainage, laryngitis and bronchitis are complications of the common cold. The primary interference is with a most important function of the nose—the cleansing of foreign matter in the first line of "air defense" to prevent it from entering the breathing tract.

However, the diagnosis and subsequent decision on how to treat the patient so affected rests basically on the relief of symptoms that cause him the misery. The stuffed, runny nose, the clogged ears, and the harsh dry cough—all the symptoms that make common cold sufferers feel miserable and interfere with their sleep—can be alleviated with medications of the oral nasal decongestant/antihistamine combination type. The burning sensation in the throat, soreness of the chest and even chest pain can also be relieved by such medication. Rest in bed if there is fever (but confined to home at least), liberal fluids, uniformly warm surroundings and adequate humidity in the room, are all helpful adjuncts to the medication. Most common cold sufferers recover rapidly and are symptom-free in four to ten days.

Further treatment, altered by the fact that the affliction hangs on for more than the usual duration of the common cold, requires consideration of allergy, which is most frequently the prolonging factor. But air pollution itself may often be the culprit.

(Concluded on following page)

For nature's hazards:
nasal congestion
due to seasonal
allergies and
summer colds

Triaminic® *syrup*

Each teaspoonful (5 ml.) contains:

Phenylpropanolamine hydrochloride	12.5 mg.
Pheniramine maleate	6.25 mg.
Pyrilamine maleate	6.25 mg.

For nasal congestion regardless of cause, you can bring quick, lasting comfort to your little patients with Triaminic Syrup. You may occasionally encounter these side effects: drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: the possibility of drowsiness should be considered by patients engaged in mechanical operations requiring alertness. Use with caution in patients with hypertension, heart disease, diabetes, or thyrotoxicosis.

(Advertisement)

At the Third National Conference on Air Pollution held recently, it was emphasized that this subject had received more attention in the past four years than in all previous history. Spicer,[11] an active participant at this conference, reiterated that it behooves the practicing physician to be aware of trends in respiratory disease and to accept a major role in community action relating to air pollution and respiratory health. By taking a positive stand physicians have been instrumental in the development of anti-pollution legislation. An outstanding example is Los Angeles where major steps have been taken by abolishing coal burning, and even banishing oil burning, seven months a year. Natural gas must be used instead and it must be used by industry when available. Backyard incinerators have been abolished in favor of landfill disposal, and building incineration ended except for a few expensive smokeless furnaces.[10] Concerted action can be taken against particular industrial nuisances. One company that disregarded complaints discovered its error when thousands of its credit cards were returned by irate customers who decided to patronize competing companies.[12]

Summary. Respiratory disease is the most important and most costly effect of air pollution, whether termed smog, smaze, or smust. Air pollution is an economic, esthetic and public health problem that affects practically every American locality and citizen. New sources of air pollution are invisible and odorless, but the harmful gases and liquid droplets are there. Triggered by sunlight, some of these undergo mid-air chemical changes and the results are even more irritating to the upper respiratory tract. The symptoms, signs and complications, especially of the upper respiratory tract, can be readily aborted by modern medication but may be unduly prolonged by polluted air. In steps taken to prevent this, the practicing physician can take a major role.

How can he be a sport with a runny nose?

For summer allergies, summer colds, or nasal congestion due to almost any cause, you prescribe quick r-e-l-i-e-f with Triaminic. It's ideal for summer allergies:

1. Acts in 15-30 minutes due to decongestant.
2. Follows up with balanced dual antihistamines.
3. Up to 24-hour 'round the clock relief when dosed one tablet at morning, midafternoon and evening.

Summer time is sport time and who can be a sport with a runny nose?

provide patient comfort

Triaminic® relieves summer allergies

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitation, flushing, dizziness, nervousness or gastrointestinal upsets.

Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

Hand Function in Parkinson's Disease

DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

All changes in function develop slowly in Parkinson's Disease; the changes in hand function may be among the first. Very early, the fingers may become flexed at the metacarpo-phalangeal joint. This position tends to be assumed whenever the patient is at rest. Somewhat later, trembling of the hand or arm may start, proceded or accompanied by easy fatigue. The awkwardness with fine movements, such as typewriting, piano playing and manipulating small buttons is secondary to a combination of weakness, lack of coordination, tremor and stiffness.

The stiffness and tremor gradually increase. Starting usually on one side, the other side is soon involved. The smaller muscles throughout the body seem to suffer more than the large muscles, notably in relative weakness, but also in coordination. Thus, writing deteriorates, becomes smaller in size (micrographia) and finally illegible. Gross changes in the posture of the fingers do not occur until the disease is far advanced.

Characteristic late changes of slight flexion of the distal interphalangeal joints, slight hyperextension of the proximal interphalangeal joint and flexion at the metacarpo-phalangeal joint ("intrinsic plus hand") are illustrated in Figure 1. Figure 2 shows a somewhat earlier pattern similar except for the absence of definite flexion at the metacarpo-phalangeal joint. Figures 3 and 4 show that the hand maintains its resting position when in active use. Hand changes are more common when rigidity is severe and tremor mild.

Charcot (1) drew attention to the resemblance between Parkinson's Disease and rheumatoid arthritis of the hand. Hughlings Jackson (2) noted that the interossei are principally involved and that the hand takes the position seen in tetany. Walsche (3) and Wilson (4) noted that rigidity is the cause of the deformities. Gortvai (5) described the improvement in hand posture following surgical lesions in the ventrolateral nucleus of the thalamus. He noted that paralysis of the ulnar nerve with procaine in patients with hand deformities of Parkinson's Disease results in the hand returning to a normal position. Stimulation of the ulnar nerve in a normal upper extremity at a point distal to the branches to the flexor carpi ulnaris and the flexor digitorum profundus results in characteristic flexion at the metacarpo-phalangeal joints and extension at the interphalangeal joints. There is good evidence, therefore, that the characteristic deformity seen in the hands in Parkinson's Disease is the result of muscular rigidity of the interosseous muscles.

Figure 1
Characteristic hand changes in late Parkinson's disease

Figure 2
Slightly earlier stages of hand change in Parkinson's disease

Figure 3
Method used to grip by patient with advanced changes of Parkinson's disease in the hand.

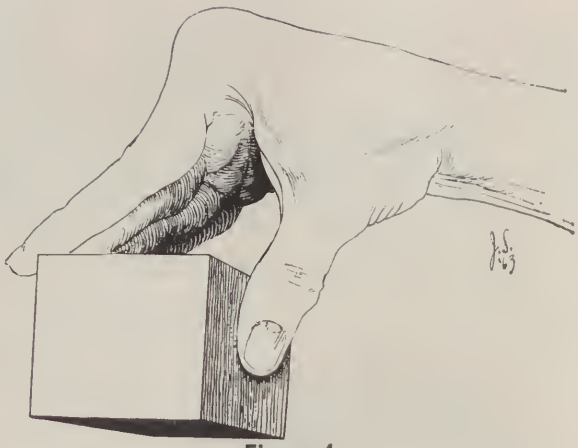

Figure 4
Method used to grasp by patient with advanced changes of Parkinson's disease in the hands.

Gortvai describes three stages of the hand deformity: first, an early stage with slight flexion at the metacarpo-phalangeal joint and extension at the interphalangeal joints. A second stage (Fig. 2) is characterized by increased extension at the proximal interphalangeal joint and beginning flexion at the distal interphalangeal joint. The third stage (Fig. 1, 3 and 4) is the same as stage 2 with marked flexion at the metacarpo-phalangeal joint.

Diagnosis:

cystitis?
pyelonephritis?
pyelitis?
urethritis?
prostatitis?

in any case,
usually gram-negative*

Therapy:

two 500 mg. Caplets® q.i.d.
(initial adult dose)

Indications: Urinary tract infections caused by gram-negative and some gram-positive organisms.

Side effects: Mainly mild, transient gastrointestinal disturbances; in occasional instances, drowsiness, fatigue, pruritus, rash, urticaria, mild eosinophilia, reversible subjective visual disturbances (overbrightness of lights, change in visual color perception, difficulty in focusing, decrease in visual acuity and double vision), and reversible photosensitivity reactions. Marked overdosage, coupled with certain predisposing factors, has produced brief convulsions in a few patients.

Precautions: As with all new drugs, blood and liver function tests are advisable during prolonged treatment. **Pending further experience, like most chemotherapeutic agents, this drug should not be given in the first trimester of pregnancy. It must be used cautiously in patients with liver disease or severe impairment of kidney function.** Because photosensitivity reactions have occurred in a small number of cases, patients should be cautioned to avoid unnecessary exposure to direct sunlight while receiving NegGram, and if a reaction occurs, therapy should be discontinued. The dosage recommended for adults and children should not arbitrarily be doubled unless under the careful supervision of a physician. Bacterial resistance may develop.

When testing the urine for glucose in patients receiving NegGram, Clinistix® Reagent Strips or Tes-Tape® should be used since other reagents give a false-positive reaction.

Dosage: Adults: Four Gm. daily by mouth (2 Caplets® of 500 mg. four times daily) for one to two weeks. Thereafter, if prolonged treatment is indicated, the dosage may be reduced to two Gm. daily. Children may be given approximately *25 mg. per pound* of body weight per day, administered in divided doses. The dosage recommended above for adults and children should not arbitrarily be doubled unless under the careful supervision of a physician. Until further experience is gained, infants under 1 month should not be treated with the drug.

How supplied: Buff-colored, scored Caplets® of **500 mg. for adults,** conveniently available in bottles of 56 (sufficient for one full week of therapy) and in bottles of 1000. **250 mg. for children,** available in bottles of 56 and 1000.

NegGram

Brand of

nalidixic acid

a specific anti-gram-negative

eradicates most urinary tract infections...

- Low incidence of untoward effects; no fungal overgrowth, crystalluria, ototoxic or nephrotoxic effects have been observed.
- "Excellent" or "good" response reported *in more than 2 out of 3* patients with either chronic or acute gram-negative infections.[1]

*As many as 9 out of 10 urinary tract infections are now caused by gram-negative organisms: E. coli, Klebsiella, Aerobacter, Proteus, Paracolon or Pseudomonas[2]... However, infections of the urethra and prostate caused by non-gonococcal gram-negative organisms are believed to be less prevalent.

Alcoholism
SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

About the Therapy of Alcoholics

ANDRE WEISS, MD
Staff Psychiatrist, Sheppard & Enoch Pratt Hospital
Instructor in Psychiatry, Johns Hopkins Hospital

The main purpose of this paper is to share the experiences encountered by me in treating, with psychotherapy, a small, but rather diverse group of inpatients. All of these patients represented serious drinking problems and were treated during the same period of time.

This study is written entirely in retrospect. During the actual stay of the patients in the hospital, when their treatment took place, the idea to write a paper about them had not been considered. This point is important to mention, because, apart from the obvious disadvantages this would present, I feel there is at least one important advantage as well. Because too often when studies or research are planned in advance, artefacts spoil the validity of a spontaneous and natural interaction between patients and therapist.

It is a well-known fact that the treatment of alcoholics in general practice, as well as in psychiatric practice, is a difficult and often frustrating experience. Few of them keep their appointments, few of them have the necessary motivation to undergo long-term psychotherapy. Zwerling[1] and his associates, reported that close to one-third of unselected volunteer alcoholics who applied to an outpatient clinic for treatment, failed to return after the first visit, and another one-third discontinued therapy before the first month was over.

I will commence with some of my experiences gained with alcoholic patients prior to becoming a psychiatrist, during my eight years of general practice in a small town. I will then describe how patients with drinking problems are treated at the Sheppard and Enoch Pratt Hospital, discussing the various policies and treatment approaches, and finally will go into some details about the patients in question and attempt to draw some conclusions.

As a general practitioner, I despised and was less than patient with the majority of alcoholics. It is interesting to note that very rarely could I call myself their family physician. Apparently, just as the alcoholic is ashamed to admit his disability to some of his relatives or friends, he is also reluctant to seek the help and advice of his family doctor, who is looked upon at times as a friend, other times as the boss, or even as the judge. These patients were apparently "shopping around" from doctor to doctor, exasperating everybody whom they consulted. Today I think rather, that the physicians, including myself, discouraged them to return for treatment with a negative, unfriendly, often critical attitude. I would like also to mention the attitude of the local general hospital, an attitude which is typical for the majority of hospitals in regard to alcoholism. I was several times criticized by the hospital authorities when I admitted somebody with severe symptoms due to acute or even chronic alcoholism. Sometimes I was obliged to, so to speak, smuggle them into the hospital, with an incomplete, or even false diagnosis, such as "Acute Gastritis," "Cardiac Decompensation," or I would only mention part of the diagnosis, such as "Cir-

Presented at the Sheppard and Enoch Pratt Hospital Scientific Day Program June 3, 1967.

rhosis of the Liver," or just "Severe Dehydration," leaving out the nasty word "Alcoholism."

I was always very impressed and sometimes surprised how rapidly these patients improved under intensive medical care when hospitalized. Intravenous fluids, vitamins, tranquilizers and some sedatives would, in a few days, put them back on their feet and they would return to the community, promising total abstinence. But these promises were rarely kept. I had invented a series of "gimmicks," all having one goal: to make them come back at regular intervals to my office, to "have an eye on them." These so-called gimmicks were weekly vitamin injections, weekly refills of prescriptions, but also periodic palpation of the liver and abdomen, as well as the check of blood pressure and weight. My psychotherapeutic approach was simple. All I would inquire was: "Did you drink this past week?" If the answer was no, I would praise them; if it was yes, I would get angry and threaten to not treat them any longer. I would also often tell them: "You are killing yourself!" I was acting as a judge and a policeman and was forcing them to lie to me. I have to admit that except for one single case in eight years, I never attempted to go deeper into the discussion of their background, family life or even the reason of their drinking. There was, however, one exception; a man I treated with intensive psychotherapy. In this case, I was his family physician and had attended his wife during her delivery of a child. He was an intelligent person, about 35 years of age. In place of the above mentioned gimmicks, at his request, I began to see him twice a week for a long talk. The therapy lasted for several months, during which time he came regularly to the sessions. Apparently, I also enjoyed the treatment, because why otherwise would I have spent so much time with him and not with the others? He stopped drinking and remained abstinent ever since. Here I would like to make my first point. In the case of an alcoholic, more than in any other psychiatric disorder, motivation for both patient and therapist is essential to achieve results. I will come back to this point in connection with another of the cases I propose to present.

At the Sheppard and Enoch Pratt Hospital the alcoholic patients are in general not treated differently from the other patients. Intensive individual psychotherapy associated with milieu therapy, and in some cases group therapy are our main tools. Most of us at *SEPH* do not consider alcoholism as a separate illness and put the emphasis on the treatment of the underlying affective disorders, personality disorder, or thinking disorder. I agree with the statement of Diethelm[2] that there is not sufficient evidence to support the claim that a special personality type predisposes to alcoholism and came to the conclusion that alcoholism is not a single entity or disease, but a symptom associated with several illnesses or syndromes.[3] I think that the variety of the pathology in the patients I had the opportunity to treat tends also to justify this opinion.

Sheppard-Pratt Hospital has some set rules and regulations concerning alcoholics. They are not admitted for very short stays for the sole purpose of sobering up. The patient with drinking problems is asked, during and after his hospitalization, to remain abstinent. No alcohol is permitted on the premises of the hospital. There is an alcohol committee composed of patients from various halls, who enforce the rules of abstinence. Membership on the committee is voluntary and often several of the members have or had drinking problems themselves. This committee would confront a patient who returned from town intoxicated and would see to it that no alcohol is consumed on the halls or grounds. The committee works in conjunction with the medical staff, which functions in an advisory capacity.

All patients are admitted to locked door halls and are given various permissions as they progress, this including the move to an open hall, ground or even town permission. If the alcoholic drinks during a trip into town, he is restricted to the hospital grounds for some time or even moved to a closed hall again, if this is found to be indicated. These restrictions are decided by the hall administrator, in consultation with the therapist. The milieu therapy consists of a variety of activities and assignments, as well as a new life experience on the hall. Occupational and work therapy, sports events, plays, literary activities, all contribute to give back to the patient the lost drive and will power and channel his interest into new areas. We are not encouraging, but at the same time, are not discouraging, either, the participation of such patients in AA meetings during their hospitalization. Such participation, however, is often encouraged after discharge. The use of

drugs is kept to a minimum.

Let us now discuss more in detail my patients in question. All of them, a total of seven, had been labeled as alcoholics by their referring physicians. It is not the purpose of this paper to try to give a definition of what the term "alcoholic" means. It seems to mean different things to different people,[4-6] and we will have to content ourselves with the fact that all seven patients were compulsive drinkers, whose drinking interferred with their family and professional lives, and became detrimental to their emotional and physical health. There were four females and three males who had started drinking from five to 25 years ago. All belonged to the middle-aged or late middle-aged group, between 42 and 49 years old. Four had graduated from college, including all three males. All of them were married, one of the females being a widow. Six of the seven had at least two or more children. All except one were voluntary admissions. The average stay was around four months; the shortest stay being one month, the longest nine months. They all had individual psychotherapy, 50 minute sessions, three times a week. Five participated in group therapy, in various groups with other therapists. The groups were not composed of alcoholics only. Most of these patients received ground permission after the first month of hospitalization. In spite of the fact that their diagnosis on the charts varied between passive-aggressive personality, reactive depression, obsessive-compulsive personality, schizoid personality and schizophrenia, it was striking that all patients were clinically depressed at the time of their admission. Most of them were not only emotionally, but also physically ill, this ranging from glaucoma, gastric ulcer, thyroid and liver ailment, hypertension, neuritis, petit mal epilepsy, fungus infections, etc. It was notable that their physical symptoms improved rapidly, in most cases without intensive medical treatment. After these statistics and generalities, let us discuss some of the patients more in detail.

A 48 year old widow (she looked at least 10 years older than her stated age), who had lost her husband several years before and who had been married twice before that, had no profession and no goals in life. Both of her parents were alcoholics and two out of three husbands were alcoholics as well. This case is presented to illustrate a so-called "hopeless situation." Her parents divorced when she was nine years old and she started to drink at the age of 18. She was first hospitalized because of her drinking at the age of 24 and several times after that for short periods of time and her long contact with psychiatrists did not seem to have made any difference in her condition. Her nervous system, vascular system and liver were pathologically altered by alcohol. From the beginning, she lacked motivation and after telling me, during several sessions, her life story, she signed herself out without attempting to use her hospitalization as a "new start." The prognosis in this case was and remains poor. Still, I was quite surprised when six months following her discharge she came back to talk to one of our social workers, stating that despite the fact that she had not stopped drinking, she was feeling better and needed much less alcohol to satisfy herself. She also stated that I had helped her a great deal and that she is thinking back to the sessions with nostalgia. And I began to think and look over my notes in an attempt to find out what in our sessions was helpful to this patient and why was I, apparently, at least partially, successful in treating her. I remembered one session in which she related in a rather matter-of-fact way an episode of her life when she was 10 years old, her parents had divorced sometime before and she lived with her mother and a maternal aunt, who would often go out at night, leaving her alone. Often she would lie alone at night in her bed, unable to sleep and cry out loud, "Daddy, Daddy," wishing that her father would be near her. It became apparent to me that all her life this woman had been looking for a father and could never find him again. I recalled how deeply moved I was during this session, because I felt very sorry for the child, not the mature woman in front of me. This feeling of the therapist had to be sensed by the patient, even if it was never openly talked about.

In the next case the same transference and counter-transference in a stronger and more therapeutic way were present. This case is very different in most aspects, even if there were some basic similarities with the previous case. The patient was a 49 year old male, a mining engineer, a high official in an industrial firm. He too, just as the previous patient, began drinking in his late teens, but he was able to finish his college studies and work himself up to a high position in his

There are 35,700* undetected diabetics in Maryland

Most of these are probably among patients over 40; the overweight; relatives of diabetics, and mothers of large babies. By the time polyphagia, polyuria, polydipsia, pruritus or other overt symptoms of diabetes appear, damage may have been done that could have been minimized. DEXTROSTIX® gives you a reliable blood-glucose estimate in 60 seconds.

Why Wait?

Ames

company. His drinking got out of hand for the past several years and he was hospitalized twice for short periods of time in general hospitals. He attempted suicide two years ago, slashing his throat and wrists superficially. He was chronically depressed and received a series of six shock treatments a few months prior to his admission to Sheppard Pratt Hospital, but his depression did not improve. It is interesting to note that several similarities between the patient's past life experience and my own were present. This gave me more incentive and motivation. The patient spent several years in Europe in boarding school, in the same country in which I studied. During World War II we both spent years in concentration camps. I knew well the small community he resided in, having worked there in the local community hospital for one year. To make his case even more interesting for me, a unique record about his childhood was available. His mother had written a book about the family's travels. Through this book, which I read, and through our sessions it became evident that he was a rather emotional and dependent child, who was forced into premature independence by rigid parents. He was raised in boarding schools or by grandparents, and soon learned that crying leads to nothing. He was forced to hide his emotions and withdrew into himself. At his mother's death in his early twenties, he did not cry. The death of his many friends in concentration camps in World War II left him apparently untouched on the surface. His war experiences were quite unusual and important. One day his captors transported several thousand American prisoners on a boat from one island to another. The patient was part of the transport. The boat was torpedoed and later sunk. All but four perished. He was in the water many hours and finally swam toward a distant lifeboat to be saved. This patient remained in our hospital voluntarily for six months and my main goal in his treatment was not to stop his drinking but to investigate the cause of his depression. Finally the answer came in a series of rather dramatic sessions. He began to recall that when the ship was struck by a torpedo, he was in the company of several good friends. As the boat did not sink at once, his friends decided to stick together and to try to help and save each other; but the patient suddenly panicked and jumped overboard, leaving his friends behind. There, in the cold water, he began to think of death and was not frightened. He was thinking that soon he would meet his mother again in Heaven. The thought of dying became more and more tempting. But suddenly, far away, he noticed a lifeboat, forgot about mother and friends and began to swim. Then he remembered his first night on the lifeboat together with three unknown survivors. He experienced auditory hallucinations and thought he recognized the voices of his friends calling for help. During the therapy session in which he related and relived this episode, the patient began to cry for the first time in treatment. He recognized his guilt feelings and how he had repressed and denied his sorrow until now. We are dealing in this case with a delayed depressive reaction, common in survivors of concentration camps.[7] The depression lifted gradually the following month and we were able to discharge him as much improved. Six months after the patient's discharge, he was functioning well and was abstinent.

The above-mentioned patient was motivated and wanted to get well. His drinking aggravated his depression. Karl Menninger[8] calls alcoholism suicide by inches, meaning that the alcoholic is slowly killing himself, using alcohol as a weapon. I sometimes wonder if this is so in all cases, and whether it is not the contrary that is true, namely, that alcohol can prevent suicide, acting as a tranquilizer or a short-term energizer, making the life of the depressed more bearable.

Discussing some of the reasons why patients were drinking, I would like to mention the school principal of a large school. He, too, remained at the hospital about six months as a voluntary patient, eagerly taking part in psychotherapy, group therapy and occupational therapy. This educator, for years, was looking to find a way to leave his profession, as his work became less and less rewarding. He became chronically dependent on alcohol and needed many drinks each night to be able to keep going. Then during one session the patient admitted that often in the past he was secretly hoping that he would become ill, not a serious illness, just ill enough to have to quit his job, and at this point, I commented: "But you have found your illness; it is alcohol. You were able to drink yourself out of your job."

This patient lacked sufficient motivation and desire to stop drinking. He resumed drinking soon after his discharge, but as his depression and his

outlook on life improved, he was able to drink less without so much of a guilt feeling as before. He went back to college and took up a new field.

Let me also mention the housewife who, due to conflicts regarding her sexual identity, had a psychotic episode with paranoid delusions and ideas of reference. Several years before her pscychotic decompensation, she began to drink large amounts of liquor each night. This case illustrates how alcohol can be the first symptom, a sort of precursor of psychosis. After treating her for close to six months, she developed, in the hospital a psychotic episode and had to be put on *Stelazine* (Tufluoperazine). This was the only patient in the group who was put on medication, and discharged on medication. She remained in the hospital for nine months and after her discharge made a marginal adjustment, but stopped drinking.

Another of my patients, a 42 year old male, was put, by his family physician, on *Antibuse* (Disulfrium) for over five years prior to his admission here. He stopped drinking, but became a drug addict, taking *Seconal* (Sodium secobarbital) or *Codeine* indiscriminately in large quantities. During his 20 years of alcoholism he exchanged his addiction back and forth several times, from alcohol to drugs and vice versa. This case illustrates the theory of Rado[9]—that it is not the toxic agent, but the impulse to use it which makes an addict of a given individual.

I think it is interesting to mention that despite the policy and orders of our hospital, banning alcohol and insisting upon complete abstinence, each of my patients who remained with us longer than six weeks became temporarily involved during their hospitalization, in some way, with alcohol. This involvement usually had a specific meaning or reason. I consider it as taking the place of messages and their significance became clear after having discussed it in therapy. It could also at times be seen as a way of interaction between a patient and his family or patient and his therapist. In most cases it expressed hostility, but sometimes it was a warning signal. As an example, I will present the case of the elderly housewife who remained five months in the hospital and who would go out with other patients for dinner. She would make it a point to pay for her friends' drinks, herself remaining abstinent during her stay at the hospital. After her discharge, she herself began to drink again. Or the patient, a middle-aged man, who, after four months' hospitalization and abstinence, would go home for the first time and find a bottle of liquor in the kitchen cabinet next to the carton of cigarettes, where no alcohol would be stored usually. This patient took one swallow from the bottle. What happened? It became evident that the patient wanted to punish his wife who left the bottle on purpose to test her husband's "improvement."

Now I arrive at last, and, I think, most important part of the alcoholic problem complex: the family, and especially the spouse, of the alcoholic. I firmly believe that if there is a "schizophrenogenic" mother,[10] so there is also an "alcohologenic" spouse. Such a spouse can be so exasperating, domineering and critical that there is no other way out for the patient than either to divorce or to drink. Often after a long interview or telephone conversation with some of the wives of my alcoholic patients, I, the therapist, have felt so desperate and depressed that I could have well used a drink. Some members of the families of alcoholics are extremely difficult to handle. All family sessions I attempted with them have been a failure and an untherapeutic experience. I would like to emphasize here how important it is for the spouses to have more contact with social service, especially in a place like Sheppard Pratt Hospital, where usually, during psychotherapy, the alcoholic symptom is somewhat left in the background. If possible and if indicated—and in most cases it is—the spouse should be recommended for individual or group therapy.

In conclusion, it is significant that all seven patients I have treated in psychotherapy have developed positive transference rather rapidly, which was helpful in treating them. The motivation of the patient, but also of the therapist, is of enormous importance. The results will often depend on the attitude of the therapist. Understanding and absence of criticism are the most valuable tools. When some of the patients asked me how they could find the strength to stop drinking, I had no answer to offer them, and I have no answer now. It is up to them to find an answer. I feel that we have to insist on total abstinence, but I also feel that these people can be helped even if the total goal cannot be attained—compromises are possible. Occupational and work therapy are of

great importance for hospitalized patients. Sometimes they can find new outlets and new interests which would take the place of their drinking. The new environment and the separation from a stressful situation at home or on the job were, by themselves, enough to help most people stop drinking during their hospitalization. Sometimes it is only by changing their home environment, their job situation and even their profession, that the total goal can be achieved. Sometimes they have to find a new purpose in life. Individual psychotherapy's goal is the awakening of insight, and also to make unhappy people somewhat happier. Only unhappy persons will become problem drinkers and what makes one happy is so individualistic and so diverse that no recipes can be used.

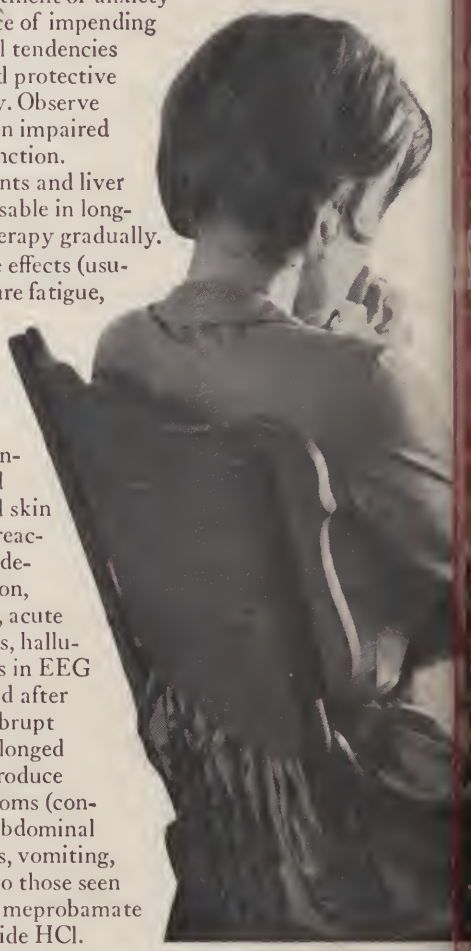
Tears without grief

Crying Spells–psychic tension with depressive symptoms?
"I don't know what's the matter with me lately...I cry and I cry... and I really don't know why I do."

A woman often is not conscious of the real reasons for her crying spells or refuses to admit them to herself. On probing, you may find that frequent weeping, like insomnia or neurotic fatigue, often is an expression of psychic tension. She needs sympathy and reassurance, and perhaps a calming agent to help her over her crisis. Consider prescribing Valium (diazepam) for her. It usually reestablishes calmness promptly. Crying spells and other secondary depressive symptoms normally subside as the tension is relieved. Your patient then can cope more easily with stresses to which she is subjected. Valium (diazepam) is generally well tolerated, and on proper mainteenance dosage usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.



Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Infants, patients with history of convulsive disorders, glaucoma or known hypersensitivity to drug.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly or debilitated patients (not more than 1 mg, one or two times daily initially) to preclude ataxia or oversedation, increasing gradually as needed or tolerated. As is true of all CNS-acting drugs, until correct maintenance dosage is established, advise patients against possibly hazardous procedures requiring complete mental alertness or physical coordination. Driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. If such combination therapy is used, carefully consider individual pharmacologic effects–particularly with known compounds which may potentiate action of Valium (diazepam), such as phenothiazines, barbiturates, MAO inhibitors and other antidepressants. Advise patients against simultaneous ingestion of alcohol or other CNS depressants. Safe use in pregnancy not established. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, acute hyperexcited states, hallucinations); changes in EEG patterns during and after drug treatment. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms (convulsions, tremor, abdominal and muscle cramps, vomiting, sweating) similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage: *Adults:* Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. *Geriatric patients:* 1 or 2 mg/day initially, increase gradually as needed and tolerated. (See Precautions.)

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg bottles of 50 and 500.

Dilantin®
(diphenylhydantoin)

PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.
PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.
DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.
Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

PARKE-DAVIS 015R67

■ **to help restore and stabilize the intestinal flora**

■ **for fever blisters and canker sores of herpetic origin**

LACTINEX contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

First introduced to help restore the flora of the intestinal tract in infants and adults,[1, 2, 3, 4] LACTINEX has also been shown to be useful in the treatment of fever blisters and canker sores of herpetic origin.[5, 6, 7, 8]

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

Unique Nitrospan micro-dialysis process* adds an important dimension–TIME–to nitroglycerin therapy

Helps decrease frequency and severity of attacks; often increases exercise tolerance. **D**ecreases need for sublingual nitroglycerin, increases patient confidence. **S**mooth, continuous release independent of gastrointestinal functions reduces headache and other side effects that might result from peak concentrations of tablet or intermittent-release preparations.

Indication and Dosage: For prophylactic use only in angina pectoris, 1 capsule every 12 hours. **Precautions:** For prophylaxis only, not for relief of acute anginal attacks. Tolerance to nitrites may develop on long-continued use. **Contraindications:** Idiosyncrasy to nitroglycerin, and early myocardial infarction. **Side Effects:** With use of nitrites, transient headache, postural hypotension, nausea and vomiting may occur. Overdoses may cause flushi, dizziness, tachycardia, headache and syncope.

*__The micro-dialysis cell.__ Nitrospan's timed-release mechanism is different from those usually employed in sustained-action capsules, which rely on unpredictable digestive processes. The nitroglycerin in Nitrospan capsules is contained within hundreds of dialysis cells of controlled permeability. The contents of each micro-dialysis cell are released by diffusion rather than disintegration, at a continuous rate independent of gastrointestinal action. Only the presence of fluid is required.

DUAL PROBLEM IN PEPTIC ULCER

Relief of hyperacidity is still a primary goal in the treatment of peptic ulcer. And antacids are the most widely used means of achieving this relief. But antacids alone cannot influence the distention and bloating which so often add to ulcer distress.

THIS IS WHY MYLANTA® PROVIDES:

the two most widely used antacids—magnesium and aluminum hydroxides—to help secure rapid acid neutralization with little chance of laxation or constipation;

PLUS

the defoaming action of simethicone—to help relieve the painful gas symptoms which often accompany peptic ulcer.

Mylanta®

antacid therapy plus an added benefit

nonfatiguing flavor/smooth pleasant texture; both assure patient cooperation during long-term therapy.

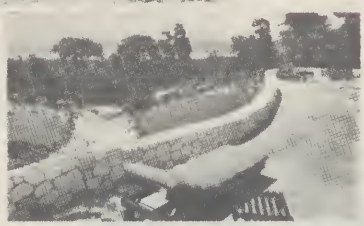
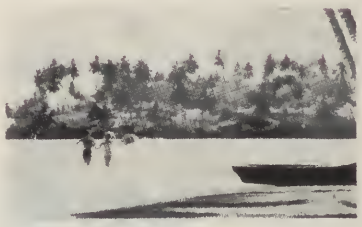
Jamaica
and Montego Bay
an island, a city...a way of life rich in legend and luxury

Photos courtesy of Pan American



The international spotlight has focused on the sun-splashed island of Jamaica as an intriguing resort region. Its star is captivating Montego Bay. Old world charm radiates from this resort capital and in its sphere is Rose Hall Plantation. Rich in legend and luxury, Rose Hall encompasses thousands of acres of beautiful white beaches, verdant plain, and extends upward past sparkling waterfalls into the splendor of the mountainsides. Here is being developed what has been masterplanned as one of the finest residential and tourist areas of the world and THE international resort area of the Caribbean. The overall picture provides for luxurious homesites on the mountainside overlooking the sea, exciting Rose Hall townhouses along the seacoast, a mountainside leisure village, health spas, and the splendid Rose Hall Beach Club. Other features will be riding trails, cricket and polo fields, golf courses, and skeet and trap facilities.

An outstanding project in the development is the restoration of Rose Hall Great House, home of Annie Palmer, the White Witch of Rose Hall. Once one of the finest mansions in Jamaica, its architecture was magnificent. It is now being restored to its former splendor in a million dollar reconstruction program.



Throughout the entire undertaking, the architects, designers and planners have one main principle—respect for the relationship between the natural areas and those areas designated for development—to preserve the "old" while creating new amenities and attractions.

Rose Hall Realty Company, Ltd. has a wide variety of offerings and a broad background of experience in Jamaican real estate. Send for more information with the coupon below.

SCIENTIFIC EXHIBIT AWARD

MEDICAL AND CHIRURGICAL FACULTY ANNUAL MEETING

APRIL 17, 18, 19, 1968

The Alcazar, Baltimore

The Medical and Chirurgical Faculty, in cooperation with Mead Johnson Laboratories, will again present an AESCULAPIUS AWARD for the outstanding scientific exhibit displayed at the 1968 Annual Meeting. This award is designed to recognize and reward excellence in concept, originality, and execution of a scientific exhibit.

A committee of the Medical Society will be the judges and the winner will be presented with a certificate, suitably inscribed with the title of the exhibit and the author's name. A prize of $200.00, donated by Mead Johnson Laboratories, will be presented to the winner during the convention.

All scientific exhibits accepted for showing at the 1968 Annual Meeting of the Faculty will be eligible for judging. Physicians interested in submitting exhibits should make application to the Chairman, Committee on Program and Arrangements, Medical and Chirurgical Faculty, 1211 Cathedral Street, Baltimore, Maryland 21201.

EXHIBIT SPACE IS LIMITED—SEND YOUR APPLICATION NOW

"COCA-COLA" AND "COKE" ARE REGISTERED TRADE-MARKS WHICH IDENTIFY ONLY THE PRODUCT OF THE COCA-COLA COMPANY.

AMERICAN MEDICAL ASSOCIATION

a federation of 54 constituent medical associations and 1936 component medical societies.

August 28, 1967

Dear Fellow Physician:

These are significant times for all American citizens and for American Medicine. This is a cordial and earnest invitation for you to join us in a re-evaluation of our resources, abilities and opportunities and then with courage and enthusiasm proceed to utilize and develop them.

This will involve us and you individually as participating citizens and faithful physicians, and collectively as more diligent and effective workers in our county medical societies, state associations, specialty groups and the American Medical Association. To this joint effort we invite your enthusiastic and wholehearted cooperation.

The greatest need is probably for more efficient, fruitful communication. We urge you to take a few minutes each month to read the President's Page in your county medical bulletin, state medical journal, and first issue each month of JAMA. We promise you a brief, worthwhile message every month, emphasizing and referring you to things that will interest you. An efficient review of each copy of The AMA News will keep you posted on general developments.

You will enjoy and profit from your membership in medical groups in direct proportion to your investment of time in them. We will anticipate seeing you regularly at our medical meetings.

The public relations of Medicine depends on how you and your office aides serve your patients, and how you perform as a citizen.

We will welcome your suggestions at all times, and we thank you sincerely for your cooperation.

Cordially,

Milford O. Rouse M.D.

Milford O. Rouse, M. D., President
American Medical Association

R. D. Bauer M.D.

Richard D. Bauer, M.D., President
Medical and Chirurgical Faculty of Maryland

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

The Faculty's House of Delegates in its Semiannual Session, Friday, September 8, 1967, took the following actions:

1. Adopted a minor amendment to the Medicolegal Code of Cooperation which brought the Faculty's action in line with that of the Bar Associations.

2. Adopted a Pharmacist/Physician Code of Cooperation.

3. Moved various Bylaw amendments.

4. Approved Emeritus Membership for various individuals on the request of their component society and recommendation of the Council.

5. Recommitted the proposed Commission on Medical Discipline for further study in consultation with the Board of Medical Examiners so as to reconcile differing views; and authorized a special meeting of the House of Delegates in sufficient time for preparation and introduction of legislation for the 1968 State Legislature.

6. Adopted the following motion:
"Resolved, That the House of Delegates reaffirm its policies adopted on September 18, 1959, and the policy adopted by the House of Delegates of the American Medical Association in December, 1959, disapproving the concept of closed panel paractice of medicine when the patient contributes financially to its support, as an abridgement of the patient's freedom of choice of physician."

7. Resolved that Resolution 1S/67 be postponed indefinitely.

The Council at its October 5 (Special) meeting took the following action:

1. Approved minutes of the Council and Executive Committee meetings.

2. Accepted the recommendations of the Med-Chi Insurance Trust in connection with a retirement program for Faculty members and their employees; and authorized officers to complete the necessary documents to place the program in effect.

3. Established Saturday, November 11, at 2:00 p.m. for the special meeting of the House of Delegates to consider the proposed Commission on Medical Discipline.

4. Authorized the chairman of the Professional Medical Relations Committee to deal with any necessary groups or organizations to implement the House of Delegates action dealing with payment of Usual, Customary and Reasonable fees under Workmen's Compensation cases.

The Executive Committee at its October 5 session:

1. Heard a report on the Mass Measles Immunization drive and learned that a total of $5,260.06 surplus has been placed in a special fund for use in future immunization drives. Heard that $11,-122.05 of the $15,000 appropriation from the educational fund for publicity and education in this drive, had been spent.

easy does it!

tear, moisten, compare–that's all!

600048

2. Discussed the question of financial support for the Woman's Auxiliary and requested the Treasurer to consider this when developing the 1968 budget.

3. Authorized a suitable financial amount to be sent to the Oakland Memorial hospital in memory of Eugene I. Baumgartner, who died in August.

4. Established dates for the 1968 Executive Committee and Council meetings.

5. Submitted a list of three names to the State Health Commissioner to serve as the Faculty representative on the Advisory Council to the Regional Medical Programs, from which the Commissioner will select one. This representative would replace J. Morris Reese, M.D., who declined to serve.

6. Authorized an appointment or designation of a physician to organize a recruiting nucleus of physicians to recruit Volunteer Physicians for Vietnam.

7. Authorized the mailing of a letter to be signed by the Faculty president urging members to purchase U.S. Savings Bonds.

8. Agreed to consider the holding of business sessions of the statewide specialty groups at the time of the annual Faculty meeting (Wednesday, April 17, 8:00 a.m.) only if requested to do so by the Specialty groups.

9. Recommended reappointment of Rachel K. Gundry, M.D., to the Advisory Council on Mental Hygiene.

10. Submitted a list of three names to the State Board of Health and Mental Hygiene for possible appoinment to the Medical Advisory Comittee to Maryland's Medical Assistance program. One name would be selected as a replacement for Dr. Baumgartner.

11. Instructed the staff to bill one of the Specialty groups for use of Faculty facilities, in view of the fact that it does not meet Faculty requirements that at least 90% of its members also be members of the Faculty in order to use these facilities at no cost.

12. Approved the minutes of the September 8, 1967, House of Delegates session.

13. Authorized the payment of a $50.00 Honorarium to the speaker at a scientific meeting arranged by prospective members at the Johns Hopkins Medical School Student AMA chapter.

14. Declined to underwrite the payment of travel and hotel expenses for a Subcommittee chairman who wished to attend a meeting in Houston, Texas.

15. Approved Faculty co-sponsorship with the State Department of Mental Hygiene of a Seminar for physicians on Treatment of Alcoholism. The Faculty will provide staff time, and the State Department of Mental Hygiene will underwrite costs of printing and mailing. Ayerst Laboratories will underwrite speakers' expenses.

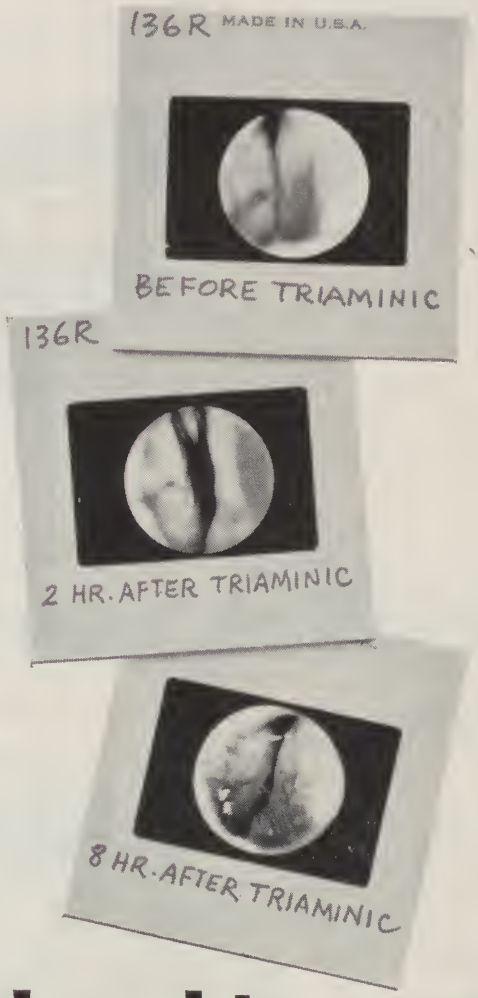
16. Approved in principle the "mop-up" measles immunization program to be conducted through the public schools.

17. Endorsed the Diabetes Detection Drive, November 12-18, with the understanding that local participation will be at the discretion of the local component societies.

18. Deferred action on a request for endorsement in principle of a reportable disease law, with the Medical Advisory Board, Department of Motor Vehicles to establish the diseases and conditions and manner of reporting.

19. Authorized payment of "honorariums" to speakers who might give a "name" lecture at the cruise convention, in addition to the cruise convention allowance offered to speakers.

20. Approved contents of a letter to be mailed through Faculty facilities.



21. Requested that an ad for a physician to work in a "closed panel" medical practice be clarified before it could be carried in the Journal.

22. Authorized appointment of a Faculty representative to the Health and Medical Services Committee of the Maryland Commission on Aging.

23. Authorized representatives of the Faculty to attend an AMA conference on Health Care of the Poor, December 15-16, 1967, in Chicago.

24. Heard a report from the chairman of a discussion held with state government officials in connection with Cancer Cytologies.

From a continuing study on nasal congestion . . .

timed to work while your patient does

A study being conducted by the Department of Otolaryngology, Greater Baltimore Medical Center is stockpiling evidence that points to the fast action and prolonged relief effected by Triaminic in the treatment of nasal congestion.

Begun in March 1966, the study to date has encompassed 85 patients with common nasal disorders—and measured their response to recommended doses of Triaminic tablets.

Timed to release its oral nasal decongestant and two antihistamines within 8 hours, Triaminic was found to effect partial or complete relief in better than 82% of the subjects treated. Clearing nasal obstruction. Reducing turbinate swelling. Making breathing easier.

It's a comforting thing to know that Triaminic *really* works.

Triaminic® *timed-release tablets*

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride .....50mg. Pyrilamine maleate.....25mg. Pheniramine maleate.....25mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets.

Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

EXECUTIVE SECRETARY'S NEWSLETTER

November, 1967

1968 DUES BILLS

1968 Dues bills are scheduled to be in the mail in late November and early December. Physicians are reminded that payment of dues must be made BEFORE JANUARY 31, 1968 in order to be eligible for Physicians' Defense.

The Council has ruled that strict interpretation of the Faculty's Bylaws will preclude authorization of this benefit of membership if members do not comply with this Bylaw requirement.

ANNUAL MEETING RESOLUTIONS

Deadline for submission of resolutions for consideration at the Faculty's Annual Meeting, April 17 - 19, 1968, is

WEDNESDAY, FEBRUARY 21, 1968

Resolutions received in the Faculty office after that date may not be considered at the Annual Session.

Members are reminded of the recent Bylaw change requiring resolutions introduced by individual members to have the endorsement of either one-third of his component society membership or 30 members of his component society, whichever is smaller.

NEWS NOTES

Thomas H. Powell, M.D., Baltimore, is presently serving in the Volunteer Physician for Viet Nam program. Dr. Powell is an orthopedic surgeon.

Junior Fellows of the American Society of Anesthesiologists are: Drs. Gary G. Gilbert, Arsenio S. Soriano, Jr., and C. R. Wheeless, all of Baltimore.

New Fellows of the same group include Charles G. Battig, M.D., of Bethesda.

OPINION RESEARCH SURVEY

The Illinois Medical Society, in a recent Opinion Research Survey conducted on behalf of the Society, learned that:

ILLINOIS MEDICAL SOCIETY LEARNS ABOUT ITSELF

60% of the GP's regard their State Society membership as valuable, compared to only 49% of the Specialists. Non-metropolitan members valued their membership more highly than metropolitan members.

The younger physicians - comprising the largest group of dissenters - charged the State Society had nothing to offer them. They claimed the State Society ignored the unique problems they are facing, (teaching them the business side of medicine; familiarizing them with services offered).

In other questions, the Society learned that 75% of the membership were not aware of services offered; had no time for ISMS affairs; BUT 90% of those members who used the services of ISMS considered their membership VERY valuable.

Physicians who participated in society activities were among the most enthusiastic of the Society's supporters, claiming they found their committee work satisfying and important.

HAVE YOU VOLUNTEERED YOUR SERVICES LATELY?

1968 CRUISE CONVENTION

Accommodations are still available for the 1968 Cruise Convention leaving Baltimore on the SS Argentina on Sunday, April 21, and returning on April 28. Scientific sessions are planned for each day on board ship. The cruise convention is part of the Faculty's 1968 Annual Meeting scheduled for April 17 - 19, in Baltimore.

Information and reservations may be obtained by calling Travel Guide Agency, SA 7-0682

John Sargeant
Executive Secretary

John Sargeant, Executive Secretary, came to the Medical and Chirurgical Faculty, in 1958, after an extensive management study pointed up the need for a paid, full-time executive to operate the many facets of Faculty business activity. Prior to joining the Faculty, he had spent five years in a similar post with the Broome County (N. Y. State) Medical Society.

Active and hard-working, "Jack" as he is known to most Faculty members, makes a point to visit with each Component Medical Society at least once a year to acquaint their membership with the latest Faculty activity. In addition, he acts as Legislative Representative during sessions of the State's General Assembly and at meetings of the Legislative Council, the between-sessions group of the General Assembly.

If you have a question on any matter he is the person to whom you should turn for the answer.

Faculty Staff Biographies

"Joe" as he is known to one and all, is directly responsible for all of the Faculty's financial affairs, membership records and Members' Insurance problems. He joined the Faculty in 1963, coming here from a series of positions with ever-increasing responsibilities. A distinct asset to the Faculty operations, he has and is supervising the many improvements towards eventual complete mechanization of the statistical financial and membership operations of the Faculty.

Joseph J. Harrison

Anna Wynde Leake

Eleanor Happel

Administrative Staff

This group of charmers are what make the wheels go around at the Faculty office. Each in her own way contributes to the essence of an efficiently run office. In staffing meetings, fielding inquiries,

June Miller

Karen Clagett

Constance Galton

Genevieve Ritchie

Administrative Staff

preparing reports and performing the multifarious duties that come from actions taken by Faculty Committees, they perform an indispensable function for the Faculty.

Mary Sue Gladden

Bernadette Silk

Beverly Capistrano

Financial and Statistical Staff

Anna Mae Kammer

Doing the detailed work required for membership records, financial statements and paying Faculty bills are these three young ladies. Working directly under the supervision of Mr. Harrison, they field many of the inquiries that flow into the Faculty office, endeavor to correct any errors that the "gremlins" might make and see to it that adequate and proper data is maintained in our records.

Barbara Welch

Journal

Mrs. Maxine Hall has only been with the Faculty for a short time. During this period she has become directly involved in the many operations, all time-consuming, that go towards publication of the Maryland State Medical Journal each month. Her previous experience includes working as a foreign correspondent for the London Daily Express and Woman's Editor to the *Straits Times* in Singapore. She is an avid breeder of pekinese.

Maxine Hall

Katherine Downey

Insurance Trust

Mrs. Katherine Downey heads up the details of operation involved in the Med-Chi Insurance Trust. The program started a brief two years ago, has grown and continues to grow in providing across-the-entire-field of insurance needed by physicians. Mrs. Downey has the information of all insurance programs at her finger-tips and can advise, assist and answer all questions posed to her.

Custodial Staff

Ellen Gordon

Laura Mae Frazier

Behind the operation of the Faculty building is an unseen force of people who see that things are operating properly, that the building is open, well-lit, clean and pleasant to enter. These are the people who do this; as well as handle many, other numerous chores that often go unseen and unsung.

Reuben Parker

Evelyn Dyson

Mary Dixon

Elizabeth Sanford

During the day-to-day operations of the Faculty library, literally dozens of questions are posed to those responsible for such operation. Mrs. Elizabeth Sanford is currently involved in an extensive survey of all the library holdings and with expert advice is presently weeding "out-of-scope" material, reevaluating many of the out-of-print books and rare books that are currently in the circulating collection. This, with other changes to modernize and up-date the Faculty library operations, will result in a more efficient and worthwhile operation for all.

Library

Vera Anderson

The bulk of the queries addressed by the public and many physicians are handled by Mrs. Vera Anderson who maintains an enviable poise when the strangest questions are asked of her. Well-groomed, efficient and always on the job, Mrs. Anderson is never at a loss for an answer. When it is not immediately forthcoming, the patient caller will be asked if the information can be obtained and the call returned when it is available.

IN-SCHOOL MOP-UP VACCINATION PROGRAM FOR MEASLES

The Maryland State Department of Health estimates that some 39,000 school children in grades one through four are still susceptible to measles. An in-school mop-up vaccination program is underway in an effort to immunize these children.

Garrett County was the first county in the State to conduct an in-school measles mop-up in September. Six hundred and five children were vaccinated in 17 schools in two days. A team of State Department of Health personnel assisted the local staff.

Baltimore City began a program in its schools in October.

Thanks to the ground work of the May, 1967 campaign, measles is now well on the way to being eliminated as a public health problem in Maryland. A successful mop-up program, surveillance, and continuing routine immunization of all one year olds will assure a measles-free community.

MARYLAND, DISTRICT OF COLUMBIA INTERNISTS PLAN FOR SCIENTIFIC MEETING

Specialists in internal medicine in Maryland and the District of Columbia will hold a scientific regional meeting in Baltimore, Md.

The meeting is one of some 35 scientific-educational meetings the *ACP* sponsors during the academic year. Held throughout the United States and Canada, the meetings help the College's 13,600 members keep abreast of developments in the basic sciences and clinical medicine.

Among special guests will be James W. Haviland, MD, Seattle, Wash., Clinical Professor of Medicine at the University of Washington, and Edward C. Rosenow, Jr., MD, Philadelphia, Pa., Executive Director of the American College of Physicians.

Martin L. Singewald, MD, Baltimore, Md., Associate Professor of Medicine, Johns Hopkins University School of Medicine and *ACP* Governor for Maryland and the District of Columbia, is in general charge of the meeting.

The American College of Physicians (Maryland/District of Columbia Regional) Baltimore, Md., Dec. 2, 1967. Info: Martin L. Singewald, MD, 11 E. Chase Street, Baltimore, Md.

NEW FELLOWS ELECTED

New Fellows of the American College of Surgeons were elected at the annual five-day clinical congress of the world's largest organization of surgeons. Those from Maryland included the following: Drs. H. Logan Holtgrewe, Annapolis; Drs. Arthur Baitch, Salvatore J. DeMarco, III, Ronald H. Fishbein, George H. Greenstein, John E. Hoopes, August Daniel King, Jr., Robert B. McFadden, Albert C. W. Montague, David Paton, Louis E. Queral, Geary L. Stonesifer, Jr., Alvin P. Wenger, Robert E. Zadek, Alberto Zapata, all of Baltimore City; Julius S. Piver and Joseph F. Schanno, of Bethesda. Also, Drs. Robert J. Thomas, Frederick; Francis D. Fowler, Marlow Heights, George J. Ellis, Jr., James P. McCarrick, and Daniel Powers of Rockville; and Drs. Robert E. Collins, J. William Costello, Lloyd H. Scribner and Perry Tirschwell all of Silver Spring.

Fellowship, a degree entitling the recipient to the designation, FACS, is awarded to those surgeons who fulfill the comprehensive requirements of acceptable medical education and advanced training as specialists in one or another of the branches of surgery and who give evidence of good moral character and ethical practice.

Staph—the most common cause of skin and soft-tissue infection

.reliably controlled with specific therapy

A suitable dosage form for every staph situation

Staph—the most common cause of skin and soft-tissue infection—also is responsible for many more serious infections, such as pneumonia, osteomyelitis, and epticemia. Often, a seemingly minor skin infection is he source of metastatic spread to deeper structures. When findings on culture incriminate staph as the ause, Prostaphlin (sodium oxacillin) will provide pecific effective therapy.

Bactericidal effectiveness. Hardly a staph organism an resist the bactericidal action of Prostaphlin (sodim oxacillin), as shown by a 34-month *in vitro* study. f all staph isolates tested, 99.5% were sensitive to xacillin.[1]

Clinically proven. There is a high correlation between these *in vitro* findings and clinical results. Of 610 patients treated with Prostaphlin (sodium oxacillin), 89.8% were reported cured or improved, including those with staph infections resistant to penicillin G.[2] And since resistance does not appear to develop *in vivo*, therapy with oxacillin can be extended when necessary.

Outstanding safety record. Besides being staph-specific and rapidly absorbed—Prostaphlin (sodium oxacillin) has established an outstanding record of safety during five years of widespread clinical use. Continuous high blood levels of oxacillin have not produced toxic effects on kidney function, assuring a significant margin of safety. However, as with all penicillins, the possibility of allergic response should be considered.

Capsules, Oral Solution and Injectable. Prostaphlin (sodium oxacillin) is available in three flexible dosage forms to suit the age of the patient and severity of infection—capsules, an oral solution for pediatric use, and multi-dose vials for injection, I.M. or I.V.

PRESCRIBING INFORMATION: For complete information, consult Official Package Circular. *Indications:* Infections caused by Staphylococci, particularly those due to penicillin G-resistant Staphylococci. *Contraindications:* A history of severe allergic reactions to penicillin. *Precautions:* Typical penicillin-allergic reactions may occur. Safety for use in pregnancy and premature infants is not established. Because of limited experience, use cautiously and evaluate organ system function frequently in neonates. Mycotic or bacterial superinfections may occur. Assess renal, hematopoietic and hepatic function intermittently during long-term therapy. *Adverse Reactions:* Skin rashes, pruritus, urticaria, eosinophilia, nausea, vomiting, diarrhea, fever and occasional anaphylaxis. Rare cases of reversible hepatocellular dysfunction have occurred. Moderate SGOT elevations have been noted. Thrombophlebitis has occurred occasionally during intravenous therapy and leukopenia was noted in two cases. *Usual Oral Dosage:* Adults: 500 mg. *q.*4 or *q.*6*h.* Children: 50 mg./Kg./day. *Usual Parenteral Dosage:* Adults: 250-500 mg. *q.*4 or *q.*6*h.* Children: 50 mg./Kg./day. Treat beta-hemolytic streptococcal infections for at least 10 days. Give oral drug 1 to 2 hours before meals. *Supplied:* Capsules—250 and 500 mg. in bottles of 48. Injectable—250 mg., 500 mg., and 1 Gm. dry filled vial for I.M./I.V. use. For Oral Solution—100 ml. bottle, 250 mg./5 ml. when reconstituted. **A.H.F.S. CATEGORY: 8:12.6**

GENERIC VS. BRAND NAME CONTROVERSY

The controversy over generic vs. brand name drugs was aired at hearings of the Senate Finance Committee and the Senate Small Business Monopoly Subcommittee.

Chairman Russell B. Long (D.,La.) of the Finance Committee planned to offer an amendment to the Social Security bill, which includes *medicare* and *medicaid* changes, to put the emphasis on generic drugs in government medical programs. The monopoly subcommittee, headed by Sen. Gaylord Nelson (D., Wis.), was investigating drug pricing policies with the same objective as Long's proposal.

Long's proposal included the creation of a federal panel to select the highest quality but lowest cost prescription drugs for which patients would be reimbursed under government medical programs.

Both the Food and Drug Administration and the drug industry opposed establishment of such a committee and national formulary of drugs.

FDA Commissioner James Goddard, MD, said it would result in "an encroachment on the practice of medicine in such a way that I believe the physicians of this country would rise up in wrath." He also said:

"In essence the bill would impose upon the formulary committee the duty of evaluating every prescription drug used in medical practice today—more than 5,000—and of providing a formulary of the drugs of choice. I would have to exclude drugs deemed unnecessary, therapeutically duplicative, or of unacceptable quality. The enormity of such a task should be borne in mind."

C. Joseph Stetler, president of the Pharmaceutical Manufacturers Association, joined Goddard and John W. Gardner, Secretary of Health, Education and Welfare, in urging that action on the matter be postponed until a report is made on a special study being conducted by *HEW*. The report is due Dec 1.

Stetler said the drug industry recognizes the government's responsibility to control federal expenditure in its drug purchase programs. But, he said, Long's proposal would put such a low ceiling on drug prices that it would "jeopardize the ability of quality, research-oriented pharmaceutical companies to perform effectively."

"The health of all of us and of future generations is dependent on the continued growth and vitality of a progressive and successful pharmaceutical industry," he said.

* * * * *

GARDNER ON ALCOHOLISM

No other national health problem has been so seriously neglected as alcoholism, according to John W. Gardner, Secretary of Health, Education and Welfare.

"The atmosphere of moral disapproval surrounding the entire subject, and the deplorable custom of treating alcoholics as sinners or criminals have obscured the nature of the problem," Gardner said in connection with a report issued by the National Institute of Mental Health.

The *NIMH* report, titled "Alcohol and Alcoholism," reviews present knowledge of alcohol, the nature and extent of drinking problems; the identification, treatment and prevention of alcoholism, and the status of current research.

Although alcoholism obviously does not occur without alcohol, the report states that "alcohol can no more be considered the sole cause of alcoholism than marriage can be considered the sole cause of divorce, or the tubercle bacillus the sole cause of tuberculosis."

On the treatment of alcoholism, the report says:

"In the past, alcoholics have been admonished, scolded, denounced, jailed, beaten, ducked, lashed, and threatened with eternal damnation. There is no evidence that any of these measures has had significant therapeutic value for more than an occasional alcoholic. Available evidence seems to demonstrate that long-lasting results can be achieved primarily by a technique known generally as psychotherapy."

TWO GOOD REASONS FOR STARTING A KEOGH RETIREMENT PLAN NOW

1. Immediate Tax Savings

A self-employed individual can set up a plan for his retirement and deduct 50 per cent of his contribution from taxable income up to a maximum of $1,250 as well as receive a 100% deduction for contributions for his employees. The tax savings a self-employed in a 48% tax bracket can NOW enjoy with a qualified Keogh Plan are illustrated below.

TAX SAVINGS NOW AVAILABLE

	Without a Keogh Plan	With a Keogh Plan
Self-employed's Contribution	$2,500	$2,500
Taxable Amount	2,500	1,250
Tax	1,200	600
Tax Savings	0	$ 600

By starting a Keogh Plan now, a self-employed can realize a 50% tax savings on his contributions this year—and in 1968, his contributions will be 100% DEDUCTIBLE!

2. Greater return at retirement

THE 'BLUE CHIP' COMPANY THAT'S LOW IN COST, TOO

POSSIBLE INCREASE MEDICARE PHYSICIANS' FEES

The federal government is planning on increasing the monthly *medicare* insurance rate for physicians' services for next year and 1969.

The present rate is $3 a month. The *medicare* law designated Oct. 1 as the deadline for setting the rate for 1968 and 1969 but Congress approved legislation postponing the announcement until Dec. 31.

John W. Gardner, Secretary of Health, Education and Welfare disclosed a possible increase from $3 to $4 in a letter to Sen. John J. Williams, Del., ranking *GOP* member of the Senate Finance Committee.

The monthly premium is paid by persons 65 and older who elected to get benefits under Part B of the medicare program providing physician services.

"I would promulgate a rate of $3.80 for the two-year period of 1968 and 1969, 25 cents of the increase being based upon our revaluation of the extent to which we believe the premium rate was below the actual cost for 1966-67 and 55 cents being the estimated additional cost to be expected from an estimated increase in utilization and in physicians' fees," Gardner said.

AMA ON PUBLIC HEALTH SERVICES

The *AMA* urged that Congress precisely define "public health services" to prevent the so-called "Partnership in Health" legislation being used as authority for unlimited expansion of government medicine.

In a letter to Chairman Lister Hill (D-Ala.) of the Senate Committee on Labor and Public Welfare, F. J. L. Blasingame, MD, executive vice president of the *AMA*, said:

"We are especially concerned with a lack of definition with respect to comprehensive public health services. Neither 'comprehensive' nor 'public health services' is defined in the law or the bill. While we recognize there is supportable advantage in removing strict categorization of grant funds, we are concerned that the categorical identification having been removed, there will no longer be any limitation on the health care which may be provided. Indeed, from testimony on this legislation by government officials, it would appear that our concern is justified. It is the intent that the Congress is authorizing a program of *individual treatment* for *unidentified patients* for *unspecified conditions* for *unlimited services?* It is clear that the lack of definition of 'public health services' is, in effect, an invitation from Congress to unlimited expansion of 'public health' beyond its traditional role in the community.

"The *AMA* has supported, and continues to support the furnishing of public health services. We have also supported flexibility of operation within the state and local health departments as an effective tool for community health. We feel, however, that the distinction between the public and private health sectors should be delineated . . . in more positive terms than the mere prohibition against interference with the existing patterns of private professional practice. . . . Accordingly, the Association finds itself unable to support this portion of the legislation providing for an undefined program of comprehensive public health services."

The *AMA* also opposed a provision for federal licensure of clinical laboratories on the ground that licensing of such facilities traditionally has been a state matter.

"We believe that federal licensure of these facilities would establish an undesirable precedent," Dr. Blasingame said.

From Chicago

NEGROES FOR MEDICINE

A national awards program to encourage more Negroes to study medicine is a recommendation of a conference report in the current Oct. 16 *Journal of the American Medical Association.*

There also should be major efforts to strengthen the teaching of premedical sciences and English at the predominantly Negro colleges, and to "salvage Negro applicants" who lack certain qualifications for medical school entrance, the report said.

The report is from a conference last June, sponsored by the Josiah Macy, Jr., Foundation,

New York City, with the cooperation of National Medical Fellowships, Inc.

Negroes represent "one of the large untapped sources of personnel for medicine," the report pointed out.

Negroes constitute 11.4 per cent of the US population, but only 2.2% of the nation's physicians.

Only 6% of college-age Negroes attend college, and more than 50% are in the predominantly Negro colleges. In these institutions, the dropout rate averages over 50%.

Well over 50% of Negro college students, but less than 10% of Negro medical students, are women. These women represent "a great potential source of Negro medical school applicants," the report said.

Other recommendations:

The two predominantly Negro medical schools should establish premedical programs—Howard with the liberal arts college of Howard University, Washington, DC, and Meharry with its neighbor, Fisk University, Nashville, Tenn.

Each medical school "should move aggressively" to salvage Negro applicants who are not adequately qualified for the study of medicine. Programs should be established for these students at a liberal arts college, and then continued support provided at medical school.

Special two-year medical schools to prepare students for careers in medicine as well as the other health professions were considered "worthy of careful study." Two-year schools should develop as joint efforts between Negro colleges or universities and medical schools that are able to supply a strong faculty, the report said.

The Negro has special problems in the study of medicine, the conference recognized.

"Moving from the campus of a predominantly Negro college to a medical school in which practically all of the other students and the faculty are white presents severe social problems which, when combined with marginal preparation, may prove too much for the student."

The Negro student should receive sufficient support from the administration, the faculty, and especially his classmates, the report said.

It might be advisable to spread the work of the freshman year in medical school over a longer period, the conference suggested. Special summer programs might allow students to test their abilities in a single course, such as anatomy, and at the same time acquire a sense of security in the environment of the medical school.

"In all discussions, the mood of (conference) participants indicated that there should be a significantly larger number of Negroes in medicine, that there are programs that can prepare larger numbers of Negroes for the study of medicine, and that these programs should be established now," the report said.

The authors are John Z. Bowers, MD, Lee Cogan, MA, and E. Lovell Becker, MD, of the Macy Foundation staff, New York.

DORSEY "FLU-GRAM"

DON'T BE LULLED BY RELATIVE LACK OF FLU LAST WINTER. THIS WINTER BE PREPARED: WHEN THE COMPLAINTS ARE COUGH AND CONGESTION, YOU CAN RELIEVE THESE SYMPTOMS WITH TUSSAGESIC TABLETS. ONE TIMED-RELEASE TABLET AT MORNING, MIDAFTERNOON AND BEDTIME BRINGS UP TO 24 HOURS' RELIEF FROM TROUBLESOME COUGH AND STUFFED AND RUNNY NOSE. TUSSAGESIC IS THE FAMOUS TRIAMINIC FORMULA, PLUS THREE OTHER PROVED CONSTITUENTS. MAKES PATIENTS MORE COMFORTABLE. FAST. ASK YOUR DORSEY REPRESENTATIVE FOR SUPPLY OF STARTER SAMPLES, OR IF FLU IS ALREADY EPIDEMIC, PHONE COLLECT. SEE BELOW.

each

Tussagesic®

timed-release tablet contains:

Triaminic® (phenylpropanolamine hydrochloride 25 mg., pheniramine maleate 12.5 mg., pyrilamine maleate 12.5 mg.)	50 mg.
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Dosage: Adults—1 tablet, swallowed whole to preserve timed-release feature, in morning, midafternoon and at bedtime. Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

Book Reviews

PERSPECTIVES IN EXPERIMENTAL GERONTOLOGY, Nathan W. Shock, Ph.D.; Charles C Thomas, Springfield, Ill.

The goal of this book is to present an overview of ideas in the field of experimental gerontology, with emphasis on ideas and experiments. It represents, therefore, more a collection of essays than a detailed summary of all the factual data on specific problem areas.

Well organized throughout, it is not, however, by any means as complete as it might be. Space limitations required the "leaving out" of certain areas. Nonetheless, it is well worth adding to your library.

MENDELIAN INHERITANCE IN MAN, Victor A. McKusick; The Johns Hopkins Press, Baltimore, Md.

This publication is primarily a catalogue of the autosomal dominant, autosomal recessive and X-linked phenotypes. For the first time it utilizes the computer system for assemblying and the "print-out" from such system for the publication of this book. As a reference book it is an excellent addition to the medical library.

CLINICAL MANAGEMENT OF BEHAVIOR DISORDERS IN CHILDREN, Harry Bakwin, MD, and Ruth Morris Bakwin, MD; W. B. Saunders Company, Philadelphia.

This volume is a distillation from a large amount of literature and from the long and careful experience of the authors, of those data that are most helpful in understanding and treating behavior problems in children. This is the third edition of this publication and it is comprehensive, practical and full of common sense. The gratitude of all pediatricians, child psychiatrists and parents should be rendered to them for such a clear and concise job of medical writing.

THE BIOSOCIAL BASIS OF MENTAL RETARDATION, Sonia F. Osler, Ph.D., and Robert E. Cooke, MD; The Johns Hopkins Press, Baltimore, Md.

This collection of various lectures dealing with mental retardation was prepared because of the heavy demand for such information. It is a direct result of a seminar course at the Johns Hopkins University School of Medicine established in 1960. It is an attempt to bring to students of medicine the most recent scientific developments in a field of great national concern. The publishers and authors have done well.

THE THEORY AND PRACTICE OF PSYCHIATRY, Frederick C. Redlich, MD, and Daniel X. Freedman, MD; Basic Books, Inc., New York.

This thoroughly modern text is firmly rooted in history. No area of psychiatry is allowed to go by default, yet no single attitude is allowed to dominate. It is balanced, accurate and well-documented. It is a source book for case-centered observation, for clinical debate and for academic discourse.

ROENTGENOLOGIC DIAGNOSIS, J. George Teplick, MD, Marvin E. Haskin, MD, and Arnd P. Schimert, MD; The W. B. Saunders Company, Philadelphia, Pa.

The organization of this volume provides a new approach in that it is an atlas of the roentgenologic appearance of diseases in their various phases of onset, progression, and complication, together with a graphic description designed to indicate diagnostic highlights.
It is prepared primarily for practicing physicians and for residents in Internal Medicine and Radiology as a guide to diagnostic determination. With 2,000 illustrations it is a worth-while publication to have in many doctor's offices, as well as medical libraries.

DIABETES MELLITUS, DIAGNOSIS AND TREATMENT, VOLUME II, George J. Hamwi, MD, and T. S. Danowski, MD; American Diabetes Association.

This book is useful to practicing physicians as a general manual and equally useful as a textbook and reference resource for students, physicians-in-training, and for instructors.
It is one of a series undertaken by the Association's Committee on Professional Education to make available in highly condensed form the current thinking of a large group of authorities on the principle problems associated with diabetes mellitus. The work of 47 authors is included in this present volume.

LEARNING MEDICAL TERMINOLOGY STEP BY STEP, Clara Tene Young and James D. Barter, MD; The C. V. Mosby Company, St. Louis.

This 1967 edition is a complete revision of the earlier 1964 edition. It presents a logical, organized, step-by-step method for unlocking the mysteries of medical terms and for building a workable medical vocabulary applicable to all specialties of medicine. It is particularly designed to facilitate the training of paramedical personnel to meet the increasing demands for trained workers in doctor's offices, hospitals, insurance and medicolegal firms and local, state and federal medical installations.

HOMOTRANSPLANTATION, by Jack Metcoff, MD; National Kidney Foundation, New York City.

The proceedings of the 16th annual conference on the kidney, held in 1964, is compiled in this book. It brings the reader up to date on the problems of tissue transplantation with particular reference to the kidneys. Under the sponsorship of the National Kidney Foundation, the conference is an annual event well-attended by those persons particularly interested in this subject.

Manufacturers of ethical pharmaceuticals since 1856

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

EXECUTIVE HEALTH EXAMINATIONS

Determination as to ethics made by The Mediation Committee, Medical and Chirurgical Faculty of the State of Maryland, September 25, 1967:

Health Evaluation Groups—Independent or Hospital affiliated

1. Many firms have arranged for a program of periodic health evaluation of key personnel by medical groups specializing in this service. In many cases the employe must sign a prior authorization for release of the findings to the company. It is desirable, and the committee urges, that, with the employe's consent, a complete copy of the examination be provided to the employe's private physician and, equally important to the company's medical officer if there is one. Such information should not be released to nonprofessional management personnel.

2. More serious, however, is the increasing frequency with which such groups refer patients to specialists for treatment of diseases found on such health examinations. This is not the proper function of such a group and should be referred to the employe's family physician.

2. Last, the active advertising or direct solicitation of new contracts for such services (whether by newspaper articles, direct mailing, etc.) is unethical. It cannot be condoned, regardless of the status of the individual who does so. Professional members of such groups, whether full-or part-time, must accept responsibility for such unethical conduct.

(*a*) Information and publicity are strictly limited (1) to dignified, restrained announcements to local county medical societies, local chapters of the Industrial Medical Association, to professional publications, and, on bona fide request, to industry or to patients, which announcements may properly include the names of professional personnel, types of services available, office hours, address and telephone number; (2) to personal contact by doctors of medicine with their business friends by individual conversation or by personal letter; and/or (3) to such personal contact with medical directors of industrial organizations.

(*b*) The following described activities are not engaged in: (1) mass salesmanship technics in office buildings by doctors of medicine or by business managers, nurses, or other nonmedical personnel or representatives; (2) mass or other circulation of publicity material to industry, except as provided in subparagraph (1) of paragraph D hereof; (3) articles in lay publications, except with the written prior approval of the censors of this society; (4) participation in radio or television programs without prior written clearance and approval of the censors of this society; (5) direct solicitation of medical contracts with industries in other cities otherwise than through the local county medical societies or the medical directors of the respective companies; and (6) the establishment or continuance of affiliated organizations or other agencies under lay management and the use thereof for the purpose of soliciting industry.

COMPONENT MEDICAL SOCIETIES

BALTIMORE CITY

All of the members of the Board of Directors of the Baltimore City Medical Society met on September 5, 1967 at 1211 Cathedral St., Baltimore, Md. This was the first meeting of the Board following the summer vacation. The meeting was called to order by Harry Connolly, MD, President of the Baltimore City Medical Society. The minutes were read and approved for the meeting of June 13, 1967. The first item on the agenda was the consideration of continuing the emergency questionnaire which is sent yearly by the Medical Society. It was decided by the Board that use of this questionnaire should be discontinued at this information could be obtained from the questionnaire soon to be mailed out by the City Health Department. John DeHoff, MD, Director of the local Health Services presented a program for a demonstration project of medical practice and the delivery of medical services with emphasis on office practice. Dr. DeHoff urged the Baltimore Medical Society to take the first steps in formulating such a project, as it is necessary to define the medical needs of the people of Maryland. Dr. DeHoff suggeted that such a project could be funded from the City Society and Public Health Service. Further, he suggested that such a program could be integrated with the surrounding counties. It was his opinion that much valuable information related to the medical facilities available in Baltimore and the surrounding community could be gleaned from such a well designed study. After discussion by the Board, the program was referred to the Policy and Planning Committee for further consideration. Dr. Farber, confirmed his belief in such a program and further stated that the Baltimore City Health Department is sponsoring a simplified version of such a survey to be taken in Baltimore. This survey entails the use of a simple questionnaire which in general answers the question "who is practicing what, and where". This survey is to be kept current and provide an up to date source of information pertinent to the City's medical facilities.

The Board unanimously approved the sponsorship of the survey proposed by Dr. Farber. John C. Harvey, MD, suggested that a letter of explanation be sent with the questionnaire from the President of the Baltimore City Medical Society explaining the necessity of such a survey and urging physicians in practice to cooperate. Frank Kaltreider, MD, emphasized that the Baltimore Medical Society should be active in planning the formulation of the State Planning Council as authorized by PL89-749. Further, he suggested that since this Council is to be the central agency for administering and planning public and private health care facilities, the Medical Society should contact the Hospital Council and that both groups in a combined effort should exert their influence in the planning of this important Council. Frank Furstenburg, MD, suggested that the two existing medical schools should also be included in this group since they will undoubtedly be influenced by policies proposed by this Council. Dr. Kaltreider agreed with this suggestion and proposed that the Baltimore City Medical Society, the Hospital Council and representatives of the two medical schools should meet jointly to discuss medical problems relative to PL89-749. This move was unanimously approved by the Board of Directors. The next item taken into consideration was related to matters of insurance. It was decided by the Board of Directors that the Society should withdraw sponsorship of any program that is already sponsored by the State Medical Society. Further, it was decided that a letter should be sent to Strudwick Associates withdrawing support of group sponsorship of the Northwestern Insurance Company by the Baltimore Medical Society. It was emphasized that participants already enrolled in this program and under contract through such programs should continue in their present status without change. The Board took into consideration the review of job classification for Mrs. Janos. It was agreed that her job classification

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

BRISTOL

Syracuse, New York 13201

should be changed and her salary adjusted commensurate with the new classification.

The Board reviewed the meeting plans for the forthcoming year, and the year's itinerary for meetings and social events involving the Baltimore City Medical Society and auxiliary groups were agreed upon. The Board of Directors met with Delegates of the State Medical Society for purposes of exchanging ideas relative to the forthcoming meeting of the House of Delegates in Ocean City on September 8, 1967.

Emeritus membership list was reviewed and the following members were accepted in the Emeritus membership category:

Herbert E. Reifschneider, MD.
Isadore M. Siegel, MD.
Thomas G. Prempas, MD.
Arthur I. Fink, MD.
Artur Saar, MD.

The question of changing the present method of handling complaints registered against doctors by a new committee was considered. The Board of Directors felt that these complaints in the past had been adequately handled by the Board and this method of handling such complaints should be continued. Dr. Harry Connolly read a letter from the District of Columbia Computer Billing System. This system is sponsored by The Medical Society of the District of Columbia and entails a cooperative standardized computer billing system. The Board felt that Dr. Connolly should appoint a special committee to investigate this system and possible endorsement by the Society should be contingent upon the findings of this committee. This committee was to be elected by Dr. Connolly in the near future.

Butazolidin®, phenylbutazone
In Acute Superficial Thrombophlebitis

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of Butazolidin alka are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make regular blood counts. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Mild drug rashes frequently subside with reduction of dosage. However, rash accompanied by fever or other systemic reactions usually requires withholding medication. Purpuric rash has also been reported. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, or a generalized allergic reaction similar to serum sickness may occur and require permanent withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Acute Superficial Thrombophlebitis: Initial: 6 capsules or tablets daily in divided doses for 2 or 3 days. Maintenance: 3 capsules or tablets daily. Usual duration of therapy is 5 to 7 days (rarely beyond 10 days). 6509-V(B)R2

*Stein, I.D.: Presented at the American Academy of General Practice, Dallas, Sept. 1967.

For complete details, please see full prescribing information.

it used to take weeks

Acute superficial thrombophlebitis before treatment

After 5 days of Butazolidin therapy

In acute superficial thrombophlebitis, patients were usually bedfast for 2 to 4 weeks, tying up hospital beds, requiring costly nursing care and time-consuming procedures such as warm soaks and packs.

When Butazolidin was added to the usual regimen, 960 of 1000 patients obtained complete resolution; most required only 30 capsules or tablets; relief of pain and discomfort and regression of inflammatory signs and fever occurred within a few days.*

Side effects occurred in 6% of the 1000 patients. While none were serious or long-lasting, Butazolidin can produce severe side effects in rare instances. Further, not every patient can take Butazolidin. Therefore, select patients with care and follow them closely. Contraindications, Warning, Precautions and Adverse Reactions are summarized in adjacent column.

Butazolidin gets bedfast thrombophlebitics out of bed, fast. Usual duration of treatment is 5 to 7 days, and rarely exceeds 10 days. Try it and see. For full details, please refer to the complete prescribing information.

LOW-BACK PAIN

A CONSERVATIVE, FOUR-POINT PROGRAM

The low back pain that is most frequently seen in general practice is mechanical in nature, i.e., postural back pain, joint dysfunction and acute back strain.[1,2] For this type of discomfort, a conservative regimen is usually sufficient to relieve aches and pains, and to help keep the patient functioning. Components of this basic program include:

1 Bed "If the patient is in the pain-spasm-cycle...there is no alternative or substitute for absolute bed rest..."[3]

2 Board "Boards should be ordered under the mattress...these boards act by immobilizing the spine..."[4]

3 Heat "A very valuabl method of applying heat at home is a prolonged hot bath..."[5]

4 Robaxin®-750 (methocarbamol, 750 mg. capsule-shaped tablets) A well-tolerated[6] skeletal muscle relaxant, methocarbamol helps relieve spasm "...without interfering with normal tone and movement."[7] And there is little likelihood of sedation.[6]

Indicated for relief of skeletal muscle spasm. **Contraindicated** in hypersensitive patients. **Side Effects** (lightheadedness, dizziness, drowsiness, nausea) may occur rarely, but usually disappear on reduced dosage. Hypersensitivity reactions develop infrequently. See product literature for further details. **Also available:** Robaxin® Tablets (methocarbamol, 500 mg.) Robaxin Injectable (methocarbamol, 1 Gm./10 cc.)

A·H·ROBINS A. H. ROBINS COMPANY RICHMOND, VIRGINIA 2322

b.i.d.

The sensible schedule that covers the patient day and night

If our objective in the use of a broad-spectrum antibiotic is prolonged action, with high blood levels, then you know why b.i.d. DECLOMYCIN is considered to be a sensible dosage schedule.

The maintenance dosage of DECLOMYCIN can be kept at this convenient schedule because of its unusually high effective blood and tissue levels.

The b.i.d. dosage of DECLOMYCIN gives you the comfortable assurance that the patient is well-covered, *day and night.*

In clinical practice, blood levels produced by therapeutic dose of DECLOMYCIN are high, prolonged, and effective; because of high serum binding and slow renal clearance. And if there's a broader susceptibility pattern of organisms, we've yet to see it.

There is no need to give higher daily dosage than 300 mg b.i.d., except in venereal diseases and Eaton Agent pneumonia.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

(Prescribing information on next page.

b.i.d. The sensible schedule that covers the patient day and night

DECLOMYCIN Demethylchlortetracycline should b equally or more effective therapeutically than othe tetracyclines when the offending organisms ar tetracycline-sensitive.

Contraindication: History of hypersensitivity t demethylchlortetracycline.

Warning—In renal impairment, usual doses may lea to excessive accumulation and liver toxicity. Under suc conditions, lower than usual doses are indicated, and, i therapy is prolonged, serum level determinations may b advisable. A photodynamic reaction to natural or artif cial sunlight has been observed. Small amounts of dru and short exposure may produce an exaggerated sun burn reaction which may range from erythema to sever skin manifestations. In a smaller proportion, photo allergic reactions have been reported. Patients shoul avoid direct exposure to sunlight and discontinue dru at the first evidence of skin discomfort. Necessary subs quent courses of treatment with tetracyclines should b carefully observed.

Precautions—Overgrowth of nonsusceptible organism may occure. Constant observation is essential. If new in fections appear, appropriate measures should be take In infants, increased intracranial pressure with bulgin fontanels has been observed. All signs and sympton have disappeared rapidly upon cessation of treatmen

Side Effects—Gastrointestinal system—anorexi nausea, vomiting, diarrhea, stomatitis, glossitis, enter colitis, pruritus ani. Skin—maculopapular and erythem tous rashes. A rare case of exfoliative dermatitis h been reported. Photosensitivity; onycholysis and d coloration of the nails (rare). Kidney—rise in BU apparently dose related. Transient increase in urina output, sometimes accompanied by thirst (rare). Hype sensitivity reactions—urticaria, angioneurotic edem anaphylaxis. Teeth— dental staining (yellow-brown) children of mothers given this drug during the lat half of pregnancy, and in children given the drug duri the neonatal period, infancy and early childhoo Enamel hypoplasia has been seen in a few children. adverse reaction or idiosyncrasy occurs discontin medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 3 mg b.i.d. Should be given 1 hour before or 2 hours af meals, since absorption is impaired by the concomita administration of high calcium content drugs, foods a some dairy products. Treatment of streptococcal inf tions should continue for 10 days, even though syn toms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 given in equally divided doses over a period of 10 to 15 days shoul followed. Close follow-up observation of the patient is recommen including appropriate laboratory tests, since demethylchlortetracyc has not had adequate evaluation in all stages of syphilis. Spinal fl examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effecti with a single dose of 600-900 mg. of DECLOMYCIN Demethylchlorte cycline. Individuals unable to tolerate large single doses due to ga intestinal side effects may be treated with 150 mg. every 6 hours f minimum of 4 doses or 300 mg. every 12 hours for a minimum of 2 d Females should be treated with a dosage of 150 mg. every 6 hours or mg. every 12 hours until a cure is effected.

Primary Atypical Pneumonia (Eaton Agent): The average adult dosage is 900 mg. in 3 divided doses for six days.

Obese Epitaph in English graveyard

THE Cost of **AMBAR EXTENTABS**

IS APPROXIMATELY ONE-HALF THAT OF OTHER LEADING APPETITE SUPPRESSANTS.

AN IMPORTANT FACTOR IN LONG-TERM THERAPY!

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety... helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

A. H. ROBINS COMPANY, RICHMOND, VA. 23220 A·H·ROBINS

Help clear up that miserable stuffed-up feeling with Dimetapp. Each hard-working Extentab brings welcome relief from the stuffiness, drip and congestion of upper respiratory conditions for up to 10-12 hours. Yet, patients seldom experience drowsiness or overstimulation. The key to success is the Dimetapp formula: Dimetane (brompheniramine maleate)—along with phenylephrine and phenylpropanolamine, two time-tested decongestants. They get the job done... in a hurry.

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis.
Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy.
Precautions: Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.
Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered.
Dosage: 1 Extentab morning and evening.
Supplied: Bottles of 100 and 500.

6/67 Q-706A

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

Now available:
New! Ready-mixed Ilosone Liquid 125! (Contains erythromycin estolate equivalent to 125 mg. erythromycin base per 5-cc. teaspoonful.)

701464

Ilosone®
Erythromycin Estolate

Lilly

(See next page for prescribing information.)

Ilosone®/the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by micro-organisms sensitive to its action—especially staphylococci, hemolytic streptococci, and pneumococci.

It has been effective in streptococcus infections, particularly acute bacterial pharyngitis and tonsillitis; staphylococcus disease, including soft-tissue infections, furunculosis, abscesses, cellulitis, carbuncles, and wound infections; pneumococcus pneumonia and acute bronchitis with pneumococci on culture, bronchopneumonia, and otitis media.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents; surgical procedures should be performed when indicated, and large doses of the antimicrobial agents should be employed.

Penicillin is the drug of choice for syphilis and gonorrhea, but Ilosone in multiple 500-mg. doses has been useful in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Known history of sensitivity to this drug; preexisting liver disease or dysfunction.

Adverse Reactions: Hepatic dysfunction with or without clinical jaundice has been reported infrequently. Changes in liver function tests indicative of intrahepatic cholestasis appear to be the result of individual idiosyncrasy. Findings subsided when treatment was discontinued. Occasionally, symptoms simulated extrahepatic obstructive jaundice or the colic of biliary tract disease.

When jaundice appeared to be related to use of the drug, laboratory findings were characterized by increased direct-reacting bilirubin, elevated alkaline phosphatase levels, negative or weakly positive cephalin flocculation and thymol turbidity tests, elevated serum glutamic oxalacetic transaminase levels, peripheral eosinophilia, and normal cholecystograms.

Gastro-intestinal disturbances not associated with hepatic effects and occasional allergic manifestations (urticaria, skin eruptions, and, rarely, anaphylaxis) have been reported. The normal intestinal gram-negative bacterial flora is not appreciably altered by erythromycin drugs.

Administration and Dosage: Ilosone is administered orally.

Infants and children under twenty-five pounds, 5 mg. per pound every six hours; twenty-five to fifty pounds, 125 mg. every six hours. Adults and children over fifty pounds, 250 mg. every six hours.

For severe infections, double the dosage. When larger doses are indicated, consider parenteral erythromycin therapy. In beta-hemolytic streptococcus infections, maintain treatment for ten days to prevent rheumatic fever or glomerulonephritis.

In syphilis, a total of 20 to 30 Gm. is administered in divided doses for ten to fifteen days. Close follow-up is necessary since erythromycin drugs have not had adequate evaluation in all stages of syphilis. Examination of spinal fluid is recommended during follow-up.

In gonorrhea, the dosage is 500 mg. four times a day for four days. Patients with a suspected lesion of syphilis should have a dark-field examination before receiving antibiotics and monthly serologic tests for three months. For detailed information, consult the package literature.

Dulcolax®

bisacodyl

DU-5255 R

few drugs work as predictably as Dulcolax. You can expect that when your office patient takes Dulcolax at home, it will be as effective as you said it would be. Your patient will be gratified, too.

The reliability of Dulcolax stems from its unique mode of action. The drug works directly on nerve endings in the colonic mucosa, producing normal peristalsis throughout the large intestine. It does not rely on systemic absorption for its effect.

This reliable action provides prompt relief of constipation. It also makes Dulcolax particularly useful for prepping the bowel for special procedures. In short, it makes Dulcolax ideal for your office practice.

Dulcolax acts so surely that the time of evacuation can often be closely predicted. Dulcolax tablets taken at night almost invariably result in a bowel movement soon after waking the following morning. Dulcolax suppositories generally work in 15 to 20 minutes, almost always within the hour.

General Dosage Information: *Adults:* When an ordinary laxative effect is desired, 1 to 3 tablets or 1 suppository usually suffices. Tablets must be swallowed whole, not chewed or crushed, and should not be taken within one hour of antacids or milk. *Children:* 1 or 2 tablets, depending on age and severity of condition. Tablets must not be given to a child too young to swallow them whole. For infants and children under 2 years of age, half a suppository is usually effective. Above this age whole suppository is usually advisable. Side Effects: As with any laxative, abdominal cramps are occasionally noted, particularly in severely constipated persons. High dosage may result in loose, unformed stools. Contraindication: Contraindicated only in acute surgical abdomen. Availability: Tablets (5 mg.) and suppositories (10 mg.). By prescription or recommendation.

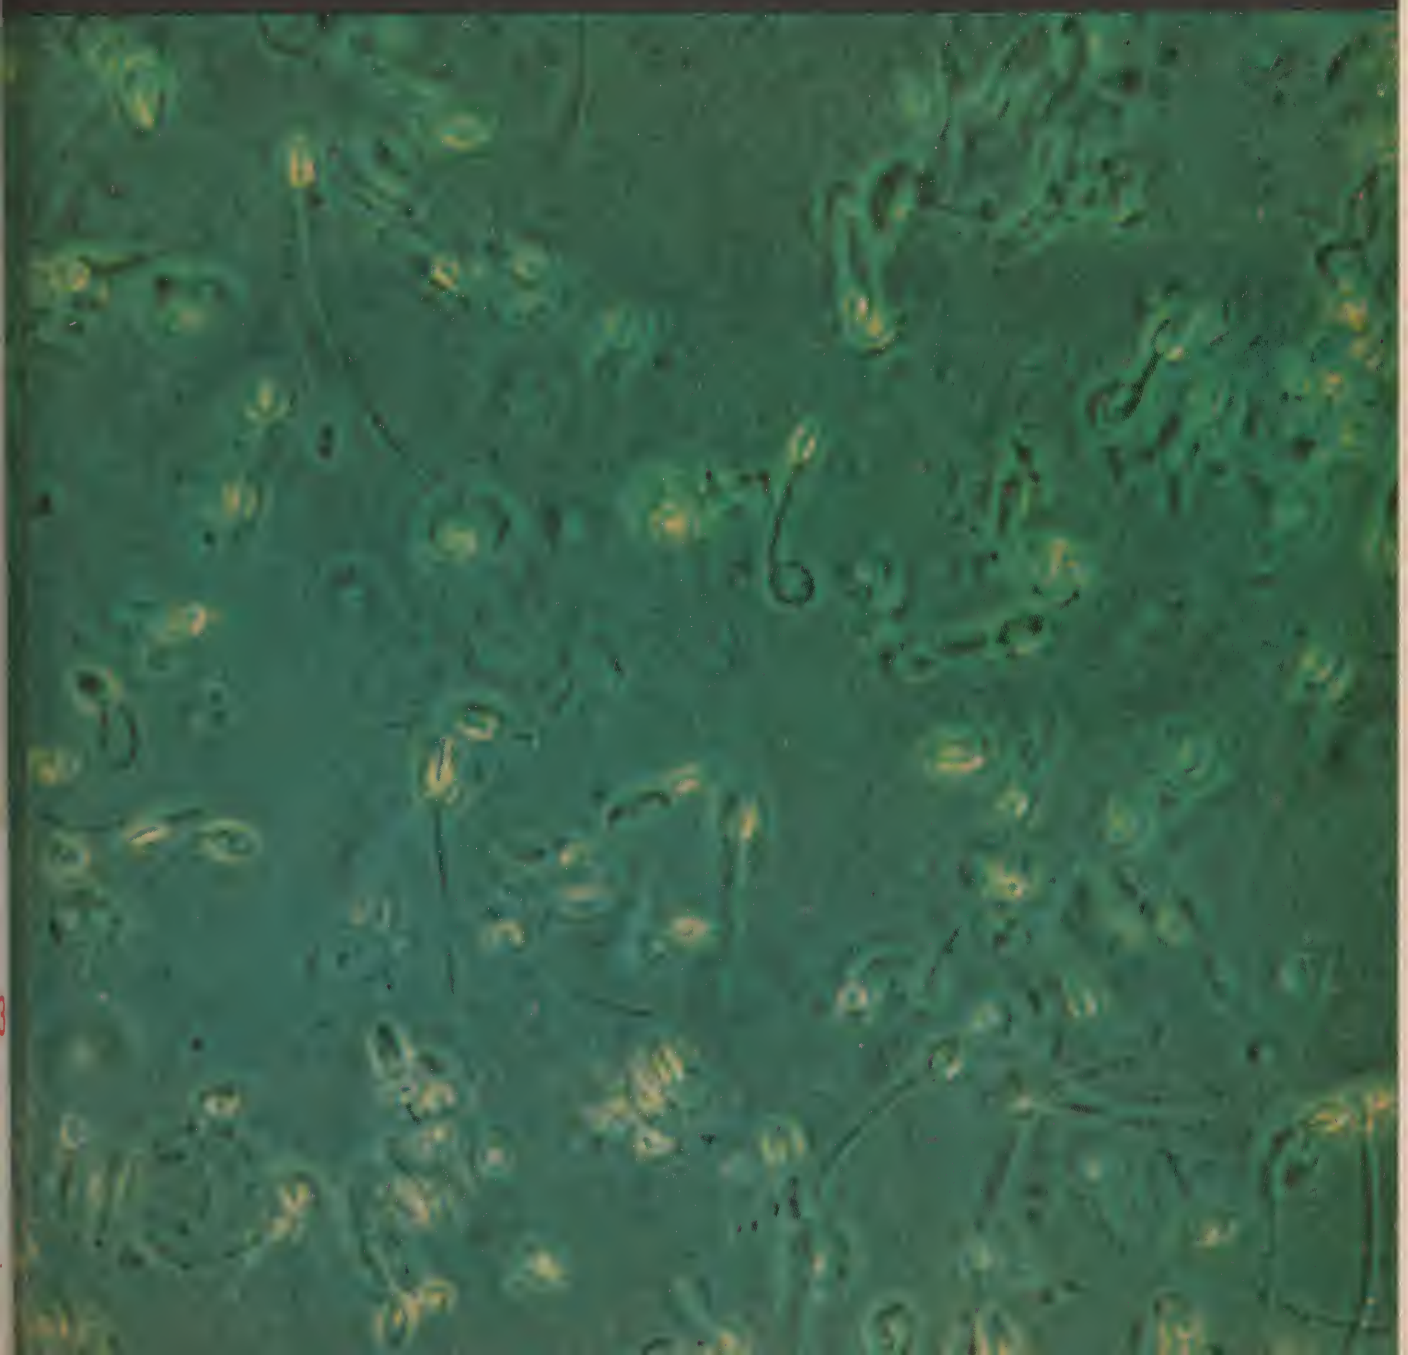
'EMPIRIN'® COMPOUND with CODEINE PHOSPHATE gr. 1/2 No. 3

Each tablet contains: Codeine Phosphate gr. ½ (Warning—May be habit forming), Phenacetin gr. 2½, Aspirin gr. 3½, Caffeine gr. ½.



■ Despite introduction of synthetic substitutes, efficacy of 'Empirin' Compound with Codeine remains unchallenged.

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

When the talk turns to oral contraceptives, it makes medical sense to remember low-dose Norinyl®-1.

(norethindrone 1mg. c mestranol 0.05mg.)

Turn page for contraindications, precautions and side effects.

Reduction of oral contraceptive dosage to the lowest effective levels is a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now also available as Norinyl-1, containing exactly one half the previous dosage of norethindrone and mestranol. Clinical experience has established that effective fertility control can be achieved with the same degree of reliability and safety with new Norinyl-1 when taken as directed.

What about switching patients from higher dosage forms?

In transferring patients to low-dose Norinyl-1 from higher-dosage oral contraceptives, some breakthrough bleeding may occur in the early cycles. In the majority of cases the bleeding episode is mild and self-limited. The long-term advantages of the lower dosage form should be weighed against the inconvenience of possible breakthrough bleeding in the individual patient.

Prescribing Information

Contraindications: Patients with any symptoms or history of thrombophlebitis, pulmonary embolism, liver dysfunction or disease, carcinoma of breast or genital organs, or undiagnosed vaginal bleeding.

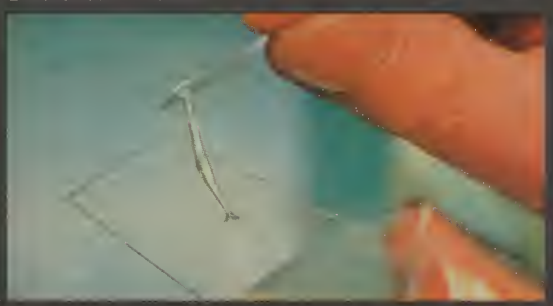
Warnings: Discontinue medication pending examination if there is sudden partial or complete loss of vision, proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. The safety of Norinyl-1 in pregnancy has not been demonstrated. If a patient misses two consecutive periods, pregnancy should be ruled out before continuing the medication. If she has not adhered to the prescribed schedule, pregnancy should be considered at the first missed period. Active ingredients of oral contraceptives have been detected in the milk of mothers who received these drugs; the significance to infants has not been determined.

Precautions: Pretreatment physical should include examination of the breasts and pelvic organs, as well as a Papanicolaou smear. If endocrine or liver function tests are abnormal during therapy, repeat tests are recommended after the drug has been withdrawn for two months. Following administration of drug, preexisting uterine fibromyomata may increase in size. Careful observation and caution are required for patients with symptoms or history of epilepsy, migraine, asthma, cardiac or renal dysfunction, cerebrovascular accident, psychic depression, and diabetes. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. Possible long-term effects of the drug on pituitary, ovarian, adrenal, hepatic or uterine function must await further studies. The physician should be alert to the earliest manifestations of thrombophlebitis and pulmonary embolism. The drug should be used judiciously in those young patients in whom bone growth is not complete. The age of the patient constitutes no absolute limiting factor, although treatment with Norinyl-1 may mask symptoms of the climacteric. The pathologist should be advised of Norinyl-1 therapy when relevant specimens are submitted.

Side Effects: The following have been observed with varying incider in patients receiving oral contracep tives: nausea, vomiting, gastrointe tinal symptoms, breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edem chloasma or melasma, breast chan (tenderness, enlargement and secretion), change in weight (increa or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when give immediately postpartum, cholestat jaundice, migraine, rash (allergic), rise in blood pressure in susceptibl individuals, mental depression. Although the following side effects have been reported in users of oral contraceptives, no cause and effect relationship has been established: anovulation posttreatment, premen struallike syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption, ar itching. The following occurrences have been observed in users of oral contraceptives (a cause and effect relationship has neither been established nor disproved): thrombophlebitis, pulmonary embolism, neuroocular lesions.

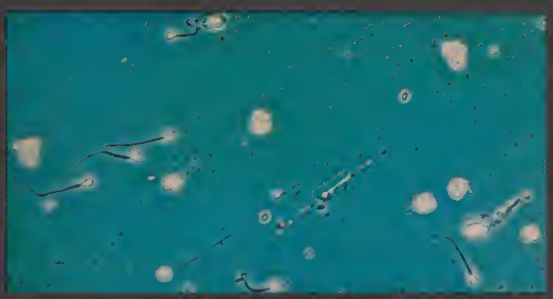
The following laboratory tests may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic functio tests, coagulation tests (increase in prothrombin, factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metyrapone test, pregnanediol determination.

norethindrone — an original steroid from



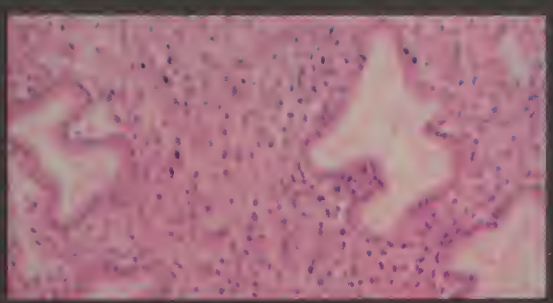
SYNTEX

LABORATORIES INC., PALO ALTO, CALIF.



Here's why Norinyl-1 makes medical sense.

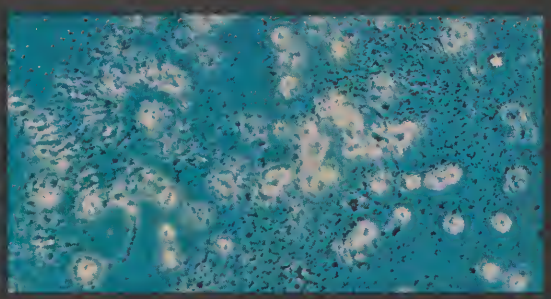
The effectiveness of Norinyl-1 as a low-dose oral contraceptive may be explained by its possible multiple action. In addition to its primary action of suppression of ovulation, Norinyl-1 may offer additional protective mechanisms... (1) creation of a cervical mucus that may be hostile to sperm penetration, and (2) development of an endometrium that may be out of phase with nidation. These effects are illustrated below.



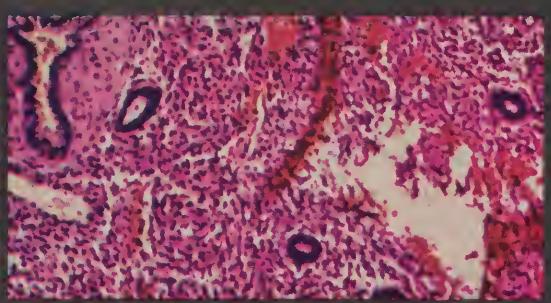
Untreated Patient

Cervical mucus at midcycle is usually thin and watery, with Spinnbarkeit (stretchability) of 15 to 20 cm.

Spermatozoa appear healthy, active, freemoving.



Endometrium of untreated patient is receptive to the fertilized ovum during secretory phase.



Norinyl-1 Patient

Cervical mucus at midcycle is scanty, viscous—with Spinnbarkeit of 1 cm. or less.

Immobile spermatozoa as they appear in cervical mucus taken from patient treated with Norinyl-1.

Norethindrone in Norinyl-1 accelerates secretory phase, suppresses glandular and vascular development.

Norinyl®-1
(norethindrone 1mg ē mestranol 0.05mg) tablets

- new low dose of time-proved ingredients
- established norethindrone/mestranol ratio
- lower patient cost

An uncommon steroid for common inflammatory dermatoses

In everyday topical steroid therapy, Synalar produces rapid resolution of inflammation and itching in steroid-responsive dermatoses—and at relatively low cost to the patient.

Advanced molecular design enhances potency

Synalar combines the advantage of earlier corticosteroid compounds with unique structural innovations. As a result, preparations of Synalar 0.01% and Synalar 0.025% have been reported to be more potent topically and significantly more effective than hydrocortisone 1.0%. The unique fluocinolone acetonide molecule provides one of the most useful topical corticosteroids for everyday practice.

Impressive clinical results in a wide range of dermatologic problems

The clinical efficacy of Synalar has been extensively documented in the world literature. Commonly encountered diseases such as allergic and contact dermatitis, eczematous and seborrheic dermatitis, and neurodermatitis respond rapidly to Synalar, often where previous therapy with other topical corticosteroids has failed.

Low patient cost for wider usefulness

With Synalar, a high degree of efficacy does not mean high price. And—a small quantity goes a long way. Thus, your patients can often obtain the "economy" of a hydrocortisone preparation with the proved efficacy of a potent, truly advanced steroid.

Synalar®
fluocinolone acetonide

For everyday topical steroid therapy

Synalar® 0.01%

fluocinolone acetonide provides economy in two practical dosage forms

For general use, the most economical and widely applicable concentration of Synalar is 0.01% Cream in a water-washable, vanishing cream base. Synalar Solution 0.01% is especially valuable in dermatoses involving moist, intertriginous areas or hairy sites where creams and ointments do not spread or penetrate readily. Synalar Solution is a unique dosage form—clear, nongreasy, cosmetically elegant.

Product Information

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. *Precautions:* Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. *Side Effects:* Side effects are uncommon with topical corticosteroids As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. In such cases the agent should be discontinued and appropriate measures taken. *Availability:* Synalar (fluocinolone acetonide) Cream 0.025%—5, 15 and 60 Gm. tubes and 425 Gm. jars. Cream 0.01%—15, 45 and 60 Gm. tubes and 120 Gm. jars. Solution 0.01%—20 and 60 cc. plastic squeeze bottles. Ointment 0.025%—15 and 60 Gm. tubes. Neo-Synalar® (neomycin sulfate 0.5% [0.35% neomycin base], fluocinolone acetonide 0.025%) Cream—5, 15 and 60 Gm. tubes.

The long-continued action of Novahistine LP should help you both get a good night's sleep. Two tablets in the morning and two in the evening will usually provide round-the-clock relief by helping clear congested air passages for freer breathing. Novahistine LP also helps restore normal mucus secretion and ciliary activity—normal physiologic defenses against infection of the respiratory tract. Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

NOVAHISTINE® LP

DOW **PITMAN-MOORE** Division of The Dow Chemical Company, Indianapolis

DEPRESSION

NORPRAMIN®
(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) in depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

LAKESIDE

IN BRIEF:

INDICATIONS: In depression of any kind —neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, anxiety, agitation and stimulation, insomnia, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy, agranulocytosis, altered liver function, ataxia, and extrapyramidal signs.

DOSAGE: Optimal results are obtained at a dosage of 50 mg., t.i.d. (150 mg./day). **SUPPLIED:** NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1000; and tablets of 50 mg., in bottles of 30, 250 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

EDITORIAL

The Cogent Reasons

*Joseph H. Hooper, Jr., M.D.**

The *MMPAC* (Maryland Medical Political Action Committee) is rapidly approaching the maturity and sophistication to which it is committed. But why only approaching? Why has it not reached the position of *PAC*s in other states where even the grass root, local political arena has been entered successfully?

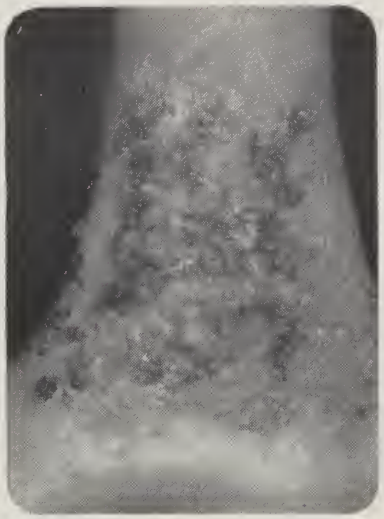
The answer is quite clear. Though we have grown dramatically in size we still lack many physician-wife combinations who by their political philosophy should be members.

Why?

Where are they?

We intend to find out.

Should it be possible they have never heard of us, we shall be heard. Should they no longer care, we shall give them reason to care—if not for themselves, then for the future of medicine and future physicians and *most important of all* for patient care, both present and future. After all, our offsprings will live in this world we leave them.



November of 1966 has come and gone and the political friends of medicine have realized more than ever the importance of that friendship. Two re-elected, incumbent Congressmen well realized the help of *MMPAC,* both vocal and financial. One freshman Congressman realised *MMPAC* contributed much toward his assumption of a Washington office. Another freshman incumbent of rubber-stamp-thinking saw himself almost unseated by a strong *MMPAC* supported challenger, in his first attempt at re-election.

This is part of the political picture over the Nation. Why then do physicians hold back? Why can they fail to realize their political potential—their full potential—when acting in an organized, orderly, legal and, if you will, patriotic fashion simply by exercising their God-given right to express their views both at home and, if necessary, at work.

The intent, purpose and activity of *MMPAC* will always be devoted to the full support of the highest professional ideals and those who share in such ideals whether he be physician or politician.

*Chairman, Executive Committee, Maryland Medical Political Action Committee.

Eczema of many years... controlled in two weeks

Before treatment

After treatment—
with ARISTOCORT Topical
Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Available in 5 Gm. and 15 Gm. tubes and ½ lb. jars.

THE CHANGING ROLE OF THE FAMILY PHYSICIAN IN THE TREATMENT OF PATIENTS WITH CHRONIC RENAL FAILURE

JOSEPH H. HOLMES, MD, D.Med.Sc.
Department of Medicine
University of Colorado Medical Center
Denver

Recent developments in the use of chronic dialysis and renal transplantation for the treatment of patients with chronic renal failure and uremia pose many new problems for the family physician and alter considerably the role he must play in the management of patients with progressive renal failure. The family physician can be an important factor in developing a successful therapeutic program for the patient even though many of the specialized techniques will be carried out in the renal "Center." Many of these advances in the treatment of chronic renal failure have been associated with wide publicity. Therefore, patients and their families are making certain demands for treatment and are groping for answers to many different questions. Since all of these patients first see the family physician, the initial evaluation becomes his problem, as is the decision as to when referral to the "Center" is necessary. The family physician must make the decision as to when the patient should be told about these new treatments. Furthermore, he must explain the problems the patient will face during such treatment, and the approximate chances for success. After the treatment has been initiated at the "Center," the care of the patient when he returns to his own community must rest with the family physician.

At the present time the initial work-up of the patient with renal disease becomes of increasing importance. This work-up should include a determination of the etiology and activity of the renal lesion, evaluation of present status of renal function and evaluation of co-existing medical problems. There should be a consideration of potential related donors, a careful review of all family members for evidence of kidney disease, and a review of the patient and family background in relation to such matters as satisfactory living conditions, cohesiveness of the family unit, religious or moral scruples, patient's occupation, attitude of employer, and the need for job rehabilitation if specific treatment such as transplant or dialysis is initiated. Many of the family and occupational problems which would preclude a successful renal transplantation will influence also the course of a chronic dialysis program.

Perhaps we should review briefly the current problems in renal transplantation, particularly those which must be considered during the initial work-up of donor and recipient.[1] The problems complicating a successful renal transplantation are primarily immunological. There are several important factors to be considered in achieving successful renal transplantation and preventing rejection of the donor kidney. The first is selection of a donor kidney which is most compatible for the recipient. A second factor is the maintenance of the donor kidney during the operative procedure so that it suffers only minimal damage from anoxia and fluid balance changes. A third factor relates to the technical aspects of transplantation in achieving a satisfactory circulatory anastomosis and a satisfactory urinary drainage. A fourth factor is the necessity of using drugs and X-ray to suppress rejection. Those immunosuppressive procedures should be selected which

Given at the Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland, April 1967, Co-sponsored by the Maryland Chapter, National Kidney Foundation.

are least toxic to the individual recipient and also permit him to achieve maximal body response to any form of stress.

What are the medical criteria which make a patient acceptable for renal transplantation at the present time? The first requisite is selection of a suitable donor. In our transplant program the results with live related donors are much better than with cadaveric organs. In donor selection, major blood group compatibility is a necessity. An O donor may be used for either an A or B recipient and an AB recipient may receive a kidney from any donor. Lymphocytic matching techniques such as those of Terasaki appear to be of real value and at present at our unit a definite mismatch will rule out that donor. However, there is some factor especially in related donors that cannot be currently evaluated by these techniques, so that an occasional good transplant may result even though there is a mismatch with the Terasaki technique.[2] Since the incidence of post transplant complications increases with age of the recipient, we have arbitrarily limited transplantation to those under 41, though exceptions may be made after extensive medical evaluation. The recipient should have no systemic disease such as lupus erythematosis, periarteritis nodosa or diabetes mellitus, nor medical problems such as cancer or tuberculosis which might limit overall prognosis or increase the difficulty of medical management during renal transplantation. The use of drugs to prevent rejection may produce toxic effects so that the recipient must meet certain medical criteria. For example, liver disease should be ruled out since most drug therapy used to prevent rejection may be hepato-toxic. When immunosuppressive drugs are used any infection in the body may flare up and cause death; thus, the detection and elimination of infection prior to transplantation is essential. When steroids are to be used for therapy the presence of a peptic ulcer, diabetes mellitus, or serious bone disease may either eliminate the patient from consideration for transplantation or may require appropriate therapy prior to transplant.

Medical conditions which pose technical problems may also eliminate the patient from consideration for transplant. Ureteral or urethral obstruction or cystitis may either be a contraindication to transplantation or require corrective surgery prior to transplantation. The presence of severe arterial disease in the pelvic region which would make arterial and venous anastomoses difficult may eliminate the patient for transplantation. In addition, a patient may be rejected for transplantation if he has had recent pelvic or intra-abdominal infection. For example, we have had to postpone renal transplantation for several months in patients who had severe peritonitis following peritoneal dialysis.

Finally, the family must be willing to make plans for a period of pretreatment of 5 to 6 weeks and post transplant treatment of up to 3 or 4 months in the immediate vicinity of the "Center." If the dislocation of the family for that period would cause serious problems, then perhaps a reestablishment of residence in the area of the "Center" must be considered. Often early psychiatric and psychological evaluation are necessary for recognition and treatment of those emotional problems which might interfere with post transplant care. With either treatment program there will be a definite period of imposed limitations on employment; thus, the patient's occupation essentiality and his relationship to his employer should be reviewed. Job essentiality means the patient has skills not generally available in the labor market as, for example, a rocket designer, so the employer will make many concessions to retain his services. If the employer is uncooperative, it may be necessary to make a job change or to initiate a job rehabilitation program. In some instances the patient has been eliminated from the transplantation program when emotional problems were uncorrectable, mental retardation was present, or when family or rehabilitation problems were insoluble.

These contraindications to renal transplantation serve as guidelines to the family physician for his initial work-up. Determination of the etiology is of primary importance in ruling out those forms of renal disease not considered suitable at present for renal transplantation. The complete medical evaluation is essential since early treatment of problems like peptic ulcer or infections will transfer the patient to a category acceptable for a transplant program. The same would be true for the psychiatric therapy. The evaluation of renal disease in the rest of the family may lead to therapeutic measures, which will make the pros-

pective donor a suitable candidate. If there are definite contraindications to renal transplantation, the family should be told quite early.

The evaluation of renal function is important not only in prescribing therapy but also in estimating the probable time when the patient may require either chronic dialysis or renal transplantation. This work-up should rule out urinary tract infection and make plans for treating any abnormality of the genito-urinary tract which can be corrected surgically. An intravenous pyelogram, isotopic studies, aortogram, or ultrasonic examination[3] may be valuable in indicating structural abnormalities and in demonstrating residual urine without catheterization. The laboratory studies should include an evaluation of current protein loss, good sediment examinations to assess degree of activity of the renal lesion, renal biopsy if that is necessary to establish either etiology or degree of activity of the renal lesion and a determination of 24-hour urinary excretion patterns for determination of volume, urea nitrogen and electrolyte excretion and creatinine clearance.[6] Since nitrogen retention usually does not occur until the creatinine clearance drops below 25 cc per minute, this has been one of our more effective tests in establishing prognosis. Furthermore, when the creatinine is between 10 and 25 cc per minute the patient will respond well to conservative management. The normal clearance range is 110-130 cc per minute. On a regular hospital diet, urinary urea nitrogen excretion averages 6 gm per 24 hours.[6] Thus, if the patient's daily urea nitrogen excretion exceeds this value, only a moderation in protein intake will be necessary, but if it is below this value dietary protein restriction is required. In renal failure sodium concentration in the urine averages 70 mEq/L even when serum concentrations are reduced. Thus, to prevent hyponatremia in renal failure patients the 24-hour sodium loss must be measured and the diet prescribed to replace this loss (average 4-6 gm NaCl/day). Assessment of the hypertension and the rate of red cell formation are important in planning conservative management and in estimating prognosis. A repetition of the laboratory tests at 3-month intervals will establish the relative progress of the renal lesion and may be important indices for planning rehabilitation or job relocation.

Let us now consider the role of the renal "Center." It may have an assisting function in the evaluation of the patient and particularly in supplying special diagnostic techniques, such as X-ray, biopsy, isotopic studies or ultrasound. The "Center" may also give advice on appropriate therapeutic regimens and discuss with the physician any special problems which they encounter during the initial work-up. When uremia progresses rapidly, the artificial kidney must be considered for therapy.[4] Other indications for dialysis may include the appearance of peripheral neuropathy, pericarditis, inability to work or a sudden change in mental status.

It is well to realize the dialysis load a "Center" faces at the present time since it must support a number of different programs. Table 1 presents the number of dialyses our "Center" performed last year and the number in each type of program. This is in contrast to a dialysis load of 360 in 1963. This type of load taxed our facilities and in some instances patients were turned away. The number of dialyses required for patients awaiting transplantation could be cut substantially with the help of the family physician since in most instances a delay in renal transplantation is directly related to the adequacy of the medical work-up of both donor and recipient.

TABLE 1

Pre-transplant	148	39
Post-transplant	69	13
TOTAL	1954	140

Shows dialysis load and its distribution for 1966 at the University of Colorado Medical Center.

Donor work-up is primarily the responsibility of the family physician and entails complete evaluation of renal function including creatinine clearances, urine culture, adequate sediment examinations, intravenous pyelogram, and aortogram. Blood is also drawn for lymphocytic matching. We feel that careful screening of the donor has eliminated many potential tragedies for both donor and recipient. The donor must have normal renal function and a single renal artery to

the kidney selected for transplantation. The latter is demonstrated by an aortogram. Allergic problems in the donor are usually not a contraindication for proceeding with transplantation. It is important to explain to each donor what being a kidney donor entails, and in the case of family members to make sure that there is proper motivation and no extreme family pressure. Occasionally it helps to have a donor discuss the problem with a psychiatrist from the "Center." Following nephrectomy in the donor, there is a prompt increase in renal function (within 3 days) up to 80% of the control values.[5] In our donor group, the post operative complications have not been serious, limited largely to infections or delayed wound healing.

After the initial renal work-up the patient is placed on good conservative management as dictated by this work-up. The rationale of conservative management in chronic renal disease is to balance the patient's intake of protein, salt and fluid to equal his excretory ability. The determination of the 24-hour excretion pattern will establish the patient's excretory ability under various fluid loads. The proper fluid load is achieved by having the patient weigh daily and increasing the fluid intake as long as the weight remains constant. If a further increase in fluid intake does not increase the urea nitrogen excretion, then there is no reason for establishing the patient's maximum ability to excrete urine. If the patient weighs daily and brings his weight record on each visit to the physician usually the complications of fluid overloading and pulmonary edema can be prevented. Other therapeutic problems in conservative management include the anemia and hypertension. In treating the hypertension, conventional drugs are used with careful observation to be sure that lowering of the blood pressure does not reduce renal function (creatinine clearance). Usually the anemia stabilizes at a hematocrit level of about 25%, and in such cases no further transfusions are required. When it gradually drops below this value, then packed red cells can be given.

The family physician must determine when referral to the "Center" for further evaluation or dialysis is necessary. In a significant group of patients by judicious use of occasional dialysis it is possible to prolong life significantly on conservative management. This is particularly important at present since both transplantation and dialysis are improving rapidly as more effective therapies. On the other hand the patient's conservative management cannot be prolonged until his condition deteriorates so that no further treatment can possibly be successful. The importance of proper time for referral is emphasized by a recent review of 135 uremic patients referred to this "Center." (Table 2)[4] Approximately 42% were referred in such severe uremia that they died within one month, either of the uremia or of associated medical complications, and thus could never even be considered for such programs as chronic dialysis or renal transplantation. For the remaining 58% of these patients, Table 2 shows the relative

TABLE 2

Patients No.	Survival Mos.	Age Yrs.	BUN mg%	Creat. mg%	Output ml

135 TOTAL					

Shows rate of survival in months of 135 patients admitted in severe uremia and who received 1–3 dialyses during the initial admission. They are grouped according to length of life after admission and compared with respect to average age, average admission blood urea nitrogen and serum creatinine levels, and average urinary output.

time period after the initial one or two dialyses before they returned to the hospital for further therapy. Fourteen patients improved sufficiently after one or two dialyses to remain at home in good condition for periods of over six months and in one instance up to 7 years.

The results of renal transplantation are difficult to evaluate because of changing techniques and increasing technical skills. The first transplant done at this institution was in November 1962, using body radiation for suppressing rejection. In subsequent transplants azothioprine and steroids constituted the primary immunosuppressive therapy. Since August of 1966 we have been using antilymphocytic globulin which appears to suppress particularly the early rejection phenomenon observed previously. This serum is prepared by injecting human spleen, lymph nodes and thymus

into horses. The titer is determined by leucocytic agglutination tests and a daily dose of approximately 1000 units/Kg given intramuscularly.[7] No serious reactions have occurred except for the extreme pain associated with the injections.

The results of transplantation at this institution (excluding the antilymphocytic globulin group) show that the results are much better if related donors are used when compared with the results using unrelated living or cadaveric donors. This is illustrated in Table 3. In fact, unrelated living donors probably should not be used at the present time. Results seem to be better when the lymphocytic matching indicates a good match between donor and recipient. In a few cases the first transplanted kidney has been rejected and a second transplant done. In these patients it is too early to determine whether the second transplant will be successful. Some patients were supported by dialysis for several months prior to receiving their second transplant, and in these patients dialysis has been most difficult because of the associated infections and general debilitation.

TABLE 3

Cadaver	0		56	4– 8

Shows homografted kidney survival rate in 139 kidneys transplanted at the University of Colorado Medical Center from November 1962 to September 1966. Group 1 (November 1962 to April 1964) represents the transplants prior to Terasaki matching and Group 2 (October 1964 to September 1966) represents donors selected by Terasaki matching. Immunosuppressive therapy was primarily azothioprine and prednisone, and this Table represents results prior to use of antilymphocytic globulin. (Prepared March 1967)

A recent editorial has summarized very well the causes of post transplant death.[8] The deaths were arbitrarily divided into early death (first 24 days) and late death. Causes of early death were related primarily to technical failures, to post operative surgical complications or to medical complications unrecognized prior to transplant. Only 25% of the deaths were due to sepsis. (Table 4) In contrast, in the late deaths over 75% were caused by sepsis

to infection depends on the approach adopted by the transplant physician. The more extensive use of immunosuppressive agents will often prevent rejection but subject the patient to a greater chance of lethal infection, whereas minimal use of immunosuppressive drugs will result in a greater incidence of rejections. I would like to emphasize these late complications of transplantation because it is important that the family physician be aware of these problems so that he can detect them early and refer the patient to the "Center" for more specific therapy. Many of these infections occur after the patient has returned to his home.

We are currently at a phase of treatment of chronic renal failure either by chronic dialysis or by transplant where both techniques require further investigation and development. In some patients we do achieve good results and since no other therapy is available, undue pressures are exerted by the community to treat all patients. However, since the facilities of dialysis and transplant units are limited, there is still the unfortunate situation that certain patients must be refused treatment. There are probably some patients who should not be advised to go through with either type of therapy at the present time. The patient himself must have a strong desire to live and be willing to start a new life. The request for treatment must be a result of the patient's desires and not family pressures. Furthermore, since the treatment itself is going to inconvenience the family for many months, will they be willing to make the necessary sacrifices? These are some of the problems that must be considered when a patient is referred for either renal transplantation or chronic dialysis.

The treatment of post transplant complications has severely limited the number of beds available for new patients in any transplant program. Thus, it would seem that at the present time when transplant is considered as a method of therapy, selection of ideal patients is justified. Whenever a patient has certain medical problems which we know will complicate transplantation, perhaps the patient should be deferred for the transplant program until our methods and techniques improve. Furthermore, if we are to develop these techniques to maximum effectiveness, there must be some degree of patient selection along the lines of trying to find out what we need to know to improve current techniques. Thus, the acceptance of a patient for renal transplantation represents a judgment based on medical evaluation and availability of facilities.

Following transplantation the patient usually lives near the "Center" for a period of several months. When the patient and his family return to his home, the role of the family physician becomes a very important one, both in helping the patient adjust to a new life and in detecting medical complications early so that they can be treated effectively. Medical evaluation must be directed toward the detection of toxic reactions to immunosuppressive agents, the detection of any change in renal function which might indicate rejection[9] and the detection of infections. At present the family physician must work closely with the renal "Center" group, at least until we have a better understanding of the possible complications associated with renal transplantation. Whenever close working relations are established with the family physician, life expectancy is greater than when a patient is returned to his home and the liaison between the "Center" and the family physician is inadequate.

The choice by the family physician of a proper medical program for the patient with chronic uremia is not a simple one. The physician is beset by family pressures generated by premature publicity. He must decide before referring a patient to

a renal "Center" that this patient represents a candidate in whom there are definite reasons to suggest that transplant or chronic dialysis will yield good therapeutic results. Furthermore, the referral must be made at the proper time and a good medical work-up provided the "Center" at the time of referral.

Summary. The improvement in renal transplant and chronic dialysis techniques, together with current publicity, has brought undue pressures on the medical profession to treat all patients with chronic renal failure. The family physician must assume a new role in the treatment of patients with chronic renal failure. The effectiveness of his initial work-up and his medical management of the patient may often be the determining factors in whether results with either chronic dialysis or renal transplantation will be successful. He must work closely with his associated renal "Center," both in the pre-transplant and the post-transplant periods. Furthermore, with currently limited facilities he can best determine the most suitable candidates for either program. Whenever after initiation of one of these programs the patient is returned to his own community, then the family physician is responsible for helping the patient readjust and for continued medical evaluation and care. Furthermore, close liaison with the renal "Center" is essential both for care of the patient and for obtaining more complete information which is necessary to improve our treatment programs.

★★

NEW DIMENSIONS OF HEALTH PLANNING

WILLIAM H. STEWART, MD
Surgeon General, Public Health Service
U. S. Department of Health, Education, and Welfare

In doing some homework for this Michael Davis Lecture, I undertook a rapid re-reading of Dr. Davis' book *Medical Care for Tomorrow,* published in 1955. It was not a very successful job of skimming, for the book is difficult to skim—largely because each paragraph is packed with information and ideas that are very much alive today. In the process I acquired, or reacquired, a great many useful concepts.

But I was interested also in something I did *not* find in Dr. Davis' book. Unless I missed it somewhere, I found no discussion of health planning as such, in anything resembling the context and terminology we are hearing everywhere today.

This omission reflects no criticism on Dr. Davis. As all of us know, his mind has been ranging far out in front of most of us for nearly half a century. The point I am seeking to make is that *even* Dr. Davis didn't write about health planning twelve years ago, because this concept had not yet appeared over our horizon. It is a very new idea. Max Ways calls it a "new style in problem-solving."

Because it is new, and widely discussed, and generating a great deal of heat and confusion, I thought that this new style in health planning would be an appropriate topic for my Michael Davis Lecture. I don't promise instant clarification. But I do believe that in this new style lies our best hope of meeting unlimited aspirations with limited resources.

The Michael M. Davis Lecture, University of Chicago, May 25, 1967, Chicago, Ill.

For that is the heart of the contemporary dilemma in health and medicine. Public expectations for health care have been immeasurably heightened by the advance of biomedical capability, public awareness of that advance, and simultaneous social changes that have rejected for all time the notion of privilege. Access to good health care, like access to education, has been accepted as a right, for everybody.

Meanwhile, resources available for health have been growing, too—in terms of manpower, facilities, and plain money. Well over 40 billion dollars were spent for health purposes in the United States last year. This represents an impressive 6% of our Gross National Product as compared with less than 4% when Dr. Davis published his book. Yet even this growth has not kept pace with public expectation.

Therefore the answer to the question, "Why plan?", is simple and clean. Whenever desires exceed resources, choices must be made. If they are to be made intelligently and productively, they must be based on an intelligent assessment of alternatives. Planning is the process of serving up alternative courses of action and their foreseeable results.

At this point let me offer my first word of warning. Planning is *not* a decision-making process. Rather, it is a process of projecting and documenting alternatives. The choices are made through the political and social decision-making

processes of society. Ultimately they are made by the people themselves.

Along about here in any discussion of planning, a troublesome question arises in the minds of the professionals who have been on the firing-line a long time. "Why all the fuss about planning? Haven't we been planning for years?"

The answer is both yes and no. If by planning we mean a process of distributing a given quantity of resources among a given number of programs, year by year, then planning is what most administrators do, most of the time. Given a certain number of bricks and a certain quantity of mortar, it is fairly easy to determine how many buildings can be put up and how large the buildings can be.

A certain amount of this tactical, hand-to-mouth planning always needs to be done. But unless a great many dimensions are added to it, the results over a period of years are likely to become less and less responsive to the real needs. We tend to multiply the same old structures, year after year. We tend to count the growing number of structures and measure progress by it. Vested interests develop, based on refined expertise in constructing the same things. Budget requests and allocations are cast in the comfortable, conventional terms. Voices crying that maybe we should use lumber instead of bricks, or make different kinds of buildings, or possibly not construct buildings at all, are increasingly ignored.

This is an oversimplified metaphor. But something like it has happened in health, in education, in welfare, in armaments, in theology—at one time or another it has happened in virtually every field of human endeavor. The new style of planning and problem-solving is designed to substitute a more effective process for the traditional muddling-through.

Consider, for example, a problem familiar to all of us—providing health care for the children of America. The traditional approach to planning would call for an effort to train increasing numbers of pediatricians and supporting personnel, establish increasing numbers of child health clinics, carry out larger immunization campaigns, and so on. The product of these programs would constitute the quantitative measurement of progress. Each of these separate lines of attack would have its vocal champions, and they would be vigorously competitive for the lion's share of the resources devoted to the health of children.

The new style of planning would approach the problem quite differently.

It would begin with a definition of goals. How healthy do we want our children to be? Do we mean all children or just those for whom private pediatric care is readily accessible? Are we interested only in mortality, or do we care about morbidity as well?

The next step, growing out of the first, would be the refinement of these broad goals, insofar as possible, into measurable terms. What level of infant mortality are we shooting at? What is an attainable objective over a given period of time for mortality rates in childhood, in adolescence? How low can we expect to bring the incidence of communicable diseases, of chronic diseases, of accidental injuries?

Then comes a stage of intensive input of information. How many children will we be dealing with in 1975, according to best present estimates? What will be their pattern of sickness and health if current trends persist unchanged? Where and in what circumstances will those children live? How many of today's children are being served by today's pediatricians and clinics, and how many of tomorrow's children will tomorrow's resources be capable of serving?

Now we need to project our objectives against the information we have gathered. What does it take to get there from here? Will a major effort to develop "more of the same" do the job? If not, what shifts in priority or emphasis give promise of carrying us farther toward our child health goals. Should we be training an entirely new breed of health worker? Should we be experimenting with new systems of delivery of care that conform to none of the traditional patterns?

Finally, we need to consider how this child health effort relates to the larger world of health programming, and to the still larger world of national resource investment. How much can we ask the nation—or the State, or the city—to invest in child health services in relation to the investment in care of the aging, in biomedical research, in housing, in transportation? What are the trade-offs, and what are the pay-offs?

Obviously this is an immensely complicated process. Also obviously, I have hit only the high spots and have skimmed with a brief phrase a

number of procedures that may require an exhaustive exercise in data gathering and projection. Looking at the enormity of the task, I think it is perfectly fair to ask the question that many are in fact asking these days: Is the game worth the candle?

I am convinced that it is. In fact I am convinced that we in the health business have no alternative but to learn the rules and play the game to the hilt.

We have no alternative because health is too big a business—a $43 billion business; it is too high on our society's list of priorities; it is too close to the heart of society's highest goal—the fulfillment of the individual. We could get by with our old hit-or-miss methods in the days when medical science was a pill and a prayer, and when health care was tacitly assumed to be a privilege for the rich and a pacifier for the poor. But no longer. Not when access to the best in health care is the expectation of every American and that expectation is too often unfulfilled.

Let me return now to the process I described a moment ago. The product of that process is not a master plan or blueprint for the future. But—as I suggested earlier—a set of alternatives. It places before the decision-makers a set of means to achieve objectives leading to a broad social goal. Insofar as possible it indicates the amount and kind of investments required—in terms of money, manpower or other resources—to accomplish certain ends. The system says, in effect: "So much input here can be expected to produce so much output there. On the other hand, if you choose this alternate mix of priorities, you should get this other result." Sometimes they are administrators; sometimes they are politically responsible officials; sometimes—always, in the long run—the decision-maker is society itself. The identity of the decision-maker depends upon the nature and level of decision required. But the planning process never makes the choice.

Moreover, these decisions we are talking about are not made once and for all time. The process is continuous. New information is constantly being fed into the system. New assessments of objectives are constantly being made as the terms of the total equation change. In our field of health, for example, a sudden advance in knowledge and technology may cause a complete re-shuffling of the deck of priorities and methods. Or success in attaining one objective may lead to the creation of new problems requiring high priority attention. If the planning process is working well it is sensitive to the shifting winds that should lead to modifications in operation.

Having followed the planning process through to its point of presenting alternative courses, and having identified the decision-makers, we need to discuss one rather important additional matter. Someone has to implement the decisions.

In the United States we have evolved a health services system which is really not a system at all. It is rooted in pluralism and individualism. Its basic elements are the private practitioner, the community hospital, the health department, the voluntary agency, the educational and research institution, and—sometimes forgotten but very important indeed—the consumer of services. No mechanism exists, nor is such a mechanism contemplated, that will dictate what each or any of these components shall do at any given moment. We sometimes talk about *mobilizing our health resources* but we are using a very loose figure of speech. Our health resources are not an army, conditioned to respond when someone pushes a button, but a proudly and fiercely individualistic group of elements linked only by their common commitment to health.

Therefore, implementation of even the best-laid plans is voluntary. In most cases it is sporadic and uneven. But two elements of the planning process can help to make this voluntary implementation work. One is the success and skill with which the alternatives are developed and documented. The other is the breadth of participation in the planning process itself.

People and institutions dedicated to health goals will—as they have demonstrated many times—act promptly and effectively if they are convinced that the proposed action is best calculated to advance the nation's health. And people and institutions dedicated to any goal will participate vigorously in a course of action that they have helped to shape.

Max Ways, to whom I have already referred, presented a useful six-point summary of some of the characteristics of this new planning process in an article in *Fortune Magazine* this past January:

1. A more open and deliberate attention to the selection of ends toward which planned

action is directed, and an effort to improve planning by sharpening the definition of ends.

2. A more systematic advance comparison of means by criteria derived from the ends selected.
3. A more candid and effective assessment of results, usually including a system of keeping track of progress toward interim goals. Along with this goes a "market-like" sensitivity to changing values and evolving ends.
4. An effort, often intellectually strenuous, to mobilize science and other specialized knowledge into a flexible framework of information and decision so that specific responsibilities can be assigned to the points of greatest competence.
5. An emphasis on information, prediction, and persuasion, rather than on coercive or authoritarian power, as the main agents of coordinating the separate elements of an effort.
6. An increased capability of predicting the combined effect of several lines of simultaneous action on one another; this can modify policy so as to reduce unwanted consequences or it can generate other lines of action to correct or compensate for such predicted consequences.

To these six I would add two more, although both are implicit to a certain extent in a couple of Mr. Ways' points.

The first is that the planning process should have the broadest possible base of input, representing not only the private individuals and public and private institutions involved in providing health care but also the private individuals and institutions involved in receiving it, and in relating health to other activities of society. This breadth of participation has two vitally important virtues: it improves the planning, and it enhances the likelihood of implementation.

My second point is that planning should be done and decisions made where the problems are—as close to the people as possible. National planning is important and necessary, but it must indulge in generalities of uneven application across the nation. Regional planning and State planning are better able to establish meaningful priorities and produce workable sets of alternative actions. Local planning is most relevant of all for the practical application of resources to the solution of genuine problems.

These two principles, in conjunction with the broad concept of planning outlined by Mr. Ways, underlie the two major experiments now underway for which the Public Health Service has responsibility—the comprehensive health planning program under P.L. 89-749, and the regional medical programs authorized by P.L. 89-239.

I submit, therefore, that planning in the new style is rich in promise for health. I believe it can help relate our fragmented efforts to each other, and relate our total efforts to the broader currents of society. I do not envision it as a great white magic, but as a useful way of getting the most health for our very large investment.

I am aware as a physician that no one should prescribe a new course of therapy without taking into account its possible harmful side effects. There are hazards involved, some of which can be inferred as the converse of the principles I have outlined.

One hazard—the one which has caused many to fear the word "planning" for many years—is the idea of one master-plan or blueprint superimposed on the nation from above. No such master-plan exists, nor is it likely to exist, nor does the means exist for superimposing it. Rather the tide is running strongly the other way—toward local determination.

Another danger, more real and present than the first, is the danger of rigidity. Regardless of where planning is done, it is possible that a course of action, once chosen, will tend to be fixed for eternity. To be successful, planning must be ever sensitive to change and decision-making ever flexible.

A third hazard is that planning may become an end in itself, rather than a means to an end. New techniques and methodologies can generate a kind of cultism that seeks to force problems into a preconceived mechanism, instead of continually adjusting the means to the ends.

Fourth, as I have already stressed, there is the danger that planning can become divorced from those who must carry out the action and those who are affected by it. There is a world of difference between "planning for" and "planning of and by" the people.

And one final word for those of you who, like myself, occasionally have the uneasy feeling that something of warmth and humanity might go out of the world of health as the emphasis on planning comes in. William Gorham, who was one of Secretary McNamara's assistants in the Department of Defense when some of the new planning techniques were being pioneered and who is now an Assistant Secretary of Health, Education, and Welfare, had this to say in a recent talk:

"It must be obvious that economic criteria are not the only criteria which should be applied to the allocation of resources and the distribution of program outputs. Nor do the analyses made . . . constitute a pre-packaged *Instant Decision* dents at a liberal arts college, and then continsense, and compassion or turn resource allocation decisions over to computers."

There is still room for judgment, common sense and compassion. In fact they are as indispensable as ever. The new style, the new techniques, seek to give judgment and common sense a firmer base in truth and a clearer look at consequences. They seek to open doors so that compassion can reach more people to greater effect. So long as our ultimate goal is the fulfillment of the individual human being, sensible and compassionate human beings remain the ultimate weapon.

Reprint from Regional Medical Program Bulletin, August 17, 1967.

SHARE YOUR MEDICAL JOURNALS WITH COLLEAGUES OVERSEAS

The doctors of the U.S.A. are being asked to send their medical journals—after they have read them—to colleagues overseas (Asia, Latin America, and Africa) who wish to have access to current medical literature but, either because of currency regulations or actual cost involved, cannot themselves subscribe to medical periodicals. We can supply you with the name, address, and medical specialty of doctors in these areas who would be happy to receive these much wanted journals, (*particularly specialty journals*), which you will mail direct to your overseas colleague.

This is a direct "Doctor-to-Doctor" program which is being sponsored by the American Medical Association with the collaboration of The World Medical Association to help alleviate the lack of current medical publications and to further international good will. Your cooperation in this program will be greatly appreciated and your contact with these colleagues in other countries, we can assure you, will prove very gratifying. If you wish to participate in this program, send your name, address, and titles of journals you will contribute to DOCTOR-TO-DOCTOR PROGRAM, Ada Chree Reid, MD, Director c/o The World Medical Association, Inc., 10 Columbus Circle, New York, New York 10019.

THE PHYSICIAN AND THE NATIONAL LIBRARY OF MEDICINE

LEONARD KAREL, Ph.D.
Special Assistant to the Associate Director for Intramural Programs
National Library of Medicine

Introduction

When the National Library of Medicine was established in 1836 as the Library of the Surgeon General's Office (US Army), the Surgeon General was authorized to spend $150 for medical literature. Today the Library, located at Bethesda, Maryland, near Washington, in a five-story contemporary building which it has occupied since 1962, is regarded as the world's largest in biomedicine. Among its holdings of 1,300,000 items, in seventy languages, are 315,000 monographs; 310,000 bound journal volumes; 285,000 theses; 168,000 pamphlets; and 4,500 reels of microfilm.

The Library provides 175,000 interlibrary loans annually, and of these 160,000 are photocopies of journal articles not available at the requesting local library. Reference personnel answer 10,000 personal inquiries, 10,000 phone inquiries, and 2,000 mail inquiries each year. Requests for 100,000 library items are made by 25,000 to 30,000 persons who use the reading room each year.

The Library is a major publisher of biomedical bibliographies; eg, *Index Medicus, Cumulated Index Medicus, Bibliography of Medical Reviews, Biomedical Serials* 1950-1960, *Bibliography of the History of Medicine;* and *NLM Current Catalog.* Among other Library publications are *Medical Subject Headings,* the thesaurus for *Index Medicus,* List of Journals Indexed in *Index Medicus;* National Library of Medicine Classification; and *Russian Drug Index.*

The National Library of Medicine

Known for 86 years as the Library of the Surgeon General's Office, the Library was developed as both a national and an international resource by John Shaw Billings, MD, Librarian from 1865 to 1895. In 1922, it was renamed the *Army Medical Library* and in 1952 was again renamed, the *Armed Forces Medical Library.* In 1956, under legislation introduced by Senators Lister Hill of Alabama and John F. Kennedy of Massachusetts, it was transferred to the Public Health Service, Department of Health, Education, and Welfare, and named the *National Library of Medicine.*

The Library was established by the Congress of the United States to assist in the advancement of medical and medically related sciences by the collection, dissemination, and exchange of scientific and other information important to the progress of medicine and of public health.

Towards fulfillment of its mission the Library 1, acquires and preserves books, periodicals, films, prints, and other library materials pertinent to medicine; 2, organizes these materials by appropriate cataloging, indexing, and bibliographic listings; 3, publishes and disseminates catalogs, indexes, and bibliographies; 4, distributes materials through interlibrary loans, photographic, or other copying procedures; 5, provides reference and research assistance; and 6, encourages, promotes, and supports activities to further the progress of medicine and of public health by strengthening existing services and developing new ones.

The Congressional mandate was strengthened recently when, on October 22, 1965, President Johnson signed the Medical Library Assistance Act, Public Law 89-291 of the 89th Congress. In signing the Act, the President commented that the

Nation's medical libraries are a vital link between medical education, practice, and research, and that too little attention has been given to the problem of collecting and sharing scientific knowledge.

The Medical Library Assistance Act is an amendment to the legislation authorizing the establishment of the Library. The Act permits assistance to medical libraries for construction and renovation, for acquisition and for improvement of resources, for training of medical librarians and other information specialists, for preparation of publications, for research in medical library science, and for the development of regional medical libraries. The Act also authorizes traineeships, fellowships, and special scientific projects by individuals or institutions.

Administration of the Act on behalf of the Library is done by the Library's Extramural Programs.

The Library today serves as the principal national focus of resources and programs for bettering communication in medicine and the health sciences and is encouraging the development of the existing system of medical libraries into a national medical information network. on July 1, 1967, the Library acquired the Public Health Service Audio-visual Facility in Atlanta, Georgia. This facility renamed the *National Medical Audiovisual Center* will coordinate a national program in biomedical audio-visuals.

Access to the collection is facilitated through an interlibrary loan program. When libraries request loans through medical library channels, the National Library of Medicine lends books within the United States and, worldwide, provides single copies of articles from journals which the requesting libraries do not possess and which are not available locally. There is no charge for this service or for other services except special photography.

The Library collects materials comprehensively in some forty biomedical subject categories and selectively in many related categories. The collection, in which are over 19,000 serial titles, is increased annually by 95,000-100,000 items. It is estimated that the Library now stores 360 million pages, of which 85 million are pre-1870, and that at least 10 million more are being acquired annually.

Its History of Medicine Division alone has between 60,000 and 65,000 printed works bearing publication dates earlier than 1801. Included in the collection are: an Arabic manuscript of the year 1094 on gastrointestinal disease; a collection of palm-leaf manuscripts from Ceylon, in Singhalese; works of Hippocrates and Galen; and letters written by George Washington, by Benjamin Rush, and by Florence Nightingale. Holdings also include 535 incunabula; 33,000 16th, 17th, and 18th century monographs; 1,600 17th century theses and pamphlets; 2,000 early American medical works; and an estimated 60,000 prints and photographs.

Computerized Library Services

Efforts of conscientious, busy practitioners to achieve and to maintain awareness of the most recent medical discoveries and applications have often led to many and continuing frustrations. The increase in the volume of medical literature and in the number of users has not been paralleled by equivalent growth of medical libraries and of information storage and retrieval methods and facilities adequate to catalog, index, store, and retrieve literature for use of physicians, scientists, and others. Therefore, the Library adopted computerization as a means of assisting, supplementing, and complementing traditional approaches to management of published biomedical literature and pioneered in the use of computers for storage and retrieval of bibliographic information.

In January 1964, a computer-based information storage and retrieval system called *MEDLARS* (Medical Literature Analysis and Retrieval System) became operational at the Library.

MEDLARS joins the professional experience of trained literature analysts and searchers with the processing capabilities of a high-speed electronic computer. The literature analysts, using terms selected from a thesaurus of approximately 7,000 terms, *Medical Subject Headings* (Part II of the January issue of *Index Medicus*), characterize each article by assigning to it a number of subject headings or descriptors. Indexed articles are entered into the computer and transferred to magnetic tapes for storage, and for rapid retrieval. Currently, *MEDLARS* contains over 550,000 citations to biomedical journal articles published since January 1964. About 55% of these are in English.

MEDLARS has improved the quality of the

Library's monthly *Index Medicus* and has substantially reduced the time required for the production of other Library bibliographies.

Index Medicus, a comprehensive, monthly subject-author index, now incorporates 180,000 articles annually from nearly 2,300 of the world's biomedical journals. At the close of each calendar year, *MEDLARS* compiles *Cumulated Index Medicus,* a complete listing, with cross-references, of the citations which were printed in that year's issue of *Index Medicus.* An abridged edition of *Index Medicus* for the personal use of physicians is being planned in cooperation with the *AMA.*

(*MEDLARS* does not now include monographs, symposia, conferences, congresses, and proceedings not published in journals.)

The journals indexed in *Index Medicus* (approximately 2,300) are selected with the advice of an extramural committee whose decisions are made largely on the quality of the journal under consideration; however, care is taken to assure subject balance. Discussions of journals are based on prior knowledge of the journal and on inspection of the journal by committee representatives. In addition, the committee is assisted by advice from subject specialists. Comprising the present committee are physicians and scientists, medical editors, and medical librarians.

MEDLARS makes possible rapid machine searches of biomedical journal literature to obtain answers to reference questions that cannot be handled expeditiously by manual searches. Machine searches which provide citations to medical literature in specific areas of interest are called demand bibliographies.

MEDLARS is responding to more than 400 highly specific computer search requests monthly. These requests are coming chiefly from physicians, techers, and researchers in medical schools, hospitals, universities, and Federal research laboratories.

In addition to demand bibliographies, the Library collaborates with professional societies and other professional organizations in the preparation of "recurring bibliographies"—formally published, widely distributed bibliographies in specialized subject areas of broad interest.

These recurring bibliographies are *Artificial Kidney Bibliography; Bibliography of Medical Education; Cerebrovascular Bibliography; Fibrinolysis, Thrombolysis, and Blood Clotting; Index of Rheumatology; Index to Dental Literature;* and *International Nursing Index.*

Although the Library supplies the sponsoring organization with citations retrieved periodically from *MEDLARS* on film ready for offset printing, publishing and distributing the bibliography—on a non-profit basis—are the responsibility of the sponsoring organization.

At frequent intervals, generally monthly, the Library selects from its demand bibliographies a few considered to be of general interest. Announcements of the availability of these bibliographies, called *NLM Literature Searches,* appear in *JAMA, Public Health Reports, Journal of the American Dental Association, NLM News,* and other publications including state journals. There is no charge for these "Searches." Clinicians, educators, and researchers interested in receiving notices on new *NLM Literature Searches* may write to the Office of the Assistant to the Director.

To enhance effectiveness of *MEDLARS,* the Library has provided its computer tapes and programs to university-affiliated centers which can make computer-generated demand bibliographies available locally or regionally to qualified practitioners, educators, and researchers. Decentralized *MEDLARS* stations are now in operation or will soon be in operation at Harvard University, the University of Alabama, the University of California at Los Angeles, the University of Colorado, and the University of Michigan. Others are being considered, and as regional libraries, authorized by the Medical Library Assistance Act, are identified, they, too, will be provided with a *MEDLARS* search capability.

Two *MEDLARS* centers are in operation outside the United States: In the United Kingdom under a cooperative arrangement between the University of Newcastle-upon-Tyne and the National Lending Library for Science and Technology at Boston Spa, Yorkshire, demand bibliographies are provided by the Lending Library. In Sweden, literature references taken from MEDLARS tapes are being provided by the *Karolinska Institutet* in Stockholm.

Physicians wishing to obtain demand bibliographies are encouraged to seek the advice of local medical librarians on suitability of the inquiries and on the preparation of requests which will

elicit the information sought. The use of *Medical Subject Headings, Guide to MEDLARS Services,* and an expression of specific interests will help avoid retrieval of irrelevant citations. Thus, a request specifying animal experiments will help to insure that citations on human studies will not appear in the bibliography; similarly, specifying a single age group will obviate retrieval on all age groups.

Citations may be arranged alphabetically by senior author, by journal title, by language, by subject headings, and by year of publication, and each citation can be printed with the descriptors assigned to it by its indexer. Although the computer can print bibliographies on 8½″ x 11″ paper or on 3″ x 5″ cards, usually the printout is provided on the less costly paper.

The elapsed time between receipt of a request and mailing of a bibliography is a function of the volume of searches requested. At present, elapsed time is about three weeks.

It is important to note that *MEDLARS* does not produce abstracts. It is also important to note that *MEDLARS* services are not provided for searches which can be conveniently and readily accomplished by the use of published indexes, handbooks, and other reference materials.

Demand Bibliography Requests from Maryland

During the period July 1966-June 1967, inclusive, the National Library of Medicine responded to 844 demand bibliography requests from biomedical personnel in the State of Maryland.

Examples of these requests are: Innervation of the Mammalian Ovary, Conceptual Development in Educable Mental Retardates, Lipomas of the Duodenum, Incidence and Surgery of Melanoma in Pregnancy, and Pharmacodynamics of *DNA.*

The distribution of the 844 requests was:

Johns Hopkins University	45
St. Joseph College	1
University of Maryland	20
Federal	727
Other (Chiefly Physicians)	51
Total	844

Summary

The National Library of Medicine, now the world's largest biomedical library, was established by Congress to further the advancement of medical and medically related sciences by the collection, dissemination, and exchange of scientific and other information important to the progress of medicine and of public health. It has become an international as well as a national resource for publications and other items relevant to medical communication, and renders service on a worldwide basis.

In January 1964, a computer-oriented information storage and retrieval system called *MEDLARS* (Medical Literature Analysis and Retrieval System) became operational at the Library. This system has improved the quality of *Index Medicus* and other Library-associated publications and has substantially reduced the time required for preparation and publication of such publications.

The *MEDLARS* store of biomedical journal articles published since January 1964 now exceeds 550,000 and is growing at an annual rate of 180,000 articles, taken from nearly 2,300 journals. Requests for computer searches come chiefly from physicians, teachers, and scientists in medical schools, hospitals, universities, and Federal research laboratories.

During the period July 1966-June 1967, inclusive, the National Library of Medicine responded to 844 demand bibliography requests from biomedical personnel in Maryland.

*National Library of Medicine, 8600 Rockville Pike, Bethesda, Maryland 20014.

END MEASLES MENACE IN MARYLAND MAY, 1967

JOHN H. JANNEY, MD, Chief
Division of Communicable Diseases
Maryland State Department of Health

In 1966, when the Maryland Immunization Project was implemented, measles vaccine had been available commercially for several years. Measles immunization had quickly become a routine practice in well baby care in many physicians' offices and health department clinics. Yet the State Department of Health surveys showed that 50% of the children under five were still susceptible to measles, as well as 34% of the six through fourteen year olds.

Perhaps the seeming familiarity of measles led to mistaken complacency. Many parents, on the centuries old assumption that measles was merely a routine hazard of growing up, had not availed themselves of this effective new vaccine to protect their children.

But to parents who have nursed a sick, feverish baby through measles, this disease is no slight hazard; nor are physicians and public health workers casual about measles. In the autumn of 1966, a nucleus group of concerned parents, physicians, and public health officials felt that more must be done to vaccinate all of the measles susceptible children in Maryland. By October, informal exploratory conversations were being held by State Health Department Immunization Project staff with Karl M. Green, MD, chairman of the Child Welfare Sub-Committee of the Medical and Chirurgical Faculty local health officers, and with representatives of the Maryland Association for Retarded Children, and the State Jaycees.

The End Measles Menace in Maryland campaign grew out of those explorations, and before the end of May, 1967, more than 66,000 children had been vaccinated at nearly 100 clinics in 21 counties and Baltimore City.

The campaign was sponsored jointly by the Medical and Chirurgical Faculty and the Maryland State Department of Health, with the endorsement and support of local health departments

Dr. Karl M. Green, chairman of the Measles Steering Committee administering vaccine at the Emmittsburg Clinic.

and component medical societies, the Jaycees and hundreds of community volunteers.

The campaign was guided by a joint Health Department/Medical and Chirurgical Faculty Steering Committee headed by Karl M. Green, MD and including Raymond L. Clemmens, MD; Murray M. Kappelman, MD; Lawrence C. Pakula, MD; Robert Yim, MD; Benjamin D. White, MD; John H. Janney, MD; John L. Pitts, MD; Robert E. Farber, MD; Margaret Sherrard, MD; Daniel Finucane, MD; and Mr. Humphrey Ridgely.

Planning and coordination of the campaign became the responsibility of the State Health

Department's Immunization Project staff, with every member of the Division of Communicable Diseases staff ultimately involved.

The Medical and Chirurgical Faculty allocated up to $15,000 from its educational fund for education and publicity. These funds made possible the purchase of the many printed materials and other promotional items needed for such a large scale campaign.

In each political subdivision, local health departments and component medical societies planned and conducted clinics using fire stations, schools, shopping centers, health departments, and hospitals as clinic sites.

The campaign was conducted on three Sundays in May, 1967.

LOAN OF JET INJECTORS

The vaccine used was Schwarz Strain (further attenuated). The vaccine was administered, in most cases, by jet injector immunization devices. These instruments were made available by the National Communicable Disease Center in Atlanta, the U. S. Department of Defense, the Health Department of Puerto Rico, and military and industrial organizations in the region.

In all, more than 100 jet injectors were lent to the End Measles Menace campaign. To appreciate fully the generosity of the leaders one should consider that these jet injectors cost approximately $1,000 each.

Personnel to provide maintenance and technical assistance came from Puerto Rico, the District of Columbia, North Carolina, Oklahoma, New York, Illinois, and the National Communicable Disease Center. In addition, personnel in the Venereal Disease sections of the Baltimore City Health Department and Maryland State Health Department were trained to service and operate the injectors. The Maryland State Police helicopter was placed on standby alert for emergency transport of injectors, vaccine and personnel.

PHYSICIANS TRAINED FOR EMERGENCY

One fringe benefit of the End Measles Menace campaign is that more than 250 Maryland physicians have been trained in the operation of the jet injectors. They now are prepared to participate in any future mass vaccination campaign or any emergency situation that may require wide-scale, rapid immunizations.

Physicians who directed the clinics and operated the jet injectors were among the many community leaders who generously donated their time, services, and expertise to the campaign.

Use of the jet injectors was a major factor in the ability to conduct the campaign on an economically sound basis.

Many months in advance, project staff members had computed the probable campaign costs. Factors weighed included the expected percentages of preschool children who would attend the clinics (for these, the U. S. Public Health Service would pay the cost of the vaccine). Vaccine for school children would have to be purchased from donations, as would all clinic supplies for all age groups.

Use of the jet injectors permitted the use of vaccine packaged in fifty dose vials, resulting in greater economy and ease of administration.

VACCINE FOR ALL CHILDREN

Despite this economy and the donation of valuable time and costly services, it was necessary to ask for a donation of one dollar per child from those parents who could afford it. The steering committee, through all of the campaign publicity, made it clear that no child would be refused a vaccination for financial reasons, and provision was made for children of families on Maryland's Medical Assistance Plan.

Careful planning and budgeting, free vaccine for the pre-school children, absorption of certain costs by the State and local health departments, and the Medical and Chirurgical Faculty's financial contribution for education and promotion made it possible for the End Measles Menace campaign to show a surplus of slightly over $5,000.

This surplus has been earmarked as a designated fund for future joint immunization or public health projects of the Medical and Chirurgical Faculty and State Department of Health.

The campaign fell short of its goal of vaccinating the estimated 200,000 susceptibles in the 1-9 age group. While there has been some concern expressed that the estimates of susceptibles were too high, subsequent surveys and spot checks would seem to bear out the validity of the original estimates.

MOP-UP CAMPAIGN IN SCHOOLS

Because of this backlog of unimmunized measles susceptible children, the Division of Communicable Diseases, Maryland Department of Health, has proposed an in-school vaccination mop-up campaign. This campaign would seek to immunize those children in kindergarten, grades one, two, three, and four, and ungraded classes, who are still susceptible to measles; and by so doing to prevent them from carrying the measles virus home to younger siblings.

The following table points up the need for an in-school program on a county by county* basis.

SURVEILLANCE

With the goal of measles eradication so close, surveillance becomes a matter of extreme concern. Prompt reporting of suspected measles cases will enable health officials to pinpoint and then immunize those children who have not received the measles vaccine. Surveillance will enable health officials to squelch possible epidemics before they occur.

*Baltimore City is not included in these figures. An independent survey and estimate places enrollment in *inner city* ungraded, kindergarten, first, and second grades at 11,971 in 60 public schools. Susceptibles since the May campaign are estimated to be 4,000. It is emphasized that these figures represent only inner city school children. A projection for the total city enrollment is 10,000 susceptibles.

PROBLEMS IN THE RECOVERY OF STROKE PATIENTS

ALBERT F. HECK, MD
Assistant Professor
Department of Neurology
Co-Director, Stroke Clinic
University of Maryland School of Medicine

An estimated two million people living today in the United States have had one or more strokes.[1] Cerebrovascular disease is one of the three great killers of Americans, ranking closely behind heart disease and cancer. While 80% of deaths from this condition occur in those over 65, among persons less than 65, stroke is the fifth commonest cause of death of those in their most productive years.[1]

Dry statistics do not reflect the misery and loss of human dignity, nor the social, financial and psychological burdens imposed by a condition which, when detected in its earlier stages, is amenable in many cases to preventive therapy. The sequelae of stroke may in many cases be greatly ameliorated by prompt, correct diagnosis, careful treatment in acute stages and by proper application of physical, medical and rehabilitative measures in the majority of patients surviving the acute illness.

Stroke may be defined as dysfunction of one or more areas of the nervous system, resulting from a deficiency between the metabolic demand and the metabolic supply to the area, this occurring at least in part on the basis of disease of the cardiovascular system.

This broad definition not only encompasses the classical categories of thrombosis, hemorrhage and embolization, but also points to the many factors and wide variety of pathological processes which may be contributing to the clinical picture of stroke in the individual patient. Any process compromising the flow of blood to the brain, the content of essential brain metabolites in the blood, or the patency of the blood vessels to the brain—eg reduction of cardiac output, fall in blood pressure, reduction in oxygen content of the blood, hypoglycemia, atherosclerotic plaques, arteritis, emboli—in the presence of localized disease of blood vessels in the brain, causes dysfunction of those areas of the central nervous system supplied by the affected vessels.

Symptoms and signs are specifically referable to the areas of the brain involved. They vary widely in their extent, severity and duration, depending on the vessel involved, the nature of the underlying pathological process, the state of collateral blood supply to the area affected and the presence, absence or duration of systemic factors tending to compromise cerebral blood flow or the metabolic content of the blood. Factors predisposing to stroke—diabetes, heart disease, hypertension, vasculitis, anemia, arteriosclerotic stenosis of great vessels in the neck and upper chest—must be evaluated and treated in their own right. Detection and correction of the many possible factors involved is most profitably directed to the patient in whom the combination of predisposing and precipitating factors exist briefly enough that no permanent damage results to the brain—the so-called "transient ischemic attack" or *TIA*.

Where permanent damage to the brain has occurred, however, it is perhaps equally significant that among the majority of the 80% who survive their acute illness, a variable degree of improvement toward normal function is to be *expected*. Where improvement does not occur there is a reason. Awareness by the physician of these reasons and of the avoidable complications to which stroke patients are predisposed may lead

to a significant reduction of morbidity in the individual patient.

Hemiplegia is the commonest motor manifestation of stroke. With onset, there is weakness, loss of reflexes and flaccid loss of muscle tone. After a variable time, the familiar hyperactivity of reflexes, spasticity of muscle tone, appearance of pathological reflexes (eg Babinski) and some improvement in strength is to be expected. As a rule, the sooner the appearance of spasticity and hyperreflexia after onset, the better the prognosis for return of function. Hypotonia and hyporeflexia may persist and compromise attempts at rehabilitation and gait retraining. Persistence of flaccidity should suggest to the physician that he has perhaps overlooked one of the predisposing or precipitating causes responsible for prolongation of the metabolic deficiency underlying dysfunction of brain tissue. Damage to the parietal lobe, with which persistent flaccidity is sometimes associated, may result in disturbances of recognition of shapes and symbols, confusion of right and left, impaired tactile discrimination, reading, writing, calculation and other functions which have immediate bearing on rehabilitation to a useful existence. Recognition of these disturbances may pinpoint the source of problems encountered in recovery and retraining and aid in the definition of more realistic goals in rehabilitation of individual patients.

Urinary incontinence requiring catheterization is a common and often severely debilitating problem in neurological disease. Prolonged catheterization is fraught with several complications, most of which are entirely preventable and all of which are treatable. Of these, infection is the commonest and potentially the most dangerous, particularly in diabetics, who are unfortunately also predisposed to atherosclerotic cerebrovascular disease. In the absence of pre-existing genitourinary pathology, practically all patients can be maintained free of infection—urethritis, prostatis, cystitis and ascending pyelonephritis—by 1) avoidance of unnecessary trauma to the lower G.U. tract and 2) meticulous attention to internal asepsis and external cleanliness. Trauma to the urethra and/or prostate gland, a significant precipitant of infection, can be minimized; repeated trauma by "routine" changing of catheters is not necessary if catheters are cleaned externally and irrigated prn. with Solution "*M*" or "*G*". Deposition of urinary concretions in the catheter, easily palpable by rubbing the tube between the fingers, is an indication for replacement. In males, dependence of the penis in its usual position with a catheter in place results in pressure in the intrabulbar fossa of the urethra and may result in a urethro-perineal fistula, a serious complication requiring surgical intervention. This may be avoided simply by strapping the catheter to the abdomen so that the penis points craniad. In males, where residual urine volume after voiding is not excessive (vide infra) problems of urethral trauma from catheterization may be averted by use of an external collecting device fashioned from a condom fastened and inverted over a tube, but this too requires meticulous attention to cleanliness of the genitalia and avoidance of excessive constriction.

Where bladder dysfunction is permanent, bladder rehabilitation, aimed at eventual removal from reliance on a catheter, should be begun as soon as possible, but only in the *absence* of infection, of bladder hypotonia or of vesico-ureteral reflux. Catheters, once in place, are best left on straight drainage. Periodic clamping of catheters in an effort to preserve bladder tone may result in infection complicating urinary stasis.

Cystography and cystometography are often necessary for proper evaluation. Following voluntary or reflex voiding, a residual urinary volume of 20% of the total bladder capacity as measured by cystometography is the maximum acceptable value if one contemplates removing the catheter. A high residual volume may result from 1) spasticity of the bladder sphincter with obstruction to urinary outflow or 2) hypotonia of the bladder wall with reduction of voiding pressure. In patients without catheters, urinary frequency with oliguria and "overflow" incontinence are the usual results of a spastic bladder sphincter. This may be not only socially debilitating, but also a major nursing problem. Spastic bladder sphincter is often amenable to one of several urological procedures, including pudendal nerve blockade or sphincterotomy. The latter situation, ie spastic sphincter, must be differentiated from that in which urinary urgency and evacuation of small urine volumes occur on the basis of hyperactivity of the stretch reflex of the bladder wall itself. This hypertonicity of the bladder detrusor is

detected by means of cystometography and is best treated by removal of the catheter together with administration of small amounts of anticholenergic drugs (Pro-banthine *Propantheline*).

The use of prophylactic antibiotics in the absence of infection is usually not indicated and may result only in a stubborn infection by a resistant organism if and when infection does occur. Suppressive therapy, however, including *Mandelamine* or *Furadantin*, together with a urinary acidifying agent such as *Methionine* (Pedameth) or an acid phosphate preparation (*pHos-pHAaid*), is helpful in controlling bacturia and urinary encrustations.

In stroke some degree of spasticity is an expected concomitant in the recovery of hemiplegia. Imbalance of muscular tone, with hypertonicity of flexor, pronator and adductor muscles in the upper extremity, of extensors, external rotators and adductors of the thigh and of invertors and plantarflexors of the foot, lead to the characteristic attitude of the extremities and the circumducting gait of the hemiparetic. Left untreated, hypertonicity may in a short time lead to contractures more disabling than the weakness involved. Protracted adduction and internal rotation of the shoulder joint in particular may lead to a stubbornly painful "frozen shoulder." Flexion contractures of the fingers and wrists render the hand all but useless and contractures of the ankle in inversion and plantar flexion seriously impair gait retraining.

Movement of all joints through a full range of motion three or four times a day as soon as such tone reappears following stroke will effectively prevent these complications. Passive movement may be carried out by untrained family members or indeed by the patient himself, using his unaffected side. Particular attention should be paid to the shoulder joint which, because of its unique anatomical structure (ie a ball joint held in position entirely by muscle and tendon), is peculiarly susceptible not only to painful contractures but also to dislocation by too vigorous manipulation, particularly during the flaccid stage of paralysis.

In the acutely ill patient, limb contractures are combated by proper position with a foot board and sand bags applied to the sides of the lower extremity to prevent plantarflexion and external

rotation of the limb; pillows should *not* be placed under the knees as this encourages flexion contracture of the leg on the thigh. The arm can be effectively maintained in an abducted, pronated position by padding it into a soft pillow and the fingers extended by bandaging them lightly with cardboard I-V tubing container.

Decubitus ulceration is almost always preventable and results from the combination of three predisposing factors: 1 uneven pressure against the skin, 2 wetness and 3 negative nitrogen balance. Infection is frequently superimposed and impairs healing. Avoidance of unevenness of bed clothes and mattresses, frequent turning of the patient, dryness of the skin and bedclothing and padding of bony prominences (eg sacrum, elbow, greater trochanter, malleoli, heels) will prevent bedsores even in the severely debilitated patient.

In the bedridden patient, particularly those in the older age groups, prolonged lack of weight bearing accelerates demineralization of bones, predisposing to fracture and to formation of mineral deposits in the GU tract. This can be avoided by early ambulation where possible; where this is not feasible, dietary restriction of calcium intake and weight bearing by the patient in a standing position while secured to a footed board or tilt table will reduce these complications.

Among patients admitted to longterm hospitals and outpatient facilities devoted to rehabilitation in the State of Maryland, the complications mentioned above are frequently encountered and are often responsible for prolongation of treatment with avoidable expense to families of patients and to the State. Urinary tract infection, requiring treatment, may preclude bladder rehabilitation for several weeks or indefinitely. Decubitus ulceration or severe contractures may delay physical and vocational rehabilitation of patients by four to six months.

An awareness on the part of physicians and other medical personnel of the natural course and possible complications to be anticipated in patients suffering from cerebrovascular disease is a prerequisite to planning proper management and meaningful therapy. The application of preventive and supportive therapy at the proper times can reduce the morbidity and mortality of this common condition and hasten the maximum degree of return toward a less dependent, more useful and happier existence for the patient.

The author is indebted to John D. Young, Jr., MD, Professor and Head, Division of Urology and Paul F. Richardson, MD, Associate Professor and Head, Division of Physical Medicine and Rehabilitation, University of Maryland School of Medicine for their comments and suggestions in the editing of this manuscript.

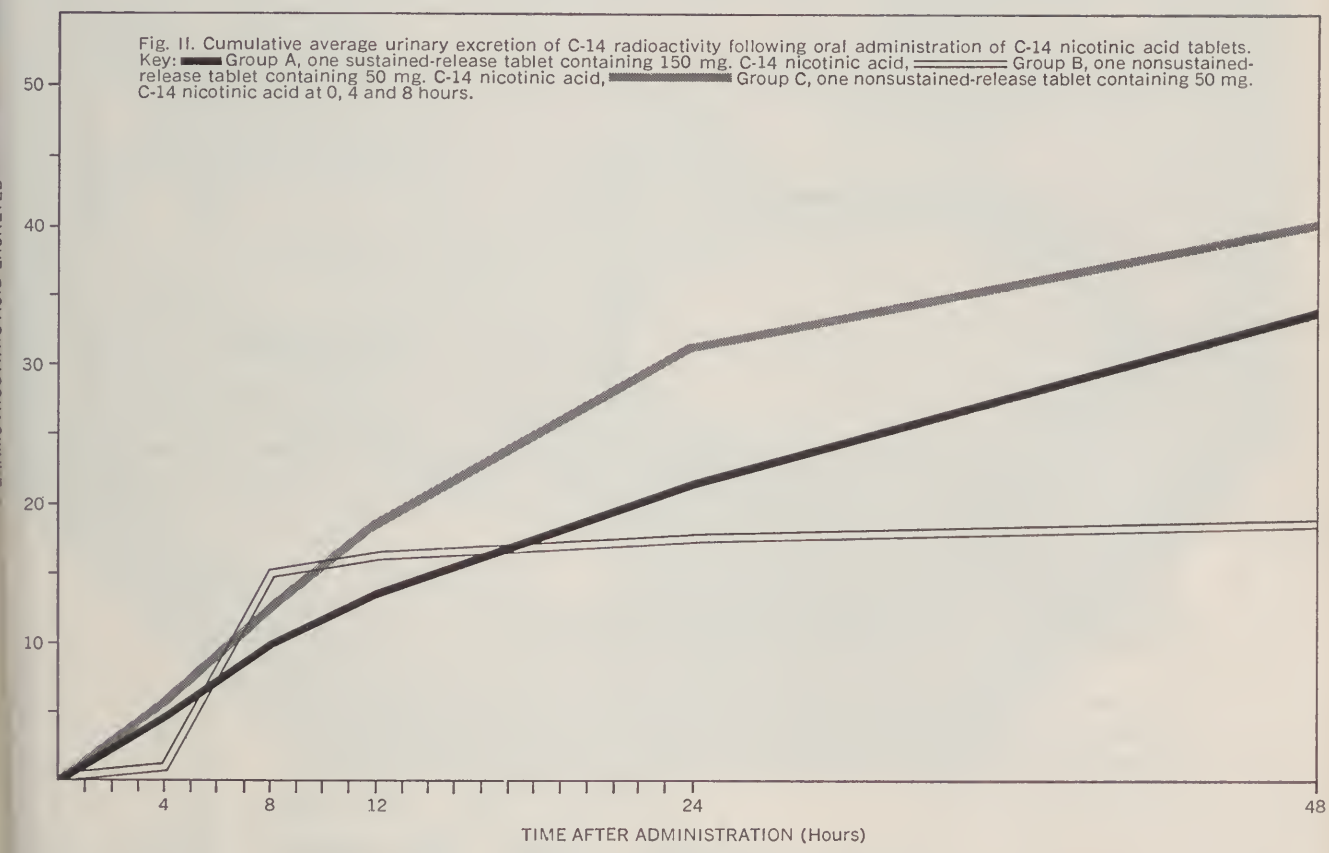
Sustained circulatory, respirator and cerebral stimulation for th

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

ss confused and moody. Personal care, memory, notional stability, social attention improve. Fatigue, athy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will rmit your patients to enjoy the benefits of time-olonged nicotinic acid/pentylenetetrazol therapy, an economical price. Dosage is only one tablet every hours.

ntraindications: There are no known contraindica-tns.

lecautions: Exercise caution when treating patients vh a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

Poliovirus Vaccine Live, Oral, Trivalent

ORIMUNE®

CONTRAINDICATIONS and PRECAUTIONS: Do not inject this vaccine. Postpone vaccination in those with acute illness; in any condition having an adverse effect on the immune response mechanism (leukemias, lymphogenous diseases, dysgammaglobulinemias, during treatment with immune serum globulins or with cancer chemotherapy agents, etc.); in advanced debilitated states; or if there is persistent vomiting or diarrhea, or clinical signs of virus (including enterovirus) infection. Live measles and oral poliovirus vaccines should probably be given separately.
SIDE EFFECTS of significance have not been reported. However, the risk of vaccine-induced poliomyelitis, estimated to be from 1:2,500,000 to 1:50,000,000 should be considered.
Supplied in trays of 10. Order through your Lederle Representative or regular source of supply.

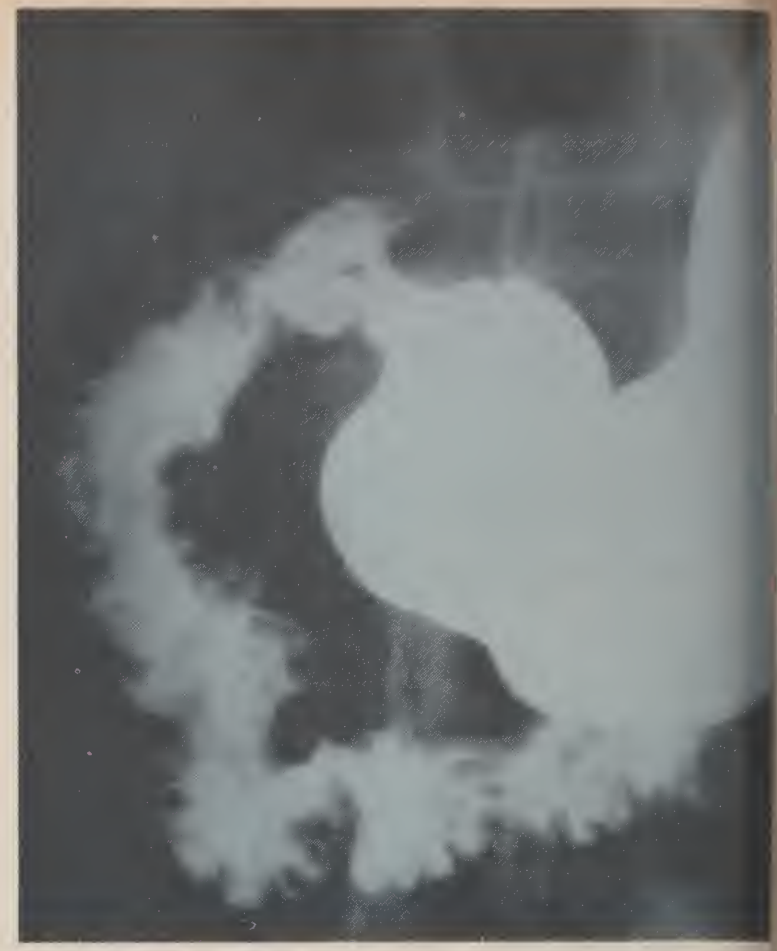
Let's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.



Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

Conventional Radiography

The restless duodenum makes radiographic diagnosis difficult, uncertain and often unproductive: Is this duodenum abnormal?

Hypotonic Duodenography

Pro-Banthīne-induced duodenal calm permits full anatomic appraisal: Same patient. Duodenal normality is now evident.

› in diagnosis

› in treatment

Pro-Banthine® brand of propantheline bromide

calms the gastrointestinal tract

For fifteen years Pro-Banthine has been the most widely used anticholinergic agent in disorders of gastrointestinal motility and gastric hypersecretion. More recently Pro-Banthine has reestablished its pharmacologic effectiveness in diagnostic procedures using intragastric fibroscopy and hypotonic roentgenography.

How the X-rays were taken

In the hypotonic duodenograph[1,2] reproduced above, the gastrointestinal tract was relaxed with Pro-Banthine. The duodenum was intubated. Pro-Banthine in a dose of 60 mg. intramuscularly was used to assure prompt aperistalsis and double-contrast visualization was achieved with ordinary barium and air.

The same pharmacologic efficiency has proved of pronounced value in such conditions as: *peptic ulcer, pylorospasm, biliary dyskinesia, functional hypermotility and irritable colon.*

Contraindications: Glaucoma or severe cardiac disease.

Precautions: Since varying degrees of urinary hesitancy may occur in elderly males with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug. Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.

Side Effects: The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

Dosage: The maximal tolerated dosage is usually the most effective. For most *adult* patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type vials of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours, intramuscularly or intravenously.

SEARLE

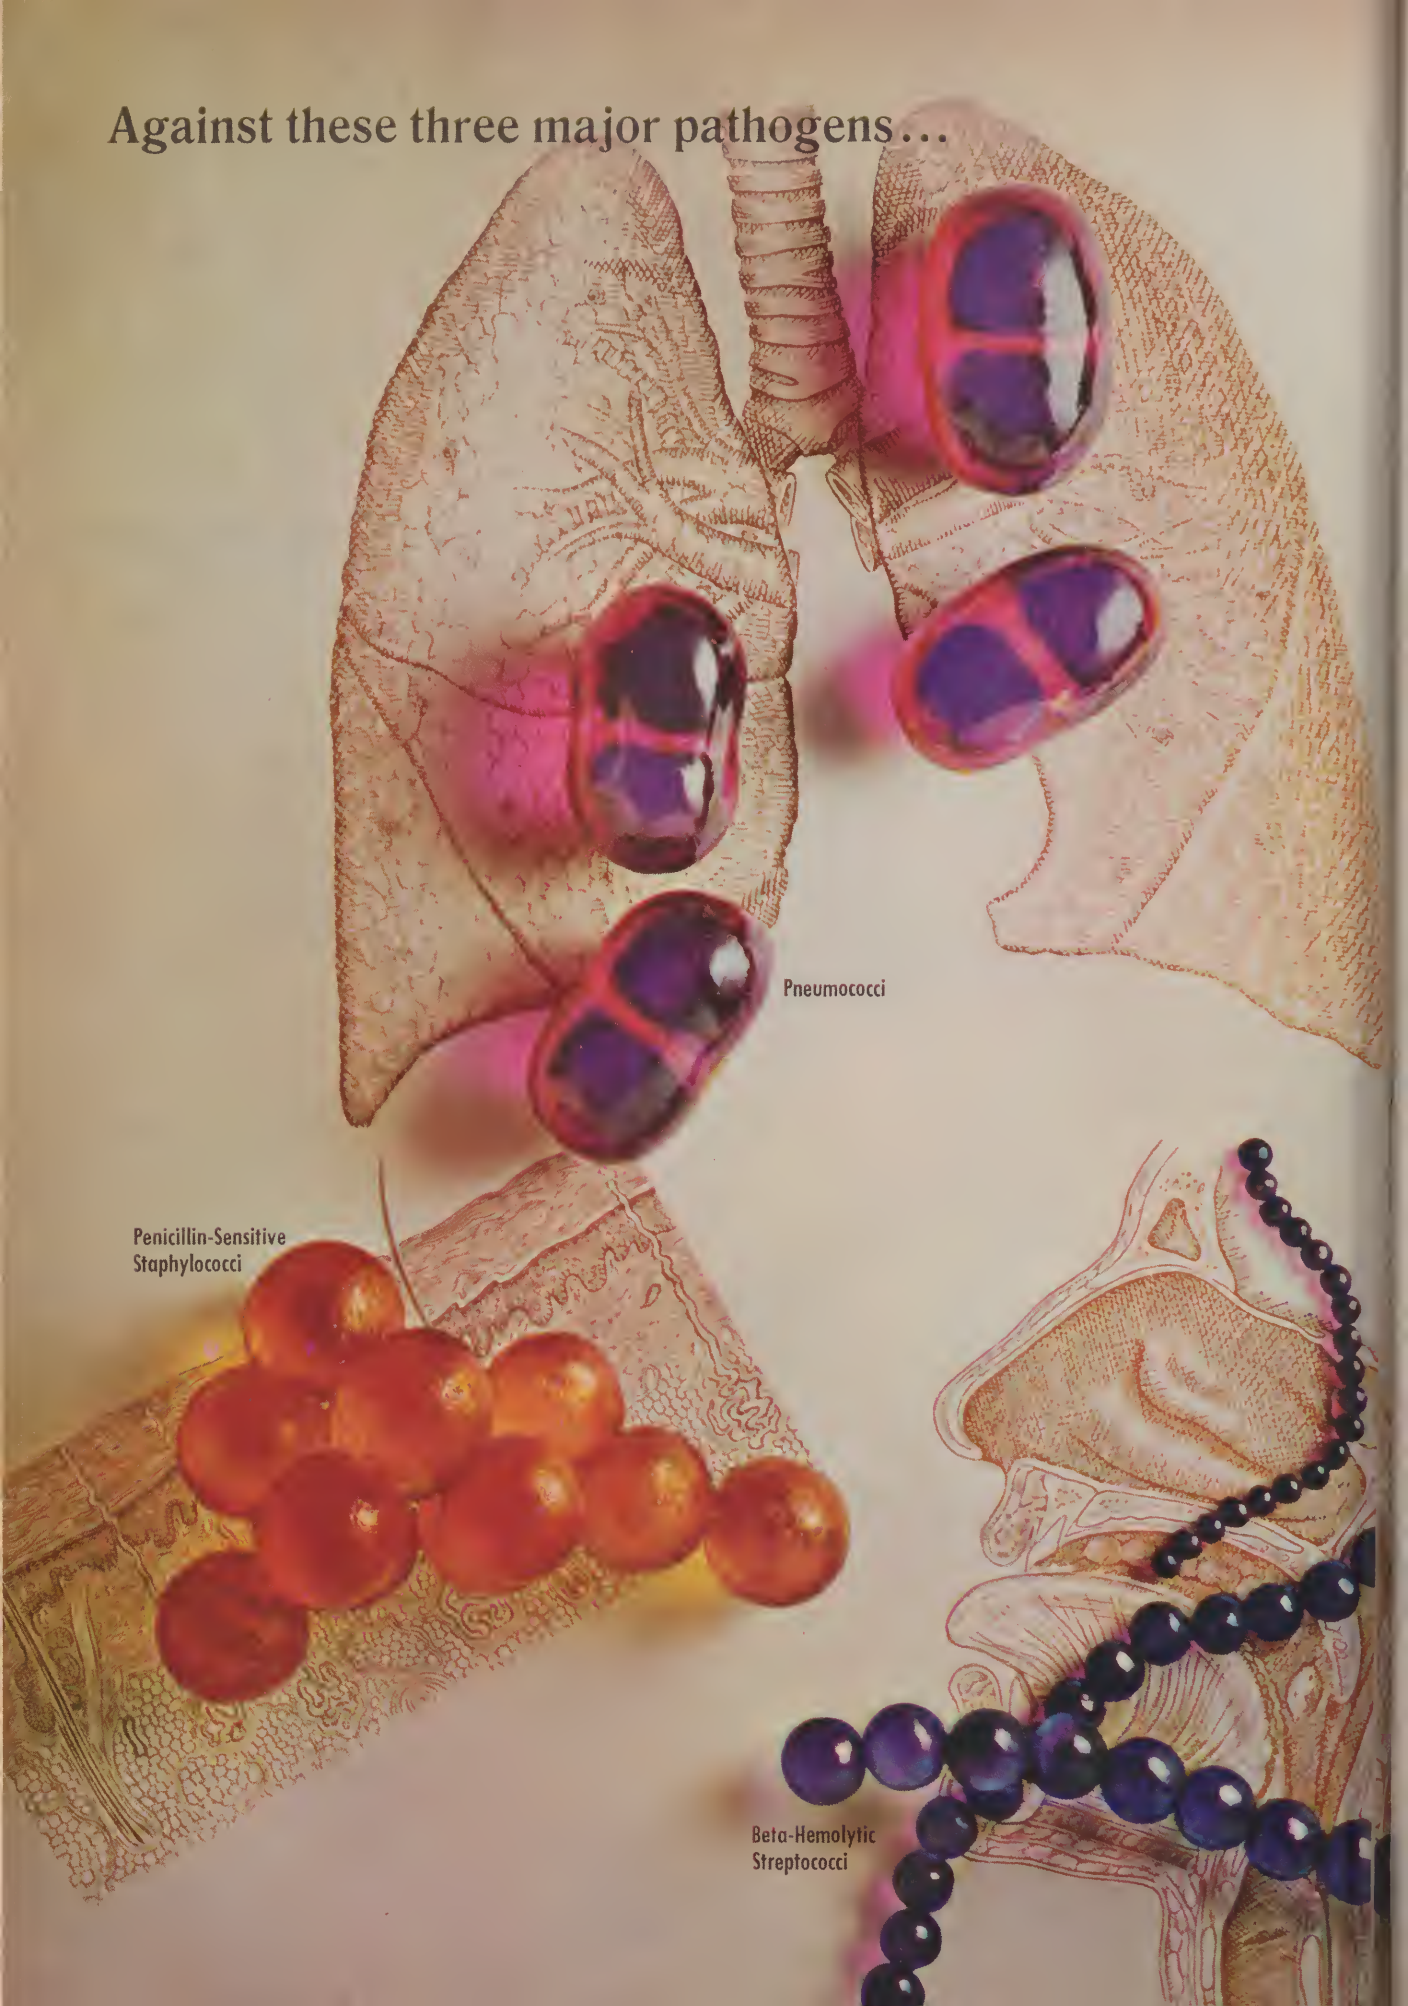
Preludin® phenmetrazine hydrochloride

For complete details,
please see full
Prescribing Information.

helps keep calories at arm's length

Preludin is indicated only as an anorectic agent in the treatment of obesity. It may be used in simple obesity and in obesity complicated by diabetes, moderate hypertension, or pregnancy. For use in pregnancy, see Warning.

Dosage: One 25 mg. tablet b.i.d. or t.i.d. Or one 75 mg. Endurets® prolonged-action tablet a day, taken by midmorning.
Contraindications: Severe coronary artery disease, hyperthyroidism, severe hypertension, nervous instability, and agitated prepsychotic states. Do not use with other CNS stimulants, including MAO inhibitors.



Warning: Do not use during first trimester of pregnancy unless potential benefits outweigh possible risks. There have been clinical reports of congenital malformation, but causal relationship has not been proved. Animal teratogenic studies have been inconclusive.
Precautions: Use with caution in moderate hypertension and cardiac decompensation. Cases involving abuse of or dependence on phenmetrazine hydrochloride have been reported. In general, these cases were characterized by excessive consumption of the drug for its central stimulant effect, and have resulted in a psychotic illness manifested by restlessness, mood or behavior changes, hallucinations, or delusions. Do not exceed recommended dosage.
Side Effects: Dryness or unpleasant taste in the mouth, urticaria, overstimulation, insomnia, urinary frequency or nocturia, dizziness, nausea, or headache. (B)R46-560-A

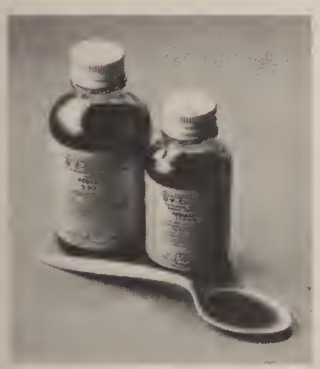
Under license from
Boehringer Ingelheim G.m.b.H.

Against these three major pathogens…



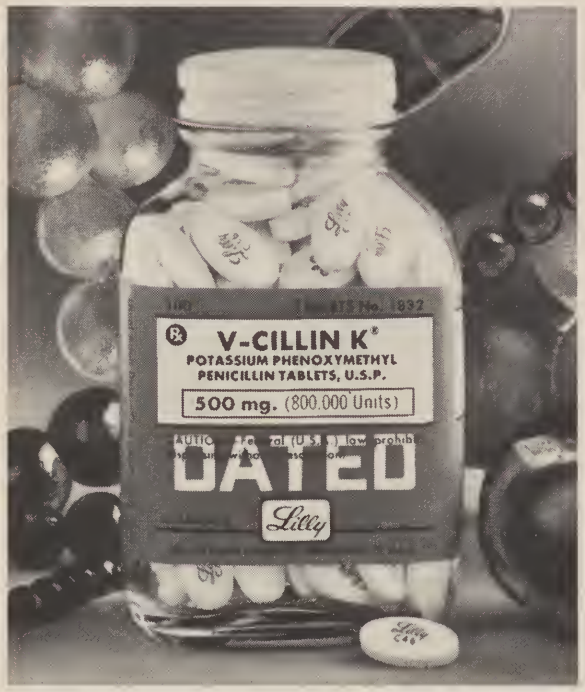
V-Cillin K® provides dependable oral antibacterial therapy

because it combines a high degree of activity...

V-Cillin K has been shown to be effective in the treatment of streptococcus and pneumococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy in patients with a history of rheumatic fever or congenital heart disease.

with high blood levels, even when taken with food

V-Cillin K is stable in acid and immediately soluble. High serum levels, therefore, are reached rapidly. Because it is acid stable, V-Cillin K is well absorbed even when taken close to mealtime. These desirable properties help make V-Cillin K a dependable penicillin for oral use.



V-Cillin K® Lilly 701449

Potassium Phenoxymethyl Penicillin

Now available: V-Cillin K®, Pediatric, for Oral Solution, 250 mg. (400,000 units) per 5 cc. of solution.

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K, the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly), combines acid stability with immediate solubility and rapid absorption. Higher, more rapid serum levels are obtained than with equal oral doses of penicillin G.

Indications: Streptococcus, pneumococcus, and gonococcus infections; infections caused by sensitive strains of staphylococci; prophylaxis of streptococcus infections in patients with a history of rheumatic fever; and prevention of bacterial endocarditis after tonsillectomy and tooth extraction in patients with a history of rheumatic fever or congenital heart disease.

Contraindication: Penicillin hypersensitivity.

Warnings: In rare instances, penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin or with bronchial asthma or other allergies. Resuscitative drugs should be readily available. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: Use cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with high parenteral dosage schedules, frequent evaluation of the renal and hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory studies (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrowth of penicillin-insensitive organisms. In such cases, discontinue administration and take appropriate measures.

Adverse Reactions: Although serious allergic reactions are much less common with oral penicillin than with intramuscular forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it possesses a significant index of sensitization. The following hypersensitivity reactions have been reported: skin rashes ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; and reactions resembling serum sickness, including chills, fever, edema, arthralgia, and prostration. Severe and often fatal anaphylaxis has occurred (see Warnings). Hemolytic anemia, leukopenia, thrombocytopenia, and nephropathy are rarely observed side-effects and are usually associated with high parenteral dosage.

Administration and Dosage: Usual dosage range, 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants, 50 mg. per Kg. per day divided into three doses.

See package literature for detailed dosage instructions for prophylaxis of streptococcus infections, surgery, gonorrhea, and severe infections.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units), 250 mg. (400,000 units), and 500 mg. (800,000 units).

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc. of solution (approximately one teaspoonful). [042567]

Failure to Isolate Causative Organisms

Some Thoughts on the Failure to Isolate Causative Organisms in Patients with Endocarditis or Why Aseptic Endocarditis

RICHARD B. HORNICK, MD
Director, Division of Infectious Diseases
University of Maryland School of Medicine

Patients with bacterial endocarditis frequently present vexing diagnostic and therapeutic problems. The classic manifestations of infection may not be present or else misinterpreted. This can result in inappropriate therapy which may further complicate proper interpretation of the clinical data by interfering with isolation of the offending organism. The prime prerequisite for effective therapy is a complete knowledge of the antibiotic sensitivity of the causative organism. Therapy guided in part by this important laboratory procedure and in part by the peculiarities of the host will provide the best therapeutic results.

Bacteremia in the typical case of endocarditis is usually continuous so that only a few carefully obtained blood cultures are sufficient to demonstrate the causative microorganism. Unfortunately some patients, 5-15%, who present with the clinical manifestations of endocarditis will show persistently negative blood cultures. The most common obstruction to bacterial isolation is the effect of a chemotherapeutic agent. Antibiotics administered to patients prior to hospitalization because of suspected febrile infectious disorders will interfere with the isolation of many of the causative agents of subacute bacterial endocarditis. The presence of low concentration of antibiotic may inhibit growth of bacteria from a specimen of blood without having any significant beneficial effect on the primary infection of the endocardium. Moreover, penicillin given prophylactically to patients with rheumatic heart disease can delay or prevent the isolation of organisms from the blood. This is especially true when the infection is caused by a viridans streptococcus that is moderately sensitive to penicillin.

Equally important as a factor influencing results of blood culture is the type of offending microbe. The presence of unusual organisms which require special cultural techniques for isolation may often create the clinical picture of "abacterial endocarditis." Examples of such organisms are those which require a strict anaerobic environment. In this category are enterococci, some streptococci and less common species of bacteroides. Anaerobic streptococci are probably the most common types of offending bacteria in those cases of enrocarditis from whom the organ-

ism is not isolated. Other fastidious organisms may cause endocarditis and are isolated with difficulty. The gonococcus is very elusive when attempts are made to isolate it from the blood. Fortunately this "bad actor" is an unusual cause of endocarditis. Other unlikely causes of endocarditis which are not amenable to isolation with routine techniques are *Histoplasma capsulatum, Coxsiella burneti* and brucellae. These are rare examples of agents which cause endocarditis but their identification is important because of the special therapeutic requirements inherent in their eradication. Those patients whose clinical features are compatible with endocarditis and whose course is refractory to ordinary measures should have elaborate cultural techniques performed to rule out such agents.

Occasionally patients with the clinical diagnosis of endocarditis will have blood taken for culture which subsequently is reported to show diphtheroids or a "contaminating staphylococcus." These findings should not be hastily rejected nor should they be accepted without question. These organisms may cause endocarditis in certain circumstances (ie after heart surgery). Furthermore, the causative microbe such as species of Listeria may be confused with diphtheroids and be reported as such. Usually diphtheroids and non-hemolytic staphylococcus are contaminants; contamination occurs often due to improper aseptic techniques when blood is drawn and placed in the culture flasks. Evidence in favor of accepting these organisms as true etiological agents requires their growth in media within 24-48 hours and their presence in more than one blood specimen.

Two other possibilities are responsible for difficulties in isolating causative agents in endocarditis. Prior administration of an antibiotic such as penicillin interferes with the isolation of certain bacteria. One of the mechanisms for this failure of bacterial growth is the ability of penicillin to produce incomplete organisms, such as "L" phase bacteria which lack a cell wall. This phase of bacterial growth appears to be normal for most bacterial species but requires special media for its demonstration. Penicillin is one of several environmental forces that causes bacteria to assume deviation to the "L phase." "L phase" organisms probably are non pathogenic for man (further proof is needed on this point) but may serve as a future source of virulent bacteria through reversion to fully complemented organisms in a proper tissue environment. These bacterial forms have been isolated from patients with endocarditis while receiving penicillin. In several instances such incomplete bacteria appeared to perpetuate the infection despite penicillin treatment. Only when chemotherapy was directed against them did clinical recovery occur. As additional evidence accumulates regarding these interesting organisms present concepts of proper antibiotic management of endocarditis may have to be altered. Additional drugs may have to be added to the therapeutic regimen. Moreover, it may be possible to shorten the prolonged course of parenterally administered antibiotics. These points are highly speculative and further experimental, clinical and microbiological verification is needed.

Finally, evidence of viral induced endocarditis in mice has been reported recently. No such human examples have yet been demonstrated but instances of "abacterial endocarditis" have been observed at autopsy. Identification of viral cause is difficult but not insurmountable.

Summary

In summary an attempt has been made to enumerate some of the possible explanations for negative blood cultures in patients with a clinical diagnosis of endocarditis. Only with this *prima-facie* evidence of disease can specific therapy be administered. Without such evidence antibiotic treatment should be given only when the clinical picture is strongly suggestive of endocarditis and other diagnoses have been ruled out. Once initiated, the clinician is usually obligated to provide a full course of antibacterial treatment.

DIARRHEA

CANTIL®
(mepenzolate bromide)

LAKESIDE

Diarrhea, one of the most vexing symptoms of common G. I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth, blurring of vision, constipation, nausea, vomiting, bloating and dizziness may occur but are usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy — withhold in glaucoma. Contraindicated in patients sensitive to phenobarbital and/or Cantil (mepenzolate bromide); in toxic megacolon, obstruction of G. I. or G. U. tract.

SUPPLIED: CANTIL (mepenzolate bromide) — 25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL — containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

Pediatric Habilitation—The Doctor's Role

GEORGE A. LENTZ, JR., MD
Assistant Professor Pediatrics
Instructor Physical Medicine and Rehabilitation
University of Maryland School of Medicine

Much has been written recently about the team approach and the role of the various disciplines in the management of a child with a chronic disorder. In this area of habilitation, what is the doctor's role? What contributions can and should he make?

Progress in medicine has brought about great changes in the care of children over the first half of this century. With the development of vaccines, and the emphasis on prevention, more and more infectious diseases are relegated to a position of minor importance. Furthermore, the early recognition, diagnosis, and treatment of many conditions has greatly altered the mortality and caused a shift from the management of acute illnesses to concern and management of chronic, disabling diseases and effects. The recent developments in the early surgical treatment of infants with meningomyelocele is one example. The increasing number of learning disabilities and behavioral problems that require complicated remediation are also problems. The role of the family physician in child care has been altered. Instead of having a seemingly lesser role in child care he is called upon to assume a more complex role as advisor, counselor, and coordinator.

A child is considered handicapped if he has a disability that limits or interferes with his work, his play, his education, his social activities, and his contributions to his home, family, and community. The field of habilitation is, therefore, the alleviation or alteration of disabilities so that they will be less of a handicap. This process of habilitation would allow the child to develop to the highest potential in all areas of life's endeavors. Lest he feel he is dealing with a small number of individuals, the physician should be reminded of the numerous studies that indicate that approximately 12 to 15% of school age children have disabilities that interfere with their growth and development in the educational sphere. In a recent report, an estimated 62,000 Maryland school age children will require special educational assistance in the year of 1968.

In a publication of the Maryland State Health Department,[2] an excess of 240,000 youngsters, approximately 1 in 7, are identified as having various chronic disorders. In Baltimore alone, there are estimated at least 1,500[1] youngsters affected by the rubella epidemic of 1964-65. These youngsters have many needs to be fulfilled to

allow them to grow to their highest potential. The magnitude of chronic disabilities the physician and the community face is generally unrealized. These youngsters and their parents require a great deal of the practitioner's time, understanding, support, and counsel.

One of the most important roles of the physician is early recognition and diagnosis. In this diagnostic role, it is not enough to list or label the conditions that are present. Rather, it is vital that a descriptive and functional evaluation be made that can be easily translated and used by the members of the remediation team. Many times the medical terminology and jargon is not well understood or practical to the therapist or teacher.

In pediatrics one is primarily concerned with growth and development, and in no instance is it more important than in the field of managing a handicapped child. A disabled child is an individual with varying degrees of growth potential. The influence of growth and development on his disability and the effects of the disability on growth and development must be understood. Every child is a constantly changing individual in a constantly changing environment. A youngster with a disability is no exception. Rather, he presents many special problems. The physician must keep these things in mind and must be able to interpret what the disability means to the child, his parents, his peers, his neighbors, and to others who are concerned with his welfare.

Having made a diagnosis and keeping the basic principles in mind, the physician's next role is to take an active part in long range planning and goal setting. The important point here is the long range aspect of things and the realistic approach. To make realistic plans one must be aware of the recent developments and the services and programs available. In this planning, the physician might keep in mind Kipling's faithful men—*Who, What, When How, Where,* and *Why.*

In the past decades, there has been phenomenal growth of allied health professions. In a recent article appearing in the *AMA* News, the ratio of para medical personnel to physicians was listed as 4:1. This figure is expected to increased to 7:1. These individuals are highly specialized in their area of competence and have an enormous contribution and role to play in the management and care of the handicapped child. Just as the physician knows the qualities and capabilities of his medical colleagues, it is equally important that he knows the capabilities as well as the limitations of these specialists. The physician's training, unfortunately, generally has been somewhat limited in this area and he should overcome this deficiency. It is of utmost importance that he be able to communicate with and enlist the aid of the many members of the rehabilitation team. He must engage in interdisciplinary discourse so that all may be able to "grow up together" in this field of pediatric rehabilitation. The great diversity and specialization presents many problems. Many youngsters move from clinic to clinic and from specialist to specialist often with little overall direction and coordination. Again, we see the need of a generalist. Realistic goals must be set, realistically reevaluated, and someone must be able to see "the forest from the trees." Therefore, the physician has a role of a navigator or helmsman in guiding the rehabilitation course.

New concepts of remediation and new programs are being developed at a very rapid rate. Many times the efficacy of the program is evaluated by the same discipline that proposed or is engaged in the implementation. It is mandatory that critical, objective, scientific evaluation of these programs be performed. Intradisciplinary evaluation and research seems indicated. Thus, another role of the physician is to give of his time and talents in the scientific evaluation of various methods of treatment and remediation.

Handicapped children arouse great emotions in all of us—parent, therapist, educator, and physician. As a professional, physicians are trained to be objective. We must let emotion concern guide but not overwhelm us. There are many vital roles the physician can and must play.

The purpose of this article has been hopefully to arouse the physician as to the scope of the problem, the needs, the services available, and most importantly the roles he must play as coordinator, counselor, teacher, and scientist in the care and management of a child with a disability.

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

Highlights

GENETICS SEMINAR HELD

The role of public health workers in the field of medical genetics was examined recently in a one-day seminar on "Medical Genetics in Public Health," sponsored jointly by Moore Clinic, Division of Medical Genetics, the Johns Hopkins Hospital, and the Health Department's Division of Mental Retardation. The program, under the supervision of Victor A. McKusick, MD, Professor of Medicine at the Moore Clinic, included presentations on general principles of genetics and genetic counseling, as well as, specific information on phenylketonuria, muscular dystrophy, mongolism, and cystic fibrosis.

BULLETIN UNDERGOES FACE-LIFTING

The Maryland Department of Health Bulletin, published since 1929, has been revamped and retitled "Maryland's Health." It will be issued quarterly, rather than bimonthly, in a magazine format suitable for hospital and office library or waiting room use. Major public health programs and problems in the state will be featured. The first issue in the new format dealt with the recent Measles Immunization Project carried out in cooperation with the Faculty.

REFERENCE HANDBOOK AVAILABLE

A new handbook describing Health Department services throughout the state has been published. Designed for use by physicians and their aides, nurses, social workers and other health personnel, it contains information on available services and their locations which should prove helpful to professional people in advising their patients or clients. Copies may be obtained from the Division of Health Education, 301 West Preston Street, Baltimore, Maryland 21201.

MONTEBELLO SEEKS NURSES

A 36-bed wing of Montebello Chronic Disease-Rehabilitation Hospital was closed last year because of the shortage of nurses. With the recent increase in salary scales, efforts have been rekindled to fill the 21 existing vacancies. When fully staffed, the hospital is able to receive and discharge an average of twelve patients per week. Closing of the wing has reduced this exchange to approximately half, and resulted in a sizeable waiting list of patients needing the special rehabilitative services of the hospital.

MEDICAL ASSISTANCE INPATIENT PAYMENTS INAUGURATED

Physicians requesting information on the new program of payments for services rendered in hospitals to patients certified eligible for Medical Assistance have received billing forms and a manual listing medical and surgical procedures by code number. Procedure listings conform in general to the nomenclature recommended by the American Medical Association and Blue Shield. To help in estimating the amount which should be included for this program in future Health Department budget requests, physicians have been

asked to bill their usual and customary fees. Payments, however, will be calculated and made on the basis of funds presently authorized by the Legislature.

Delays in payments for home and office visits, when they occur, are frequently due to mistakes in entering the 11-digit certification number on the billing form. The Department has requested in its 1969 budget an appropriation for funds to establish a "charge-a-plate" system of stamping bills. If these funds are appropriated by the General Assembly, the factor of "human error" should be greatly minimized.

MEDICAL ASSISTANCE ADVISORY COMMITTEE

To conform with Federal requirements governing Medical Assistance Programs, the State Board of Health and Mental Hygiene established the Medical Assistance Advisory Committee, which met for the first time in March 1967. Its composition includes representatives of the medical, dental, legal and nursing professions, pharmacists, hospitals, medical school faculties, nursing homes, local health and welfare services, Maryland Hospital Service, various segments of the community, the Department of Mental Hygiene, and the Department of Public Welfare. Health Department representatives serve as supporting staff.

Three major program committees to consider the areas of Professional Services, Institutional Services, and Program Development have been formed. Under these are subcommittees concerned with specialized aspects of the program. All committees work closely with Health Department staff members. The recommendations of these committees, if adopted by the committee as a whole, are transmitted to the Board of Health and Mental Hygiene for action. The Board relies heavily on the advice of the Advisory Committee and the State Health Department staff in establishing regulations for Health Department administration of the Medical Assistance Program.

EASTERN SHORE VD PROJECT COMPLETED

The Venereal Disease section of the Division of Communicable Diseases through the summer months conducted a testing and treatment program among migrant workers on the Eastern Shore. Syphilis serology was performed on 1440 blood samples. Positive reactions were obtained in 246 cases, 55 of which left the area before an examination could be performed. Of the remaining 191 cases, 7 were diagnosed as having primary syphilis, 20 as secondary, 27 as early latent and 137 as late latent. Treatment was given in 112 cases, mostly young persons. A companion project still under way in two western counties indicates similar findings.

IRON DEFICIENCY

ANEMIA

Imferon®
(iron dextran injection)

There's as much iron . . . 250 mg. . . . in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron . . . or orally administered iron proves ineffective or impractical . . . or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves. Precise dosage is easily calculated.

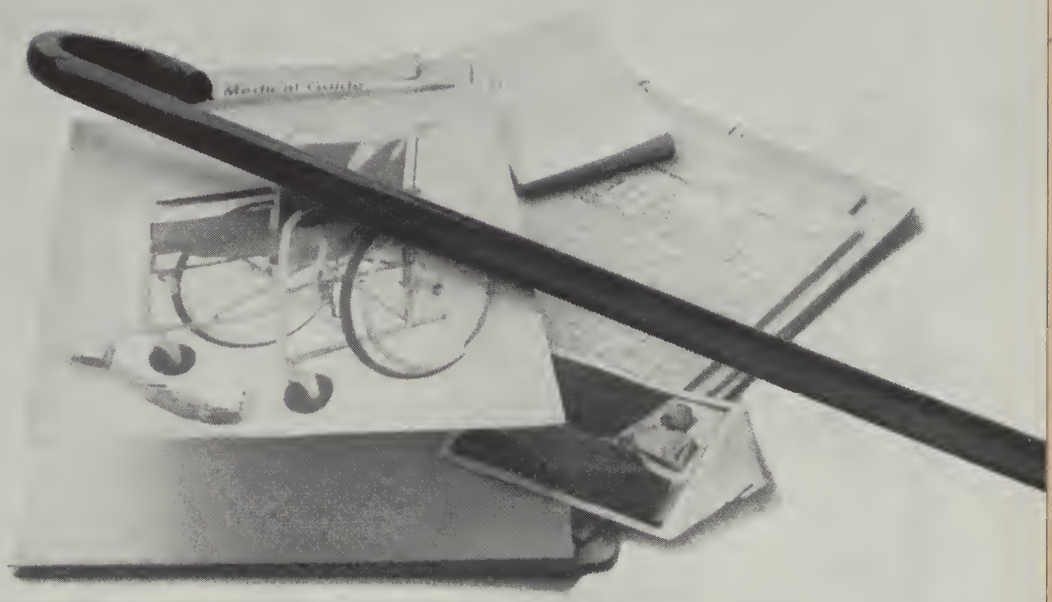
LAKESIDE

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

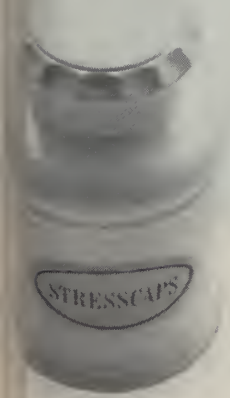
SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.



PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.



SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

in chronic illness

B and C vitamins are part of therapy: An imbalance of water-soluble vitamins and chronic illness often go hand in hand. STRESSCAPS capsules, containing therapeutic quantities of vitamins B and C, are formulated to meet the increased metabolic demands of patients with physiologic stress. In chronic illness, as with many stress conditions, STRESSCAPS vitamins are therapy.

Stresscaps®

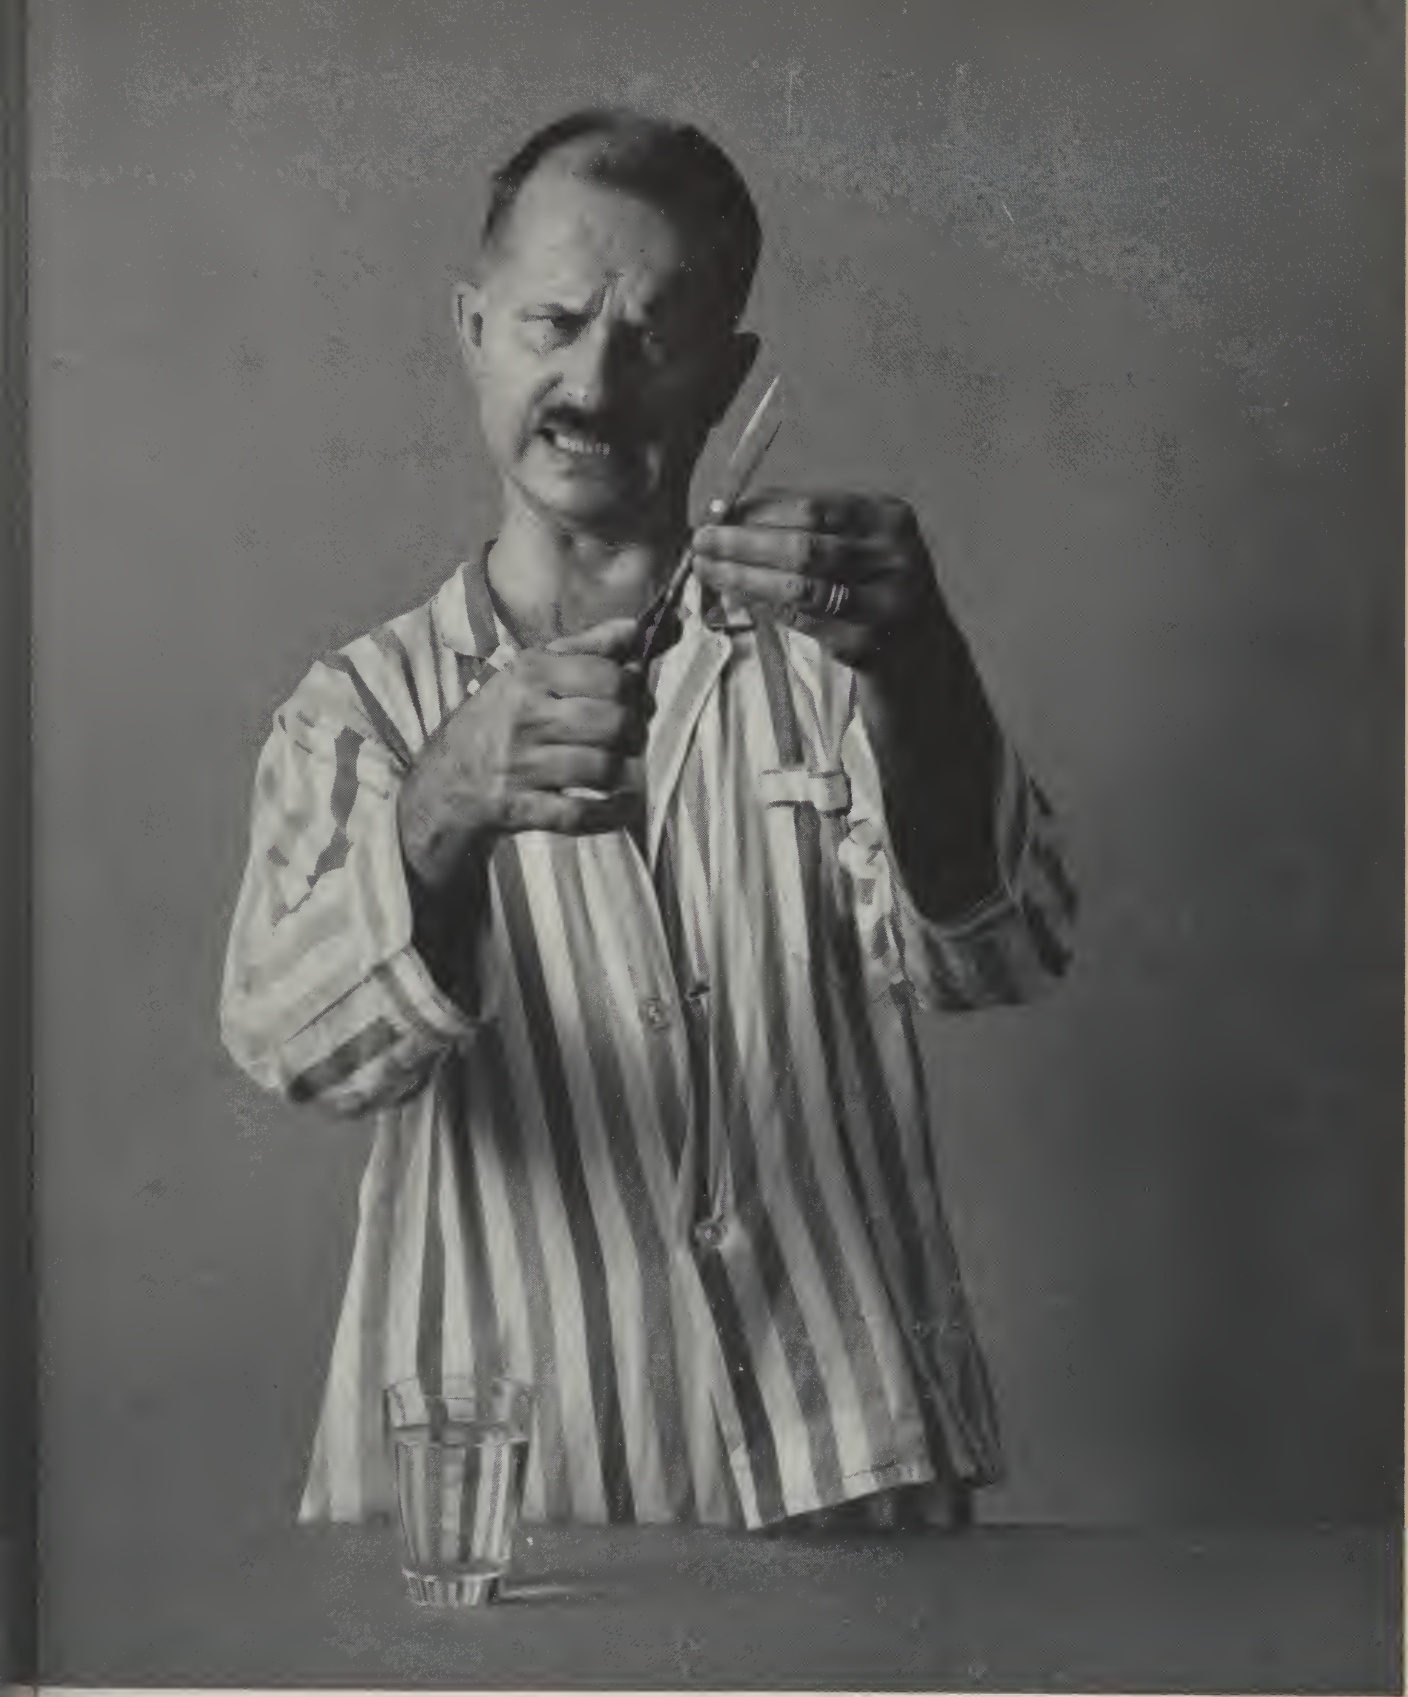
Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY

Each capsule contains:

Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.



LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York

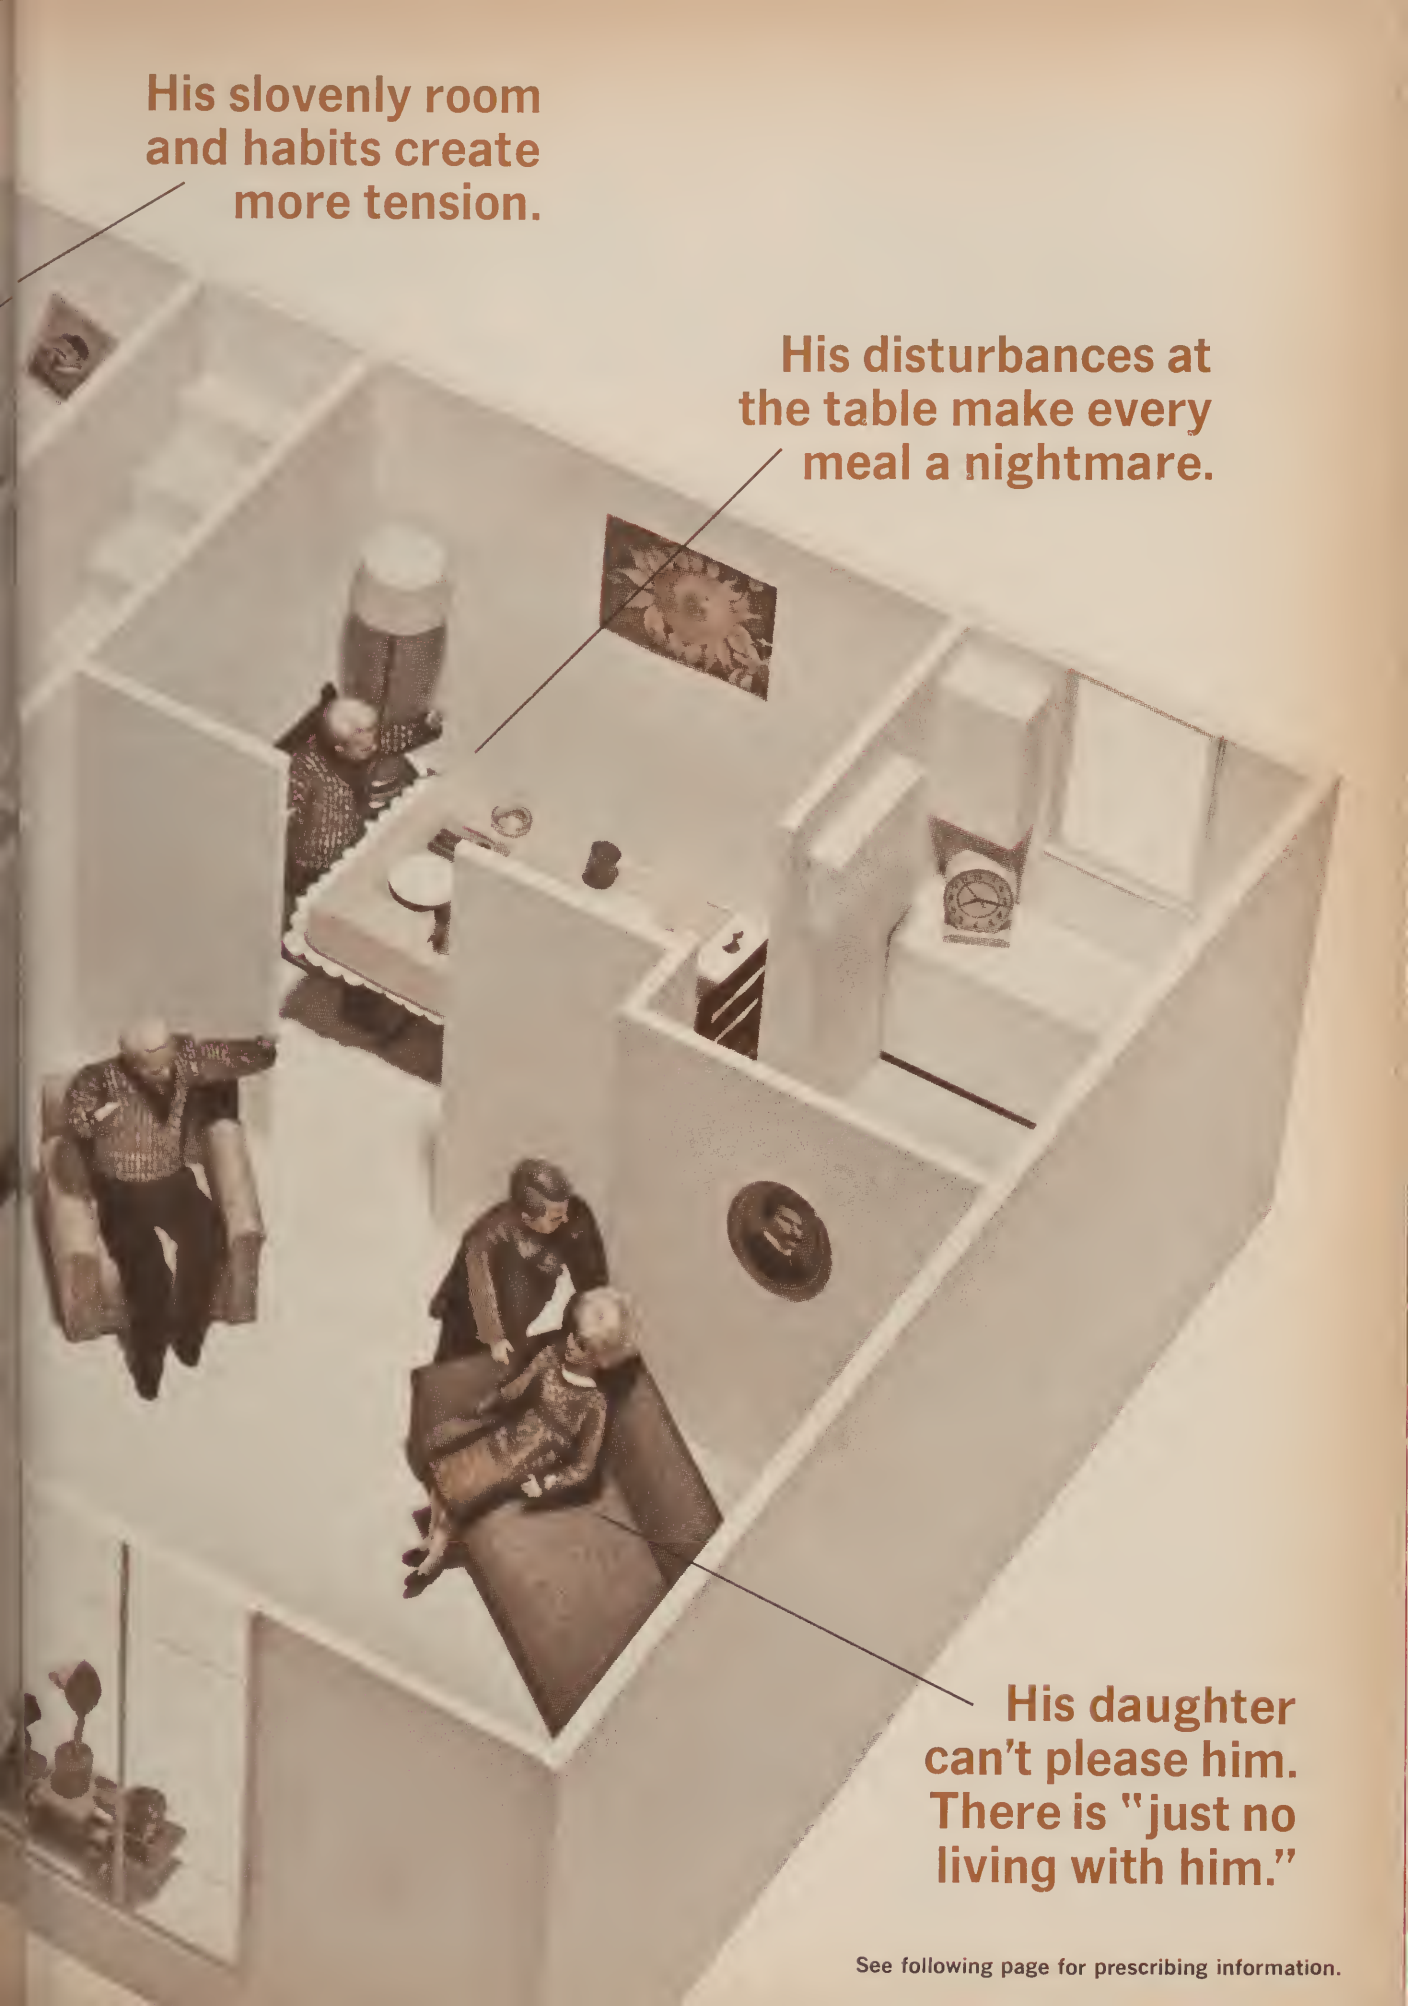
When the agitated geriatric disrupts the home...



His teen-age granddaughter won't invite friends home because of his outbursts.

for moderate to severe anxiety

Mellaril®
(thioridazine)
25 mg. t.i.d.

SANDOZ

See following page for prescribing information.

When the agitated geriatric disrupts the home...

Anxiety that *seriously interferes* with the individual's performance at work, at home, or in the community may be regarded as *moderate to severe* in degree.

Mellaril often recommends itself to the treatment of moderate to severe anxiety because it

- helps control the most frequent symptoms: marked tension, agitation, apprehension, restlessness, hypermotility
- often alleviates anxiety-induced somatic complaints
- frequently helps strengthen emotional resources
- helps the patient maintain realistic contact with environment, closer harmony with family

Thus, when you consider the anxiety moderate to severe... consider Mellaril.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.

Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.

Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.

Before prescribing, see package insert for full product information.

for moderate to severe anxiety

Mellaril®
(thioridazine)
25 mg. t.i.d.

SANDOZ

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

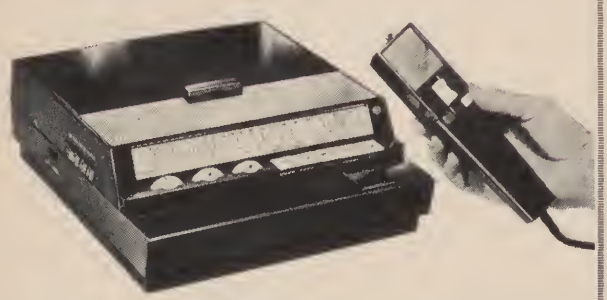
Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Getting Involved with Alcoholism in Medical Practice

JOHN H. HIRSCHFELD, MD
Presented at the 1966 Interim Scientific Session, Phi Lambda Kappa Medical Fraternity



In November 1962, when as a member of the Committee of Public Health, Preventive Medicine and Postgraduate Education of the Maryland Medical Society I was asked to form and head a subcommittee on Alcoholism, little did I realize that some three years later I would be deeply involved with treating alcoholics. Apart from being on many committees and on the Third Task Force of the Mayor of Baltimore, I have this year been projected to the Presidency of the Baltimore Area Council on Alcoholism. These ever-increasing contacts with patients are causing my confreres to change my identity gradually from chest specialist to alcohologist.

First, a few cold statistics. There are at this time in the United States seven million alcoholics, a conservative estimate. This does not imply that there are seven million Skid Row alcoholics or Bowery bums. Only 3% of all alcoholics are in the Skid Row category. The remainder are distributed among all strata of the population—my patients and yours. It is infrequent that an alcoholic walks into the office readily admitting to alcoholism. The disease presents itself in rather devious ways. Frequently a patient seeks out help claiming to have "lost time from work because of a bad cold, or a stomach virus," and wants you to write him an excuse for his job after "having recovered." Or a patient on anticoagulants shows the craziest variation of his prothrombin level from week to week.

Others come to the office complaining of a multitude of pains, aches, or other symptoms, without ever responding satisfactorily to any symptomatic therapy. A housewife has unexplained palpitation and tachycardia. While her cardiogram shows signs of relative coronary insufficiency, therapy is singularly ineffective until four months later the young lady breaks down and tearfully relates that her minister advised her to tell me how worried she was about her husband who, working at an arduous job, returns home drunk night after night. Other instances occur, especially in women—housewives, middle-aged salesladies—who see you a few days after "an injury," or showing unexplained bruises. When you scold them for not having seen you earlier, they sweetly say that they did not want to bother the doctor in the middle of the night or over the weekend. Obviously, in their vanity these women do not want to have you see them while they are drunk.

Let us get a definition of alcoholism in order to understand the disease. There are several. Jackson Smith, MD, defined an alcoholic as an individual

How come the world's richest companies buy the lowest priced dictating machine?

Eastern Airlines, Union Carbide or Gulf could easily afford any of the six nationally advertised dictating machines priced from $249.50 to $800. Yet they, as well as Ford, American Airlines, Allied Chemical, United States Lines, Goodyear Tire & Rubber, Home Life and many other giants of business, are buying the new Voca at $199.95. Could it be that the Voca is just as good, regardless of price? Or perhaps even better? Find out. We'll be glad to give you the full story. Phone, or mail the coupon today.

Alfred S. Bright, C.L.U.
Agency Manager,
HOME LIFE INSURANCE CO., N.Y.

"In our offices, we need dictating equipment we can depend on . . . that's why we selected VOCA."

Voca Patent Nos. 3,243,133; 199,189, other patents pending.

Only $199.95 complete with dictating or transcribing accessories.

Why? I want to know why experts choose the Voca dictating/transcribing machine over more expensive makes. Please send me full details and full color brochure.

whose drinking causes him obvious difficulty physically, socially, or in his marriage or occupation, and who drinks more, to overcome this difficulty. The World Health Organization gives this definition: "Alcoholics are those excessive drinkers whose dependence upon alcohol has attained such a degree that it results in a noticeable mental disturbance, or in an interference with their bodily and mental health, their interpersonal relations, their smooth social and economic functioning, or those who show prodromal signs of such development."

Another definition is that the alcoholic is one who drinks more than you. Joking aside, the quantity does not necessarily have anything to do with it, although all alcoholics have at one time consumed ever larger quantities until their tolerance shrinks, and in the advanced stage a relatively few drinks will cause severe intoxication. Most alcoholics have, as I am told, certain psychologic traits. They are frequently depressed and almost always phobic. Phobic neurosis is the most common neurosis in metropolitan USA. For instance, this causes 30% of all women to be frigid, and 40% of all women to be afraid to drive downtown. Frequently, the passive dependent homosexual may resort to alcohol as an escape. (Not so frequently the aggressive male homosexual.)

This reminds me of a recent case brought to my office by a non-practicing or arrested alcoholic. She phoned me that an acquaintance of hers had called her desperately that she has been sexually attacked, and that she was all scratched up. Sensing a possible police case, I asked her who attacked her and found out that the attack had occurred in the course of a wild drinking spree in the apartment of a girl friend. While I was relieved that this, after all, was not a case involving the police, I saw and examined both women and could never find out who did the sexual attacking—except that both had been stone drunk, until one began to hallucinate, and accused the other of a lesbic advance and then began clawing her. Talking to these two confirmed alcoholics and examining them both took over two hours, way past lunch time. Everybody was hungry, so the ex-alcoholic who had brought them to me took these two souls out to a late lunch, consisting of spaghetti, meat balls, and I later found out, wine. (The ex-alcoholic, however, sat there without

stopping the two drunks.) Later they again went to their apartment and got stone drunk on bourbon.

This brings me to the futility in dealing with many alcoholics. There is no rhyme or reason in what they do sometimes. There is a tendency to lie, to cover-up, and to live in a "make-believe world of their own" where doctors' bills, for instance, take care of themselves. Even the lack of judgment on the part of our ex-alcoholic Good Samaritan was a significant symptom.

We spoke of the phobic, but there are counter-phobic alcoholics—those indulging in heroic undertakings to overcome their unconscious phobia. Here is the he-man, who frequently needs alcohol to prepare him for his heroic physical or sexual undertakings.

During a history and physical of a patient in the office, one often can get clues of hidden alcoholism. For instance, there is the breakfast and lunch-skipper, whose stomach, perhaps because of the hangover, is intolerant of food at an early hour. One of our internists is particularly fond of giving a thorough ophthalmoscopic examination—not that there are any specific eye ground changes for alcoholism—but rather to discover the smell of alcohol at this range. Naturally, coarse tremors, nystagmus or history of unexplained convulsions in an adult may give a lead. In the hospital, sudden disorientation, hallucination or the "shakes" in a case of pneumonia, fracture, or after surgery for an acute abdomen, may painfully reveal a carefully concealed story of chronic alcoholism. We must suspect alcoholism in any patient who constantly requests tranquilizers or sleeping medication; who complains he can't eat breakfast; who uses strong-smelling mouthwash or excessive perfume; who has a tremor, unexplained rapid pulse, hoarse voice, venous distension on the face, spider angiomata of the chest or arms, unexplained bruises or cigarette burns.

A personal history may uncover clues:

1. The patient without a high school education. Fifty-five per cent of alcoholics drop out of school prior to graduation, showing signs of immaturity and impulsiveness, two characteristics of many alcoholics. So the school gadfly metamorphoses to a bar fly.
2. The man who changes jobs frequently. One-third of the patients in a large Alcoholism Clinic gave a history of having had more than

five jobs in the past ten years.

3. The man who holds a position well below his obvious education and ability.

4. The executive in a good position who takes an inferior job with a smaller company.

5. The self-employed man who goes into bankruptcy.

On prying deeper one usually finds out from the family that the man had a deep alcoholic problem.

6. The apparently, healthy man who is unemployed.

7. The patient who is not living with his wife.

Of great significance is the fact that two out of three alcoholics are not living with their wives, and, vice versa, the female alcoholic is frequently a middle-aged divorcee. Roughly half of all divorces of mature adults are thought to arise from the alcoholism of one or both partners.

The myth that some races of ethnic groups are immune from alcoholism has, by now, been destroyed. Given enough time, perpetuation of our social life pattern and prosperity, no one is safe from alcoholism.

Prohibition, as you know, is not the answer, since some of you will remember to what extent clandestine drinking and crime flourished. When in fact it was broken by several Canadian provinces going wet, the poem quoted here demonstrates prohibition's failure:

Four and twenty Yankees
Feeling mighty dry
Took a trip to Canada
And bought a case of rye.
When the case was opened
The Yanks began to sing,
"To Hell with the President.
God save the King."

On the other hand, communities must take a more serious view of this disease. The physician alone cannot solve this social illness. To use the general tax dollar to pay for comprehensive programs may seem logical and imperative for those who have been victimized or deprived of a loved one by a drunken driver, but preferably a heavier tax on alcoholic beverages, channeled into a special *Medical Alcoholism Fund,* would serve a dual purpose of curbing the overabundance of these products and pay for the treatment of their effect upon the human mind and body.

With the permission of both author and editor, this article is reprinted from *Phi Lambda Kappa Quarterly,* Vol. 42, No. 2, May 1967.

Therapy:

two 500 mg. Caplets® q.i.d.
(initial adult dose)

NegGram®

Brand of

nalidixic acid

a specific anti-gram-negative

eradicates most urinary tract infections...

- Low incidence of untoward effects; no fungal overgrowth, crystalluria, ototoxic or nephrotoxic effects have been observed.

- "Excellent" or "good" response reported *in more than 2 out of 3* patients with either chronic or acute gram-negative infections.[1]

*As many as 9 out of 10 urinary tract infections are now caused by gram-negative organisms: E. coli, Klebsiella, Aerobacter, Proteus, Paracolon or Pseudomonas[2]... However, infections of the urethra and prostate caused by non-gonococcal gram-negative organisms are believed to be less prevalent.

In ations: Urinary tract infections caused by gram-negative and some gram-po ive organisms.

Sl effects: Mainly mild, transient gastrointestinal disturbances; in oc sional instances, drowsiness, fatigue, pruritus, rash, urticaria, mild eo ophilia, reversible subjective visual disturbances (overbrightness of lig , change in visual color perception, difficulty in focusing, decrease in vis l acuity and double vision), and reversible photosensitivity reactions. Ma d overdosage, coupled with certain predisposing factors, has produced ori convulsions in a few patients.

Pr utions: As with all new drugs, blood and liver function tests are advis-ab during prolonged treatment. **Pending further experience, like most ch otherapeutic agents, this drug should not be given in the first trimester of gnancy. It must be used cautiously in patients with liver disease** or **se e impairment of kidney function.** Because photosensitivity reactions have oc red in a small number of cases, patients should be cautioned to avoid un essary exposure to direct sunlight while receiving NegGram, and if a rea on occurs, therapy should be discontinued. The dosage recommended for ults and children should not arbitrarily be doubled unless under the car l supervision of a physician. Bacterial resistance may develop.

When testing the urine for glucose in patients receiving NegGram, Clinistix® Re ent Strips or Tes-Tape® should be used since other reagents give a fals positive reaction.

Dos e: Adults: Four Gm. daily by mouth (2 Caplets® of 500 mg. four times dai for one to two weeks. Thereafter, if prolonged treatment is indicated, the sage may be reduced to two Gm. daily. Children may be given app imately *25 mg. per pound* of body weight per day, administered in div d doses. The dosage recommended above for adults and children sho not arbitrarily be doubled unless under the careful supervision of a phy ian. Until further experience is gained, infants under 1 month sho not be treated with the drug.

How upplied: Buff-colored, scored Caplets® of **500 mg. for adults,** conve-nie available in bottles of 56 (sufficient for one full week of therapy) and in bott of 1000. **250 mg. for children,** available in bottles of 56 and 1000.

Baltimore City Medical Care Services Survey

A household survey of medical care services and needs has been completed by the City Health Department's Medical Care Services Section. Begun early this year the survey's objectives were to measure the utilization of medical services by economically deprived inner city residents and to ascertain the extent of unmet needs. One thousand households were interviewed and a summary of the study is as follows:

1. Of the 1,000 households interviewed 515 or 51.5% had members reported to have Medical Assistance Program (*MAP*) identification cards.

2. Households with members on the Medical Assistance Program were significantly larger and younger than those not on the program. The median number of family members of households on *MAP* was 3.7 compared to 2.7 for households not on *MAP*. The average age in *MAP* households was 25 years compared to 39 years for households not on *MAP*.

3. Individuals on the Medical Assistance Program reported a significantly higher incidence of illness than those not on *MAP*.

4. Of those individuals who said they suffered an illness, 38.8% went to a private physician compared to 56.2% who went to a clinic or outpatient facility; 5% went to both. In this regard it is of interest to note that studies of the City's medical care program, prior to its expansion through Title 19 funds, show that more services were received from private physicians than through the now discontinued medical care clinics at seven contract hospitals. As soon as data are made available, assessments of services under the Medical Assistance Program will determine whether an actual shift in the provision of medical services has occurred.

5. Illness among all individuals was reported most frequently for those aged 65 and over. For those on *MAP*, illness was more frequent in the 45-64 age group.

6. Females in the age group 45-64 predominately utilize private physician services; in contrast males 45-64 went to outpatient facilities.

7. For those who had not visited a doctor during the two weeks prior to the interview, the median length of time since their last check-up by a physician was 5.5 months for those on *MAP* and 7.7 months for those not on *MAP*.

8. No significant difference was noted in the percentage of children having check-ups by a physician whether on *MAP* or not (36% vs. 33%). Of 1,392 children in *MAP* households, 496 had check-ups during the year prior to the interview; this is compared with 759 children not on *MAP* of whom 254 had check-ups.

9. Unmet needs—in 88 households someone needed a hearing aid, a component part, or repairs. Other artificial appliances needed included artificial eyes, 5, artificial arms, 2 and artificial legs, 2. Of 461 individuals who were said to need eyeglasses 315 were in households on the *MAP*. Over 100 of those in need of

eyeglasses were children under 21 years of age.

This Medical Care Services household survey report is one of a continuing series of studies of the city's medical care needs conducted under the supervision of Martin K. Gorten, MD, Assistant Commissioner of Health for Medical Care. Mrs. Helen B. Freedman, senior public health analyst, analyzed and assembled the material, and Henry W. D. Holljes, MD, and Matthew Tayback, MD, served as consultants.

According to the Maryland State Department of Health, the administrative agency of the Maryland Medical Assistance Program of which Baltimore's program is now a part, at least 16% of Baltimore City's population is on the Medical Assistance Program eligibility rolls.

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

Cardiac Rehabilitation

THE ACUTE STAGE. PSYCHOLOGICAL FACTORS IMPORTANT IN REHABILITATION

DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

It is the purpose of these notes to draw attention to some important features of cardiac rehabilitation. There will be no attempt to cover medical or pharmacological features of therapy. Psychological matters are given particular emphasis for three reasons. They are of major importance in good medical management; they may be the only aspect of the illness subject to prevention and/or modification by treatment; they are frequently neglected.

Cardiac Rehabilitation

Cardiac rehabilitation starts the hour the diagnosis of heart disease is made. The initial reaction of the physician, the way he breaks the news to the patient and family and the direction he gives in regard to exertion may have a profound effect on the patient's interpretation of the meaning of his illness. The physician's interpretation of the meaning of heart disease to the patient is important no matter how acute or chronic the expected course of the disease. The following discussion, however, will be concerned mainly with acute myocardial infarction.

Early Psychological Reactions to Acute Myocardial Infraction:

1. The Patient:

Olin and Hackett[1] have pointed out a curious finding in a number of patients who had suffered a typical myocardial infarction. Although most of their 32 patients were familiar with the symptoms of coronary artery disease, their immediate reaction to the development of chest pain was to attribute it to less threatening diseases than myocardial infarction. None of these patients suffered from fright and anxiety. Indeed their reaction was that "It couldn't happen to me."

We have been convinced that this denial reaction is not unusual in acute myocardial infarction. It occurs in young men who are "on the make" financially and whose whole fabric of economic security stands to collapse if they cannot continue their activities. Although denial is essentially an emergency defense against anxiety, it may persist into the convalescent period following myocardial infarction and may interfere with a sensible follow-up. In short, these patients try to take medical matters into their own hands; they follow directions poorly, may leave the hospital too soon and do not return for follow-up. Identification of this personality pattern early may allow the physician to manage the patient with greater ease.

A far less common emotional pattern is seen in the patient whose infarction is the answer to a major life problem. It may present the excuse he has been looking for to withdraw from a job

which is too much for him. It is my impression that this reaction of invalidism is less common following myocardial infarction than it is following industrial injuries, at least in the younger age group of patients with myocardial infarction.

2. The Family:

Hackett[2] has reported two types of reaction to the patient's illness on the part of families: a guilt-manipulation cycle and the alienation syndrome. In the former the family feels guilty about the patient's illness and allows itself to be manipulated by the patient. This reaction, in my experience, is particularly seen in the family of the hard working, devoted-to-business executive, who is generally believed to have been working too hard.

The alienation syndrome is the withdrawal of the family from the patient under the pressure of illness. This reaction of the family is unusual in patients with acute myocardial infarction; more often the heart attack may serve to bring the family together.

3. The Physician:

Iatrogenic heart disease[3] is "used chiefly of imagined ailments induced in a patient by autosuggestion based on a physician's words or actions during examination."[4] Generally the term is used to apply to patients who have no heart disease, but it can just as well be used to describe those physician—induced symptoms arising purely from anxiety in patients who actually have some type of heart disease. In general, iatrogenic symptoms arise only in patients who have an underlying anxiety. The physician merely sows seeds of anxiety in the fertile psychological soil of an anxious patient. Furthermore, it is my impression that these symptoms arise most frequently when the physician is uncertain of the diagnosis or mode of therapy and rarely where the diagnosis is clearly established and treatment standardized. In any case, it is important for the physician to be conscious that his every action and word may be misinterpreted by an emotionally unstable patient.[5] Thus, explanation of the nature of the disease to the patient must be a dialogue; the physician must be sure the patient understands what is said and is involved in treatment decisions. He must be allowed to express fears and to ask questions.

Reassurance is important early in acute myocardial infarction. Optimism as to the final outcome is justified since the majority of patients with acute myocardial infarction are able to return to their pre-infarction occupation.[6]

4. Social Psychology of acute myocardial infarction:

Of all the major diseases, myocardial infarction is the most acceptable socially. In some cultures it is looked on as a badge of good conduct and hard work.[2] Those who are able to leave the hospital appear normal, are able to do at least light activity and have no necessary mental deficit. There is no obvious deformity. All the other major diseases—cerebrovascular accident, cancer and arthritis have a poor prognosis, result in mental deterioration, the possibility of surgical mutilation or obvious impairment.

Summary

The meaning of an acute myocardial infarct to the patient and his family may turn out to be of overriding importance to rehabilitation.

Diagnostic Procedures Recommended in the Care of Prenatal Patients Exposed to Rubella or Presenting Rubella-Like Symptoms

If a woman in the first trimester of pregnancy develops a rubella (German measles) infection either clinical or inapparent, there is a considerable risk that her child may be born with serious physical defects. Rubella infection in the second trimester also carries a risk but to a lesser degree. Once such maternal infection occurs, nothing can be done to prevent infection of the fetus with possible congenital rubella sequelae. Some authorities recommend interruption of pregnancy up to 14 weeks gestation in prenatal cases with confirmed rubella.

There are available laboratory examinations which may aid the physician in choosing a course of treatment when his prenatal patient presents with suspicious signs and symptoms of rubella or gives a history of exposure to a case of the disease. These tests, if timely done, can determine if the recent exposure has induced rubella infection or if the patient is immune from a previous infection. History of prior rubella is practically worthless in the absence of laboratory confirmation of the diagnosis.

PROCEDURE

Collection of Specimens

1. Laboratory serologic tests on two blood specimens taken at different times are necessary.

a) The first specimen must be collected as soon as possible after exposure or after the patient has shown symptoms suspicious of rubella, preferably within 2 or 3 days.

b) The second specimen should be collected 14-21 days after the first.

2. Seven or 8 ml. of blood are drawn in the usual sterile blood tube and either the serum or the whole blood without preservative sent promptly to the Bureau of Laboratories, 16 E. 23rd Street, Baltimore 21218. DO NOT FREEZE.

3. Each specimen must be accompanied by a laboratory request slip which includes:

a) Physician's name and address
b) Test desired
c) Patient's name, age, and address
d) Estimated week of pregnancy
e) Date of onset of recent rubella-like illness, if any
f) Date of exposure to a case of rubella

Items d, e, and f are useful to the laboratory in selecting suitable tests.

4. The laboratory will report the rubella antibody titre found on the HI (*hemagglutination inhibition*) test and/or the CF (*complement fixation*) test when indicated.

5. A report of the HI test on the first specimen, although not conclusive, will be sent to the physician as soon as possible in order to permit any indicated procedure.

Interpretation of Laboratory Results and Suggested Care of the Patient

A. If the HI titre of the first blood is less than 1:8 ($<$1:8), the result is to be interpreted as an absence of rubella antibodies. It is evident that the woman has no protection against rubella. One of two courses may be followed by the physician:

1. He can wait 14 to 21 days and take a second specimen of blood.

a) If the HI titre of the second blood remains less than 1:8 ($<$1:8), the suspected exposure has not resulted in rubella infection and/or the rubella-like illness was not rubella.

b) If the HI titre of the second blood is greater than 1:8 ($>$1:8), this is evidence of active rubella infection and nothing can be done to prevent possible congenital rubella in the fetus.

DIURESIS

MERCUHYDRIN®
(meralluride injection)

Twenty years ago the publication of "A System for the Routine Treatment of the Failing Heart"[1] established a schedule of diuretic therapy as a primary factor in the treatment of acute congestive failure. With emphasis upon daily injections of Mercuhydrin (meralluride injection) until dry weight was obtained, Gold, et al. achieved a 40% increase in improvement, in ⅓ the time, over other methods then current. Today, most medical texts continue to recommend parenteral mercurials in acute congestive failure when prompt diuresis is indicated.

Recently Modell[2] has stated: "The mercurial diuretics are the injectable diuretics of choice since they are the most potent as well as the most dependable. Their toxicity is not an important consideration either by comparison with other potent diuretics or in relation to the seriousness of the conditions in which they provide such excellent relief."

LAKESIDE

IN BRIEF

Mercuhydrin is indicated in edema of cardiac or hepatic origin and in the nephrotic syndrome; it is contraindicated in acute nephritis and in anuric or oliguric states. *The usual adult dose is one to two cc. daily or every other day until "dry weight" is obtained.* Sensitivity is rare but small initial doses are advised to minimize potential reactions; vertigo, fever, and rash have occurred. Overdosage may produce electrolyte depletion, muscle cramps, and G.I. reactions. Supplied: 1 cc. and 2 cc. ampuls in boxes of 12, 25 and 100; 10 cc. rubber capped, multiple-dose vials (intramuscular or subcutaneous use only) in boxes of 6 and 100.

1. Gold, Harry, *et al.: A System for the Routine Treatment of the Failing Heart,* The American Journal of Medicine, Vol. III, No. 6:665-692 (Dec.) 1956.

2. Modell, Walter: *Drugs of Choice 1966-1967,* p. 97, 1966.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

2. Gamma globulin (20-25 ml.) I M may be tried as a prophylactic provided it is given within 7 days of exposure. The effectiveness of gamma globulin in preventing congenital rubella is not known; it may merely serve to mask clinical evidence of infection. A second blood should be examined 21 days after gamma globulin is given to detect possible rubella infection. If the second blood shows a four-fold rise in either HI or CF titres, this is proof that infection has taken place. In this situation nothing can be done to prevent congenital rubella.

B. If the HI titre of the first blood is 1:8 or greater, this is evidence of rubella infection before the blood was drawn. It is possible that this infection was still active at the time the blood was drawn. A second blood specimen should be taken 14 to 21 days after the first and both specimens (*paired sera*) examined simultaneously for HI and CF antibodies.

1. If the second specimen shows no significant rise (four-fold or more) in either HI or CF antibody titres, this is evidence that the rubella infection was probably terminated before the first blood was drawn. If the HI titre is very high (1:1024 or greater), it is likely that the infection was recent. A clinical history though not always dependable may help to determine if such infection occurred during pregnancy.

2. If the second blood shows a four-fold or greater rise in HI or CF titres, this is evidence of infection which was active when the first blood was drawn. Nothing can be done to prevent possible fetal damage from rubella.

CONCLUSION

Until such time as a dependable vaccine against rubella becomes available, the prevention of congenital rubella depends upon the dubious effectiveness of gamma globulin or the interruption of pregnancy. Neither of these procedures should be instituted until the immunity status of the patient is determined by carrying out the rubella serology suggested above.

NOTE: The Bureau of Laboratories is now running routine rubella HI tests on all prenatal bloods tested for STS and Rh. This should become standard procedure in prenatal care.

These recommendations have been drawn up by the Division of Communicable Diseases and the Division of Virology of the Maryland State Department of Health with the assistance of Doctors Joseph A. Bell, Janet M. B. Hardy, Ernest H. Joy, and John L. Sever.

It's Still the American Academy of General Practice

A proposed amendment calling for changing the Academy's name was considered by the Congress of Delegates of the *AAGP* in Dallas at the Academy's Annual Convention held Sept. 16-21, 1967. The amendment calling for a new name, "American Academy of Family Physician" was proposed at the direction of the 1966 Congress of Delegates with the futher request that delegates poll their chapters for the opinion of the membership on the change and be prepared to consider it at the 1968 Congress.

The vote of 58 for and 45 against the new name was not a sufficient majority to effect the change. A two-thirds majority is required to amend the Academy's Constitution. We, in the state of Maryland voted *two to one* for the change.

It was the consensus of opinion that the American Academy of General Practice was founded for specific objects and purposes which are set forth in the Constitution of the organization; and that its present name embodies the purpose and language of those objects.

Though reluctant to remove the term "General Practice" from the official name of the Academy, the delegates at the Annual Convention did approve steps taken to establish the new "American Board of Family Practice," and did endorse the new name for the proposed primary physicians' board.

G. OVERTON HIMMELWRIGHT, MD
Past President, Maryland Academy of General Practice

A survey of the entire American Academy of General Practice revealed that almost 10,000 (74.1%) of those responding desire to participate in the tests for certification. Eight thousand of these indicated they would be ready to take the examinations in July, 1968.

The Commission on Education, however, has notified the state chapters that refresher courses could not properly be set up before the first examination in July, 1968. The Subcommittee on Postgraduate Education, however, will provide specific study suggestion for interested 1968 candidates.

The Certification Test Committee has informed the state chapters that the proposed examination would last two days. The first day would consist of multiple choice questions; the second day, of programmed testing and filmed questions. Clinical divisions and basic sciences will be coordinated within the whole test, instead of being separate entities. There will be no oral examination.

Standards for this new specialty and requirements for qualifications of applicants were outlined in the August 1967 issue of this Journal.

Information for Authors

COPYRIGHT. Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

MANUSCRIPTS. Manuscripts will be accepted for consideration with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL. Address manuscripts to Editor, 1211 Cathedral St., Baltimore Maryland 21201.

Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Specifications: Manuscripts must be original typed copy (not all capitals), not carbons, on firm typewriter paper, doublespaced throughout (including text, case reports, legends, tables, and references), with margins of at least 1¼ inches. Subheads should be inserted at reasonable intervals to break the typographic monotony of lengthy texts. A carbon copy is to be retained by the author. The manuscript should include the title of the article (titles are best brief and concise), the full name of the author (or authors) with degrees, academic or professional titles, affiliations, complete addresses, and any institutional or other credits. Pages should be numbered consecutively. Uncommon and parochial or esoteric abbreviations if used must be explained and the generic as well as the trade names of pharmaceutical products given. Italics are rarely used.

Tables: Each table should be typed on a separate sheet of paper, be numbered consecutively, have a brief descriptive title, and its position in text indicated. Take care that columns add up correctly and that statistics are consistent in both tables and text.

Permissions: When material is reproduced from other sources, full credit must be given to both author and publisher and written permission from these sources included. Where work is reported from a governmental service or institution, clearance by requisite authority should accompany the manuscript.

References: References should be limited to those citations noted in the text, and kept to a minimum (less then 18). A complete review of the literature is rarely desirable. The references must be typed double-spaced and are to be numbered as they appear consecutively in text, with their positions in the etext indicated. An alphabetized bibiography is used only when the listing is of books suggested merely for supplementary reading. All references must be checked to assure complete accuracy (an inaccurate reference is useless to the reader). Each journal reference must include author(s) and initials complete title of article, name of publication, volume, first page of article, and date. Complete dates (month, day, as well as year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s) and or editor(s) with initials, title of book, edition, location, publisher, year, volume if given, and page. If reference is to a chapter within a book, include the author of the chapter, if this is not the same as the author of the book, and the title of the chapter, if any.

Illustrations: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black on white, should be submitted and such illustrations numbered consecutively and their positions indicated in text. Magnifications will be modified in proportion to the amount of reduction necessary for an illustration to fit the pages of the JOURNAL. Please do not

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 Stymie.

If you, too, need a *good* printer, let's communicate!

Monumental Printing Co.

3110 Elm Avenue **Baltimore, Md. 21211**

Woman's Auxiliary
MARYLAND
HYGEIA FILIAE
W A M C F

NOVEMBER 1967 MRS. HARRY L. BERMAN, Editor

SEMIANNUAL MEETING

Seventy-five women gathered at the Diplomat Motor Hotel in Ocean City, Maryland, on Friday morning, September 8, 1967, for the Semiannual Meeting of the Woman's Auxiliary held concurrently with the semiannual meeting of the Medical & Chirurgical Faculty.

Previous to the business meeting, buns and coffee were served under the direction of the hospitality chairman, Mrs. Richard D. Bauer, who engendered a cheerful and enthusiastic atmosphere which prevailed throughout the entire meeting.

Mrs. William S. Stone, president of the Auxiliary, presided over the meeting, which was opened by a prayer and the pledge of allegiance. Dr. Robert B. Goldstein, Medical & Chirurgical Faculty Advisor to the Auxiliary and chairman of the Med-Chi Public Relations Committee, brought greetings to the doctors' wives.

Doctor Joseph H. Hooper, Jr., Chairman of the Executive Committee of the Maryland Medical Political Action Committee, spoke to the assembly on the importance of their participation as doctors' wives in politics as it affects medicine.

Among the business transacted at the meeting, was the election of the following members to the nominating committee: Mrs. Percy H. Sutley of Lutherville, chairman; Mrs. Archie R. Cohen, Clear Spring; Mrs. A. Austin Pearre of Frederick; Mrs. Frank E. Poole, Salisbury; and Mrs. John G. Ball of Bethesda. Preliminary plans were announced for an AMA Education and Research Foundation benefit at the Morris Mechanic Theatre in Baltimore on Wednesday evening, April 17, 1968.

Highlight of the meeting was the program arranged by Mrs. Carlton Brinsfield, program chairman. Guest speaker, Dr. Maxwell N. Weisman, Director of Community Psychiatric Services, State Department of Mental Hygiene, Maryland, found a deeply interested audience in his topic, "Is Your Teen-Ager Dependent on Alcohol and Drugs?"

Delegates to the semiannual meeting were: Mrs. Robert Kimberly and Mrs. Ferdinand Kadan of Baltimore City, Mrs. Raymond Cunningham and Mrs. Elliott C. Flick of Baltimore County, Mrs. Edgar E. Folk III and Mrs. I. Randall Ross of Cecil County, Mrs. Wallace H. Sadowsky and Mrs. H. Proctor Sidwell of Harford County, Mrs. L. Louis Mould and Mrs. G. Allen Moulton of Allegany County, Mrs. Fred Musser and Mrs. Jack Sugar of Prince George County, Mrs. John Robben and Mrs. John Lertora of Montgomery County, Mrs. Daniel Sprecher and Mrs. Thomas Craig of Washington County; Mrs. Vincent O. Eareckson and Mrs. Louis Welty of the Four-County Auxiliary (Caroline, Kent, Queen Anne and Talbot); Mrs. E. Kent Carney and Mrs. William Campbell of Wicomico County; and Mrs. Thomas F. Herbert and Mrs. Albert Cooper Members-at-Large.

The MISSING LINK in Weight Control

Diet Control — **Appetite Control**

and now finally
. . . the neglected factor

Not marketed in combination with any anorexiant drug. since that would limit the dosage flexibility of both.

A DEVICE TO SATISFY THE HUNGER FOR BULK IN PATIENTS ON A REDUCING DIET.

Designed for bulk hunger . . . not laxation!

ESCRIPTION:
Artificially sweetened and flavored. Each wafer contains 453 mg. of these non-nutritive, synthetic hydrophilic colloid bulking agents: carboxymethylcellulose 181 mg. and methylcellulose (400 centipoise type) 272 mg. Safe for use by diabetic patients placed on a restricted reducing diet. Usual daily intake less than 3 calories per day.

CTION:
Ex-Caloric Wafers produce such bulk in a part of the alimentary tract as to ordinarily impart a highly satisfactory sense of fullness for those obese patients who complain of an empty feeling ("hollow hunger") when placed on a reducing diet and deprived of their between-meal snacks.

DMINISTRATION:
3 or 4 wafers t.i.d., a.c. or p.c. or mid-morning, mid-afternoon and mid-evening. At least 1 large glass of water must be taken with each dose.

ONTRAINDICATIONS:
Ex-Caloric Wafers are completely innocuous and may be administered with impunity in any necessary quantities to all obese patients, including children and the aged. The only contraindications are acute ulcerative colitis and organic intestinal obstruction.

WHEN ANXIETY IS A SIGNIFICANT COMPONENT OF THE CLINICAL PROFILE

LIBRIUM®
(chlordiazepoxide HCl)

Also available as
LIBRITABS™ (chlordiazepoxide)
5-mg, 10-mg, 25-mg tablets

ROCHE

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral*—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 50. Libritabs™ (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

Dilantin®
(diphenylhydantoin)

PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.
PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.
DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.
Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

If hypothyroidism leaves your patient feeling like this...

consider

LETTER®

(SODIUM LEVOTHYROXINE, ARMOUR) TABLETS

Synthetic Thyroid Replacement Therapy

Letter® provides all the advantages of the synthetically pure chemical sodium levothyroxine. Dosage is precise and potency is consistently uniform.

and

Letter® is micronized to provide maximum opportunity for full absorption and clinical response.

In addition Letter® is distinctively color coded with an identifying number stamped on each tablet to provide accurate dosage control.

Indications: Hypothyroid conditions. **Contraindications:** Thyrotoxicosis, acute myocardial infarctions unless associated with hypothyroidism. In hypothyroidism with hypoadrenalism coadministration of corticoids with LETTER® is recommended. **Precautions and Side Effects:** Excessive dosage may result in diarrhea, cramps, palpitation, nervousness, rapid pulse, sweating. If symptoms appear, discontinue medication for several days, then reinstitute at a lower level. Since myxedema patients with heart disease may suffer seriously from abrupt increases in dosage, caution should be exercised in adjusting dosage. **Dosage:** Generally, the initial adult dosage is 0.1 mg. daily. This may be increased in small increments every one to three weeks until proper metabolic balance is achieved. **Available:** Bottles of 100 tablets, in six potencies: 0.025 mg. (violet), 0.05 mg. (peach), 0.1 mg. (pink), 0.2 mg. (green), 0.3 mg. (yellow), and 0.5 mg. (white).

TWO GOOD REASONS FOR STARTING A KEOGH RETIREMENT PLAN NOW

1. Immediate Tax Savings

A self-employed individual can set up a plan for his retirement and deduct 50 per cent of his contribution from taxable income up to a maximum of $1,250 as well as receive a 100% deduction for contributions for his employees. The tax savings a self-employed in a 48% tax bracket can NOW enjoy with a qualified Keogh Plan are illustrated below.

TAX SAVINGS NOW AVAILABLE

	Without a Keogh Plan	With a Keogh Plan
Self-employed's Contribution	$2,500	$2,500
Taxable Amount	2,500	1,250
Tax	1,200	600
Tax Savings	0	$ 600

By starting a Keogh Plan now, a self-employed can realize a 50% tax savings on his contributions this year—and in 1968, his contributions will be 100% DEDUCTIBLE!

2. Greater return at retirement

New Publications

Widespread concern, particularly among alarmed parents, over the nation's rising drug abuse problem and the raging "front-page" controversy centered around the increasing use of *LSD,* marihuana and other hallucinogenic drugs by thrill, curiosity and "self-improvement" seekers on and off college campuses has spurred the *AMA* to develop a 25-page booklet, *The Crutch That Cripples: Drug Dependence.*

The publication is designed to give the public a sound understanding of drugs, their uses and abuses and the problems which irresponsible use leaves in its wake.

The publication was prepared by the Committee on Alcoholism and Drug Dependence, Council on Mental Health, in response to heavy mail and telephone inquiries received in recent months by the *AMA's* Department of Mental Health.

Written lucidly and in colorful language readily understood either by parents or the younger set, *The Crutch That Cripples,* discusses all aspects of drug use.

Among the topics covered are medical uses of drugs, drug dependence, drug abusers, abuse of narcotics, sedatives, stimulants and hallucinogens, where to get help for drug abusers and prevention of abuse. The booklet also calls attention to a current bibliography available from the Department of Mental Health on drug abuse and drug dependence.

Copies of the publication may be obtained from the *AMA* Order Department.

* * * * *

The third revision of *Group Practice: Guidelines to Forming or Joining a Medical Group,* originally published in 1962, is now off the presses. Medical societies and individual physicians may obtain complimentary copies by writing the Department of Health Care Services, *AMA.*

Jointly produced by the *AMA,* the American Association of Medical Clinics and the Medical Group Management Association, the 40-page booklet covers all aspects of group practice.

* * * * *

A new film depicting the wide range of rewarding career opportunities existing in fields allied to medicine, long sought by auxiliaries and others concerned with health careers programming, will be available for bookings after December 1.

The 28-minute color film, entitled *Horizons Unlimited,* after the *AMA's* health careers handbook of the same name, gives brief on-the-job glimpses of men and women serving in career pursuits highlighted in the publication. To give viewers greater insight as to the length of preparation and particular scope of specific professions and occupations, "thought voices" are utilized in some segments of the film.

The University of Kansas Medical Center, Kansas City, served as the setting for the film, which will replace the time-dated film, *Helping Hands For Julie,* developed by the *AMA* in cooperation with E. R. Squibb & Sons, in 1959.

The new film was developed solely by the *AMA.* Physicians, medical societies and other medical groups should place their orders for showings, stating preferred and alternate dates, with the Films Section, *AMA,* 535 North Dearborn, Chicago, Illinois 60610. Schools and other non-medical groups should direct their requests for loan of the film to Modern Talking Pictures, Prudential Plaza, Chicago, Illinois, 60601.

* * * * *

Having been deluged in recent months with irate complaints from physicians charging that those physicians who lend the use of their names for testimonial advertisements, many of which contain prominent photographs of the physician, are "prostituting the profession," the *AMA's* Judicial Council has reiterated its opinion providing a guideline for physicians in their relation to commercial enterprises.

In rendering its opinion the Judicial Council considered only the advertisements in question. It did not assess the conduct of the physicians involved because 1 no charges had been brought against any physician as an individual and 2 the Council refused to impute improper motives to any of the physicians who, it felt, acted without any intent to violate ethical standards.

The Council concluded, however, that is was imperative to warn physicians of the consequences of providing testimonials without fully consider-

NegGram®

Brand of

nalidixic acid

a specific anti-gram-negative

eradicates most urinary tract infections...

- Low incidence of untoward effects; no fungal overgrowth, crystalluria, ototoxic or nephrotoxic effects have been observed.

- "Excellent" or "good" response reported *in more than 2 out of 3* patients with either chronic or acute gram-negative infections.[1]

*As many as 9 out of 10 urinary tract infections are now caused by gram-negative organisms: E. coli, Klebsiella, Aerobacter, Proteus, Paracolon or Pseudomonas[2]... However, infections of the urethra and prostate caused by non-gonococcal gram-negative organisms are believed to be less prevalent.

ing their potential impact upon the profession.

The complaints have stemmed from a rash of recent newspaper, Sunday supplement and magazine advertisements and also sensationalized "book jacket" copy prepared by publishers of books written by physicians.

Here is the opinion rendered by the Judicial Council:

"It is demeaning to the medical profession for a physician to permit the use of his name and professional status in the promotion of commercial enterprises. A physician may freely engage in business ventures outside the practice of medicine. However, out of respect for his profession, he should not allow his name or the prestige of his professional status as a physician to be used in the promotion of commercial enterprises."

HOME OFFICE — BOSTON, MASS.

Get fast relief from financial congestion.

Use First National Bank's new Professional Loan program. It takes a lot of money these days to hang out a shingle. Besides the shingle, you need office furniture, diagnostic equipment, and perhaps sophisticated laboratory equipment. Even if you join a colleague who has an established practice, you don't do it for nothing.

Your greatest expense comes at a time when you can probably least afford it. Isn't that always the way it is?

We're sympathetic.

So much so, in fact, that we've created a special new loan program for professional people. It's good for any professional need, any time. Even after years of practice, for example, you may need costly new equipment.

One thing special about this program is the interest rate: a low 4½ percent. Not only that, you can take as long as seven years to repay the loan. This way, you have an operating expense spread over a reasonable time period.

Don't let temporary financial congestion cramp your plans for starting practice or an expensive research effort. We can offer fast, long-lasting relief.

First National Bank of Maryland
where being FIRST makes all the difference.

For further information on this special low-rate Professional Loan: in Baltimore, call SA 7-4000, and ask for Mr. Jack Ortt or Mr. Dave Freese; in Hagerstown, RE 3-6000, Mr. Frank McConell or Mr. Bob La Follette; in Rockville, PO 2-8800, Mr. Walter Clark or Mr. Ray Greenstreet; in Salisbury, PI 2-8143, Mr. Ross Waterman or Mr. Ted Crockett. Or ask any branch manager.

MEDICAL AND CHIRURGICAL FACULTY OF THE STATE OF MARYLAND
1211 Cathedral Street, Baltimore 1, Maryland
(Adopted by the Council, September 7, 1967)

RECOMMENDATION OF THE AD HOC COMMITTEE TO STUDY THE ABORTION LAW

We believe the current law should be changed and updated for the following reasons:

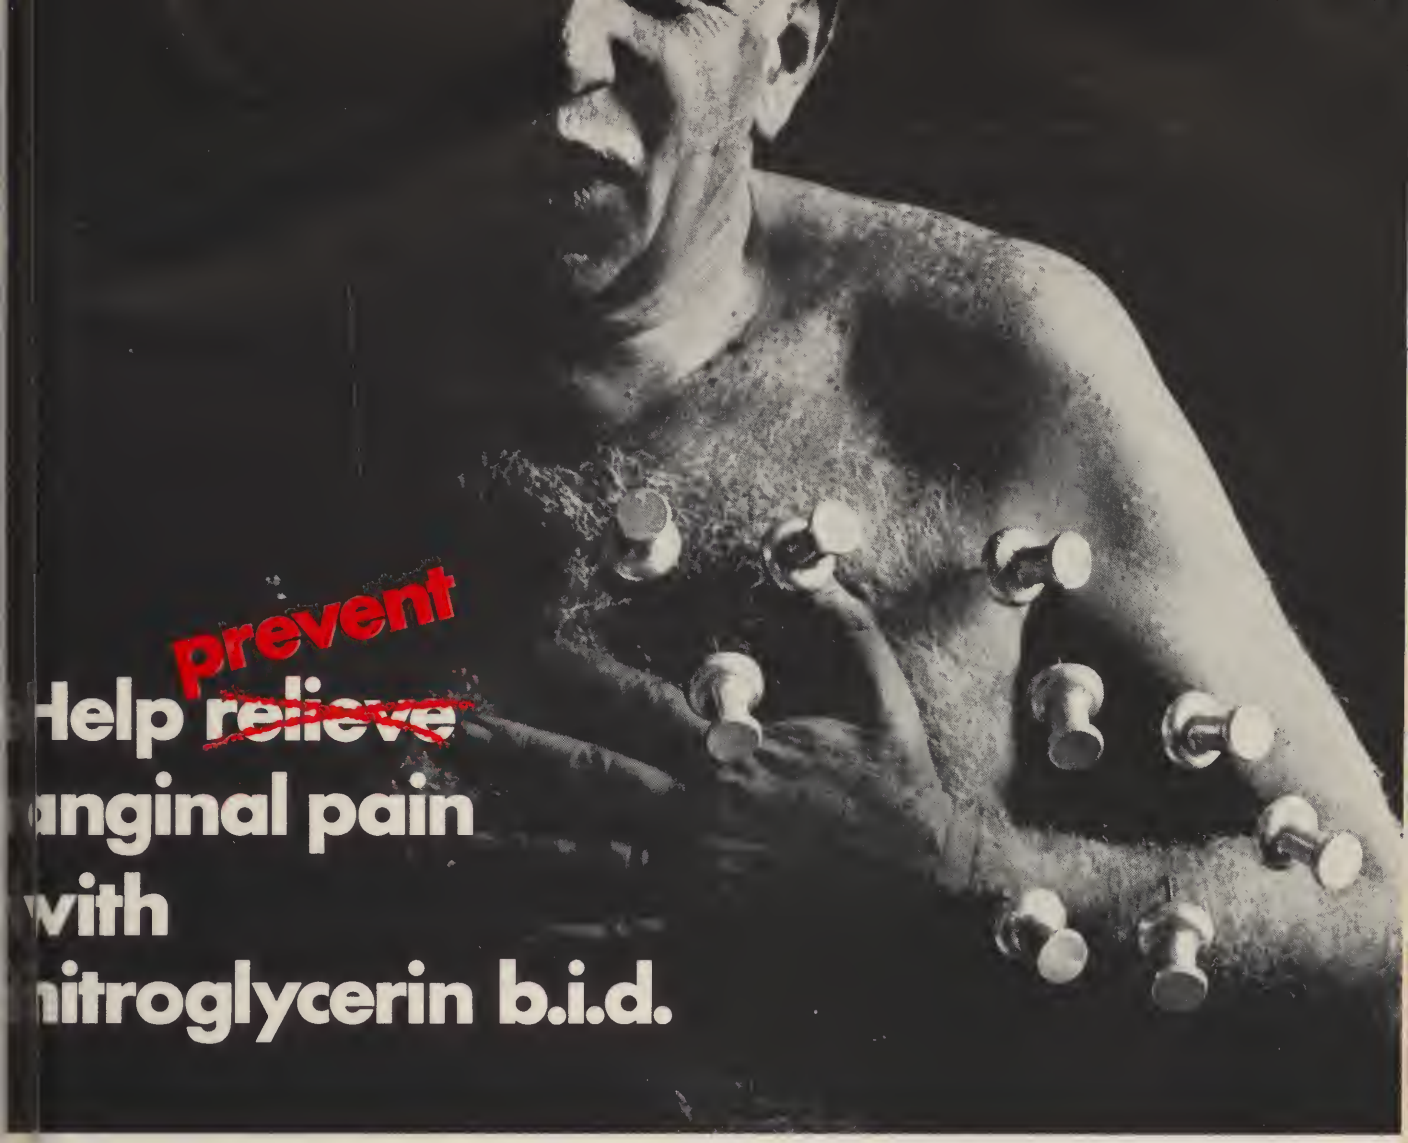
(1) Because the current law should recognize advances in medical knowledge, and it does not. For example, the medical sciences of psychiatry and genetics were unknown at the time the bill was written.

(2) Because the law should contain safeguards to patients and the community which are presently absent. For example, a therapeutic abortion can now be performed in a home or in a physician's office within the present law.

(3) Because the law should permit a physician to exercise his own best *medical* judgment in the best interest of each of his patients.

It is true that within the medical profession there is a whole spectrum of opinion ranging from those who never perform a therapeutic abortion because of religious belief, to the other extreme, those equally conscientious physicians, who believe that all women should be masters of their own reproductive capacity, and that the interruption of an unwanted pregnancy should be solely an individual matter between the patient and her doctor.

However, this proposed change in the law, which we believe to be representative of the opinion of physicians in Maryland, recommends none of those positions which are based on social, economic, or religious grounds. Rather, our recommendations are designed to permit ethical physicians the right to exercise their *own sound medical* judgment relative to therapeutic abortion as in any other medical decision. We recognize that the granting of a license to a physician to practice medicine by the State of Maryland does not grant to that physician the right to decide for himself, based solely on his own personal and social judgments, whether to obey or disobey any existing law. We are pleading for a change in the law that will permit a licensed physician under circumstances prescribed by law to exercise his considered medical judgment in the light of current medical, scientific knowledge.



We recommend the following change in Section 3 of Article 27 of the Annotated Code of Maryland to change the grounds under which a physician may lawfully cause the abortion of a pregnant woman: starting on line 35, ". . . after consulting with one or more physicians, chosen because of their recognized professional competence, who have examined the patient and have concurred in writing that continuance of the pregnancy threatens the mental or physical health of the mother; or that the infant may be born with incapacitating physical deformity or mental deficiency; or that continuance of a pregnancy resulting from legally established statutory or forcible rape or incest threatens the mental or physical health of the patient; and the procedure must be performed in a hospital accredited by the Joint Commission on Accreditation of Hospitals."

Finally, in the event that these proposals are made into law, the Medical and Chirurgical Faculty of the State of Maryland should provide guidelines to its members for appropriate practices in these respects. These guidelines could serve as criteria to be used by both the Joint Commission on Accreditation of Hospitals and the State Health Department. The interlocking effort of the American Hospital Association and the American Medical Association working through the Joint Commission on Accreditation of Hospitals, the Medical and Chirurgical Faculty of the State of Maryland and the Maryland State Department of Health, could and would prevent any misinterpretation of the intent of the law.

JOSEPH SEITCHICK, MD, *Chairman*

Unique Nitrospan micro-dialysis process* adds an important dimension–TIME–to nitroglycerin therapy

elps decrease frequency and severity of attacks; often creases exercise tolerance. Decreases need for sub-ıgual nitroglycerin, increases patient confidence. nooth, continuous release independent of gastrointes-ıal functions reduces headache and other side effects at might result from peak concentrations of tablet or termittent-release preparations.

dication and Dosage: For prophylactic use only in an-ıa pectoris, 1 capsule every 12 hours. **Precautions:** For ophylaxis only, not for relief of acute anginal attacks. lerance to nitrites may develop on long-continued use. **ntraindications:** Idiosyncrasy to nitroglycerin, and rly myocardial infarction. **Side Effects:** With use of trites, transient headache, postural hypotension, nausea and vomiting may occur. Overdoses may cause flushing, dizziness, tachycardia, headache and syncope.

***The micro-dialysis cell.** Nitrospan's timed-release mechanism is different from those usually employed in sustained-action capsules, which rely on unpredictable digestive processes. The nitroglycerin in Nitrospan capsules is contained within hundreds of dialysis cells of controlled permeability. The contents of each micro-dialysis cell are released by diffusion rather than disintegration, at a continuous rate independent of gastrointestinal action. Only the presence of fluid is required.

SCIENTIFIC EXHIBIT AWARD

MEDICAL AND CHIRURGICAL FACULTY ANNUAL MEETING

APRIL 17, 18, 19, The Alcazar, Baltimore

The Medical and Chirurgical Faculty, in cooperation with Mead Johnson Laboratories, will again present an AESCULAPIUS AWARD for the outstanding scientific exhibit displayed at the 1968 Annual Meeting. This award is designed to recognize and reward excellence in concept, originality, and execution of a scientific exhibit.

A committee of the Medical Society will be the judges and the winner will be presented with a certificate, suitably inscribed with the title of the exhibit and the author's name. A prize of $200.00, donated by Mead Johnson Laboratories, will be presented to the winner during the convention.

All scientific exhibits accepted for showing at the 1968 Annual Meeting of the Faculty will be eligible for judging. Physicians interested in submitting exhibits should make application to the Chairman, Committee on Program and Arrangements, Medical and Chirurgical Faculty, 1211 Cathedral Street, Baltimore, Maryland 21201.

EXHIBIT SPACE IS LIMITED—SEND YOUR APPLICATION TODAY

1968 ANNUAL MEETING

April 17-19
In Baltimore

Wednesday, April 17—	9:30 a.m.	Meeting of House of Delegates, Alcazar
	12:30 p.m.	"Quiz the Experts" Luncheon, Sheraton-Belvedere Hotel
	2:15 p.m.	Scientific sessions begin, Alcazar
	8:15 p.m.	AMA-ERF Benefit performance at Morris Mechanic Theater
Thursday, April 18 —	9:30 a.m.	Medical Grand Rounds, Alcazar Presented by The Johns Hopkins University School of Medicine
	11:30 a.m.	Lecture
	2:15 p.m.	Surgical Grand Rounds, Alcazar Presented by the University of Maryland School of Medicine
	4:15 p.m.	Lecture
	6:15 p.m.	Annual Presidential Reception and Dinner, Sheraton-Belvedere Hotel
Friday, April 19 —	9:30 a.m.	Scientific sessions begin, Alcazar
	2:00 p.m.	Meeting of House of Delegates, Faculty Building

To help the physicians keep abreast of recent scientific advancement, there will be many scientific and technical exhibits on display at the Alcazar.

The Health Evaluation Tests, one of the most popular features of the Annual Meeting, will again be available at the Alcazar for physicians and their families. This is a valuable benefit of membership in the Faculty.

EXECUTIVE SECRETARY'S NEWSLETTER

December, 1967

MEDICAID PAYMENTS FOR INHOSPITAL CARE

The State Health Department has sent to those who requested it a procedures manual and new forms MS 9 for submitting of bills for payment for services rendered to Medicaid patients in hospitals.

Payments are retroactive to July 1, 1967; and payments should be billed on the basis of the Physician's Usual, Customary and Reasonable fees. Payments will be made on a percentage basis, within State Health Department budget limitations.

Those physicians who have not received their manuals and forms should contact Mr. John Morris, State Health Department, 301 West Preston Street, Baltimore, Maryland 21201.

1968 DUES BILLS

Dues bills for 1968 are in the mail now. Physicians are reminded that payment of dues must be made BEFORE JANUARY 31, 1968, in order to be eligible for Physicians' Defense.

The Council has ruled that strict interpretation of the Faculty's Bylaws will preclude authorization of this benefit of membership if members do not comply with this Bylaw requirement.

ANNUAL MEETING RESOLUTIONS

Deadline for submission of resolutions for consideration at the Faculty's Annual Meeting, April 17 - 19, 1968, is

WEDNESDAY, FEBRUARY 21, 1968

Resolutions received in the Faculty office after that date may not be considered at the Annual Meeting.

Members are reminded of the recent Bylaw change requiring resolutions introduced by individual members to have the endorsement of either one-third of his component society membership or 30 members of his component society, whichever is smaller.

NEWS NOTES

Marvin Cornblath, M.D., is the new professor and head of the Department of Pediatrics at the University of Maryland School of Medicine. He

will assume his new duties September 1, 1968.

H. Vasken Apashian, M.D., formerly with Tufts University School of Medicine, has become the new head of the Department of Cell Biology and Pharmacology, also at the University of Maryland School of Medicine.

Joe Price, D.D.S., will speak on "The Challenge of Prepaid Dentistry" at the Professional Forum meeting, Thursday, December 19, at the Baltimore Country Club. Reservations may be made through the Professional Forum office at 613 Munsey Building, Baltimore, 21202.

WAGE AND SALARY COMPARISON

Recently a study was conducted of union-oriented tradesmen. The following result was obtained:

Carpenters	$4.44 per hour	(40 hour week)
Electricians	$5.05 per hour	(40 hour week)
Plumbers	$4.94 per hour	(40 hour week)
Linotype Operators	$4.20 per hour	(36 hour, 40 minute week)
Bricklayers	$5.40 per hour	(40 hour week)

Based on this and computing on a basis of 40 hours straight time and 48 hours overtime, for which time and a half is paid, we arrive at the following annual income figures:

	40 hour week	88 hour week
Carpenters	$ 9,235.00	$25,844.00
Electricians	10,504.00	29,380.00
Plumbers	10,275.00	28,340.00
Linotype Operators	8,060.00	24,440.00
Bricklayers	11,232.00	31,408.00

The 88 hour week figure used is based on the average work week of the practicing physician.

Before prescribing, see complete prescribing information in SK&F literature or *PDR*. A brief precautionary statement follows.
Contraindications: Glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal obstruction, or bladder neck obstruction.
Precautions: Use cautiously in the presence of hypertension, hyperthyroidism, coronary artery disease; warn vehicle or machine operators of possible drowsiness.
Usage in Pregnancy: Use cautiously, especially in the first trimester. *Note:* The iodine in isopropamide iodide may alter PBI test results and will suppress I^{131} uptake; discontinue 'Ornade' one week before these tests.
Adverse Reactions: Drowsiness; excessive dryness of nose, throat or mouth; nervousness; insomnia. Other known possible side effects of the individual ingredients: nausea, vomiting, diarrhea, rash, dizziness, fatigue, tightness of chest, abdominal pain, irritability, tachycardia, headache, difficulty in urination. Thrombocytopenia, leukopenia and convulsions have been reported but no causal relationship has been established.

a stuffy nose is no laughing matter

JOHN SARGEANT EXECUTIVE SECRETARY

The Executive Committee at its meeting on November 11, 1967, took the following action:

1. Authorized the annual staff Christmas party

2. Authorized the Executive Secretary to determine any special building closing arrangements over the Christmas and New Year holidays

3. Authorized attendance of a staff member at the Professional Convention Management Association meeting, January 2-4, 1968

4. Deferred action on installation of a silent call system for paging physicians attending meetings in Osler Hall

5. Approved a recommendation of the Policy and Planning Committee and authorized up to $1,000 per year for the preparation of a history of all component societies, with such being done over a period of time

6. Approved action taken in connection with a possible case of the practice of medicine by a lay person.

7. Deferred discussion to the January, 1968, Council meeting in connection with a Health Manpower Resources Program

8. Reaffirmed its previous action in rejecting a request for payment of a Subcommittee chairman's expenses to attend a scientific meeting

9. Received an acknowledgment of memorial tribute from Mrs. Helen Baumgartner

10. Approved action of the Council Chairman and President in urging appointment by the Governor to the State Board of Health and Mental Hygiene of Robert W. Gibson, MD.

11. Approved participation in the newly-formed Maryland Advisory Council on Eye Care, in cooperation with the District of Columbia and Virginia; with the understanding that no expenses would be involved

12. Authorized on recommendation of the Editorial Board of the Journal and subject to approval of legal counsel, participation in a royalty arrangement with University Microfilms Library Services and Academic Archives, Inc.

13. Discussed the services provided by legal counsel in return for the Faculty's annual retainer

14. Adopted a motion in connection with the death of Frank K. Morris, MD, Secretary-Treasurer of the Board of Medical Examiners.

* * * * *

The House of Delegates in special session on Saturday, November 11, 1967, took the following action:

1. Adopted a proposed Commission on Medical Discipline with the understanding that it serve as a guide to the Faculty's legislative representatives in Annapolis

2. Observed a moment's silence in memory of the late Frank K. Morris, MD, Secretary-Treasurer of the Board of Medical Examiners.

The Council at its November 16, 1967, session took the following action:

1. Introduced Paul F. Guerin, MD, who became a member of the Council by virtue of his election as Chairman of the Library and History Committee

2. Introduced the new AMA Field Representative, Gerald Blanchard, who has been assigned Maryland as one of his states in the territory he covers.

3. Approved recommendation for Emeritus Membership to the House of Delegates for a member on request of his component society

4. Adopted 1968 Council meeting dates.

5. Ratified legal defense for physicians requesting it

6. Approved the principle of Laboratories reporting to the State Health Department findings "suggestive" of gonorrhea, syphilis or tuberculosis; with the understanding that no patient contact will be made without the consent of the attending physician.

7. Adopted a policy of telephone listings to be applied on a statewide basis for yellow pages of telephone books. This is as follows:

Recognizing that a single, statewide policy should be in existence with respect to physician listings in the "yellow pages" or classified telephone directory listings, because many telephone books cross over political subdivision lines, the Mediation Committee recommends adoption of the following policy:

1. Listings shall be made under the heading Physicians and Surgeons. It is understood that where a physician has a specialty that warrants listing under another heading, this is permissible. (such as Clinical Laboratories)
2. Listings may include the following *ONLY*:
   name, address and phone number; office hours; an "if no answer" number; "physicians" or "surgeons" home address and telephone number;
3. Listings may be made *only* as follows:
   Practice limited to . . . (using only those specialties approved by the American Medical Association or as modified and approved by a special liaison group to be named by the Faculty to work with the C & P Telephone Company)
4. Listings must be uniform in size and type face.
5. Display or box advertisements are strictly prohibited.
6. Listings may not be carried in a telephone directory where he does not have an office or residence, except in combined area directories where a listing may be published in all three yellow page directories, viz., Washington, Maryland Suburban, Virginia Suburban, Baltimore City, Baltimore Suburban West, Baltimore Suburban East.
7. It is preferable for physicians to list the letters "MD" following their name rather than the title "Dr." preceding their name, inasmuch as this leaves no doubt that the person listed is a medical doctor. At times, other types of "doctorates" can be listed in error.
8. Where multiple offices of a physician are listed, each office listing MAY NOT be preceded by the words "Physicians Office." The same applies to any other category of listing that might arise.
9. The Medical and Chirurgical Faculty may list, in the Metropolitan Baltimore area, a telephone number where the public may call to receive assistance in selecting a physician.
10. Items 2, 3, 4, 6 and 7 apply also to telephone directory listings in the White pages.

8. Adopted the following policy with respect to educational programs for pregnant girls:

The problem of providing for the education of the pregnant student in the Public School System must be solved on an individual basis in accordance with the needs of the student and the capabilities of the local school system. While hard and fast rules cannot be made, the following general principles should be heeded.

1. An opportunity should be provided for all pregnant girls to receive their education through all grade levels.
2. Of the two possible choices, home teaching vs. school teaching, the latter is to be desired, in most cases. The pregnant student may be accommodated in the regular classroom until transfer is recommended by the physician or principal or requested by the student.
3. Transfer at the appropriate time should be made to one of the following three settings.
   a. Special classroom in a regular school
   b. Special school
   c. Home teaching
4. The pregnant student shall be obliged to have routine prenatal medical supervision. A medical report containing information pertinent to her school activities shall be required on a monthly basis from each pregnant student.
5. The curriculum provided each pregnant student should be supplemented with appropriate material pertinent to the student's situation.

9. Received with appreciation a check for $600.00 from Henry P. Laughlin, MD, to be added to the Laughlin dedicated fund

10. Referred to the Treasurer for possible inclusion in the 1968 budget a request for up to $1,000 from annual meeting income for use

in conducting the health evaluation tests for members at the annual meeting.

11. Adopted the following resolution with the understanding that it be transmitted to Maryland's congressional delegation:

WHEREAS, considerable confusion of the public will be created by defining as "physician" in federal law, persons other than those fully licensed to practice medicine and surgery; and

WHEREAS, H.R. 12080, adopted by the House of Representatives, U. S. Congress, and now up for consideration in the U. S. Senate, provides for a broadening of the definition of the term "physician" by amending this definition to include a doctor of podiatry with respect to the functions he is authorized to perform under the laws of the State in which he works; and

WHEREAS, The U. S. Senate has broadened this still further to include under the same title the same provision with respect to Chiropractors; and

WHEREAS, The definition of a physician as adopted by the *AMA* House of Delegates is:

"A physician is one who has acquired a contemporary education in the fundamental and special sciences, comprehended in the general term 'medicine' used in its unrestricted sense, and who has received the degree of Doctor of Medicine from a medical school of recognized standing," and

WHEREAS, The Attorney-General's office of the State of Maryland has issued legal opinions stating that only Doctors of Medicine may identify themselves by the term "physician," and

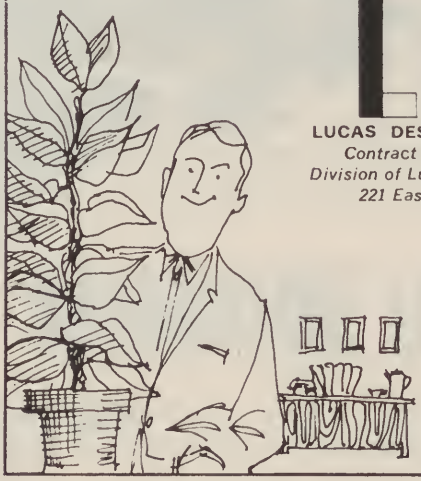
WHEREAS, The Medical and Chirurgical Faculty of the State of Maryland recognizes the work of Podiatrists and the great assistance they can be to doctors of medicine; and

WHEREAS, The Medical and Chirurgical Faculty of the State of Maryland has consistently opposed the concept of Chiropractic, and continues to do so; therefore, be it

RESOLVED, That the Medical and Chirurgical Faculty of the State of Maryland expresses itself as being opposed to the inclusion of any other professions or persons in the definition of "physician" as adopted by Federal Statute, unless that person truly is a qualified Doctor of Medicine or is licensed to practice unrestricted medicine and surgery.

12. Approved participation in a special Gubernatorial project with the understanding that the Executive Committee will name members to work on this project; and that the Faculty's recommendations would be in an advisory capacity only.

13. Appointed legal counsel for the 1968 year



14. Deferred action on the suggestion that a committee be named to discuss long range building needs of the Faculty. Such action can only be taken after the Library's present program of collection evaluation is completed.

15. Named a committee to consider an appropriate honor for Louis Krause, MD, who has retired as Library Committee chairman. Dr. Krause continues to serve on the committee

"When I couldn't even smell corned beef and cabbage,
I decided it was time for you, Doc."

Maybe he doesn't know when he's well off. But you might want to prescribe long-acting Novahistine LP anyway.

Two tablets in the morning and two in the evening will usually provide day and night relief by helping to clear congested air passages for normal, free breathing. Novahistine LP is formulated to provide continuous therapeutic effect for 8 to 12 hours. The decongestant ingredients help restore normal mucus secretion and ciliary activity—physiologic defenses against infection of the respiratory tract. Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

NOVAHISTINE® LP

DOW **PITMAN-MOORE** Division of The Dow Chemical Company, Indianapolis

From Baltimore

The American Cancer Society, Maryland Division, Inc., has announced a new program of cancer study fellowships.

John A. Wagner, MD, Chairman of the Division Professional Education Committee, said that fellowships are available to visit specific laboratories or clinics within the United States. The purpose of the grant is for physicians to acquire particular skills with respect to research, specific diagnostic techniques or specific therapy as related to neoplastic disease. The travel fellowship can provide transportation and room and board to those physicians, who due to budgetary restrictions, find travel money unavailable for this type of study.

Dr. Wagner pointed out that the grant applicant must be a medical educator at a recognized teaching institution or community hospital in Maryland. Applications should be made at least two full months prior to the anticipated date of travel, he said.

According to Dr. Wagner, a Sub-Committee headed by Conrad Julian, MD, has been appointed to receive and review grant applications. Details will be made available shortly to all medical institutions in the state.

Inquiries concerning cancer study fellowships should be directed to Dr. Conrad Julian, American Cancer Society, Maryland Division, Inc., 20 East Eager Street, Baltimore, Maryland 21202.

From Chicago

Five new medical schools were opened this fall, and others are increasing their enrollments of beginning medical students.

The result is an increase of first-year medical students to an estimated 9,280, compared with 8,964 last year, says The *AMA* News, published by the American Medical Association.

There now are 94 US medical schools in operation. Eleven other new medical schools are continuing development programs. These developing schools, plus the five just put into operation, are expected to be graduating an additional 1,062 medical students annually by the mid-1970s. Medical schools will then be graduating about 10,000 students annually.

Total medical school enrollment was 82,835 last year, and is expected to increase substantially this year.

The new schools are the University of Arizona College of Medicine, at Tucson; Brown University's Program in Medical Science, at Providence, R.I.; the University of Hawaii School of Medicine, at Honolulu; Michigan State University's College of Human Medicine, at East Lansing; and Pennsylvania State University's Milton S. Hershey Medical Center, Hershey, Pa.

In addition, freshman enrollment has been increased five each in the schools of medicine and dentistry at Creighton University, Omaha, Neb. The increases will boost medical school enrollment to 82 freshmen and the dentistry division enrollment to 51 freshmen.

Students are expected to be admitted in September, 1968—two years ahead of schedule—to the new campus of the New Jersey College of Medicine and Dentistry in Newark. This is a new campus for an existing medical school.

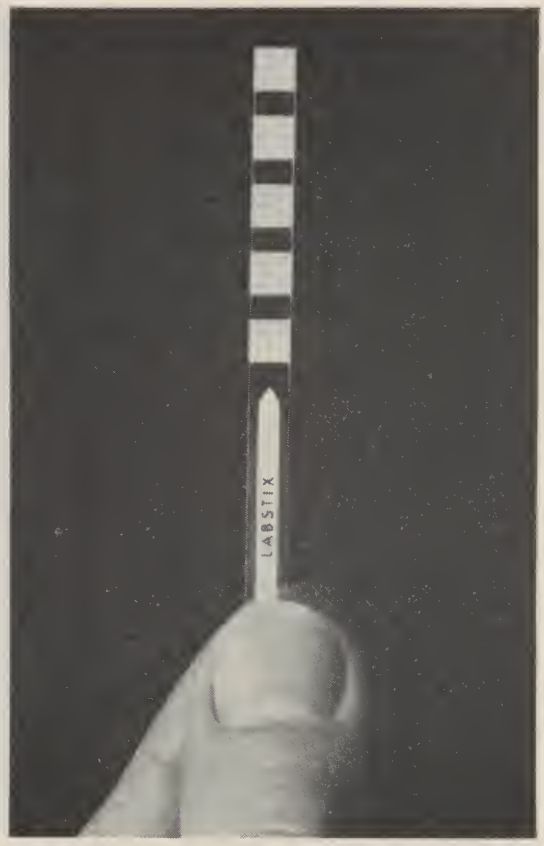
The University of Arizona welcomed a class of 32 when it opened its $7.3 million medical school complex in September. A full enrollment of 64 students is expected about 1969, according to Merlin K. DuVal, Jr., MD, dean of the school.

While Brown University admitted its first medical school students in 1963, that class this fall reached the equivalent of its first medical year. Under the direction of Mac V. Edds, Jr., MD, this privately owned and supported university has earmarked a $17.1 million medical school expansion program. The medical school offers a six-year program, with the final three years emphasizing independent study and research. The school envisions a maximum enrollment to 50 students per class.

Twenty-seven students are enrolled in the University of Hawaii's School of Medicine. Windsor C. Cutting, MD., dean, says construction is expected to start within the next six months on a $7 million medical school building, but meanwhile, classes are being conducted in other campus buildings, as well as in Leahi Hospital.

Michigan State University's College of Human Medicine is directed by Andrew D. Hunt, Jr., MD, dean. Categorized as a "two-year" school, its program is considered as a "continuous six-year experience," with "medical school" training starting in the fourth year after three years of undergraduate work. The school is aiming for an enrollment of 64 students per class and is completing plans for an $11.8 million Life Sciences Building.

A class of 40 is enrolled in the new College of Medicine of the Milton S. Hershey Center of Pennsylvania State University. The $50 million complex, under Dean George T. Harrell, Jr., MD, has devised an education program which will "emphasize problem solving through the scientific method."



While reporting the good news of school openings, The *AMA* News also gave an editorial warning.

"The American Medical Association's Board of Trustees has stated that while medical school output will continue to increase steadily, the increase will probably not be sufficient to resolve the medical manpower problem," the editorial said.

"Medical educators know it takes from six to ten years from the time it is decided to build a new medical school until the graduation of the first class. It requires a minimum of three years after money is available to develop a medical school to the point where it will enroll its first class.

"Expansion of an existing medical school, while the most rapid way to achieve the desired increase in physicians, still requires time. At least two and one-half years are required to plan and build facilities which will allow for a major expansion of a medical school's classes."

The five new medical schools "can serve as inspirations," the editorial said, but they ought to serve as warnings that "the time to act—the time to begin planning and gaining the necessary sup-

Take five...

LABSTIX® provides 5 important urinary findings*—on a single reagent strip! That's *more* information than you can get from any other single reagent strip. You know the results in just 30 seconds—while the patient is still in your office—and readings are reliable and reproducible. LABSTIX is easy to handle, too. Never goes limp, even when wet, because it's made with clear, firm plastic. And results with LABSTIX are easy to read—color contrast between the test areas and the transparent plastic is clearly defined. An unexpected "positive" from testing with LABSTIX may help in detecting hidden pathology before marked symptoms are manifest.

*Blood; ketones; glucose; protein, and pH.

port for a new school or the expansion of an existing one—is now."

SPECIALTY BOARD RULING IS ISSUED

The Judicial Council of the American Medical Association has found that the resolution on unapproved specialty boards adopted by the House of Delegates at the 1967 Annual Convention was not based upon evidence of unethical conduct.

The Council considered the matter at the request of the American Board of Abdominal Surgery and the American Society of Abdominal Surgeons, charging that Resolution 123 as amended and adopted "constitutes an unwarranted and improper censure" of the *AMA* members who are also members of the two organizations.

NOT A VIOLATION—The findings of the Council also stated that the Council has jurisdiction to determine the issues involved, and that Resolution 123 "should not be construed or interpreted as a determination of any violation of the Constitutions and Bylaws or the Principles of Medical Ethics of the American Medical Association on the part of the petitioners or those members of the *AMA* who are similarly involved."

Resolution 123, introduced by John W. Cline, MD, past president of the *AMA* from San Francisco, stated that the *AMA* took "cognizance of the recent action of the American Board of Abdominal Surgery, which Board is not approved by the *AMA*, and has acted in defiance of the House of Delegates."

Dr. Cline was invited to appear before the Council, and spoke concerning the introduction and adoption of the resolution.

Council Statement: "Within the frame of reference of Resolution 123 as adopted by the House of Delegates," the Council statement said, "the testimony given at the hearing disclosed no evidence which would establish that the Petitioners or members of the American Board of Abdominal Surgery and the American Society of Abdominal Surgeons have acted in violation of the Constitution and Bylaws or the Principles of Medical Ethics of the American Medical Association."

Blaise Alfano, MD, Melrose, Mass., secretary of the American Board of Abdominal Surgery, and one of the physicians who requested the opinion, commented that he was pleased with the decision, and said this clears up the controversy.

Edward J. Krol, MD, Chicago, chairman of the board of the same group, commented:

"I think the American Board of Abdominal Surgery and the Society have been vindicated by this action of the Judicial Council.

"I am encouraged by this demonstration that we have a real democracy in the *AMA*," Dr. Krol added.

New developments in the rehabilitation of the handicapped were covered in depth during the annual convention of the National Society for Crippled Children and Adults (the Easter Seal Society) held November 16-19 at the Century Plaza Hotel, Los Angeles.

Among these, medical and educational aspects of learning disorders in children, only recently identified as a major handicapping problem, were examined at a seminar moderated by Samuel Clements, Ph.D., director of the National Project on Minimal Brain Dysfunction. This was followed by a demonstration of the team approach to the problem in which distinguished leaders in medical, psychological and educational fields participated.

Bob Considine, columnist, author and broadcaster, spoke on a new Home Safety Program being sponsored by the National Society.

Hundreds of Easter Seal board members, volunteers and professional staff members from every state and Puerto Rico gathered to hear from outstanding authorities in virtually every aspect of crippling. Subjects covered a wide range including the duties and responsibilities of the Society, its relationships with other agencies and government, and ways and means of improving and expanding rehabilitation services for crippled children and adults.

Vernon R. Alden, president of Ohio University, and Lisle C. Carter, assistant secretary for Individual and Family Services, US Department of Health, Education and Welfare, keynoted the convention's opening session.

Opportunities for government cooperation in planning for comprehensive personal health services were discussed by Carruth J. Wagner, MD, assistant surgeon general and director, Bureau of Health Services, US Public Health Service; Jerrold M. Michael, assistant surgeon general and assistant director, Bureau of Health Services, and

C. Wayne Tucker, deputy assistant director, Bureau of Health Insurance, Social Security Administration.

George Shapiro, PhD, associate professor, University of Minnesota, conducted a communications institute and there were sessions for parents of handicapped children; also others on volunteer leadership and board responsibility, and for state and local Easter Seal presidents.

Mrs. Billy Graham, wife of the renowned Evangelist, received a "Volunteer of the Year" award and Dinah Shore, 1968 Easter Seal Campaign chairman, was a special guest at a dinner honoring President Mangelsdorf.

Chairman of the convention committee was Leon Chatelain, Jr., Washington, D.C., and Don Belding, Pacific Palisades, was chairman of the California host committee. Sumner G. Whittier was executive director of the National Society and Miss Jayne Shover was convention coordinator.

From New York

The Executive Committee of the American Society of Bariatrics today announced the Society's endorsement of the American Medical Association's statement of Policy Regarding Weight Reduction Practices.

In addition, the Society has issued its own statement of policy regarding weight reduction practices which reads, in part:

"Members of the American Society of Bariatrics recognize that obesity is a panorama of diseases of multiple etiologies and with multiple signs and symptoms. They are required by their membership in the American Society of Bariatrics to obtain a complete patient history including full laboratory and physical tests to reveal the possibility and extent of disease conditions.

"The American Society of Bariatrics is opposed to physicians who do not conduct their bariatric practices in accordance with the above conditions and with the standards of the Society as set forth in its constitution and by-laws."

From Washington

A group of advisors to the Public Health Service and an *AMA* official separately emphasized the seriousness of the health manpower problem.

The Allied Health Professions Education Subcommittee of the National Advisory Health Council said in a report to the *PHS* surgeon general, William H. Stewart, MD, that health manpower is the critical factor in the provision of health services in this nation.

"With the rising capacity of medicine to provide a satisfying array of services, the lowering of financial barriers to service, and the growing acceptance of a public responsibility to assure that all people have adequate medical service, needs and demands for medical care continue to outstrip their availability," the report said.

"Many people are struggling with approaches to the measurement of health manpower shortages. But no one figure can express the total need. And even if it were possible to envision ideal health services staffing for a community, a state, or a nation, the continuing development of new knowledge and techniques, new patterns of service, and new methods of payment are constantly changing the needs, both for numbers and varieties of health workers."

* * * * *

BRAIN DRAIN

Alvin J. Ingram MD, of Memphis, Tenn., a member of the *AMA* Board of Trustees, told the *AMA* Conference on Aging and Long-term Care in Baltimore, Md., that there is an urgent need for all categories of health personnel.

"We have been challenged by government to revamp our system of health care, to make it available to every one and to do so more economically than at present," Dr. Ingram said. "To do this will require not only larger numbers of health personnel, but more coordinated and efficient use of all members of the health team.

"The basic purpose of all of medicine—research, education and practice—is the application of the art and science of the profession to the individual patient or to the community as a whole.

"Furthermore, we are constantly exposed to remarks about the brain drain, the siphoning of physicians trained in other countries and their acceptance here to fill our own voids, even at the expense of intensifying already desperate shortages in other nations.

"Yet we have our brain drain in this country—the consistent and progressive decrease in the ranks of practicing physicians as members of the profession turn from the primary responsibility of patient care to research, teaching and administrative service. In the past 15 years, the number of physicians in full time private practice has decreased at the rate of almost *one per cent* a year, from 75% in 1950 to 62% in 1965."

Dr. Ingram decried the growing dependence of the nation's health care system on foreign physicians.

"This dilemma can hardly be exaggerated," Dr. Ingram said. "Not one foreign graduate meets our domestic requirements which include graduation from an approved medical school which has undergone regular, competent inspection."

Dr. Ingram cited government figures showing that the percentage of foreign physicians in the United States had risen from 16% in 1956 to 26% in 1966 and that nearly half of them were from under-developed or developing countries that badly need their services at home.

* * * * *

INEFFICIENT ADMINISTRATION OF RESEARCH GRANT

The House Committee on Government Operations has issued its third report charging costly and inefficient administration of research grant programs by the National Institutes of Health and other Public Health Service bureaus.

The Congressional watchdog panel said the *PHS* had made relatively little effort to improve its administration of grants since the committee's two previous reports in 1961 and 1962.

"Inadequate administrative performance is demonstrated, for example, by the inept handling of payments for the indirect research costs of grantees and the extremely poor administration of the General Research Support and Health Sciences Advancement Award programs," the recent report said.

"NIH and other *PHS* bureaus were found to have made excessive indirect cost payments to grantees." (About $500,000 in one case).

The *AMA* supported legislation to continue federal aid for construction, training and research under the Health, Education and Welfare Department's retardation program, but opposes grants to help pay for initial staffing.

The *AMA* position was outlined by F.J.L. Blasingame, MD, *AMA* executive vice president, in a letter to the *House* Public Health and Welfare Subcommittee. He said:

"The extent to which the problem of mental retardation can be ameliorated in future years depends largely upon continued research. Although some breakthroughs have been effected such as the prevention of some types of mental retardation as a result of our increased knowledge of body metabolism, there are still gaps in research, personnel and financing which must be overcome. While the ultimate answer to the problem of mental retardation is prevention, we recognize that in the meantime, mentally retarded individuals must be cared for and must be educated and trained to the limit of their capabilities.

"In this regard, the *AMA* supports efforts to provide higher standards of care for the institutionalized retarded, special educational programs day care centers within the community, counseling services for the parents of retarded children, and efforts to create job opportunities for retarded adults. For these programs to be effective, the nation needs additional facilities and an increase in properly qualified personnel. We, therefore, are pleased to submit for the record our continued support of the expansion, extension and improvement of facilities and services through construction, training and research grants. . .

"The bill, however, also amends the present Act to authorize grants for meeting a portion of the cost of compensating professional and technical personnel during the initial operation of the facility. Although such federal financial assistance during the early years might enable a mental retardation facility to undertake a more comprehensive program than it might otherwise attempt, it can be demonstrated that once reliance is placed on a federal subsidy for staffing, the role of the federal government as a provider of operating funds will not easily be ended. Once a facility has been constructed, the community can and should as-

sume the responsibility for its operation, including the costs of staffing."

ANNUAL REPORT ON MEDICAL EDUCATION

This year's entering class at US and Canadian medical schools is the largest in history: approximately 9,280 freshman medical students, up from last year's 8,964, reports the current (Nov. 20) Journal of the American Medical Association.

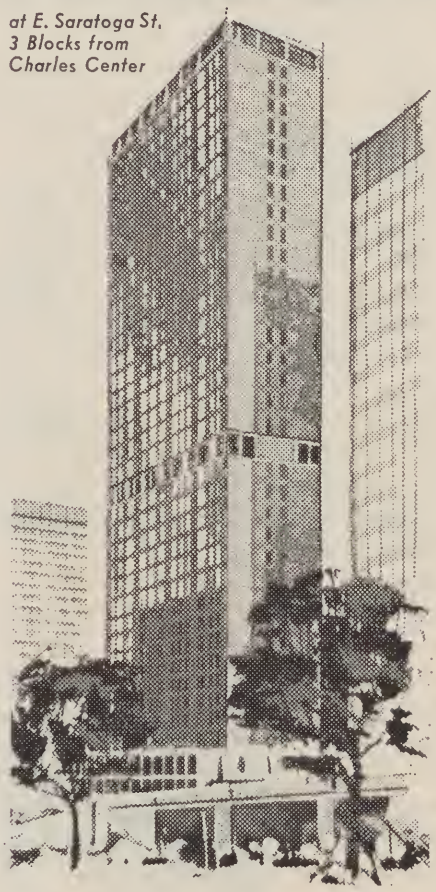
Part of the increase is due to the 137 students admitted to five new medical schools which opened this fall. Two new US medical schools and one new Canadian medical school began operations in recent years. (Nine more US and three Canadian medical schools are continuing their development.)

By the mid-1970s, these 20 new schools are expected to be graduating an additional 1,653 medical students annually. About 10,000 medical students will be graduated annually by 1975, according to medical school deans' estimates. The total graduated from US medical schools during the past year was 7,743—a record, and up 169 from the preceding year's total.

These and other statistics concerning US and Canadian medical education are in the 67th annual report of the *AMA*'s Council on Medical Education, published in the current Journal of the *AMA*.

Enrollment was at a new high in American Medical schools in the academic year 1966-67, the report said. The total was 33,423 students, up from the precedings year's 32,835.

Thirty-two existing medical schools have been awarded federal grants to expand facilities, enabling them to accommodate an additional 792 students in first-year classes. Expansion grants have been approved, but not yet funded, for five more schools. These expansions would add 92 more first-year openings.



The *AMA*'s Board of Trustees has said that "an immediate and unprecedented increase in physician output is needed." The most rapid way to achieve this without sacrificing educational quality is to expand existing medical schools, the Board said.

The Journal report points out that some states are the source of more medical students than their schools can accommodate, notably California, New York, and New Jersey. In some instances,

Luxury Apartments in the Heart of Downtown Baltimore

222 SAINT PAUL

All amenities, including swimming pool, 24-hour doorman security, attendant parking.

Decorated Model Apartments Open

Phone 837-5300

however, there is a later return of medical interns and residents to those states, where they stay on in practice.

Other states, (particularly Massachusetts, Pennsylvania, and the District of Columbia) admit large numbers of out-of-state medical students.

Oregon and Georgia are examples of states that maintain a fairly even balance of students entering medical school, medical students educated, interns and residents trained, etc.

The study also shows that New York ranks first in the number of entering medical students per 100,000 population (7.5 per 100,000, or a total of 1,353 freshman students this year).

North Dakota is second in the number of entering medical students in relation to its total population; Nebraska, Utah, the District of Columbia, and New Jersey follow, in that order. California ranks 43rd in this category, although it ranks third in total numbers of entering medical students.

As of Sept. 1, 1966, there were 48,656 US, Canadian, and foreign medical graduates in US graduate medical education leading toward licensure, general or specialty practice, or specialty board certification.

Of this total, 10,366 were interns, 32,050 were residents, and 6,240 were in other types of training.

Americans also go abroad for medical study. A few enter Canadian medical schools, and considerably more turn to medical schools in other countries. The Institute of International Education reported that in 1966-67, there were 2,377 US citizens working toward medical degrees in foreign schools.

LOW-BACK PAIN

A CONSERVATIVE, FOUR-POINT PROGRAM

The low back pain that is most frequently seen in general practice is mechanical in nature, i.e., postural back pain, joint dysfunction and acute back strain.[1,2] For this type of discomfort, a conservative regimen is usually sufficient to relieve aches and pains, and to help keep the patient functioning. Components of this basic program include:

1 Bed "If the patient is in the pain-spasm-cycle...there is no alternative or substitute for absolute bed rest..."[3]

2 Board "Boards should be ordered under the mattress...these boards act by immobilizing the spine..."[4]

3 Heat "A very valuable method of applying heat at home is a prolonged hot bath..."[5]

4 Robaxin®-750 (methocarbamol, 750 mg. capsule-shaped tablets) A well-tolerated[6] skeletal muscle relaxant, methocarbamol helps relieve spasm "...without interfering with normal tone and movement."[7] And there is little likelihood of sedation.[6]

I icated for relief of skeletal muscle spasm. **Contraindicated in** hersensitive patients. **Side Effects** (lightheadedness, dizziness, dwsiness, nausea) may occur rarely, but usually disappear on reduced dage. Hypersensitivity reactions develop infrequently. See product li ature for further details. **Also available:** Robaxin® Tablets (thocarbamol, 500 mg.) Robaxin Injectable (methocarbamol, 1 Gm./10 cc.)

■ Despite introduction of synthetic substitutes, efficacy of 'Empirin' Compound with Codeine remains unchallenged.

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

When the talk turns to oral contraceptives, it makes medical sense to remember low-dose Norinyl®-1.

(norethindrone 1mg. & mestranol 0.05mg.)

Turn page for contraindications, precautions and side effects.

Reduction of oral contraceptive dosage to the lowest effective levels is a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now also available as Norinyl-1, containing exactly one half the previous dosage of norethindrone and mestranol. Clinical experience has established that effective fertility control can be achieved with the same degree of reliability and safety with new Norinyl-1 when taken as directed.

What about switching patients from higher dosage forms?

In transferring patients to low-dose Norinyl-1 from higher-dosage oral contraceptives, some breakthrough bleeding may occur in the early cycles. In the majority of cases the bleeding episode is mild and self-limited. The long-term advantages of the lower dosage form should be weighed against the inconvenience of possible breakthrough bleeding in the individual patient.

Prescribing Information

Contraindications: Patients with any symptoms or history of thrombophlebitis, pulmonary embolism, liver dysfunction or disease, carcinoma of breast or genital organs, or undiagnosed vaginal bleeding.

Warnings: Discontinue medication pending examination if there is sudden partial or complete loss of vision, proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. The safety of Norinyl-1 in pregnancy has not been demonstrated. If a patient misses two consecutive periods, pregnancy should be ruled out before continuing the medication. If she has not adhered to the prescribed schedule, pregnancy should be considered at the first missed period. Active ingredients of oral contraceptives have been detected in the milk of mothers who received these drugs; the significance to infants has not been determined.

Precautions: Pretreatment physical should include examination of the breasts and pelvic organs, as well as a Papanicolaou smear. If endocrine or liver function tests are abnormal during therapy, repeat tests are recommended after the drug has been withdrawn for two months. Following administration of drug, preexisting uterine fibromyomata may increase in size. Careful observation and caution are required for patients with symptoms or history of epilepsy, migraine, asthma, cardiac or renal dysfunction, cerebrovascular accident, psychic depression, and diabetes. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. Possible long-term effects of the drug on pituitary, ovarian, adrenal, hepatic or uterine function must await further studies. The physician should be alert to the earliest manifestations of thrombophlebitis and pulmonary embolism. The drug should be used judiciously in those young patients in whom bone growth is not complete. The age of the patient constitutes no absolute limiting factor, although treatment with Norinyl-1 may mask symptoms of the climacteric. The pathologist should be advised of Norinyl-1 therapy when relevant specimens are submitted.

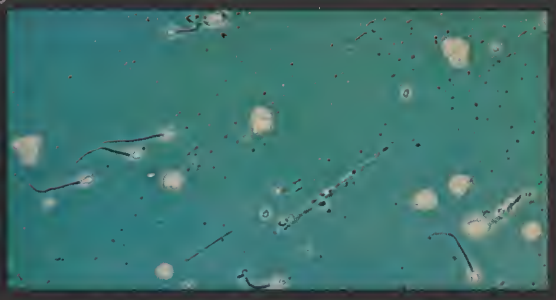
Side Effects: The following have been observed with varying incidence in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms, breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately postpartum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals, mental depression. Although the following side effects have been reported in users of oral contraceptives, no cause and effect relationship has been established: anovulation posttreatment, premenstruallike syndrome, changes in libido, changes in appetite, cystitislike syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption, and itching. The following occurrences have been observed in users of oral contraceptives (a cause and effect relationship has neither been established nor disproved): thrombophlebitis, pulmonary embolism, neurooocular lesions.

The following laboratory tests may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests, coagulation tests (increase in prothrombin, factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metyrapone test, pregnanediol determination.

norethindrone — an original steroid from

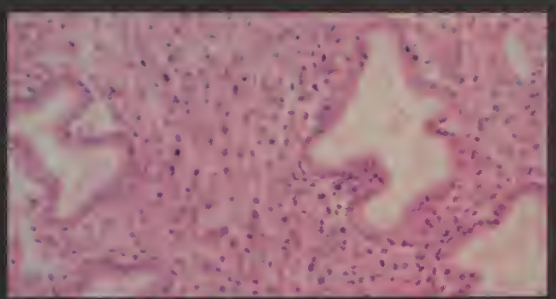
SYNTEX

LABORATORIES INC., PALO ALTO, CALIF.



Here's why Norinyl-1 makes medical sense.

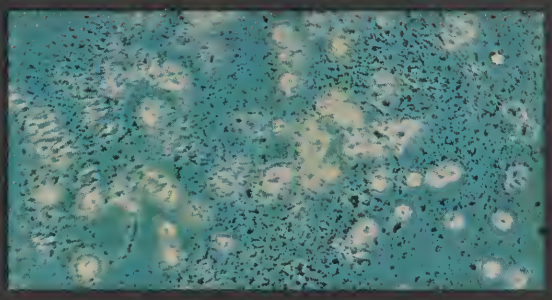
The effectiveness of Norinyl-1 as a low-dose oral contraceptive may be explained by its possible multiple action. In addition to its primary action of suppression of ovulation, Norinyl-1 may offer additional protective mechanisms... (1) creation of a cervical mucus that may be hostile to sperm penetration, and (2) development of an endometrium that may be out of phase with nidation. These effects are illustrated below.



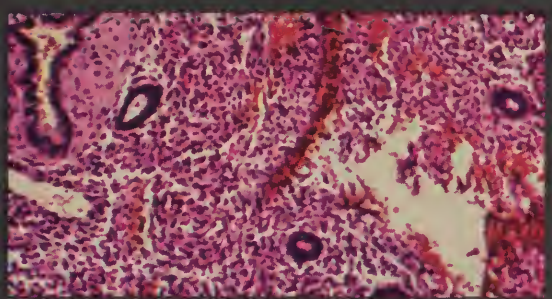
Untreated Patient

Cervical mucus at midcycle is usually thin and watery, with Spinnbarkeit (stretchability) of 15 to 20 cm.

Spermatozoa appear healthy, active, freemoving.



Endometrium of untreated patient is receptive to the fertilized ovum during secretory phase.



Norinyl-1 Patient

Cervical mucus at midcycle is scanty, viscous—with Spinnbarkeit of 1 cm. or less.

Immobile spermatozoa as they appear in cervical mucus taken from patient treated with Norinyl-1.

Norethindrone in Norinyl-1 accelerates secretory phase, suppresses glandular and vascular development.

Norinyl®-1 tablets
(norethindrone 1mg. ē mestranol 0.05mg.)

- new low dose of time-proved ingredients
- established norethindrone/mestranol ratio
- lower patient cost

An uncommon steroid for common inflammatory dermatoses

In everyday topical steroid therapy, Synalar produces rapid resolution of inflammation and itching in steroid-responsive dermatoses—and at relatively low cost to the patient.

Advanced molecular design enhances potency

Synalar combines the advantage of earlier corticosteroid compounds with unique structural innovations. As a result, preparations of Synalar 0.01% and Synalar 0.025% have been reported to be more potent topically and significantly more effective than hydrocortisone 1.0%. The unique fluocinolone acetonide molecule provides one of the most useful topical corticosteroids for everyday practice.

Impressive clinical results in a wide range of dermatologic problems

The clinical efficacy of Synalar has been extensively documented in the world literature. Commonly encountered diseases such as allergic and contact dermatitis, eczematous and seborrheic dermatitis, and neurodermatitis respond rapidly to Synalar, often where previous therapy with other topical corticosteroids has failed.

Low patient cost for wider usefulness

With Synalar, a high degree of efficacy does not mean high price. And—a small quantity goes a long way. Thus, your patients can often obtain the "economy" of a hydrocortisone preparation with the proved efficacy of a potent, truly advanced steroid.

Synalar®
fluocinolone acetonide

Turn page for contraindicati... precautions and side effects

For everyday topical steroid therapy

Synalar® 0.01%

fluocinolone acetonide provides economy in two practical dosage forms

For general use, the most economical and widely applicable concentration of Synalar is 0.01% Cream in a water-washable, vanishing cream base. Synalar Solution 0.01% is especially valuable in dermatoses involving moist, intertriginous areas or hairy sites where creams and ointments do not spread or penetrate readily. Synalar Solution is a unique dosage form—clear, nongreasy, cosmetically elegant.

Product Information

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. *Precautions:* Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. *Side Effects:* Side effects are uncommon with topical corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. In such cases the agent should be discontinued and appropriate measures taken. *Availability:* Synalar (fluocinolone acetonide) Cream 0.025%—5, 15 and 60 Gm. tubes and 425 Gm. jars. Cream 0.01%—15, 45 and 60 Gm. tubes and 120 Gm. jars. Solution 0.01%—20 and 60 cc. plastic squeeze bottles. Ointment 0.025%—15 and 60 Gm. tubes. Neo-Synalar® (neomycin sulfate 0.5% [0.35% neomycin base], fluocinolone acetonide 0.025%) Cream—5, 15 and 60 Gm. tubes.

Tuinal

One-Half Sodium Amobarbital and
One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules

ıinal helps wakeful patients fall asleep fast, stay leep all night.

dications: Tuinal is indicated for prompt and moderely long-acting hypnosis. It is not suitable for conıuous daytime sedation.

ontraindications: Barbiturates should not be administed to anyone with a history of porphyria, nor should ey be given in the presence of uncontrolled pain, beıse excitement may result.

arning: May be habit-forming.

ecautions: Tuinal should be used cautiously in paıts with decreased liver function, since prolongation effect may occur.

dverse Reactions: Idiosyncrasy, such as excitement, ngover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Overdosage: C.N.S. depression. Symptoms—Depression of respiration and of superficial and deep reflexes, slight constriction of the pupils (in severe poisoning, dilation), decreased urine formation, lowered body temperature, coma. Treatment—Symptomatic and supportive (gastric lavage; intravenous fluids; maintenance of blood pressure, body temperature, and adequate respiration). Dialysis may speed removal of barbiturates from body fluids.

Dosage: 50-200 mg. (¾-3 grains) at bedtime.

His slovenly room and habits create more tension.

His disturbances at the table make every meal a nightmare.

His daughter can't please him. There is "just no living with him."

See following page for prescribing information.

When the agitated geriatric disrupts the home...

Anxiety that *seriously interferes* with the individual's performance at work, at home, or in the community may be regarded as *moderate to severe* in degree.

Mellaril often recommends itself to the treatment of moderate to severe anxiety because it

- helps control the most frequent symptoms: marked tension, agitation, apprehension, restlessness, hypermotility
- often alleviates anxiety-induced somatic complaints
- frequently helps strengthen emotional resources
- helps the patient maintain realistic contact with environment, closer harmony with family

Thus, when you consider the anxiety moderate to severe... consider Mellaril.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.

Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.

Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.

Before prescribing, see package insert for full product information.

for moderate to severe anxiety

Mellaril®
(thioridazine)
25 mg. t.i.d.

SANDOZ

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

Editorial

GENERIC VS TRADE NAMES

Ever since the late US Senator Estes Kefauver conducted his widely publicized drug investigations many years ago, the drug industry has been under fire by politicians anxious to make a name for themselves as guardians of the public's pocketbook. The latest in a series of hearings on this subject has given more publicity to the fallacy that the term *generic* means *cheaper* drugs with the same basic quality control that trade name drugs have.

At a recent Congressional hearing, the vice-president, Corporate Affairs, Eli Lilly and Company, Henry F. DeBoest, made certain cogent comments under questioning before the Monopoly Subcommittee of the *US* Senate's Select Committee on Small Business.

Because this Subcommittee had questioned the pricing of Seconal tablets, it was Mr. DeBoest's problem to justify this pricing policy and to endeavor to explain exactly why the Lilly product was higher in price than another *sodium secobarbital* product.

Ranging in explanation from the fact that the Senate Subcommittee had erred in the pricing of Seconal (reducing the price from $18.30 per thousand to $15.24), he was able to show that the cost per capsule was 6.8 cents for the trademark product compared to 6.3 cents for a generic substitute. He effectively refuted the charge of the Subcommittee that Lilly's product was sold at four times the price of the generic product.

However, the main points that Mr. DeBoest made were more far-reaching than this simple equation. He stated that, companies such as his emphasize scientific research, national distribution of product and full customer services; compared to those which have no research, regional distribution only of their products and limited customer service. What does this mean to the public and to the physician?

Scientific Research means consistency in the production of safe and effective products. This can often mean the difference between life and death. This means the physician may prescribe with confidence in a drug and the company that makes it.

It means quality of product—which, in turn, means that in research, in production or manufacture, raw materials, final product, packaging and labelling, this standard must be met.

As James L. Goddard, Food and Drug Commissioner, has said,

". . . if all drugs were reliable there would be a concrete basis for price comparison, and drugs could be included in a Formulary solely on a cost criteria."

Competition in Product line was another area touched upon. It was pointed out that drugs provided are packaged in various forms. Different dosage forms are needed in the treatment of different patients. Package sizes also vary. The so-called generic firms can concentrate on providing those product lines which are consumed in volume and thus avoid the little-used or no-profit item.

In addition, the full-product and full-distribution company must put itself in the position of providing its complete line of products everywhere in the country so as to be available to the patient wherever he may be. Some companies choose not to do this.

In times of disaster most of the ethical drug companies make themselves available to the Red Cross, US State Department and other agencies who are tending to the victims of fire, flood, earthquake and tornado.

In still another area, we find these same high-quality drug companies making available as fast as possible to the practicing physician the availability of new drugs, their uses and side-effects.

Backing up this enormous communications system are the specialists available on a 24-hour basis to the practitioner whenever he has a particular problem involved in the use of their drugs.

So, on and on went Mr. DeBoest, refuting many of the charges made for the publicity effect they would have.

In closing, he testified to the fact that his company manufactured *generic* drugs. In fact, some several hundred. But to equate these with "cheapness" was not true.

All in all, the testimony presented should give the Congressional investigators food for thought. We can only echo these closing remarks:

> "We feel strongly, however, that changes in our medical care system should be made with great caution, for the scientific, economic and social interrelationships of its many parts are in delicate balance. Experimenting with parts of any complex mechanism may seriously impair its capacity to perform effectively. We believe that competition among drug manufacturers and among drug distributors and pharmacists is insuring that sick people in this country receive high-quality drugs at prices well below the value which they contribute."

SOME THOUGHTS ON THE SIDE EFFECTS OF ORAL CONTRACEPTIVES

PETER F. VERKOUW, MD
Annapolis, Maryland

Oral contraceptives are the most effective means of pregnancy prevention if one doesn't consider methods that are either impossible, like total abstinence, or impractical, like surgical removal of the female reproductive system.[1]

Pregnancy, its complications and its sequelae, creates a major world health problem. Examples are 1 to 1½ million estimated illegal abortions in the USA per year and population increase which eliminates per capita income increase in a country like India.[2, 3]

Faced with the opportunity to tackle a major health problem effectively the physician is confronted with the question of safety. This question cannot be answered completely and satisfactorily at present.[2, 4] We know that "the pill" is almost totally effective; we do not know that "the pill" is almost totally safe.

In this country oral contraceptives are available on a physician's prescription only. The physician has to take a stand.[4] Numerous difficult questions come up. Do you prescribe "the pill" at all? If you do, what are your standards for evaluating and selecting your patients? What do you tell them, how often do you see them back, for how many years do you give these potent hormones? The answers to these questions have to do with safety. For instance, can one give oral contraceptives to a woman with a past history of phlebitis, to a girl with a strong family history of breast cancer, to a patient who showed occasionally glycosuria during her last pregnancy, to a lady with frequent migraine attacks?

Not only the doctor who prescribes antifertility agents has to be aware of the answers to these questions; any practicing physician sees patients who have been placed on these drugs by one of his colleagues. The pediatrician finds that they influence lactation; the surgeon may see a very hyperemic thyroid gland; the neurologist has to consider them in the evaluation of a headache problem; the internist in the interpretation of abnormal laboratory data.

All oral contraceptives are combinations of synthetic steroids with potent hormone like effects. The principal sought after effect is guaranteed suppression of ovulation. As far as I have been able to determine all preparations presently available for doctor's prescription have this effect if taken according to instructions.[1]

As expected, a potent hormone capable of interfering predictably with one of the most essential functions of the female organism, must have other predictable effects. It does. Are those effects important or minimal, are they of significance in all patients, are they really predictable or are they erratic, are they simply annoying or dangerous and possibly even life threatening?

I shall not go into a complete enumeration of all the observed side effects of oral contraceptives. I do want to consider some of the more important and controversial areas in this field.

Consider the female reproductive system first. There are predictable changes in uterine endometrium and cervix, vagina and ovaries.[1] These changes appear to be reversible upon discontinuation of therapy.[6] So called sequential oral contraceptives which employ a high estrogen like effect in the early phase of drug administration

Presented at Medical Staff Meeting, 11-8-67; Anne Arundel General Hospital, Annapolis.

cause hyperactivity of the cervical glands with production of a clear, odorless secretion, sometimes confused with leukorrhea from vaginitis. Vaginitis does not occur more frequently in users than in non-users of sequential preparations, but in the combination preparations vaginitis appears somewhat more frequently.[6] Cases of stubborn monilial vaginitis that only disappeared after discontinuing oral contraceptives have been reported.[7] There is no evidence that anti-fertility drugs increase the risk of cervical or uterine cancer during relatively short-term use.[1] Extensive studies in this regard have been undertaken and the popular "Pap"—smear has been of tremendous help. Oral contraceptives have actually been administered to women with abnormal cervical cytology and no deleterious effects, attributable to the drugs, have been observed.[8] It is felt however, that endometrial biopsy data after long term use are still incomplete.[6]

The ovary, being the most important target organ of anovulatory drugs via pituitary suppression, does show histological changes during this type of therapy, as expected.[1, 6] There has been no evidence that damage to the ovary or to the oocytes results.[6] Millions of women have conceived normally after several years of ovulation suppression, and have given birth to normal children, so far. Most women who discontinue oral contraceptives return to their normal menstrual pattern within three months.[6] Some women may not ovulate for some time and some exhibit prolonged amenorrhea or acyclic bleeding. I have found no evidence that such a pattern could be attributed to contraceptive drugs. It should be recognized that some women already had these problems prior to drug therapy.[6] There are no studies correlating resumption of ovulation with type or duration of therapy.[9]

The menstrual cycle becomes standardized on the usual contraceptive regimen and breakthrough bleeding or amenorrhea appears more frequently in normal controls using vaginal contraceptives.[1]

The breast, another reproductive system target organ does not increase in average size, although some women claim mild hypertrophy; mastalgia is reported in less than 1% of women and does not increase over as many as 9 years of contraceptive use; lactation appears to be reduced by the higher dose preparations; and the frequency of breast nodularity is reduced which suggests inhibition of a potential precancerous state.[1] No increase in breast cancer has become evident.[10]

The other endocrine glands have revealed no serious functional abnormalities during or after oral contraceptive use.[1, 6] The pituitary is obviously depressed in some respects but resumes normal function after cessation of oral contraceptive therapy. This is clearly indicated by the practically immediate return of normal ovarian secretory activity and the almost hyper-normal fertility. Urinary output of luteinizing gonadotrophins is decreased, but human growth hormone secretion is elevated which may account for the diabetogenic effect of oral contraceptives.[1, 6, 10a]

The pituitary-adrenal feedback mechanism and adrenal function appear to remain normal, but changes occur in the excretion of 17-keto- and 17-ketogenic steroids, possibly related to an increase in the protein bound fraction of cortisol and changes in the intermediary metabolism of cortisol. Important to remember is that the urinary secretion of these steroids is decreased, sometimes to subnormal values, during anti-fertility therapy.[11]

Thyroid function remains normal in users of oral contraceptives and RAI uptake studies confirm this.[1] Measurements of protein bound iodine show a definite increase, frequently up to the hyperthyroid range. This is due to a characteristic estrogen effect, also seen during pregnancy, that increases the amount of thyroxin-binding-globulin in the blood.[1] It is very important to keep this laboratory side-effect of oral contraceptive in mind. Unusual thyroid vascularity has been reported in women on oral contraceptives who underwent thyroidectomies. It is suggested that contraceptive medication be stopped at least 2 months prior to surgery and large doses of Lugol's solution be used to decrease thyroid vascularity for at least one month.[5]

We now come to a number of effects or side effects of oral contraceptives that are more difficult to attribute directly to the drugs.[1] They are nausea, weightgain, mental depression, and changes in sexual activity, satisfaction, and response.[12] All of these symptoms are influenced by psychological factors. The information given by the physician who prescribes the drug is important.[1] Adequate studies are lacking. All I can say

is that a certain amount of nausea and weightgain due to fluid retention are seen with these drugs. For the great majority of women they do not represent a major problem.[13] Nausea tends to disappear after the first few cycles. According to some studies weightgain appears to be an all or none effect. It seems to occur in about one third of women who take oral contraceptives. Many women who complain about weightgain during use of the drug use the medication as an excuse and are actually overeating. Depression is not uncommonly seen in a young, overburdened housewife. There is no good evidence to support the view that depression results from the pharmacologic action of birth control pills. The patient eagerly blames the pills for her mood changes, thereby avoiding her own responsibility for her symptoms.[12]

There appear to be no bona-fide reasons to attribute changes in libido, sexual activity and satisfaction to the direct action of oral contraceptives. Again, so many psychological factors are involved, and so few adequate studies have been done, that it becomes difficult to make a qualified statement. Although the patient may blame the pill, it seems wise to look for other reasons for her complaints.[12]

Much attention has been devoted to alleged side effects of oral contraceptives that are potentially dangerous. And justifiably so. The most notorious possibility has been the increase in thromboembolic phenomena. Well documented, but not always unanimous, studies have shown that oral contraceptives tend to increase certain blood clotting factors, like fibrinogen, the vitamin K dependent factors (*prothrombin,* VII and X), factor VIII, platelet count, and antifibrinolytic activity. Most coagulation abnormalities during oral contraception tend to produce values in the so-called hypercoagulable range. These changes are similar to those seen during pregnancy, but occur to a lesser degree.[14, 15, 16] Some evidence has suggested that the rise in factor VII is cumulative.[17] Pulmonary infarctions, strokes, peripheral arterial occlusions, and even myocardial infarctions have been reported as possibly related to the use of oral contraceptives.[18–21] It is impossible to review in a short time span the careful statistical analyses that have been made, but a few points should be made clear.

There is unequivocal evidence that severe thromboembolic disease does occur in nonpregnant, apparently healthy, young women. The incidence rate is very low.[22] The conclusion that a demonstrable increase in certain clotting factors increases the risk of thromboembolic episodes is not justified on the basis of the available evidence.[15, 16] Also the commonly held belief that pregnancy increases the risk of thromboembolic disease is unwarranted. The incidence of thromboembolism during pregnancy compares favorably to that in the population at large.[22] Thromboembolic disease does increase towards the end of pregnancy and in relation to delivery and puerperium when there are numerous predisposing factors, such as bedrest, inflammation, damaged bloodvessels and the like.

In 1963 the so-called *Enovid* (Searle) Ad Hoc Committee (The Wright Committee) found no evidence that there was a significant increase in the risk of thrombo-embolic death from the use of *Enovid.*[23] This conclusion has been criticized, since it dealt only with mortality and not with morbidity. Basically the conclusion of the report still stands; it has been reviewed and expanded upon by others and found valid.[22] When an extremely unusual disease occurs in a young, healthy female one tends to look for a reasonable explanation. And how reasonable it is to attack the "pill." The reported incidence of thromboembolic morbidity in *Enovid* users varies from 20 (1963) to 50% (1962) of predicted idiopathic morbidity.[22]

Reviewing many articles it is impossible to escape the conclusion reached by the generally conservative editors of the *Medical Letter* that at this point a causal relation has not been established. "With millions of women using oral contraceptives, almost every known disorder must be expected to occur in some of the women."[2]

Nevertheless, I must admit that there are case reports in which it sounds extremely suggestive that there is a reasonable possibility of a relation between the onset of a thromboembolic episode and the ingestion of oral contraceptives.[18] A physician who withholds these drugs in a patient with an increased risk of developing phlebothrombosis certainly cannot be criticised. Increased risk factors are: a positive past history of deep thrombophlebitis, marked obesity, heart disease, trauma,

surgery, malignancy, and sickle cell disease.[24]

Changes in hepatic function probably are produced frequently by antifertility agents.[1, 25, 26] Most of the functional changes are transient and this is a reflection of adaptive mechanisms in the liver dealing with the increased metabolic load of drug-detoxification. It is estimated that in 10 to 40% of women increased BSP retention occurs which may gradually disappear in spite of continued drug administration. This is a known estrogen effect on liver function.[27] About one out of 10,000 women using oral contraceptives will develop jaundice. This can be due to three different processes: 1—an unusual sensitivity of the bile secretory apparatus to the hormones—this is seen in women who have had recurrent cholestasis of pregnancy; 2—a process similar to that seen with the anabolic steroids, causing a cholestatic type jaundice without evidence of hepatocellular damage; and 3—a situation where actual hepatocellular damage occurs and where a hypersensitivity of the liver cell is suspected.[25] All these reactions appear to be completely reversible upon discontinuation of the drug.[26] Jaundice or pruritus of pregnancy, congenital hyperbilirubinemia, and primary biliary cirrhosis are contraindications for the use of oral contraceptives. Opinion is divided as far as other liver ailments are concerned, such as liver-cirrhosis and a history of hepatitis. It seems safer to withhold the drug if there is any question about the functional integrity of the liver.[27]

I must mention, briefly, a few other important effects of oral contraceptives.

There are several good studies that show a significant decrease of glucose tolerance in women who take the "pill."[28] This effect is presumably due to the estrogen effect of the medication. The exact mechanism of action is unknown; it is well known that pregnancy in itself has a tendency to decrease glucose tolerance. It is possible that estrogens increase the plasma binding of insulin, thereby rendering it inactive; or estrogens may increase pituitary *ACTH* secretion thereby stimulating cortisol secretion or, estrogens may increase levels of human growth hormone which is diabetogenic. The last possibility has received reasonable support in recent studies.[10a] It is unknown whether the observed changes in glucose tolerance are damaging in themselves; it is known that 30 to 60% of women who exhibit abnormal glucose tolerance during pregnancy will develop permanent diabetes in 1 to 7 years. The abnormal glucose values in women on birth control pills may well serve as a good indication of so-called pre-diabetes. In one series 10% of the subjects had an abnormal fasting bloodsugar and 46% had an elevated 2 hour postprandial bloodsugar.

It should be stated here that there have been no reports of dramatic increases in cases of diabetes mellitus and that insulin requirements do not change in diabetics during oral contraceptive therapy.[6]

A second important metabolic change is the reported alteration of serum-tri-glycerides, total serum cholesterol, low density and very low density lipo-proteins in women taking oral contraceptives.[29] The changes observed produced a pattern resembling that seen in men. It is common knowledge that levels and distribution of serum lipids and lipo-proteins have been correlated with the incidence of atherosclerosis. Therefore, it seems justified to conclude that there is at least some evidence that oral contraceptives may accelerate the development of atherosclerosis. This is obviously an effect of which the ultimate results will only become known after many more years of observation.[4] As far as I have been able to determine it is the most incriminating effect of oral contraceptives. If these studies are confirmed and if the so-called atherogenic index has as much significance as has been claimed by some, oral contraceptives may well bring numerous women a little bit closer to their coronaries and strokes. This would be a most regrettable outcome.

A recent study alerts clinicians to a possible relation between the development or aggravation of arterial hypertension and the institution of oral contraceptive therapy.[30] This possibility is suggested by marked increases in blood pressure in a small group of women placed on birth control pills. An impressive increase was seen in renin-substrate concentration and its reactivity to exogenous renin which results in increased angiotensin production, as well as an increase in endogenous renin activity and aldosteron excretion. These changes were also seen in some normotensive women, therefore their significance in relation to the development of hypertension is not clear. The blood pressure came down to normal or improved markedly in 8 out of 11 women after

stopping the oral contraceptives. From this article it appears wise to discontinue these drugs in women who develop hypertension. It is also stated that in these cases one is probably dealing with an unusual group of patients, since there certainly haven't been many reports of this nature after a considerable experience with oral contraceptives in millions of women.

Finally, I shall mention in passing, side effects like increased facial pigmentation, hirsutism, vascular bruits, galactorrhea, dizziness, blurred vision, alopecia, and headaches.[1, 31] One can find them scattered through the literature in several reports. Adequate studies about their significance are lacking.[1]

The problem arises on how to handle a girl who walks into a doctor's office and wants a prescription for birth control pills?[4] Sir William Osler has said that one of the distinguishing features of man as opposed to other mammals is that he (or she) likes to take pills. It is always hard to talk a determined woman out of anything and many of the pill-users are quite determined, but I do try to talk them out of taking oral contraceptives. At the same time I try to be fair. The case against birth control pills should not be overstated and one doesn't help matters by scaring the patient. I tell her that there are excellent alternatives, and that she should certainly give those a try. The pill should be an acceptable, but a last resort, after all other methods are found unacceptable or impractical.[2] Then I insist on a complete history and physical examination. One should certainly think strongly about advising against the use of oral contraceptives if one finds a history of deep thrombophlebitis, migraine headaches, jaundice or pruritus of pregnancy, sickle cell disease, a marked family history of diabetes or arteriosclerotic complications. The physical examination should be entirely normal. The findings of an abnormal blood pressure, varicose veins, heart lesions, obesity, breast masses, pelvic abnormalities should delay the administration of oral contraceptives, often indefinitely.

If I can't find any good reason not to give the prescription I pick the combination of the lowest possible doses. It seems reasonable to assume that some or many of the side effects are dose related.[2] I tell the patient that I believe that the "pill" is safe on a short term basis, I explain that the subjective symptoms will probably disappear after the first few cycles, and that I do not believe that she can take the pill all of her fertile life without the possibility of hurting herself. I tell her to come back in 3, 6, and 12 months and thereafter at least once per year.

IN SUMMARY

Oral contraceptives have many physiological side effects, some of which are still being discovered and elucidated. There is no evidence that these side effects are either disturbing or harmful to the great majority of healthy females, if given on a relatively short term basis, say arbitrarily 5 years. Oral contraceptives are therefore a useful addition to the contraceptive armamentarium. There is insufficient information available about longterm deleterious effects and therefore a statement as to ultimate safety cannot be made by anyone.[2] The role of the physician is one of adequate discussion of the alternatives, proper screening of candidates, and reassurance as far as immediate health dangers are concerned, adding a word of caution about possible long term harmful effects.

Beginning with the January 1968 issue of the Maryland State Medical Journal, there will be a Medicolegal Page written and edited by Belden R. Reap, Sr., MD, JD. It is hoped that this new feature will contribute to the continuing education of physicians, and cultivate in them a refreshed awareness of newer medicolegal trends, malpractice pitfalls in office and hospital practice, as well as recent and important court decisions. A very definite effort will be made to keep the content of the articles interesting. Questions will be answered promptly.

THE UTILIZATION OF TRAINED MILITARY PERSONNEL IN THE BALTIMORE HOSPITAL AREA

ARTHUR E. COCCO, MD
and
FLORENCE M. GIPE, RN, MS, EdD

The obvious need for paramedical personnel in this time of hospital staff shortage makes the question of proper utilization of trained paramedical personnel of paramount importance. This problem becomes even more obvious with the expansion of medical facilities, when such expansion is limited by insufficient personnel, thus, making the limiting factor of expansion *manpower deficit*. The question frequently asked is where can our medical institutions obtain adequate numbers of trained paramedical personnel? Similarly, it is asked are we doing all that is possible to properly utilize and attract interested and competent hospital personnel, especially those who give evidence of having certain knowledge and skill which are required to function successfully as a qualified medical assistant.

During the past five years various theories have been advanced in explanation of the shortage of trained paramedical personnel. These include: low pay, increased need for members of the health team as technical skills advance, increased numbers of hospital and health facilities, underutilization of available resources.

Since the Armed Forces of the United States employ and train large numbers of paramedical personnel this source eventually offers a potential supply of skilled workers for civilian use especially after discharge or retirement from military service. The purpose of this study was to learn if ex-military trained personnel are being utilized in medical institutions and what special factors limit their employment.

PROCEDURE OF STUDY

Questionnaires were sent to twenty-two hospital registered nurse directors of nursing service who employed registered nurses, licensed practical nurses, leaders and subleaders of the nursing care personnel team as well as members of the paranursing care group. The following is a sample of this questionnaire:

1. Do You Employ?
   a. Trained male aides
   b. Discharged military corpsmen
2. Do You Employ Discharged Military Corpsmen Under the Title As?
   a. Orderlies
   b. Assistant nurses
   c. Medical and surgical technicians
   d. By what other title do these classifications appear in your personnel office?
3. How Do Discharged Military Corpsmen Compare To Other Ancillary Male Employees In Nursing?
   a. Inferior
   b. Equal ability
   c. Superior
4. Are All Ancillary Male Personnel In Nursing Paid the Same Salary Regardless of Their Past Training and Experience and the Work They Perform?
   Do not state salary, only note differential between an orderly and
   a. Military corpsmen
   b. Men assistant nurses
   c. Medical and surgical technicians (who assist in O.R.)
   d. Men nurse aides or attendants

5. What Are the Educational Requirements of?
   a. Military corpsmen
   b. Medical and surgical technicians
   c. Attendants
   d. Orderlies
6. Do You Consider Educational Preparation and Requirements When Employing These Ancillary Personnel?
7. Are Educational Benefits Offered to Paramedical Personnel Employees Such as Further Opportunities With Pay for Education to Do A Better Job?

RESULTS

Twenty-one hospitals out of the twenty-two hospitals which were sent questionnaires responded. Of these, eighteen hospitals reported that during the past they had employed at some time or another personnel who were trained in the army. Of these eighteen representative hospitals all but one expressed the opinion that military trained personnel were superior in every aspect. Such male personnel had been employed with a specific title such as:

1. Medical or surgical technician
2. Assistant nurse
3. Male aide
4. Orderly

Of the entire group reported 93% were classified as orderlies. The remaining number were classified in the other listed categories. Two directors of nursing stated that no military corpsmen had ever applied for work in their hospital. One hospital reported that a number of military corpsmen had been employed but only two remained for periods of time longer than one year. The basic explanation for this turnover was that the salary was too low. Differences in salary for trained military personnel versus untrained personnel ranged from ten cents per hour to two dollars per week. Only one hospital paid trained military personnel as high as ten dollars per week more than inexperienced paramedical personnel. In none of the hospitals was there a separate classification for trained and experienced military corpsmen. The bulk of the hospitals still carried these trained and experienced personnel on the hospital payroll as orderlies.

All hospitals except four stated they require some high school training as a prerequisite for employment. The state hospitals in Maryland and several private institutions were emphatic stating that high school graduation was mandatory. It was learned that the bulk of military personnel were high school graduates and many had actually completed some college credits when located in the army. Although some emphasis on education is made by nearly all medical institutions, none of the hospitals offered civilian educational benefits other than those concerned with special medical or nursing techniques and procedures. In no hospital was clinical experience in allied nursing specialties for army corpsmen given due consideration. The clinical experience of army personnel presently being utilized averaged from five to twenty-one years while clinical experience for civilian workers averaged less than one year. In many of the hospitals nursing service department studies, it was learned that specific job analysis for each classification of worker was or had been utilized and it was apparent that in most instances ex-military personnel were assigned work of higher quality and responsibility and that his performance of such skills and techniques were usually of a higher quality than that of non-military personnel. In one large hospital, military corpsmen were not allowed at the bedside with other "sub-professionals." This hospital director of nurses was of the opinion that ex-military personnel should be utilized only in operating rooms, emergency accident rooms, in outpatient clinics and intensive care units.

DISCUSSION AND FURTHER CONCLUSION

Personal communication with the US Surgeon General revealed that approximately 12,000 paramedical personnel are separated from the Army each year. (Figures are not available for other branches of the service nor are figures available relative to the number released yearly to the Maryland area.) These people (ex-army corpsmen) were informed and advised of hospital and clinic employment opportunities provided by local State Employment Offices. This counseling is done by representatives of the Veteran's Employment Service of the US Department of Labor in cooperation with and working through the local State Employment Service Offices, which maintains information for veterans as to the types of available employment in public works and private industry. There is no authoritative "medical organization" either on a national or state level actively pursuing and aiding placement of this impor-

tant body of personnel. Personal communication with some paramedical personnel trained in the army who are presently working in civilian hospitals in Baltimore revealed that none were directed to their present positions by any of the aforementioned agencies.

Since discharged military personnel are hired in civilian hospitals as orderlies, the low salaries commensurate with this position seems to be the major deterrent toward the continuation of this occupation in civilian life. As with most who work in the health field the occupational stimulus is strong. Most people, however, agree that this stimulus is not sufficient to overcome the grossly inadequate income benefits. This deficit is further potentiated by the lack of recognition in civilian hospitals of experience gained in the army. This lack of recognition seems the result of societies and organizations issuing licenses to allied health personnel in technical specialties. These groups frequently place great emphasis on educational requirements in an effort to insure high quality (an admirable goal), and give no recognition to practical experience or training obtained in military schools. Admittedly many of these people have served sufficient time in the military to be eligible for military retirement programs, and therefore may not require excessive salary committments. Even so, the present wage offered seems so far out of line with the current standard that the impossibility of raising and educating a family are obvious. Do these important people and their families deserve less?

SUMMARY

From what has been learned from the Nursing Service Directors, and personal contact with discharged military paramedical personnel, it appears that the services of well trained ex-military paramedical personnel are not available to hospitals because:

A. No organized effort is made by *organized medicine* to channel this manpower flow into needed areas.

B. Low salaries. Military personnel have openly asserted their preference for work in hospitals and clinics, but that the pay is not a living wage.

C. Low status or lack of worthwhile recognition. This is in part the result of demanding licenses for various levels of health workers without due consideration for military training or experience.

The solutions to these problems are obviously complicated and multi-faceted. Many groups will offer support and opposition to each detail and in accord with the past, disagreement will be prominent. If these problems are to be solved, however, in accord with standards required by the physicians who are responsible for patient care, active pursuit by all is not only important but is highly and immediately necessary.

PHYSICIAN UTILIZATION BY INNER CITY RESIDENTS OF BALTIMORE

HENRY W. D. HOLLJES, MD
Medical Care Services, Baltimore City Health Department
and
HELEN B. FREEDMAN, BA
Senior Public Health Analyst, Medical Care Services, Baltimore City Health Dept.

From 1948 to 1963 Baltimore City provided a Medical Care Program for indigent people on a capitation basis.[1] A change to a fee-for-service payment took place in 1963 as reviewed by Rodman[2] who observed a 10% increase in the physician utilization rate; Alexander[3] indicated that such an increase was to be expected. The Baltimore City Medical Care Program ceased to exist after June 30, 1966 and was replaced on July 1, 1966 by the Maryland Medical Assistance Program (*MAP*).

MAP continued the fee-for-service payment system but substantially increased the eligible population through the addition of medically indigent individuals under 65 years. Furthermore, the seven hospital sponsored medical care clinics that existed under the old program terminated their operations. Public medical care recipients are now free to go to any hospital outpatient clinic or any private physician for medical care.[1] The effect that these changes have had upon the inner City of Baltimore was studied by the Baltimore City Health Department.

In order to determine the immediate impact of the new program during the Spring of 1967, one thousand households were surveyed in economically deprived areas in Baltimore City.[4] This survey attempted to assess how disadvantaged people were using existing medical services. Also, the extent of enrollment in the new program was determined in the ten census tracts sampled. The pattern of medical services utilization was compared between those enrolled in *MAP* and those not covered by *MAP*. At the time that the household survey was conducted, hospital outpatient departments were reimbursed 100% of cost and the Medical Assistance Program fees-for-service to physicians were as follows: $3.50 office call, $4.00 home day call and $4.50 home night call.

The object of this communication is to describe the major findings of the household survey and compare some of these with the previous medical care program.

OBSERVATIONS

Household Population Characteristics—4,379 individuals were interviewed, an average of 4.4 persons per household. In 450 households (45.0%), the head was reported as a female. In 515 households (51.5%) some or all members were reported to have *MAP* Identification Cards. Households with members on *MAP* were significantly larger (median—3.7 members) and younger (average age of 25 years) than those households without *MAP* members (2.7 and 39 years respectively). Individuals in households on *MAP* reported a significantly higher incidence of illness than those not on *MAP* (11.4% vs. 8.7%).

Utilization of Physicians' Services—Of individuals who reported that they were not only ill but in addition visited a physician, a significantly larger percentage was found in the group on *MAP* (8.4%) as contrasted with the group not on *MAP* (5.8%). Furthermore, 38.8% were attended by their neighborhood physician either at their home or at his office; 56.2% utilized the medical

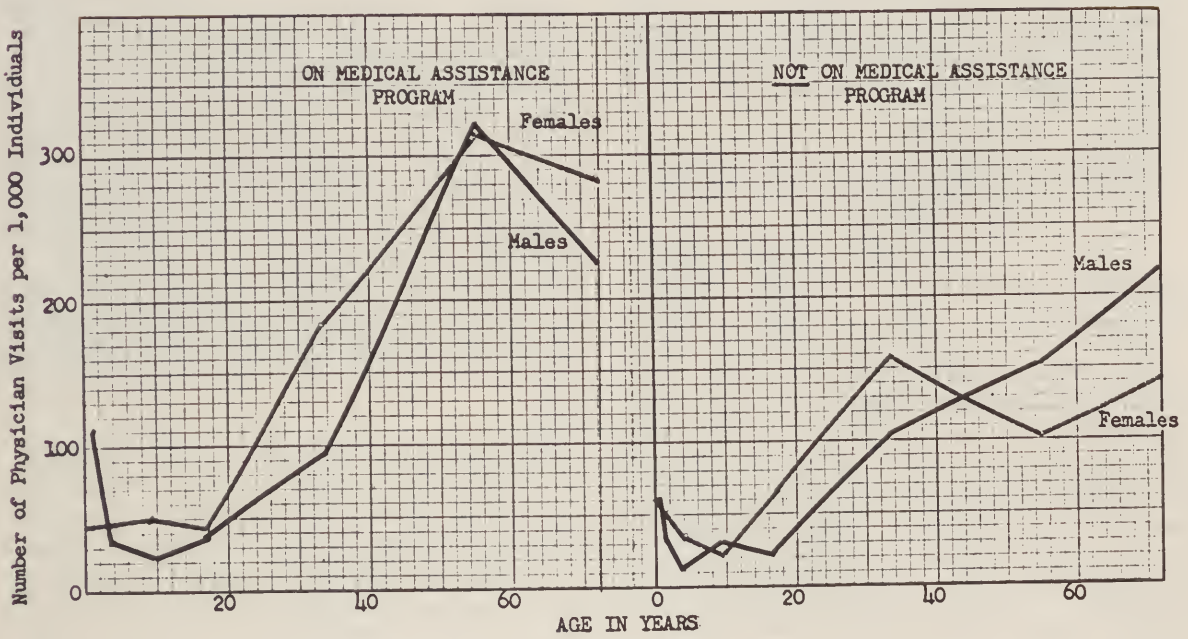
BY AGE AND SEX



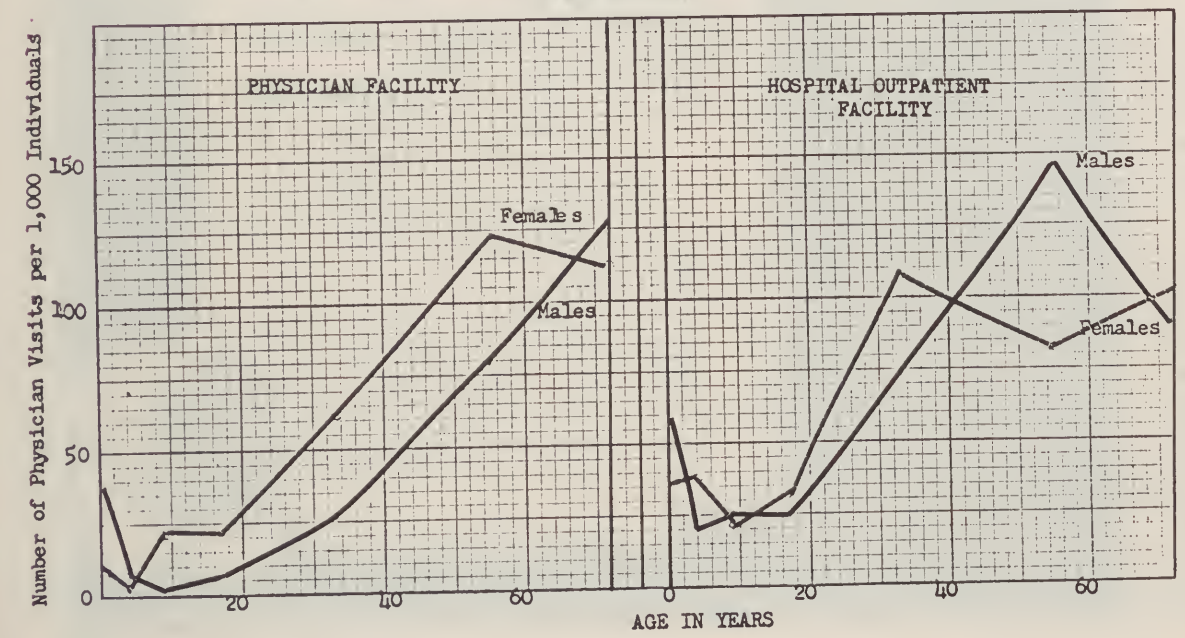


Diagram 2

UTILIZATION RATES BY INDIVIDUALS IN TWO WEEKS PRIOR TO DATE OF INTERVIEW
BY AGE AND SEX

services of a clinic or outpatient facility; and 5% went to both. This pattern of seeking medical care indicates an apparent reversal of the trend in physician utilization for Baltimore City during 1963 as reported by the National Health Survey of 1964,[5] and by a 20% random sample of individuals on the Baltimore Medical Care Program in 1966.[6] A comparison of these trends is presented in tabular form.

Physician and Hospital Clinic Utilization Rates (Percent)

	1963-1964[5]	1966[6]	1967
Physician Services	61.9	57.8	38.8
Hospital Clinics	18.7	42.2	56.2

Age Specific Rates—For all households sickness was reported more frequently among individuals aged 65 and over (217.8 per 1,000 individuals). For the households with *MAP* members, individuals 45-64 years of age had a higher incidence of illness (265.5 per 1,000). Similarly the number of persons who used physicians' services was higher in the group 65 and over (166.2 per 1,000). However, when rates were computed separately for those on *MAP* and not on *MAP*, individuals on *MAP* between 45-64 had a higher usage (224.2 per 1,000). This corresponds to the utilization rates computed from data on the Baltimore City Medical Care Program for the year ending June 30, 1966. *MAP* patients aged 45-64 years, both males and females, utilized physicians' services to a significantly higher ($p<.001$)* extent than people not on *MAP* (diagram 1). In this age group females predominantly used private physicians' services while males preferred hospital outpatient facilities (diagram 2).

DISCUSSION

Since the total population served by *MAP* is much greater than that on any previous Baltimore City medical care program, the total number of services provided by private physicians also appears greater. A projection of this household survey supports this view while it provides even greater expansion of hospital outpatient services. In short, more paid patient services are being provided by both private physicians and hospital clinics since the establishment of *MAP*. As neither the number of private practitioners nor the number of public service hospital facilities has increased appreciably in Baltimore during the past ten years, the increase in the number of paid services indicates that *MAP* has had a decided effect by increasing the productivity and remuneration of both physicians and hospital facilities.

The expansion in hospital outpatient services may be related to the *MAP* provision that allows 100% cost reimbursement. Private physicians participating in *MAP* are reimbursed on a fee schedule noted above. Before *MAP* the hospitals of Baltimore complained that the capitation rate under which they were paid fell short of expenses which were incurred directly by patients and by referral of patients from neighborhood physicians.

The response of the hospitals to cost reimbursement for fees and charges as well as the response of the physicians to fixed fees were not measured in this survey but may be reflected in the utilization of services. Whereas, hospitals formerly incurred deficits as the utilization of their services increased beyond the maximum capitation rate, they now receive more adequate compensation. The response of private physicians to fixed fees could have resulted in greater individual physician productivity as noted in *A Report To The President: Medical Care Prices.*[7] With the advent of *MAP*, more physicians' services and more hospital services appear to be utilized by a greater number of patients than under any previous program in Maryland.

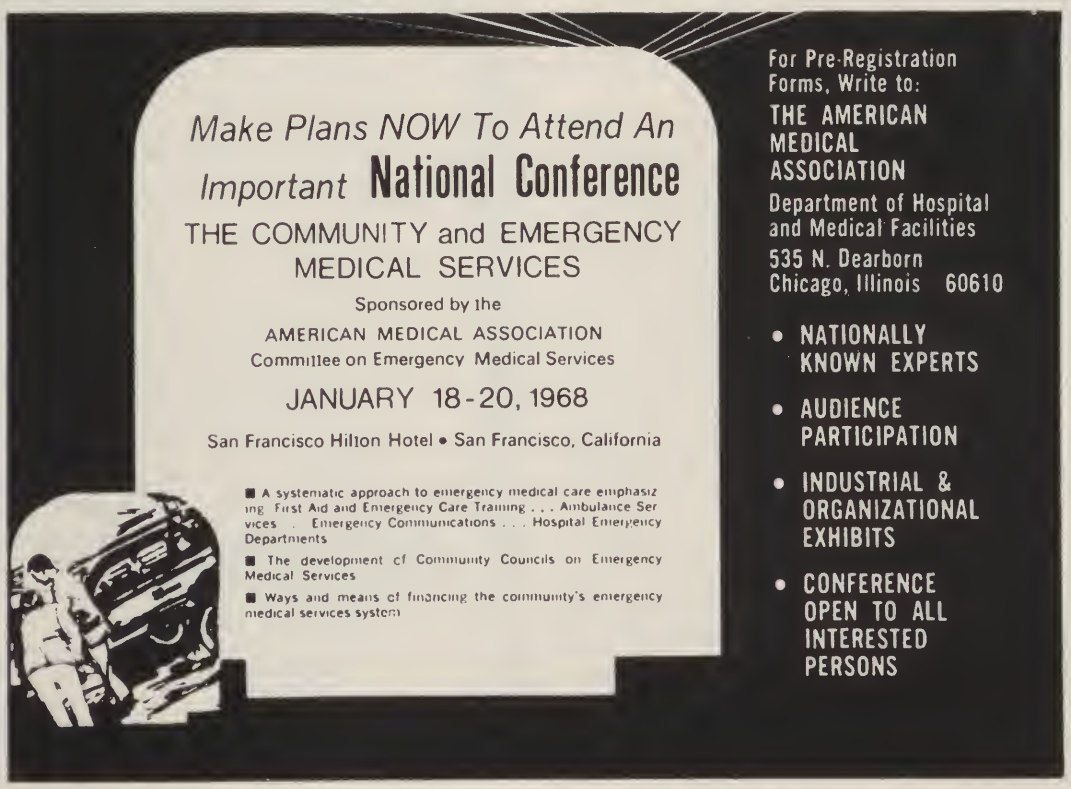
The apparent reversal of the trend in physician utilization may indicate an insufficient growth in the number of neighborhood doctors within the area to serve the needs of the patients, with the result that medical care is more readily available in the hospital outpatient department nearest them.

Middle-aged *MAP* patients stated a higher rate of visits for physicians' services than middle-aged patients not on *MAP*. Presumably, this is secondary to a higher incidence of chronic disease and disability of persons on *MAP*. Those individuals not on *MAP* were healthier and more productive and for these reasons were less likely to be in need for medical assistance.

The sex differences noted are more conjectural. Perhaps the nature of the illnesses of males 45-64

*The probability of this difference occurring by chance is less than one out of a thousand and therefore highly significant.

on *MAP* is such that specialty clinics at hospitals are better able than neighborhood physicians to provide care while with the females of this group the reverse is true.



In summary the Maryland Medical Assistance Program is effecting greater utilization of private physicians' services as well as hospital outpatient services than any previous similar program, according to the household survey conducted by the Baltimore City Health Department. There is a strong indication that both men and women 45-64 who are on *MAP* are in poorer health than people of that age who aren't on the program. Certain medical economic factors, including the more liberal payments for outpatient services to hospitals, the probability of increased productivity on the part of physicians, and the apparent need for more neighborhood physicians are noted.

Acknowledgement

The authors gratefully acknowledge the help of Martin K. Gorten, MD, Director of the Medical Care Services Section of the Baltimore City Health Department, for his suggestions in the design of the study and upon review of the manuscript, for his suggestions for its improvement. Also, we wish to thank the staff of the Medical Care Services Section for their assistance in the tabulation of the study and in the preparation of the manuscript.

DRUGS—JUDGMENT OR REGULATION?

As with many important issues today the subject of so-called "generic dispensing" is clouded with a great number of confusing and conflicting statements.

Generic prescribing is not new and has been an integral part of prescribing for many, many years. A drug usually has three names: a chemical name, which has significance primarily to the chemist and other scientists; a generic or public name, which is somewhat simpler and has greater understanding in pharmacology, medicine, and pharmacy; and a trade or brand name which conveys information as to the manufacturer of a particular product. Thus for particular generic drug entities there may exist different brand names, connoting a difference in the method of manufacture, controls at different levels of production, and a history of clinical performance characteristic of *that particular brand.*

A pharmaceutical product is more than a drug, and the care, skill and integrity employed in its manufacture may make all the difference in the performance of that product in a patient. There are those who would have us believe that all products containing the same generic drug are therapeutically identical but this is not true. The Commissioner of the Food and Drug Administration in recent testimony and speeches has clearly indicated that although he might like to give the assurance that all drug products are clinically equivalent, at this point in time he cannot honestly do so.

A great deal has been made of the fact that the government buys drugs under generic names only. However, if one examines the bid awards, one finds that an overwhelming majority of products are supplied by brand name manufacturers. In a recent speech, a representative of the Defense Personnel Support Center indicated, "Basically, our problem is this: chemically equivalent items are not necessarily stable, therapeutically equivalent products . . . 45% of the pre-award samples submitted by the low bidder last year failed to pass our tests."

The truth of the matter is that the technology of understanding drug action, availability, absorption, excretion, binding, partition coefficient, solubility, enzymatic interaction and a host of other factors is still in its infancy. These are more than mere technical characteristics; they are determinants of therapeutic performance. Thus the history of *experience* by the physician and pharmacist and the integrity of the producer to produce drugs which result in consistently reproducible action is the most reliable guide available at this time. Any effort to remove the prescription decision from the physician and substitute some government constituted authority, is a dangerous proposal which could be detrimental to the health of the patient and a serious blow to high quality medical care in this country.

The number of products for which generic prescribing might result in savings for the patients represent less than 20% of the total number of prescriptions dispensed annually. In some of these instances the real savings are relatively insignificant. The proposed savings that are supposedly available have been wholly exaggerated. In the majority of instances of generic prescriptions, it has been the policy of most pharmacists to dispense only those products which experience has shown to be therapeutically reliable—generally a branded product.

The physician, who has the ultimate responsibility for the treatment of the patient, should be constantly aware of the drug products *prescribed* and *dispensed* for his patients. He can on occasion, by consulting with his pharmacist, select

* The author wishes to remain anonymous.

products in which a degree of confidence can be assured with some cost savings resulting. However, an understanding of all parameters involved is essential. There have been too many instances where patients on maintenance therapy with such drugs as anticoagulants are hospitalized; products of different manufacture are supplied and results have been disturbing and even life-threatening.

Regardless of the advancement of our scientific information, a great deal of the practice of medicine and of pharmacy involves the use of professional judgment. Any artificial barriers which interfere with the exercise of this judgment are unwise and dangerous. The physician should be free to prescribe the products which he deems best for his patients. Any changes in the medication should only come about after proper consultation between physician and pharmacist and only effectuated with the consent of the physician. Those who seek other approaches should make certain that they are fully aware of the consequences that may result and determine whether the risks involved are truly worth the savings. In the best interests of public health, we do not believe that they are!

DIAGNOSTIC PROCEDURES IN GASTROENTEROLOGY, Charles H. Brown, MD; The C V Mosby Company, St. Louis.

This book fills the need for a manual to aid Roentgenologists and others in connection with special diagnostic tests and procedures in the area of gastroenterology.

The procedures are presented in an outline form rather than in detail. Much emphasis is placed on gentleness in the handling of patients. In essence, this book is a good reference and will enable the physician to avoid mistakes that are time consuming and potentially hazardous to the patient.

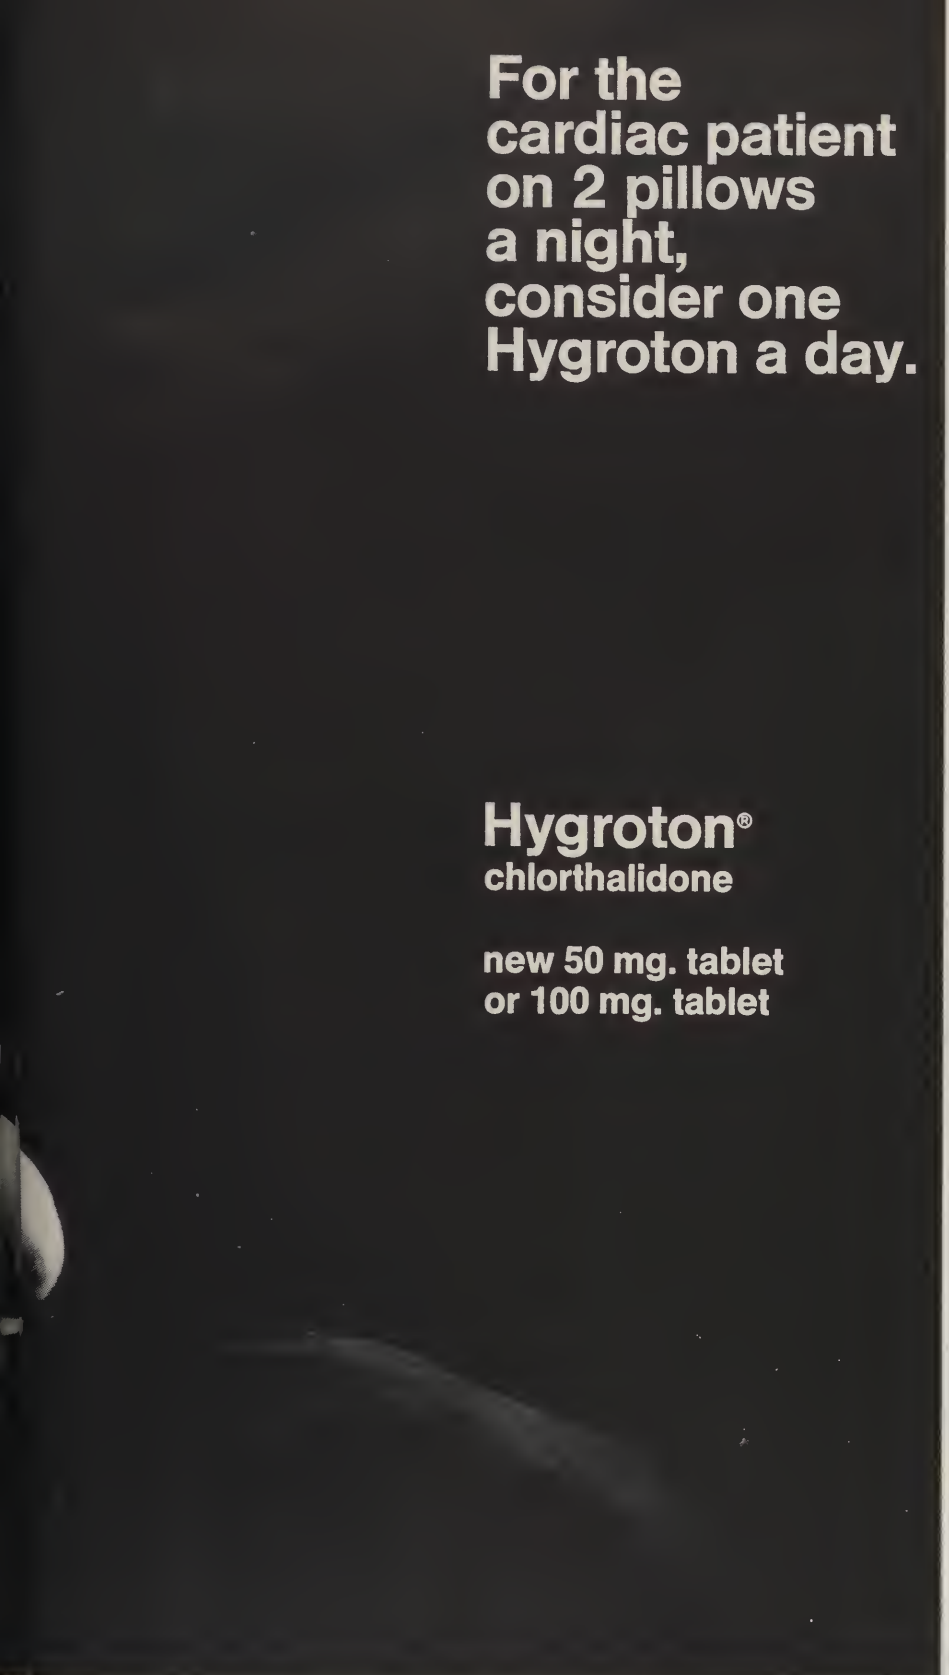
SYNOPSIS OF GYNECOLOGY, Daniel Winston Beacham, MD, Woodard Davis Beacham, MD; The C V Mosby Company, St. Louis.

This synopsis is intended primarily for students who do not intend to pursue gynecology as their chosen field. It is intended as supplemental to the larger textbook and can be used for study at odd moments and memorization of the leading points in gynecologic examination, diagnosis and treatment. The practicing physician will also find it extremely helpful as a guide to the understanding of pelvic disturbances he may encounter or as a compact presentation of the outstanding features of this interesting department of medical knowledge.

MEDICAL LICENSING IN AMERICA, 1650-1965, Richard Harrison Shryock, The Johns Hopkins Press.

This somewhat small publication of a little over 100 pages devotes itself to two subjects and two eras involving medicine. The subjects cover "Problems and Procedures in Licensing 1900-1965;" and "Conclusions." The eras are the periods of 1650-1875 and 1875-1965.

The conclusions reached are not earth-shaking but, in fact, commend the medical profession in its approach "Towards perfection which has actually been attained."



NEUROPSYCHIATRY IN WORLD WAR II, VOLUME I; Office of the Surgeon General, United States Army Medical Service, Washington, DC.

Battle experiences clearly demonstrate that combat psychiatric breakdown can originate from normal or previously stable personnel, as well as from those of greater vulnerability. During WW II, the Army Medical Department was confronted with the difficult task of dealing with an unprecedented incidence of psychiatric casualties for which there had been little preparation. The struggle to overcome these handicaps and the eventual establishment of effective programs of prevention and treatment are all presented in this 826 page volume.

Indications: Hypertension and many types of edema involving retention of salt and water.
Contraindications: Hypersensitivity and most cases of severe renal or hepatic disease.
Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur.
Use with caution in pregnant patients, since the drug may cross the placental barrier and adverse reactions which may occur in the adult (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn.
Precautions: Antihypertensive therapy with Hygroton should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents or other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Barbiturates, narcotics or alcohol may potentiate hypotension. Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated.
Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Hygroton should be discontinued and potassium supplements given, provided the patient does not have marked oliguria.
Take special care in cirrhosis or

For the cardiac patient on 2 pillows a night, consider one Hygroton a day.

She was the picture of arteriosclerotic heart disease in failure.
She couldn't sleep a wink without an extra pillow.
Then her doctor prescribed digitalis and Hygroton.

First, her cardiac output improved.
Then her breathing improved—along with her urinary output.

Nights could be a lot more pleasant for patients like this in your practice. Try it and see.

Hygroton therapy may also mean troublesome side effects for certain patients. A summary of essential prescribing information is shown below.

Hygroton®
chlorthalidone

new 50 mg. tablet or 100 mg. tablet

vere ischemic heart disease and patients receiving corticosteds, ACTH, or digitalis. Salt restriction is not recommended.
verse Reactions: Nausea, gastric itation, vomiting, anorexia, conpation and cramping, dizziness, akness, restlessness, hyperglynia, hyperuricemia, headache, scle cramps, orthostatic hypotsion, aplastic anemia, leukopia, thrombocytopenia, agranulytosis, impotence, dysuria, tsient myopia, skin rashes, urticaria, purpura, necrotizing angiitis, acute gout, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Other reactions reported with this class of compounds include: jaundice, xanthopsia, paresthesia, and photosensitization.
Average Dosage: 50 or 100 mg. with breakfast daily or 100 mg. every other day.
Availability: White, single-scored tablets of 100 mg. and aqua tablets of 50 mg., in bottles of 100 and 1000.

BUSINESS SESSIONS

SPECIAL MEETING

November 11, 1967

MINUTES

The 259th meeting, special session, of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was called to order at 2:00 p.m., Saturday, November 11, 1967, at the Faculty Building, 1211 Cathedral Street, Baltimore, Maryland, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance. An asterisk indicates an alternate delegate.

Doctors: Manning W. Alden, Council; Robert G. Angle, Montgomery County; *Charles Bagley III, Wicomico County; Timothy D. Baker, Baltimore City, John G. Ball, Montgomery County; Edward M. Barczak, Baltimore City; Richard D. Bauer, Council; Harry McBrine Beck, Baltimore City; Donald W. Benson, Baltimore City; M. McKendree Boyer, Past President; Douglas G. Carroll, Baltimore City; Robert G. Chambers, Baltimore City; *Katharine A. Chapman, Montgomery County; Henry V. Chase, Council; Archie R. Cohen, Council; H. Douglas Cooper, Wicomico County; William B. Culwell, Carroll County; Worth B. Daniels, Jr., Baltimore City; Henry V. Davis, Cecil County; John B. De Hoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; *F. Mark Dugan, Baltimore City; J. Sheldon Eastland, Council; William Carl Ebeling, Council; Vincent J. Fiocco, Carroll County; Whitmer B. Firor, Past President; Russell S. Fisher, Council; Harold H. Gist, Washington County; Paul F. Guerin, Council; William B. Hagan, Council; John S. Haught, Prince George's County; William G. Helfrich, Baltimore City; Thomas F. Herbert, Howard County; Philip W. Heuman, Harford County; Frederick M. Johnson, Charles County; Ferd E. Kadan, Baltimore City; James R. Karns, Baltimore City; Lauriston L. Keown, Baltimore City; Edward L. J. Krieg, Baltimore County; C. Rodney Layton, Queen Anne's County; Herbert H. Leighton, Garrett County; Thomas F. Lewis, Allegany County; William J. McClafferty, Baltimore City; George S. Malouf, Prince George's County; Karl F. Mech, Council; Walter C. Merkel, Board of Medical Examiners; B. Martin Middleton, Council; Donald W. Mintzer, Baltimore City; G. Allen Moulton, Jr., Allegany County; Frederick E. Musser, Prince George's County; Clayton Norton, Anne Arundel County; Sidney Novenstein, Washington County; Charles F. O'Donnell, Council; Hilary T. O'Herlihy, Anne Arundel County; William A. Pillsbury, Jr., Council; J. Emmett Queen, Council; Belden R. Reap, Sr., Montgomery County; J. Morris Reese, Council; Guy M. Reeser, Jr., Talbot County; Thomas R. Reid, Frederick County; Paul F. Richardson, Baltimore City; Peter W. Rieckert, Dorchester County; *James A. Roberts, Montgomery County; Raymond C. V. Robinson, Baltimore City; Salvador Rossello, Baltimore City; Edwin Ruzicka, Talbot County; John F. Schaefer, Council; Emmanuel Schimunek, Baltimore City; Arthur G. Siwinski, Council; R. Kennedy Skipton, Prince George's County; *Gordon M. Smith, Montgomery County; Aaron C. Sollod, Baltimore City; Martin E. Strobel, Baltimore County; E. L. Suarez-Murias, Baltimore City; Aaron H. Traum, Montgomery County; Thomas E. Van Metre, Jr., Baltimore City; Merton T. Waite, Anne Arundel County; Emerson C. Walden, Baltimore City; William C. Weintraub, Prince George's County; Lawrence R. Wharton, Jr., Baltimore City; Daniel Wilfson, Jr., Baltimore City; Charles H. Williams, Baltimore County; Ralph H. Williams, Washington County; Donald O. Wood, Baltimore County; Charles E. Wright, Frederick County; John D. Young, Jr., Baltimore City; Raymond M. Yow, Council.

Staff personnel were also present for the meeting.

* Alternate delegate.

ANNOUNCEMENTS

The President made certain announcements with regard to the conduct of business at the session.

SUBSTITUTE PROPOSAL

John M. Dennis, MD, Chairman of the Ad Hoc Committee on Changes in the Medical Practice Act, reporting on its behalf, recommended that the amendment to strike out "Commission" and insert "Board of Medical Examiners" wherever it appeared, which was pending when the proposed act was recommitted, be rejected, and that the proposed act be then amended by the substitution of a revised proposal submitted by the Committee.

GENERAL DEBATE

General debate followed during which Walter C. Merkel, MD, president of the board of Medical Examiners, and John F. King, Esquire, Counsel for the Faculty, among others, spoke.

PENDING AMENDMENT REJECTED

Thereupon, the House rejected the amendment to strike out "Commission" and insert "Board of Medical Examiners" wherever it appeared, and proceeded to a seriatim consideration of the substitute proposed by the Committee. After debate and amendment, the proposed substitute was agreed upon, and the chair put the main question, as amended,

SUBSTITUTE ADOPTED AS AMENDED

"That the following proposed statute be adopted with the understanding that it is to serve as a guide to our representatives at the Legislature in Annapolis."

The text of the proposed statute as adopted is as follows:

PROPOSED COMMISSION ON MEDICAL DISCIPLINE

The Commission on Medical Discipline of Maryland, hereby established and hereafter referred to in this Chapter as the Commission, shall consist of the following persons:

The President of the Medical and Chirurgical Faculty of the State of Maryland

The Immediate Past-President of the Medical and

Chirurgical Faculty of the State of Maryland

The President-elect of the Medical and Chirurgical Faculty of the State of Maryland

Two Practicing Physicians appointed by the Governor of the State of Maryland selected from a list submitted by the Medical and Chirurgical Faculty of the State of Maryland such list having been composed from a list of nominees submitted by Component Societies of the Medical and Chirurgical Faculty

Three Members of the Board of Medical Examiners to be selected by said Board of Medical Examiners

The Chairman of the Council of the Medical and Chirurgical Faculty of the State of Maryland

Seven of the nine members of the Commission shall constitute a quorum for the transaction of all business.

The Commission may establish and maintain an office within this State and shall make, adopt and promulgate rules and regulations for its own government and for the proper supervision and control of the professional conduct of all persons under its jurisdiction as provided herein and not inconsistent with the laws of this State or of the United States.

There shall always be nine members and no person shall serve in a dual capacity. In the event of such occurrence, the Governor may designate a practicing physician from a list submitted by the Medical and Chirurgical Faculty of the State of Maryland, such list having been composed from a list of nominees submitted by Component Societies of the Medical and Chirurgical Faculty.

(a) *Terms of Office:* The terms of office for appointees shall be for three years or until his successor is duly elected, appointed or qualified. Terms of office shall be from the 1st of July each year, except when the initial appointments are made; such appointments will be for staggered terms so as to provide for continuity on the Commission.

(b) *Reports:* The Commission shall make annual reports to the Governor, the Board of Medical Examiners and to the Medical and Chirurgical Faculty of the State of Maryland.

(c) *Removal of members:* Any member of the Commission may be removed by the Governor for cause.

(d) *Compensation:* Members of the Commission shall receive no salary but may be reimbursed for actual expenses incurred in connection with their official duties with the Commission.

(e) *Duties and Obligations:* The Commission shall refer any cases coming to its attention to the appropriate Committee of the Medical and Chirurgical Faculty of the State of Maryland for investigation and report. The report shall be acted upon within 90 days unless given a time extension by the Commission and shall contain such recommendations as the investigation reveals might be necessary for adequate disciplinary procedures. Such recommendations will then be considered by the Commission which will take whatever action it deems appropriate, as provided herein.

The Medical and Chirurgical Faculty of the State of Maryland may initiate action by virtue of information coming to its attention from its own members or through any other source, such cases being handled in the same manner as though they had been referred to it by the Commission.

(f) *Power and Duties:* When the Commission has completed its investigation according to the process outlined herein, it shall have the power to reprimand, place on probation, revoke, or suspend the license or dismiss the charges against any licensed physician for any of the causes listed below as unprofessional conduct but such action shall not be limited to these causes:

1. Fraudulent or deceptive procuring or use of a license.
2. Solicitation or advertising contrary to Article 43, Section 146 of the Annotated Code of Maryland.
3. The performance of a criminal abortion.
4. Conviction for, or plea of nolo contendere to, a crime involving moral turpitude.
5. Abandonment of a patient.
6. Addiction to narcotics, habitual drunkenness or rendering professional services to a patient if the physician is intoxicated or under the influence of drugs.
7. Promotion by a physician of the sale of drugs, devices, appliances or goods provided for a patient in such a manner as to exploit the patient for financial gain of the physician.
8. Immoral conduct of a physician in his practice as a physician.
9. Willfully making and filing false reports or records, in his practice as a physician.
10. Willful omission to file or record, or willfully impeding or obstructing a filing or recording, or inducing another person to omit to file or record medical reports required by law.
11. Failure to furnish details of a patient's medical record to succeeding physicians or hospital upon proper request.
12. Solicitation of professional patronage by agents or persons, or profiting from the acts of those representing themselves to be agents of the licensed physician.
13. Division of fees or agreeing to split or divide the fees received for professional services with any person for bringing to or referring a patient.
14. Willful misrepresentation in treatments.
15. Practicing medicine with an unlicensed physician except in an accredited preceptorship or residency training program; or aiding, abetting such unlicensed persons in the practice of medicine.
16. Gross and willful and continued overcharging for professional services; including filing of false statements for collection of fees for which services are not rendered.
17. Offering, undertaking or agreeing to cure or treat disease by a secret method, procedure, treatment or medicine.
18. Revocation of license by any other state or territory for any cause whatsoever.
19. Professional or Mental Incompetency.

(g) *Immunity from Suit:* All persons acting as members of authorized committees of the Medical and Chirurgical Faculty of the State of Maryland and its component societies or as the Commission shall be immune from suit in any action, at law or equity, based upon any disciplinary proceedings or other official acts in the furtherance hereof and performed in good faith.

(h) *Subpoena:* The Commission shall have the power to issue subpoenas and administer oaths in connection with any investigation, hearing or proceeding.

(i) *Hearing and attorney rights:* Any physician who shall have a case referred to the Commission on Medical Discipline shall have the opportunity to appear in person before the Commission at a hearing duly convened, at which time he shall have the right to be represented by counsel and all proceedings of the Commission shall be subject to the provisions of the administrative procedures act.

(j) *Certificate of revocation, suspension or reprimand.* If a majority of a quorum of the members of the Commission vote in favor of finding the accused guilty of unprofessional conduct as specified in the charges, the Commission shall prepare written finding of fact and may thereafter prepare and file in the office of the Board of Medical Examiners a certificate or order of revocation, suspension or reprimand in which case notice thereof shall be served upon the accused forthwith.

(k) *Dismissal of charges—Exoneration.* If the license holder is found not guilty, the Commission shall forthwith order a dismissal of the charges and the exoneration of the accused, and no further action may be taken by the Commission on the charges involved.

(l) *Revocation or suspension of license—Stay pending review.* The filing by the Commission in the office of the Board of Medical Examiners of a certificate or order of revocation or suspension, after due notice, hearing and findings in accordance with the procedure specified in this chapter, certifying that any holder of a license has been found guilty of unprofessional conduct by the Commission shall constitute a revocation or suspension of the license to practice medicine and surgery in this state in accordance with the terms and conditions imposed by the Commission and embodied in the certificate or order of revocation or suspension. If the licensee seeks judicial review of the Commission's decision pursuant to the provisions of this chapter, such revocation or the period of such suspension shall be stayed and shall not be effective or commence to run until final judgment has been entered in any proceeding instituted under the provisions of this chapter and the licensee's judicial remedies exhausted hereunder.

(m) *Contents of certificate—Recording.* The certificate or order of revocation or suspension shall contain a brief and concise statement of the ground or grounds upon which the certificate or order is based and the specific terms and conditions of such revocation or suspension, and shall be retained as a permanent record by the Board of Medical Examiners as well as by the Commission.

(n) *Issuance of license after revocation or suspension.* The Board of Medical Examiners shall not issue any license or any renewal thereof to any person whose license has been revoked or suspended by the Commission except in conformity with the terms and conditions of the certificate or the order of revocation or suspension, or in conformity with any order of reinstatement issued by the Commission or in accordance with the final judgment in any proceeding for review.

(o) *Appeal from decision by Commission.* Any person whose license has been revoked or suspended by the Commission, or if said person is placed on probation, or reprimanded he shall have the right to a judicial review of the Commission's decision. He may enter an appeal to the Circuit Court of Baltimore City or in the Circuit Court in the County in which the charges originated or in which the physician maintains his principal office and serve notice of said appeal on the Commission within 30 days after the filing of the certificate or of the revocation, suspension, probation or reprimand. All parties, including the Commission, shall have the right of further appeal to the Court of Appeals of Maryland.

* * * * *

Reference is made to this section in the Proposed Commission on Medical Discipline, under "f" (2)

No physician shall advertise except in the following manner:

(a) A physician may use a personal professional card not larger than three and one-half inches by two inches, upon which may be printed his name, title, address, specialty, telephone number and office hours and nothing else.

(b) A physician may send removal notices to any of his bona fide patients or to any other physician, notifying them that he is removing his offices from one address to another. Such notices, upon which may be printed his name, title, specialty, telephone number, office hours, residence and business addresses, information necessary to indicate the removal of offices and nothing else, shall not be larger than five inches by seven inches.

(c) A physician may send to any other physician of his choosing an announcement that he has opened an office or changed the professional composition of his office for the practice of medicine, the format of said announcement to be such as may be approved from time to time by the Medical and Chirurgical Faculty.

(d) A physician may exhibit signs on or in the premises of the building wherein he practices, the form, content and general manner of said signs shall be as established from time to time by regulations of the Board. There shall be no more than three such signs on or in each premises or building.

RECOGNITION OF FRANK K. MORRIS, M.D., DECEASED

J. Emmett Queen, M.D., noted the sudden death of Frank K. Morris, M.D., Secretary-Treasurer of the Board of Medical Examiners, and moved "That a moment's silence be observed in his memory and that the family of the late Dr. Morris be advised of this action." This motion was adopted unanimously and the House rose in observing a moment's silence in memory of the late Dr. Morris.

HOUSE ADJOURNED

There being no further business, the House adjourned at 5:20 p.m., *sine die.*

WILLIAM A. PILLSBURY MD, Secretary

Report of the Ad Hoc Committee on Changes in the Medical Practice Act.

Mr. President and Members of the House of Delegates:

PROPOSED COMMISSION ON MEDICAL DISCIPLINE

Basically, this revised proposal incorporates the following changes in the original proposal. The Board of Medical Examiners is now in complete agreement with this revised proposal.

1. Change in the composition of the Commission on Medical Discipline so that it now provides for the Chairman of the Council of the Faculty, as well as three members of the Board of Medical Examiners

selected by that Board.

2. Removal of all references in the current Medical Practice Act to revocation, suspension or placing on probation of physicians so that this function is performed entirely by the proposed Commission on Medical Discipline.
3. Removal of reference to use of outside legal counsel, so that all advice on legal matters will be obtained through the Attorney-General's office, as is customary with all state agencies.

Section 18

The Commission on Medical Discipline of Maryland, hereby established and hereafter referred to in this Chapter as the Commission, shall consist of the following persons:

The President of the Medical and Chirurgical Faculty of the State of Maryland

The Immediate Past-President of the Medical and Chirurgical Faculty of the State of Maryland

The President-elect of the Medical and Chirurgical Faculty of the State of Maryland

Two Practicing Physicians appointed by the Governor of the State of Maryland from a list submitted by the Medical and Chirurgical Faculty of the State of Maryland

Three Members of the Board of Medical Examiners to be selected by said Board of Medical Examiners

The Chairman of the Council of the Medical and Chirurgical Faculty of the State of Maryland

Seven of the nine members of the Commission shall constitute a quorum for the transaction of all business.

The Commission may establish and maintain an office within this State and shall make, adopt and promulgate rules and regulations for its own government and for the proper supervision and control of the professional conduct of all persons under its jurisdiction, not inconsistent with the laws of this State or of the United States.

There shall always be nine members and no person shall serve in a dual capacity. In the event of such occurrence, the Governor may designate a practicing physician from a list submitted by the Medical and Chirurgical Faculty.

(a) *Terms of Office:* The terms of office for appointees shall be for three years or until his successor is duly elected, appointed or qualified. Terms of office shall be from the 1st of July each year, except when the initial appointments are made; such appointments will be for staggered terms so as to provide for continuity on the Commission.

(b) *Reports:* The Commission shall make annual reports to the Governor, the Board of Medical Examiners and to the Medical and Chirurgical Faculty of the State of Maryland.

(c) *Removal of members:* Any member of the Commission may be removed by the Governor for neglect of duty, misconduct or malfeasance or misfeasance in office.

(d) *Compensation:* Members of the Commission shall receive no salary but may be reimbursed for actual expenses incurred in connection with their official duties with the Commission.

(e) *Duties and Obligations:* The Commission shall refer any cases coming to its attention to the appropriate Committee of the Medical and Chirurgical Faculty of the State of Maryland for investigation and report. The report shall contain such recommendations as the investigation reveals might be necessary for adequate disciplinary procedures. Such recommendations will then be considered by the Commission which will take whatever action it deems appropriate.

The Medical and Chirurgical Faculty of the State of Maryland may initiate action by virtue of information coming to its attention from its own members or through any other source, such cases being handled in the same manner as though they had been referred to it by the Commission.

(f) *Power and Duties:* The Commission shall have the power to revoke or suspend the license of or place on probation any licensed physician in the State of Maryland, for any of the causes listed below as unprofessional conduct, but such action shall not be limited to these causes:

1. Fraudulent or deceptive procuring or use of a license;
2. Solicitation or advertising contrary to Section 20;
3. Insanity or admission and confinement in a mental institution or mental hospital;
4. The performance of one or more criminal abortions;
5. Conviction of any crime involving moral turpitude;
6. Failure or refusal of a physician, without adequate cause, to render, or to arrange to have another physician render, necessary medical attention to any patient under his immediate care.
7. Addiction to narcotics, habitual drunkenness or rendering professional services to a patient if the physician is intoxicated or under the influence of narcotic drugs.
8. Having been found by a court of competent jurisdiction (within or without the State) to have exercised in the Practice of Medicine undue influence on a patient for financial gain.
9. Promotion by a physician of the sale of drugs, devices, appliances or goods provided for a patient in such a manner as to exploit the patient for financial gain of the physician.
10. Immoral conduct of a physician in his practice as a physician.
11. Willfully making and filing false reports or records, in his practice as a physician.
12. Willful omission to file or record, or willfully impeding or obstructing a filing or recording, or inducing another person to omit to file or record medical reports required by law.
13. Failure to furnish details of a patient's medical record to succeeding physicians or hospital upon proper request.
14. Solicitation of professional patronage by agents or persons, or profiting from the acts of those representing themselves to be agents of the licensed physician.
15. Division of fees, or agreeing to split or divide the fees received for professional services with any person for bringing to or referring a patient.
16. Accepting rebates or kickbacks, for referral of patients.
17. Advertising professional superiority or the performance of professional services in a superior manner.
18. Willful misrepresentation in treatments.
19. Practicing medicine with an unlicensed physician except in an accredited preceptorship or residency training program; or aiding, abetting such unlicensed person in the practice of medicine.
20. Gross and willful and continued overcharging for professional services; including filing of false statements for collection of fees for which services

are not rendered.

21. Offering, undertaking or agreeing to cure or treat disease by a secret method, procedure, treatment or medicine.
22. Revocation of license by any other state or territory for any cause whatsoever.
23. Professional or Mental Incompetency.

(g) *Immunity from Suit:* All persons acting as members of authorized committees of the Medical and Chirurgical Faculty of the State of Maryland or as the Commission shall be immune from suit in any action, at law or equity, based upon any disciplinary proceedings or other official acts in the furtherance hereof and performed in good faith.

(h) *Subpoena:* The Commission shall have the power to issue subpoenas and administer oaths in connection with any investigation, hearing or proceeding.

(i) *Hearing and attorney rights*: Any physician who shall have a case referred to the Commission on medical discipline shall have the opportunity to appear in person before the Commission at a hearing duly convened, at which time he shall have the right to be represented by counsel and all proceedings of the Commission shall be subject to the provisions of the laws of Maryland relating to administrative bodies.

(j) *Certificate of revocation or suspension—Reprimand.* If a majority of a quorum of the members of the Commission vote in favor of finding the accused guilty of unprofessional conduct as specified in the charges, the Commission shall prepare written finding of fact and may thereafter prepare and file in the office of the Board of Medical Examiners a certificate or order of revocation, suspension or reprimand in which case thereof shall be served upon the accused.

(k) *Dismissal of charges—Exoneration.* If the license holder is found not guilty, or if less than a majority of the members vote for a finding of guilty, the Commission shall forthwith order a dismissal of the charges and the exoneration of the accused.

(l) *Revocation or suspension of license—Stay pending review.* The filing by the Commission in the office of the Board of Medical Examiners of a certificate or order of revocation or suspension, after due notice, hearing and findings in accordance with the procedure specified in this chapter, certifying that any holder of a license has been found guilty of unprofessional conduct by the Commission shall constitute a revocation or suspension of the license to practice medicine and surgery in this state in accordance with the terms and conditions imposed by the Commission and embodied in the certificate or order of revocation or suspension. If the licensee seeks judicial review of the Commission's decision pursuant to the provisions of this chapter, such revocation or the period of such suspension shall be stayed and shall not be effective or commence to run until final judgment has been entered in any proceeding instituted under the provisions of this chapter and the licensee's judicial remedies exhausted hereunder.

(m) *Contents of certificate—Recording.* The certificate or order of revocation or suspension shall contain a brief and concise statement of the ground or grounds upon which the certificate or order is based and the specific terms and conditions of such revocation or suspension, and shall be retained as a permanent record by the Board of Medical Examiners as well as by the Commission.

(n) *Issuance of license after revocation or suspension.* The Board of Medical Examiners shall not issue any license or any renewal thereof to any person whose license has been revoked or suspended by the Commission except in conformity with the terms and conditions of the certificate or the order of revocation or suspension, or in conformity with any order of reinstatement issued by the Commission or in accordance with the final judgment in any proceeding for review.

(o) *Appeal from decision by Commission.* Any person whose license has been revoked or suspended by the Commission, or if said person is placed on probation, he shall have the right to a judicial review of the Commission's decision. He may enter an appeal to the Circuit Court of Baltimore City and serve notice of said appeal on the Commission within 30 days after the filing of the Certificate or of the revocation, suspension or probation. All parties, including the Commission, shall have the right of further appeal to the Court of Appeals of Maryland.

Birth and Fetal Death Certificate Forms Revised

Beginning January 1, 1968 the Baltimore City Health Department will put into use revised birth and fetal death certificate forms. There is no significant change in the "Certificate of Death" form. Hospital medical directors and medical records personnel have been advised of these changes. Reproductions of the "Certificate of *Live Birth*" and the "Certificate of *Fetal Death*" are presented herewith for reference.

CHANGES MADE IN CERTIFICATE OF LIVE BIRTH FORM

1. Item #6D asks whether the "Usual Residence of Mother" was or was not within city limits. (Enter "Yes" if the mother's residence is inside the boundaries of an incorporated city, town or location mentioned in #6C; otherwise, enter "No".)
2. Item #14 is for "Termination of Last Pregnancy At Any Time After Conception" by month and year. This means any pregnancy regardless of whether it resulted in an abortion, miscarriage, fetal death, or live birth.
3. Item #15 asks whether Item #14 was or was not a live birth.
4. Item #18B is concerned with the "Month of Pregnancy Prenatal Care Began." (Enter the number of months that the mother was pregnant when she first received care from a physician or attended a prenatal clinic for this pregnancy.)
5. Item #22 "Method of Delivery" replaces the former item for "Operative Procedures" (in the left margin).
6. Item #23 "Source(s) of Prenatal Care" replaces the former item in the left margin as to whether the mother was "a private physician's or a hospital service patient."
7. Item #25 calls for the "Lowest Apgar Score" and the number of minutes after birth that it was recorded. As a guide to prognosis and the need for particularly close observation or care in the delivery room and nursery, Dr. Virginia Apgar has devised a method of scoring which is of practical value. Sixty seconds after the complete birth of the infant (disregarding the cord and placenta), the 5 objective signs listed in the table below are evaluated and each given a score of 0, 1, or 2. A total score of 10 indicates an infant in the best possible condition.
8. Item #26 asks if the mother is "Certified for Medical Assistance Program"; if so, the "Program Case No." is to be listed.
9. Item #27 replaces the former items for "Occupation and Industry of the Father." The new item calls for the "Highest Grade of School Completed by both the Father and the Mother." You should enter the highest grade completed in "regular" schooling in the spaces for "Elementary School," "Junior High School," "Senior High School" or "College." (Do NOT enter any other kind of schooling or training. While beauty and barber schools, business or trade schools and the like are important, they are not considered "regular" schools for the purpose of this item.)

CHANGES MADE IN CERTIFICATE OF FETAL DEATH FORM

1. Item #6D—same as on the Certificate of Live Birth form (see above).
2. Item #17, "Direct and Antecedent Causes":
   (a) Line (A) calls for the "Immediate Cause of Fetal Death."
   (b) The expression "Due to" has been changed to "Due To or As A Consequence Of."
3. Item #20B is a continuation of the item "Was Autopsy Performed?"—The additional information asks "If Yes, Were Findings Considered in Certifying Causes of Death?"

EVALUATION OF THE NEWBORN INFANT

Sign	0	1.	2.
Heart rate	Absent	Below 100	Over 100
Respiratory effort	Absent	Slow, irregular	Good, crying
Muscle tone	Limp	Some flexion of extremities	Active motion
Response to catheter in nostril (tested after oropharynx is clear)	No response	Grimace	Cough or sneeze
Color	Blue, pale	Body pink, extremities blue	Completely pink

Head Growth During Infancy

ROBERT S. MOSSER, MD
University of Maryland
School of Medicine

The growth of the head during the first two years of life reflects the growth of the intracranial contents and provides the physician with a valuable clinical sign which may be of value in the early diagnosis and treatment of hydrocephalus. Normal head growth usually means normal brain growth, and from a less optimistic point of view, reduction of head growth rate may be of prognostic value as an early indication of mental deficiency. Parents are usually quite aware of deficiencies in growth of their infants. Weight is particularly noted and becomes a part of the birth announcement to the point of being a national news item along with sex and given name when famous parents are involved. Body length and height later receive consideration. Head size and growth are usually little noted, and it remains the responsibility of the infant's physician to repeatedly measure and record head circumference throughout the first year or two of life. With the help of readily available graphs of normal distribution, the infant can be compared to a large normal population as well as to himself with respect to this important objective measurement.

Infant head growth is of importance as a measure of brain growth in the normal situation, but at times represents the combination of brain growth and the presence or accumulation of an additional space-occupier such as abnormal fluids, including blood or, less commonly, tumor. Head circumference measurements are reliably reproduced by several observers when taken at the largest possible circumference using an accurate pliable plastic or paper tape. In the absence of skull deformity of considerable degree, circumference becomes a clinically reliable index of intracranial mass.* The opposite is true for an elongated skull with transverse flattening so frequently seen in low birth weight infants. A more circular circumference where the head is broad with shortened antero-posterior diameter will, of course, show relatively low circumference with respect to intracranial mass. Skull thickness is so nearly uniform that it does not ordinarily come into consideration.

There are probably only two exceptions to the rule that unusually small heads are regularly accompanied by mental deficiency of some degree. Small head size may be a family trait. There are certainly families where small heads or large heads are the rule, and usually it is possible for parents to trace the trait through several generations on one or both sides of the family. The second exception is the small head which results from premature synostosis of the cranial sutures. These children are not necessarily retarded in any sphere at the time that the diagnosis is made, and they usually receive surgical correction of the skull abnormality so that untreated follow-up cases are infrequently available.

Both primary and secondary microcephaly are regularly attended by mental deficiency. Primary microcephaly is accompanied by pathological

*In oxycephaly, where the skull is unusually high, circumference may be relatively small with respect to intracranial mass.

changes suggesting defective in-utero organogenesis. The adult head circumference in these children is usually less than 43 centimeters. Secondary microcephaly follows traumatic lesions, encephalitis, meningitis, metabolic encephalopathies, cerebral anoxia, and other cerebral disturbances. The head is usually well below the 3rd percentile for age and sex. Frequently the primary disease or insult to the nervous system cannot be determined.

It is important at this point to recall that although the brain is decelerating in growth rate at the time of birth, it (along with many other organs) is destined to triple its birth weight during the first year of life. It differs from other large organs, however, in that the potential for growth is greatly reduced during the second year of life at which time 80% of adult mass is attained. Growth and differentiation lost during the important first year cannot be reclaimed.

Average adult brain weights are accepted as being about 1360 grams for males and 1230 grams for females. It is generally accepted that weight variations in the broad normal range show no correlation with mental abilities, but that adult brain mass of less than 960 grams (the brain size of a one-year old) is incompatible with normal intellectual function in the male. 800 grams is the equivalent female weight. According to Lassek (*The Human Brain*, Chas. C. Thomas, 1957) weights at this level are found among idiots. It would be injudicious for a physician to tell the parents of a six-month-old with a head circumference of a two-month-old not to worry because "He'll outgrow it."

Head growth during early life is frequently independent of somatic growth. Every physician who deals with infants can recall having seen severe growth or nutritional failure patients whose heads appeared to be abnormally large. Measurements of such heads almost always show that they are within the normal size range for age. There is no good reason to suspect that the intellectual endowment of these "failure to thrive" infants will not remain intact if their primary condition causing growth failure is treated.

Infants whose head growth is far too rapid in early life present more of a challenge in that they must all be suspected of having a surgically treatable condition requiring early diagnosis. Familial macrocephaly with normal intellect presents no great problem except as a point of differential diagnosis prior to the time when intellect can be judged with accuracy. Pathologic macrocephaly without hydrocephalus which is accompanied by intellectual deficit is not treatable, but fortunately is a rare condition. After eliminating these two causes for early rapid head growth one is left with hydrocephalus not obviously present at birth but developing during early life due to a congenital, inflammatory or neoplastic lesion. Treatment for communicating hydrocephalus may be in the form of repeated lumbar punctures, by one of a number of shunting procedures or by attempted direct attack on an anatomic structure causing obstruction to the cerebrospinal fluid pathway. These procedures are all fraught with danger and complications, and they are frequently not successful, but they continue to be our only form of treatment and, with rare exceptions, should be used in all cases. Attention to head growth that makes early diagnosis possible frequently enhances the chances of success of such procedures. A large part of the medical profession's lack of enthusiasm for the treatment of hydrocephalus is caused by therapy undertaken too late to be successful. Active hydrocephalus destroys brain tissue and late therapy, no matter how successful, does not restore tissue.

Hydranencephaly, porencephalic cysts, compensatory hydrocephalus, and other less common fluid-containing intracranial lesions are most often of prenatal origin and not usually associated with head enlargement beyond normal limits, although exceptions do occur. Chronic subdural hematoma from injury at the time of birth or during very early life may produce abnormal head growth, particularly in the early months. This is a treatable lesion in the very early stages and one cannot rely upon changes in head growth as a criterion for undertaking the diagnosis.

An attempt has been made to outline the major causes of abnormally slow or rapid head enlargement in infancy. This easily obtained objective measurement is of value prognostically in preparing a family to help their mentally retarded child through life, and therapeutically when it allows the physician to reclaim some potential mental retardates by promoting more frequent and earlier treatment of active hydrocephalus.

PULMONARY EMBOLISM

A. HASSAN KHAZEI, MD
Division of Thoracic and Cardiovascular Surgery
University of Maryland Hospital
and
South Baltimore General Hospital

Pulmonary emboli have been found at autopsy in approximately 10% of general hospital patients and in a higher percentage of institutional patients with cardiac or prostatic disease. There is a disparity between the small number of ante mortem diagnoses and the incidence of pulmonary embolism found at necropsy. This gap is due to the paucity of symptoms, acuteness and severity in cardiopulmonary hemodynamics causing rapid death, and lack of quick and precise diagnostic methods. The success in dealing with pulmonary embolism depends greatly on the physician's awareness and suspicion of the common occurrence of this complication.

The principle source of emboli lies in the deep veins of the thighs, calves, pelvis and right heart. In at least 20% of patients, no source will be discovered at autopsy, and in a similar number, multiple sources will be found. Most patients with thromboembolic phenomenon do not have evidence of antecedent venous thrombosis, and in over 50% of patients, the pulmonary embolism will be the first sign.[1] A patient having one pulmonary embolus has a 30% chance of having a second and an 18% chance of having a subsequent fatal embolus.

The symptoms of pulmonary embolism depend primarily on the size of the embolus or emboli and the previous functional state of the heart and lungs. The clinical picture often reflects the effects of reduced cardiac output with weakness, sweating, syncope, apprehension, hyperpnea, restlessness, and peripheral vasoconstriction. Retrosternal chest pain may be prominent in massive embolism. The symptomatology may be totally lacking in spite of massive pulmonary embolism until a short time before death. Frequently, tachypnea is present. Unexplained tachypnea should raise the suspicion of pulmonary embolism. Physical signs include pulsation in the second left interspace, a pseudo-pericardial friction rub, a systolic and, at times, a diastolic murmur and thrill at the second left interspace, an interscapular bruit, increased cardiac dullness on the right, and gallop rhythm. Unfortunately, these signs are neither common nor characteristic. However, an accentuated P2, distended neck veins and enlarged liver when present are important diagnostic leads. These signs are only significant in the absence of preexisting pulmonary hypertension. It should be remembered that an accurate diagnosis between massive pulmonary embolism and coronary occlusion is not always possible and that the possibility of this complication should be thought of each time that one is confronted with a suspected

diagnosis of myocardial infarction.

The characteristic electrocardiographic findings are usually lacking but consist of right heart strain, that is, a deep **S** wave in lead 1, a deep **Q** wave in lead 3, depressed **ST** segment in lead 2, and inverted **T** waves in leads 2 and 3. Changes may be reflected in the right precordial leads. Israel and Goldstein reported significant changes in the electrocardiograms of 70% of their patients who had at least two tracings made after pulmonary embolism.[2] X-ray findings are varied and may be of considerable diagnostic assistance. Evidence of pulmonary infarction on a plain film may be suggestive. However, infarction of the lung may not occur because of the dual circulation of the lungs. In general, pulmonary embolism lodging even in major pulmonary arteries produces infarction only when there is associated infection or when there is passive congestion in the lung. Therefore, the absence of infiltration on a plain film is not indicative of absence of embolism. Arendt and Rosenberg found that 50% of all patients clinically suspected of having pulmonary embolism develop an infarction that can be demonstrated by a plain chest X-ray.[3] The so called "anemic lung," hypovascularity of a portion or the entire one lung, is of diagnostic value but occurs rarely. Pulmonary angiography remains the best diagnostic method available today. However, a negative angiogram does not necessarily rule out the possibility of emboli in the pulmonary vasculature. Similarly, this technique does not indicate precisely the magnitude or the degree of obstruction. Lung scanning is similarly of considerable value in the diagnosis, although a number of false-positive findings in patients free of pulmonary embolism have been reported. Recently, ultrasound has been used in the diagnosis of this complication and appears to be promising. However, more experience is necessary before its true value can be determined.[4]

Intravenous or deep intramuscular heparinization is the treatment of choice. Inferior vena caval disruption is employed when the use of heparin is contraindicated, e g., hemorrhagic diathesis, significant hypertension, and acute duodenal ulcer, or when there is repeated pulmonary embolus in spite of adequate heparinization. The application of a caval clip is preferred to caval ligation since the incidence of postoperative edema and pain in the lower extremities is significantly reduced.

Pulmonary embolectomy is reserved for instances where recovery seems otherwise unlikely. The difficulty, however, lies in the selection of these patients. Hypotension is usually indicative of a low cardiac output as a result of significant obstruction to the pulmonary blood flow and is a common indication for surgical intervention.[5]

Measurement of right ventricular pressure *RVP* during angiography is indicated. An increase in *RVP* (systolic or end diastolic) is an indication of significant obstruction to the flow of blood through the lung and is usually associated with poor prognosis unless the obstruction is relieved. Finally, in certain circumstances where the presence of a massive pulmonary embolism can be established without doubt, one may select to proceed with embolectomy in spite of a relatively normal blood pressure and *RVP*.[5]

Recently, Urokinase has been used in a small number of patients with encouraging results, but more experience is necessary before conclusions are made.[6]

Let's be specific about Campbell's Soups...
and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

For the ambulant patient with hemorrh

. . . METAMUCIL®

brand of psyllium hydrophilic mucilloid

Relieves strain

Metamucil produces soft, well-formed stools that minimize pain and strain and reduce the chance of thrombosis in hemorrhoidal veins.

Softens stools

Metamucil, a highly purified vegetable colloid, absorbs water, hydrates the intestinal contents and produces a demulcent "smoothage" that aids healing of hemorrhoids and anal fissures.

Reduces pain

Metamucil reduces pain by eliminating the abrasive irritation of hard, dry stools.

Restores bowel function

Metamucil produces a gentle distention of the intestinal wall that stimulates natural peristalsis and helps reestablish normal, rhythmic bowel function.

And in constipation...

Metamucil furnishes, as it has for more than 30 years, the simple physiologic corrective to constipation, eliminating both hard stools and the need for harsh laxatives.

Usual Adult Dosage:

One rounded teaspoonful of Metamucil powder in a glass of cool liquid, or one packet of Instant Mix Metamucil in a glass of water. An additional glass of liquid is helpful.

SEARLE *Research in the Service of Medicine*

Against these three major pathogens...

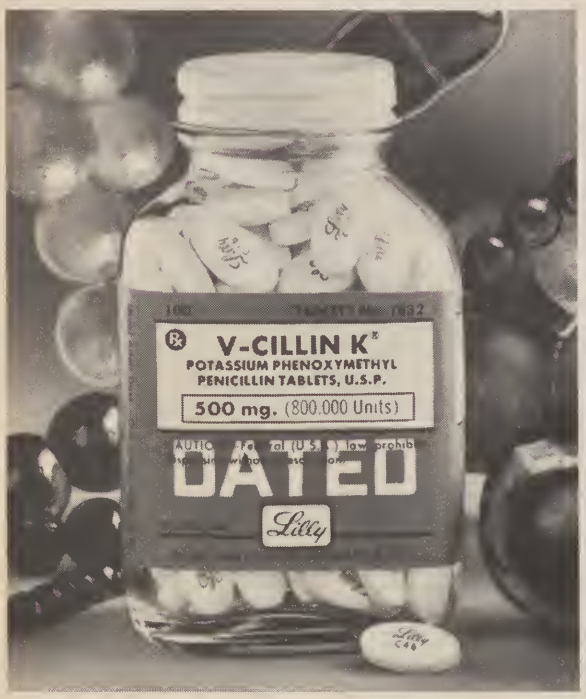
V-Cillin K® provides dependable oral antibacterial therapy

because it combines a high degree of activity...

V-Cillin K has been shown to be effective in the treatment of streptococcus and pneumococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy in patients with a history of rheumatic fever or congenital heart disease.

with high blood levels, even when taken with food

V-Cillin K is stable in acid and immediately soluble. High serum levels, therefore, are reached rapidly. Because it is acid stable, V-Cillin K is well absorbed even when taken close to mealtime. These desirable properties help make V-Cillin K a dependable penicillin for oral use.



V-Cillin K® Lilly 701449

Potassium Phenoxymethyl Penicillin

Now available: V-Cillin K®, Pediatric, for Oral Solution, 250 mg. (400,000 units) per 5 cc. of solution.

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K, the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly), combines acid stability with immediate solubility and rapid absorption. Higher, more rapid serum levels are obtained than with equal oral doses of penicillin G.

Indications: Streptococcus, pneumococcus, and gonococcus infections; infections caused by sensitive strains of staphylococci; prophylaxis of streptococcus infections in patients with a history of rheumatic fever; and prevention of bacterial endocarditis after tonsillectomy and tooth extraction in patients with a history of rheumatic fever or congenital heart disease.

Contraindication: Penicillin hypersensitivity.

Warnings: In rare instances, penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin or with bronchial asthma or other allergies. Resuscitative drugs should be readily available. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: Use cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with high parenteral dosage schedules, frequent evaluation of the renal and hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory studies (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrowth of penicillin-insensitive organisms. In such cases, discontinue administration and take appropriate measures.

Adverse Reactions: Although serious allergic reactions are much less common with oral penicillin than with intramuscular forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it possesses a significant index of sensitization. The following hypersensitivity reactions have been reported: skin rashes ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; and reactions resembling serum sickness, including chills, fever, edema, arthralgia, and prostration. Severe and often fatal anaphylaxis has occurred (see Warnings). Hemolytic anemia, leukopenia, thrombocytopenia, and nephropathy are rarely observed side-effects and are usually associated with high parenteral dosage.

Administration and Dosage: Usual dosage range, 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants, 50 mg. per Kg. per day divided into three doses.

See package literature for detailed dosage instructions for prophylaxis of streptococcus infections, surgery, gonorrhea, and severe infections.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units), 250 mg. (400,000 units), and 500 mg. (800,000 units).

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc. of solution (approximately one teaspoonful). [042567]

Additional information available to physicians upon request. Eli Lilly and Company, Indianapolis, Indiana 46206.

Lilly

701449

A Building Block approach to treating hypertension

With these three therapeutic building blocks you can create a once-a-day regimen to fit almost any degree of hypertension. See the following pages for details . . .

Consider starting your hypertensives on this basic thiazide

ABBOTT

A single daily dose of Enduron provides sodium excretion around the clock

Enduron is a true 24-hour single-dose thiazide. Its sodium excretion is not squeezed into an abrupt peak during the first several hours. It is well-sustained in a plateau-like effect—with little reduction for the first 12 hours, and decline thereafter only gradual.

Potassium loss, by contrast, is low. It reaches an early minor peak, then subsides rapidly. Moreover, since dosage is but once a day, there is but one daily peak of potassium loss. As with all thiazides, however, dietary potassium supplementation should also be considered, especially in long or intensive therapy.

Use Enduron as an ideal starting therapy in mild hypertension. Use it too, as a basic therapeutic building block with which other agents can be joined, for managing your more resistant hypertensives.

Once a day, every day

ENDURON®
METHYCLOTHIAZIDE

DAILY DOSAGE RANGE	Minimum	Usual	Intermediate	Maximum
	2.5 mg. tablet	5 mg. tablet	7.5 mg.	10 mg.

See Brief Summary on final page of advertisement.

To build added response, shift to Enduronyl

ABBOTT

The deserpidine component adds enhanced antihypertensive activity

The rauwolfia component of Enduronyl is deserpidine (Harmonyl®), a purified crystalline alkaloid supplied only by Abbott. It augments Enduron with its own antihypertensive and tranquilizing action.

Thus the combined clinical effect of these two therapeutic building blocks in Enduronyl is greater than can ordinarily be achieved with either alone.

To add flexibility, Enduronyl comes in two strengths: regular and Forte. Both provide 5 mg. of Enduron. The variation is where most helpful: in the deserpidine. The tablets are scored, and give a surprisingly wide and economical choice of once-a-day doses (see below).

Choose Enduronyl for your patients in the broad range of mild to moderate hypertension. Patient acceptance is excellent!

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 MG. WITH DESERPIDINE 0.25 MG.

ENDURONYL FORTE

METHYCLOTHIAZIDE 5 MG. WITH DESERPIDINE 0.5 MG.

	Minimum	Usual	Intermediate	Maximum
DAILY DOSAGE RANGE	2.5 mg. methyclothiazide 0.125 mg. deserpidine	5 mg. methyclothiazide 0.25 mg. deserpidine	7.5 mg. methyclothiazide 0.375 mg. deserpidine	10 mg. methyclothiazide 0.5 mg. deserpidine
DAILY DOSAGE RANGE	2.5 mg. methyclothiazide 0.25 mg. deserpidine	5 mg. methyclothiazide 0.5 mg. deserpidine	7.5 mg. methyclothiazide 0.75 mg. deserpidine	10 mg. methyclothiazide 1 mg. deserpidine

See Brief Summary on final page of advertisement.

707075-R

Eutonyl affords a different kind of basic therapy for moderate to severe cases

Effect tied to reduced peripheral vascular resistance; no central depressant action

Eutonyl is a unique nonhydrazine agent. It is reported to act by reducing peripheral vascular resistance.[1,2]

In clinical trials, significant reductions in mean blood pressure were seen in 84% of patients studied—all were moderate to severe cases. Eutonyl lowers diastolic in proportion to systolic, and in about half of the cases studied, reductions in the sitting and recumbent positions were nearly as great as in the standing position.

Most important: There is no central depressant action. In fact, some patients reported an *increased* sense of well being.

Here, then, is a highly effective *basic treatment* for moderate to severe cases—and one that will not hamper your patient with lethargy or drowsiness while on treatment.

Once a day, every day

EUTONYL®
PARGYLINE HYDROCHLORIDE

DAILY DOSAGE RANGE	Minimum	Usual starting	Intermediate	Maximum
	10 mg. tablet	25 mg. tablet	50 mg. tablet or as needed	200 mg.

1. Brest, A. N., et al., Cardiac and Renal Hemodynamic Response to Pargyline, Ann. N. Y. Acad. Sci., 107-1016, 1963.

Eutron adds thiazide for enhanced therapy with milder side effects

ABBOTT

Only a 7/4 mm. span between standing and recumbent pressures in clinical trials—reduced chance of orthostatic hypotension

The combining of Eutonyl and Enduron in Eutron permits a significantly greater antihypertensive effect than with either agent used alone. This in turn may allow therapeutic success with lesser dosage—and correspondingly milder side effects.

A significant finding in clinical trials was the drug's action in lowering blood pressure to *nearly equal levels in all body positions*. Total average spread between standing and recumbent readings (after treatment) was only 7/4 mm. Hg.

Thus, in your moderate to severe cases, Eutron affords a usually smooth course of therapy, often with reduced likelihood of orthostatic effects. (The usual precautions against rising suddenly, of course, will always apply.) And, because of the thiazide component, Eutron may be used in the presence of congestive heart failure.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 MG.
WITH METHYCLOTHIAZIDE 5 MG.

DAILY DOSAGE RANGE	Minimum	Usual starting	Intermediate	Maximum
	12.5 mg. pargyline hydrochloride and 2.5 mg. methyclothiazide	25 mg. pargyline hydrochloride and 5 mg. methyclothiazide	37.5 mg. pargyline hydrochloride and 7.5 mg. methyclothiazide	50 mg. pargyline hydrochloride and 10 mg. methyclothiazide

See Brief Summary on final page of advertisement.

TM—Trademark

707075-R

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Enduron is used to control edema and mild to moderate hypertension; also used with other drugs for hypertension. Enduronyl is used in mild to moderately severe hypertension; when used with Enduronyl, more potent agents can be given at reduced dosage to minimize undesirable side effects.

Contraindications: Neither Enduron nor Enduronyl should be used in severe renal disease (except nephrosis) or shutdown; in severe hepatic disease or impending hepatic coma; in patients sensitive to thiazides. Hepatic coma has been reported as a result of hypokalemia in patients receiving thiazides.

Enduronyl is contraindicated in patients with severe mental depression and suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity reactions in patients with a history of allergy or asthma. If added potassium intake is indicated, dietary supplementation is recommended. Enteric-coated potassium tablets should be reserved for cautious use only when adequate dietary supplementation is not practical because those tablets may induce serious or fatal small bowel lesions consisting of stenosis with or without ulceration. These small bowel lesions have caused obstruction, hemorrhage and perforation frequently requiring surgery. Medication should be discontinued immediately if abdominal pain, distension, nausea, vomiting or GI bleeding occurs.

Precautions: Use thiazides with caution in severe renal dysfunction, impaired hepatic function, or progressive liver disease. In surgical patients, thiazides may reduce the response to vasopressors and increase the response to tubocurarine. Use thiazides with caution in pregnancy (bone marrow depression, thrombocytopenia, or altered carbohydrate metabolism have been reported in certain newborn infants). Also reported have been: blood dyscrasias including thrombocytopenia with purpura, agranulocytosis and aplastic anemia; elevations of BUN, serum uric acid, or blood sugar. Symptomatic gout may be induced. Antihypertensive response may be enhanced following sympathectomy.

Use Enduronyl with caution in patients with a history of peptic ulcer, as rauwolfias may increase gastric secretion. Discontinue at the first sign of mental depression. Rauwolfia alkaloids may increase hypotensive effects of surgery or anesthesia, and should be discontinued two weeks prior. They also lower the convulsive threshold and shorten seizure latency. In epilepsy, dosage adjustment of anticonvulsant medication may be necessary. Alcohol, barbiturates, or narcotics may potentiate action of deserpidine.

Adverse Reactions: During intensive or prolonged therapy, guard against hypochloremic alkalosis and hypokalemia (especially the latter if patient is on digitalis). All patients should be observed for signs of hyponatremia ("low-salt" syndrome). Reported thiazide reactions include: anorexia, nausea, vomiting, diarrhea, headache, skin rash, dizziness, paresthesia, weakness, photosensitivity, jaundice, and pancreatitis.

Reported rauwolfia reactions include: nasal stuffiness, nausea, weight gain, diarrhea, aggravation of peptic ulcer, epistaxis, skin eruption, and reduction of libido and potency. Excessive drowsiness, fatigue, weakness, and nightmares may signal early signs of mental depression.

EUTONYL® | EUTRON™

PARGYLINE HYDROCHLORIDE

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications: For treatment of patients with moderate to severe hypertension, especially those with severe diastolic hypertension. Not recommended for patients with mild or labile hypertension amenable to therapy with sedatives and/or thiazide diuretics alone. It is desirable to establish the dosage of Eutron by administering component drugs separately.

TM-Trademark.

Contraindications: Pheochromocytoma, advanced renal disease, increasing renal dysfunction, paranoid schizophrenia and hyperthyroidism. Hepatic coma has been reported as consequence of hypokalemia with thiazide therapy. Until further experience is gained not recommended for patients with malignant hypertension, children under 12, or pregnant patients.

Concomitant use of the following is contraindicated: other monoamine oxidase inhibitors; parenteral forms of reserpine or guanethidine; sympathomimetic drugs; foods high in tyramine such as cheese; imipramine and amitriptyline, or similar antidepressants; methyldopa. 2 week interval should separate therapy and use of these agents.

Methyclothiazide is contraindicated in patients with known sensitivity to thiazides.

Warnings: Pargyline hydrochloride is a monoamine oxidase inhibitor. Warn patients against eating cheese, and using alcohol, proprietary drugs or other medication without the knowledge of the physician. When indicated, alcohol, narcotics (meperidine should be avoided), antihistamines, barbiturates, chloral hydrate, and other hypnotics, sedatives, tranquilizers, or caffeine, may be used cautiously in reduced dosage. In emergency surgery ¼ to ⅓ the usual dose of narcotics, analgesics, and other premedications should be used avoiding parenteral administration where possible. Carefully adjust dose of anesthetics to response of patient. Withdraw pargyline two weeks before elective surgery.

Warn patients about the possibility of postural hypotension. Those with angina or coronary artery disease should not increase physical activity with an improvement in well being. Pargyline may lower blood sugar.

Avoid use of enteric-coated potassium tablets, as these may induce serious or fatal small-bowel lesions consisting of stenosis with or without ulceration. These small-bowel lesions have caused obstruction, hemorrhage and perforation frequently requiring surgery. Medication should be discontinued immediately if abdominal pain, distension, nausea, vomiting or GI bleeding occurs. These products contain no added potassium salts and if added potassium intake is desired, dietary supplementation is recommended. Coated potassium tablets should be reserved for cautious use when adequate dietary supplementation is impractical. In patients with a history of allergy or asthma the possibility of sensitivity reactions should be considered.

Precautions: Measure blood pressure while patient is standing to determine antihypertensive effect. Use with caution in hyperactive or hyperexcitable persons. Such persons may show increased restlessness and agitation. Withdraw drug during acute febrile illness. Watch patients with impaired renal function for increasing drug effects or elevation of BUN and other evidence of progressive renal failure; withdraw drug if such alterations persist and progress. Use with caution in patients with liver disease. As with all new drugs, complete blood counts, urinalyses, and liver function tests should be performed periodically. With prolonged therapy, examine patients for change in color perception, visual fields and fundi. Also reported have been: blood dyscrasias including thrombocytopenia with purpura, agranulocytosis and aplastic anemia; elevations of BUN, serum uric acid, or blood sugar. Symptomatic gout may be induced. In surgical patients thiazides may reduce response to vasopressors and increase response to tubocurarine.

Adverse Reactions: Pargyline may be associated with orthostatic hypotension. Mild constipation, slight edema, dry mouth, sweating, increased appetite, arthralgia, nausea and vomiting, headache, insomnia, difficulty in micturition, nightmares, impotence, delayed ejaculation, rash, and purpura have been encountered with pargyline. Hyperexcitability, increased neuromuscular activity (muscle twitching) and other extrapyramidal symptoms have been reported in a few patients with reduced cardiac reserve.

During intensive or prolonged therapy, guard against hypochloremic alkalosis and hypokalemia (especially the latter if patient is on digitalis). Observe all patients for signs of hyponatremia ("low salt" syndrome).

Reported thiazide reactions also include anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, and pancreatitis. Nocturia has been observed with the combination.

Tuinal

One-Half Sodium Amobarbital and
One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal is indicated for prompt and moderately long-acting hypnosis. It is not suitable for continuous daytime sedation.

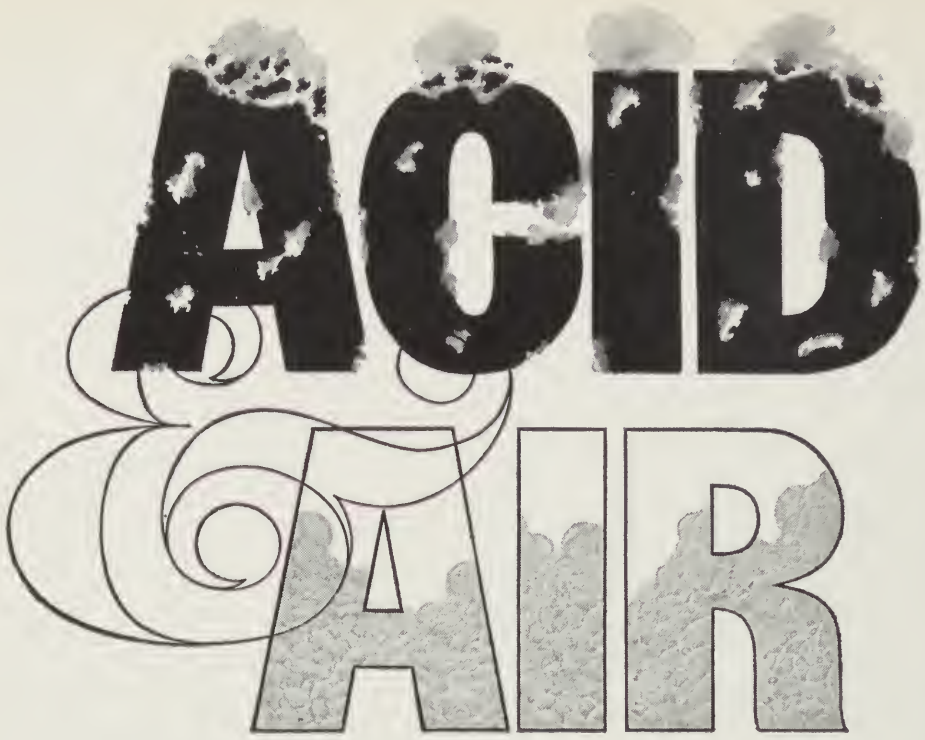
Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Overdosage: C.N.S. depression. Symptoms—Depression of respiration and of superficial and deep reflexes, slight constriction of the pupils (in severe poisoning, dilation), decreased urine formation, lowered body temperature, coma. Treatment—Symptomatic and supportive (gastric lavage; intravenous fluids; maintenance of blood pressure, body temperature, and adequate respiration). Dialysis may speed removal of barbiturates from body fluids.



Dosage: 50-200 mg. (¾-3 grains) at bedtime.

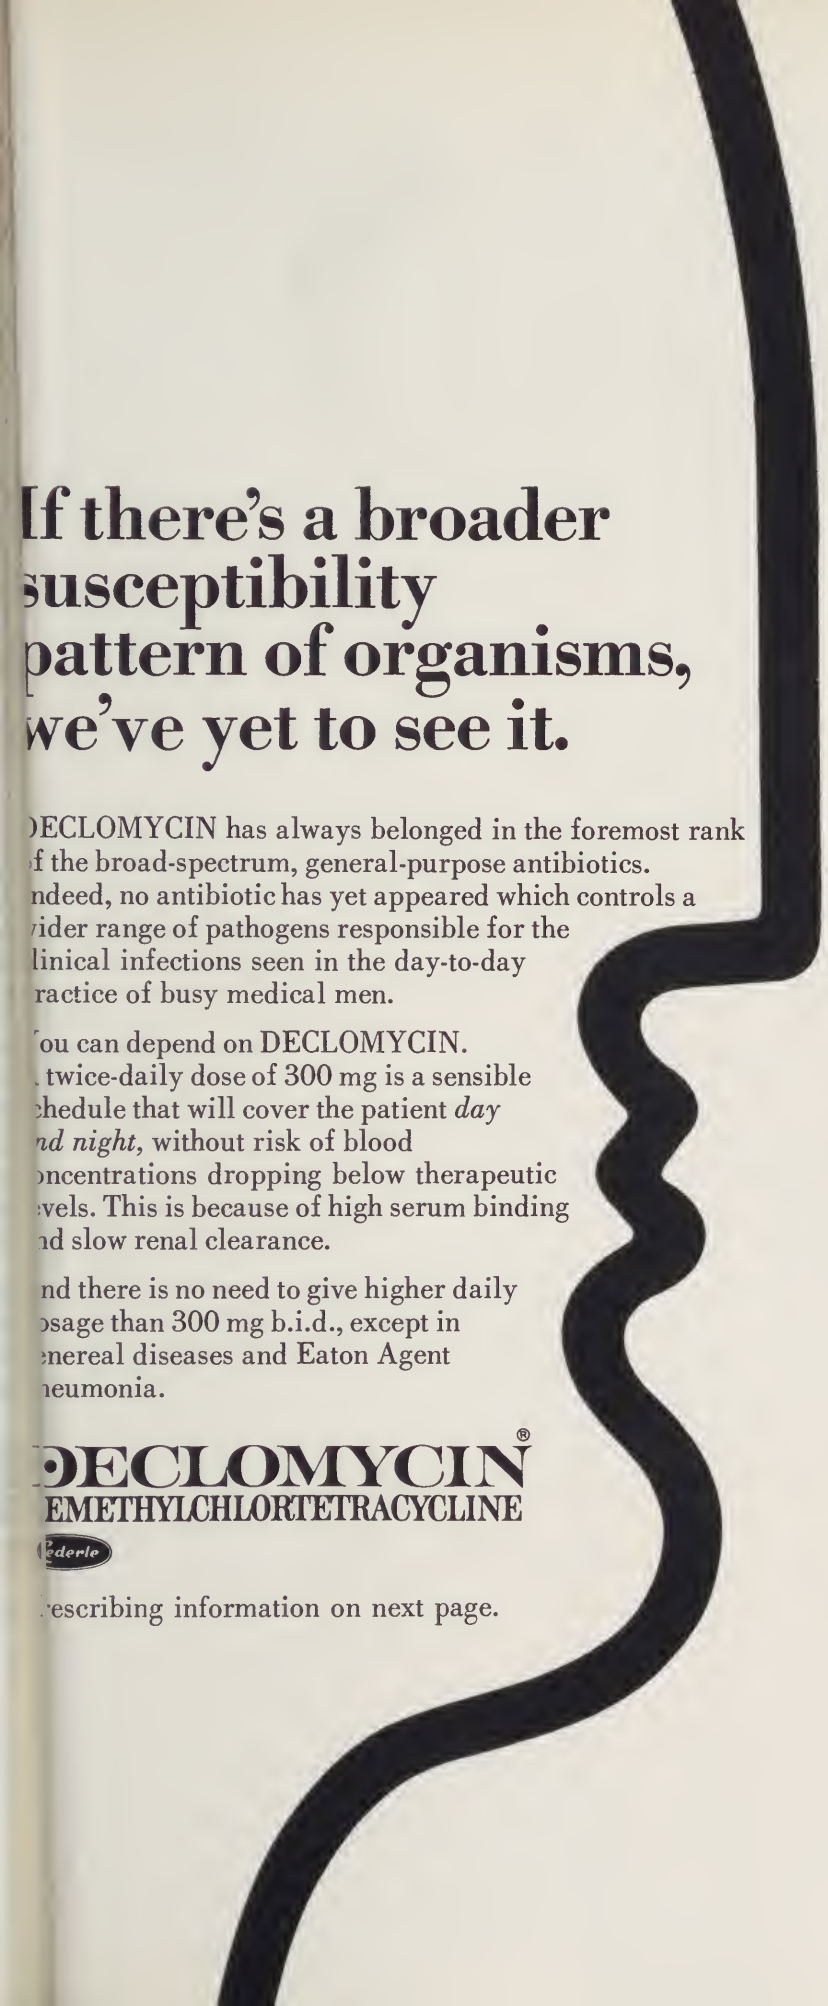
DUAL PROBLEM IN PEPTIC ULCER

Relief of hyperacidity is still a primary goal in the treatment of peptic ulcer. And antacids are the most widely used means of achieving this relief. But antacids alone cannot influence the distention and bloating which so often add to ulcer distress.

THIS IS WHY MYLANTA® PROVIDES:

the two most widely used antacids—magnesium and aluminum hydroxides—to help secure rapid acid neutralization with little chance of laxation or constipation;

PLUS



the defoaming action of simethicone—to help relieve the painful gas symptoms which often accompany peptic ulcer.

Mylanta®

antacid therapy plus an added benefit

nonfatiguing flavor/smooth pleasant texture; both assure patient cooperation during long-term therapy.

Rickettsia

Treponema

If there's a broader susceptibility pattern of organisms, we've yet to see it.

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occure. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes. A rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth— dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 Gm. given in equally divided doses over a period of 10 to 15 days should be followed. Close follow-up observation of the patient is recommended, including appropriate laboratory tests, since demethylchlortetracycline has not had adequate evaluation in all stages of syphilis. Spinal fluid examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effectively with a single dose of 600-900 mg. of DECLOMYCIN Demethylchlortetracycline. Individuals unable to tolerate large single doses due to gastrointestinal side effects may be treated with 150 mg. every 6 hours for a minimum of 4 doses or 300 mg. every 12 hours for a minimum of 2 doses. Females should be treated with a dosage of 150 mg. every 6 hours or 300 mg. every 12 hours until a cure is affected.

Primary Atypical Pneumonia (Eaton Agent): The average adult daily dosage is 900 mg. in 3 divided doses for six days.

"Man's best friend" in wintertime diarrheas

In winter "flu" and viral gastroenteritis, Donnagel (4 oz. size!) can bring aid and comfort to sufferers from both diarrhea and its discomforts because it contains kaolin and pectin *plus* belladonna alkaloids (as in Donnatal®). Donnagel treats the whole diarrhea problem. Available on your prescription or recommendation.

For acute, non-specific diarrheas **Donnagel® -PG** (Donnagel with paregoric equivalent). Donnagel formula plus powdered opium, USP, 24.0 mg. (equivalent to paregoric 6 ml.) (warning: may be habit forming). Alcohol, 5%.

All the antidiarrheal benefits of paregoric without the unpleasant taste. Real banana flavor makes it acceptable, even to children. See product literature before prescribing.

A-H-ROBINS

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

DON'T JUST SIT AROUND ESCHEWING THE FAT.

Enlist in Project Weight Watch.

You'll be joining the ranks of professionals who believe overweight is one health hazard that can be reduced.

It's not an easy project; there's no simple solution. You already know how difficult it is to talk people out of overeating. Appetite suppressants alone won't establish new eating habits. And fad diets usually don't work.

But nourishing, everyday food in an easy-to-follow diet can change a man's life.

That's what prompted preparation of research-tested scientific diets which are offered to you free. They're a realistic balance of the 4 food groups—meat, bread and cereals, fruits and vegetables and dairy foods. They're diets you'd write yourself, if you had the time.

Send for them. The overweights can't wait.

Send me the Project Weight Watch kit of materials including diets.

PROJECT WEIGHT WATCH
FACTS, NOT FADS

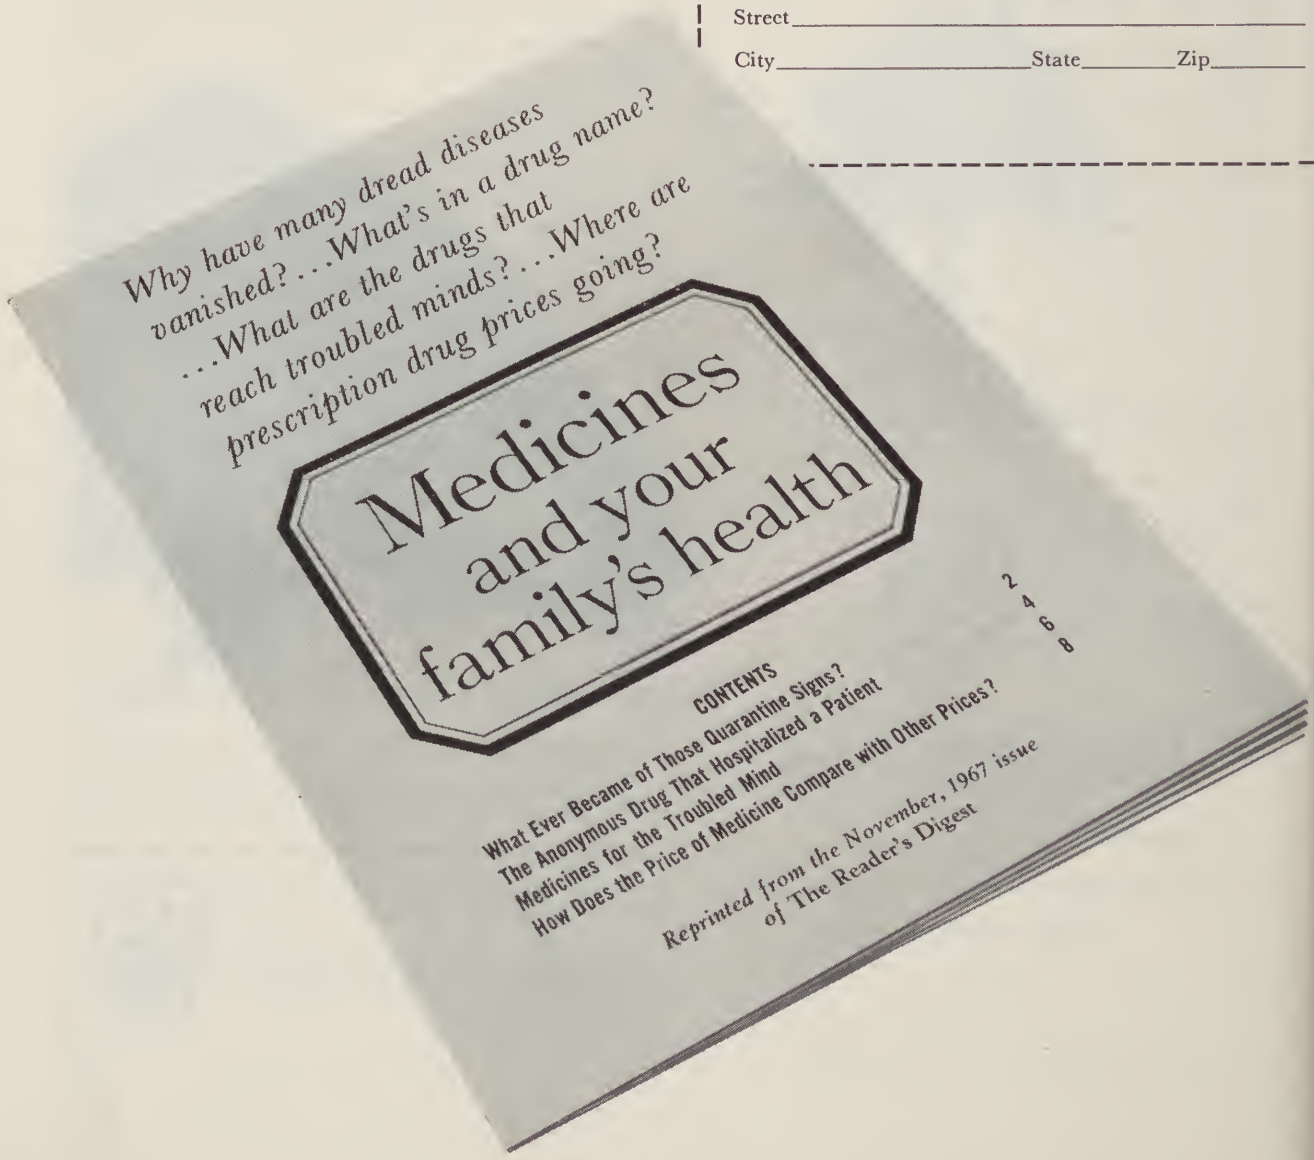
Dear Doctor:

Wouldn't you like your patients to learn more about the contributions made by the world of medicine to their welfare? So that they can better appreciate the efforts of the health team to keep them in good health?

To tell the stories of medical and pharmaceutical advances to people throughout the country, the Pharmaceutical Manufacturers Association is sponsoring a unique "magazine within a magazine." It is called *Medicines and your family's health* and the first issue appears in the November *Reader's Digest*.

We would like to send you 50 free reprints of *Medicines and your family's health* for use in your reception room. Your patients will find the articles in this issue factual, educational and of immediate personal interest.

Just fill out the coupon below and send it to us.



Order Desk
Pharmaceutical Manufacturers Association

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

Cardiac Rehabilitation: Part II

Coronary Care Units

DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

Intern:

Infarct Number Ten has a spleen.
The ECG changes are keen;
Wolfe-Parkinson-White,
A shift to the right,
And Bundle Branch Block in between.

Research Fellow:

He's Case Number Ten for my tract:
"The Use of Reserpine Extract."
I'll soon be successor
To dear old professor,
If I can complete the abstract.

Patient:

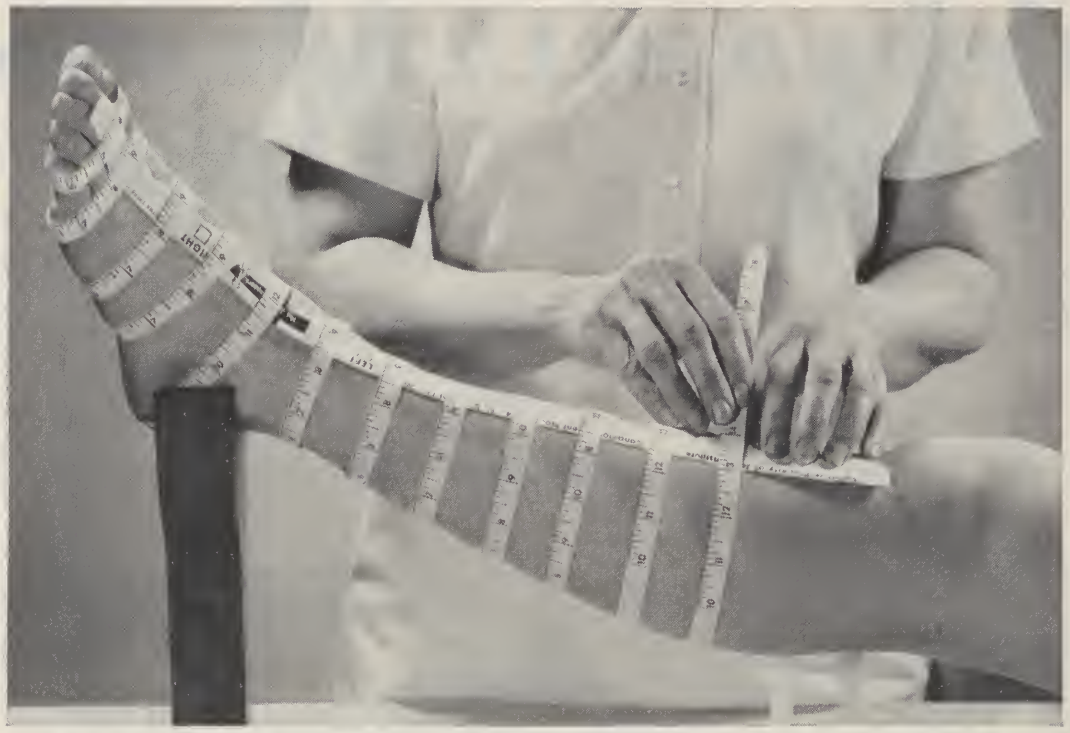
They christened me John Henry Shinn,
But here I am Case Number 10.
It might be a cancer;
I've gotten no answer.
There's nobody here who will listen.

The above somewhat cynical doggerel is an attempt to illustrate that each specialist in a Coronary Care Unit (CCU) has his own interest and is limited by the very fact that he is a specialist. He is interested in a disease, a technical method, a laboratory finding, a procedure or an area of knowledge—rather than in patients as people. Like the fable of the blind men describing the elephant they had felt, each specialist observes different parts of the whole picture and no one sees the patient as a person.

* * * * *

Nurse:

Dr. Jones wants more notes on Case Ten;
A check on his pulse rate again
He wants information,
Avoids seeing the patient,
And doesn't know where to begin.



Social Service:

The monitor says he's O.K.,
But he's in a hell of a way
His first wife came in
With two sets of twins
And his second is here with her lawyer.

* * * * *

There is accumulating evidence from many sources[1,2] that the hospital mortality rate from acute myocardial infarction can be reduced by the use of a well-organized and equipped CCU. Early mortality can be reduced and late complications handled more effectively. The establishment of CCU's should be enthusiastically supported throughout the country.

With every advance, however, there are some losses. There is no question that development of progressive patient care (PPC), respiratory units (RU), intensive care units (ICU), recovery rooms (RR) and coronary care units CCU is resulting in better technical medical care, but there is clear evidence that the patient's emotional problems and

Why Vascular Specialists Prescribe JOBST Supports

The JOBST VENOUS PRESSURE GRADIENT support is fitted by precise measurements to the contour of the affected limb of the individual patient and exerts precise hydrostatic counter pressures. JOBST supports represent an advanced clinical method of treatment known and accepted by most vascular specialists as the *treatment of choice* for leg ulcers, varicose veins, stasis dermatitis, postmastectomy lymphedema, post phlebitis syndrome, post-fracture, post-operative and injury edema. Trained experts will measure and fit your patients for you at JOBST Service Centers, Suite 200, 818 Eighteenth Street N.W., Washington, Phone 298-5530. Or Suite 415, Medical Arts Bldg., 101 West Read Street, Baltimore, Phone 539-0560.

© JOBST, 1966

JOBST offers a complete range of custom-made support garments for the treatment of venous insufficiency and management of lymphedema.

personality are being neglected. Fortunately in the case of CCU, these deficiencies can be eliminated if the problem is clearly recognized and action is taken. The difficulty is not so much recognition of the problem, but doing something about it.

The Problem

Frederick A. Whitehouse, MD, former director of rehabilitation for the American Heart Association, recently stated that heart disease is one of the greatest neurotic ailments of all time. He estimated that twenty million Americans are victims of wholly imaginary cardiac disorders. They limit themselves physically and psychologically, and derange the relations within their family and work because of their fears and anxiety. It is essential that these reactions be prevented in patients who come into CCU with acute myocardial infarctions.

There seem to be three major reasons why the emotional life of the patient in the Coronary Care Unit is not given full consideration. All of these are results of increasing specialization within the medical and para-medical field.

Emphasis on techniques, research and organization rather than on patients as people

Not only the doctor but also the nurse is specialized in the care of patients in CCU's. There is a move afoot to start specialization among medical students in their third and fourth years. The result of this specialization of professional staff is interest in *diseases* rather than people, interest in *research* rather than service.

Another result of the specialized CCU may be the elimination of the patient's personal physician as a significant figure. Because of the highly specialized techniques required, the housestaff or even the nurse may be much better qualified to render emergency treatment than the personal physician. The personal physician feels unneeded and may not be welcomed by either the medical staff or the patient.

Division of responsibility

Because a group of physicians and nurses are involved in the care of the patient, each tends to have his own specialized area of action. No one takes full responsibility for the total care of the patient. The patient's private personal physician will have the responsibility of talking to the patient about the meaning of his heart attack and his future activities at work and in the family. If the patient does not have such a concerned and responsible personal physician, no one may talk to him about the meaning of the disease. This division of responsibility is characteristic of all team or committee type medical care.

Proliferation of technical personnel

The rapid development of new monitors and other machinery for use in ICU's makes the development of new technicians inevitable. There is a plan afoot to develop assistant-doctor-technicians whose duty in a CCU would combine those of a doctor, a nurse and an electronic repairman. He would introduce catheters, operate a defibrillating machine and other techniques which ten years ago were in the laboratory being developed by physicians. Depending on technicians to perform many of the services now performed by the doctor will tend to separate the responsibility for total patient care still further.

The Solution

It is persiflage to say that recognition of this problem will automatically result in improvement in total patient care. Depersonalization has been widely recognized in hospitals[3,4,5] for decades. Indeed the very term "Coronary Care Unit" reveals an unconscious disease-orientation rather than patient-centered concern.

Attempts to solve this problem by social workers, ministers, conferences, teams and committees are bound to fail, because all of these methods attempt to remove the responsibility from the physician, where it rightfully belongs. To paraphrase Francis Peabody.[6] "Unless the physician cares about the patient, the patient's care will be poor".

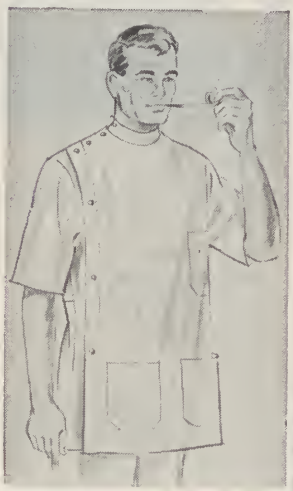
Kurt Gorwitz, ScD, Statistics Director

The Hospitalized Geriatric Patient

In 1950 there were 12 million Americans aged 65 and older; by 1960 this number had increased to more than 16 million and it is now estimated to have reached 20 million. While the 275,000 Maryland residents in this age group represent 7.5 percent of the state's total population, patients 65 years of age or older currently occupy 29.9 percent of all beds in Maryland's four regional mental hospitals. The distribution of these 2,406 patients by diagnosis and by length of hospitalization is shown in the following table.

These data indicate that geriatric patients can be divided into two broad categories of nearly equal size. The patients who were first hospitalized in old age have been under continuous care for relatively short time periods and were primarily admitted for diseases of the senium. The patients first hospitalized at a younger age have been under continuous care for relatively long time periods and were primarily admitted for psychotic disorders.

In 1966 there were 963 admissions in this age group while 250 patients became 65 while hospitalized. At the same time, it accounted for 437 discharges and 764 deaths. A significant reduction in the number of these older admissions and resident patients is attainable through a coordinated program relating the following areas:



1. Imaginative services in the mental hospital designed to minimize the number of patients who become chronic.
2. Establishment, expansion and improvement of state licensed and inspected nursing homes and other suitable alternatives to hospitalization.
3. Development of services in general hospitals for the concomitant treatment of physical and mental illnesses.
4. Development and expansion of supportive community services and programs, such as meals on wheels and golden age clubs.
5. Providing financial independence and resultant self-esteem through Social Security and Medicare.
6. Elimination of involuntary automatic retirement at specified age levels.

Length of Hospitalization	Total	Diseases of Senium	Other Brain Syndromes	Psychotic Disorders	All Others
Less Than 1 Month	76	45	9	7	15

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

Highlights

ASEPTIC MENINGITIS DECLINING

Localized outbreaks of aseptic meningitis, chiefly in Baltimore City, began about July 1 and reached a peak early in September, declining slowly thereafter. The disease was relatively mild, lasting 4 to 7 days, with symptoms of headache, fever, stiff neck and occasionally a rash and gastrointestinal upset. The spinal fluid cell count was elevated, as high as 1600 in one case. In a 16-week period, 117 specimens were examined by the Bureau of Laboratories, and virus isolations obtained from 48 cases. Coxsackie B-5 was isolated from 18 patients, Echo 4 from 17, Echo 9 from 9, and miscellaneous enteroviruses from the remainder. 70% of the patients were under 15 years of age.

VIRUS ACTIVITY IN MARYLAND

During the late summer and early fall of this year, considerable virus activity occurred in Maryland as determined by the isolation of a large number of viruses from clinical materials received by the Bureau of Laboratories. Approximately 700 specimens were examined during this time and viruses were isolated from 21%. Viruses recovered were coxsackie B-4, coxsackie B-5, coxsackie A-9, echovirus type 4, echovirus type 9, adenovirus type 3, adenovirus type 7a, herpes simplex, varicella, cytomegalovirus, poliovirus type 2, and twelve unidentified enteroviruses.

GOVERNOR'S TB COMMITTEE REPORTS

The Governor's Committee to Study Tuberculosis Control in Maryland, appointed in September 1965, recently presented a report of its findings. Among its recommendations, some of which have already been implemented, the committee advises the adoption of firm statewide control policies with expansion and strengthening of the Division of Respiratory Diseases. Funds to accomplish this have been requested in the Department's 1969 budget.

DRUG ABUSE LAW TO BE INTRODUCED

The Department's Division of Drug Control has drafted a "Model State Drug Abuse Act" to enable regulation and control of barbiturates, amphetamines, and other drugs with a potential for abuse because of their depressant, stimulant or hallucinogenic effects. Designed to conform with federal statutes, the act would require accurate records to be kept by all those engaged in the manufacture, delivery or distribution of such drugs, would impose an expiration date of six months on prescriptions, and would limit refills to five, after which a new prescription would be needed to obtain further supplies.

GERMAN HEALTH OFFICIALS VISIT ALLEGANY LANDFILL

Two German health officials, from the Central Office for Solid Waste Disposal of the Institute of Water, Soil and Air, German Ministry of Health, recently visited the Frostburg sanitary landfill in Allegany County, where a three-year demonstration project is under way to determine the feasibility of combining land reclamation of abandoned strip mines with a possible solution to the state's mounting solid waste problem. The project,

financed by a US Public Health Service grant and funds from the citizens of Frostburg and Allegany County, was planned and is operated by personnel from the Department's Division of Solid Wastes. Earlier this year, a team of American public health officials, including Maryland's Assistant Commissioner for Environmental Health Services, made a similar trip to Germany. The interchange is part of the two countries' Cooperative Program in Natural Resources, Pollution Control, and Urban Development.

CARE OF STROKE PATIENTS

The problems faced by community hospitals in the care of stroke patients were discussed at a recent all-day symposium co-sponsored by the Heart Association of Maryland and the Health Department. The 150 participants included physicians, nurses, physical and occupational therapists, and hospital administrators, and represented 33 hospitals throughout the state as well as local health departments.

APPEALS HEARD ON MEDICAL ASSISTANCE PROGRAM

In the first year of operation of the Medical Assistance Program, from June 30, 1966 to July 1, 1967, 73 appeals for fair hearings were received by the Health Department. Most of these resulted from Department of Welfare decisions on eligibility, only 18 being based on inability to obtain medical care; nine of these were referred to local health departments, and nine were judged inappropriate for appeal. Since July 1, there has been a steady increase in appeals on eligibility determination, probably related to added eligibility restrictions and to rising costs of medical care, especially in hospitals and nursing homes.

200 ENROLLED IN HOME STUDY COURSE

About 200 state and local personnel are currently enrolled in the 17-lesson homestudy course in Environmental Sanitation developed by the National Communicable Disease Center of the US Public Health Service, and co-sponsored by the State and Baltimore City Health Departments. Designed to teach the general principles of sanitary science, the course is a prerequisite for an 8-week, full-time training course to be offered to all Maryland sanitarians for the first time in February 1968. Successful completion of both courses qualifies persons to be certified by the American Public Health Association as Registered Sanitarians.

NUTRITION TO RECEIVE INTERAGENCY APPROACH

The Chief of the Division of Nutrition and the Food Service Director of the Division of Respiratory Diseases are chairman and vice-chairman, respectively, of the new Maryland Interagency Committee for Improved Nutrition. The new committee was established to promote the coordination of nutrition services throughout the state.

VISION-HEARING SCREENING WORKSHOPS WELL ATTENDED

The training and refresher course in vision and hearing screening techniques, conducted recently in three locations throughout the state, was attended by approximately 150 public health nurses, school nurses, and technicians. The course, given in cooperation with the Department of Education, was under the direction of the School Health Section, Division of Maternal and Child Health, and hearing consultants to the Crippled Children's Division. Audiologists from Johns Hopkins and representatives of the Maryland Society for the Prevention of Blindness participated.

Rte. Box 218A
Chestertown, Md. 21620

Dotted line on map indicates proposed bridge to be completed 1971—30 minutes to Baltimore.

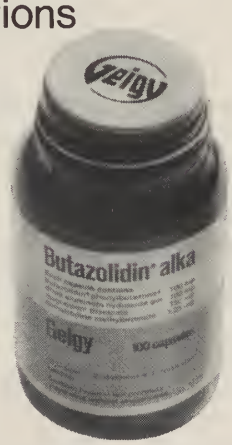
If it doesn't work in a week, forget it.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of Butazolidin alka are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make regular blood counts. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Mild drug rashes frequently subside with reduction of dosage. However, rash accompanied by fever or other systemic reactions usually requires withholding medication. Purpuric rash has also been reported. Agranulocytosis, ex-



In rheumatoid arthritis, Butazolidin alka needs only a week's trial. If it doesn't work in a week, forget it.

A short trial period may spare patients weeks of discomfort. That's one reason why Butazolidin alka seems a good choice when aspirin fails.

It's not for every patient. Check carefully the Contraindications, Warning, and Precautions shown below.

And adverse reactions may occur. The most common are nausea, edema and rash. Rarely, agranulocytosis has been reported. All adverse reactions are listed below, too.

You'll know quickly if it works.
And most of the time, it will.

foliative dermatitis, Stevens-Johnson syndrome, or a generalized allergic reaction similar to serum sickness may occur and require permanent withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Rheumatoid Arthritis: Initial: 3 to 6 capsules or tablets daily in 3 or 4 equal doses. Trial period: 1 week. Maintenance dosage should not exceed 4 capsules or tablets daily; response is often achieved with 1 or 2 capsules or tablets daily.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Folklore and Facts about Employees with Alcoholism—Part 1

LEWIS F. PRESNALL
New York, N. Y.

As a prelude to this topic, some of the events of the past 22 years, relating to the development of rehabilitation programs for employees having alcoholism should be reviewed.

In 1943, the first effort was established by a major multiplant company in the United States to help employees with alcoholism. A year later the National Council on Alcoholism—the national voluntary health agency in this field—was founded by Mrs. Marcy Mann. Alcoholics Anonymous had been started in 1935 and had already begun to demonstrate conclusively that a large number of alcoholics, generally thought to be hopeless cases, could recover. It had also been demonstrated that employees with alcoholism could frequently recover and be retained as valuable, dependable workers.

During the period from 1944 to 1959, the National Council on Alcoholism and its affiliates in industrial cities worked with most of the companies, unions, and government agencies that attempted, often with considerable success, to establish alcoholism programs for employees. Staff members of the Yale Center of Alcohol Studies also assisted interested companies. Seldon Bacon, MD, and Ralph M. Henderson developed "The Yale Plan for Business and Industry," which was a general outline of suggestions on how to deal with alcoholism among employees.

However, during the 16 years from 1944 through 1959 there was no sharp increase in the number of companies that initiated alcoholism programs each year, in spite of the reported success of those corporations that were already conducting programs resulting in recovery of over 50% of the alcoholic patients receiving treatment.

The National Council on Alcoholism, the Yale Center of Alcohol Studies,* the growing number of official state-supported alcoholism agencies, and private individuals who had recovered from alcoholism, had invested much time and energy in their efforts to interest more employers in the installation of formal programs on alcoholism. By 1959 there were only about 50 companies, large and small, that could be said to have formal programs in full operation—in any way approaching maximum effectiveness.

Much good had been accomplished and through the existing programs, the effective working lives

Mr. Presnall is Director of Industrial Services, National Council on Alcoholism.

Presented at the Ninth Annual Western Industrial Health Conference San Francisco, Calif., Oct. 8, 1965.

* Now the Rutgers Center of Alcohol Studies.

DIARRHEA

CANTIL®
(mepenzolate bromide)

LAKESIDE

Diarrhea, one of the most vexing symptoms of common G. I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth, blurring of vision, constipation, nausea, vomiting, bloating and dizziness may occur but are usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy — withhold in glaucoma. Contraindicated in patients sensitive to phenobarbital and/or Cantil (mepenzolate bromide); in toxic megacolon, obstruction of G. I. or G. U. tract.

SUPPLIED: CANTIL (mepenzolate bromide) — 25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL — containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

of many employees had been extended, but the rate at which these pioneer efforts of industrial health and industrial relations were adopted by other companies was discouraging.

A Search for New Approaches

Late in 1960 it was decided by the National Council on Alcoholism (*NCA*) that it was time to develop some new approaches to the problem. Since 1944, a vast amount of information had been accumulated about what did and did not work in the alcoholism programs of various companies. Data were available to *NCA* on all successful programs. Even more importantly, much data had been accumulated regarding approaches that had failed. In any pioneer field, one learns most from the failures but, unfortunately, no one published his failures. However, *NCA* was in the unique position of having such information since the organization had been in close touch with company programs that had been started and later encountered such serious difficulties that they were dropped and forgotten.

With these resources as a starting point, *NCA* was fortunate in having the advice and counsel of Mr. Clifford F. Hood, former president of U. S. Steel Corporation and presently a member of its executive committee and board of directors. He formed a small industrial advisory committee of other leading corporation officials. This group then began working closely with *NCA* staff to develop services designed to provide information and assistance to companies, unions, and government employers regarding alcoholism programs. A staff member with industrial experience was assigned to work with the committee. In developing a specific department of industrial services at *NCA* there were 4 basic unanswered questions which were revealed by an evaluation of the older alcoholism programs: 1. In the face of a growing mass of evidence, why were companies so reluctant to accept alcoholism as a serious problem among employees? 2. Why had so many so-called successful alcoholism programs been unable to reach salaried and executive personnel with early help when they developed alcoholism? 3. What were the reasons for the high mortality rate of alcoholism programs? (Perhaps 5–10 programs had been started for each program that survived as a permanent part of policy and procedure.) 4. How could better methods be developed for early identification of alcoholism and motivation of alcoholics to seek help?

Through analysis of past experience some solid answers to these questions began to appear.

In a sense it was necessary to formulate what amounted to the methodology of a new profession. This was done by combining the methods used in the field of community organization, with its most sophisticated technics of fact-gathering, and the methods of management consultation. The approaches resulting from the merging of these 2 methodologies were tested in the field and evoked responses from companies which indicated that employers did want, and could use this kind of consultation.

A final problem then had to be solved. Where could staff people be found who were capable of implementing this new professional method? People were not available who had the precise experience or training to apply the new approach. Thus, the *NCA* began to recruit a staff of individuals who had either extensive industrial-line and staff experience or who had worked in industrial consultation: people who had both the aptitudes and the background to integrate the new methods with their previously acquired skills. Following recruitment, *NCA* put the new staff people through an intensive work-in-training orientation.

These new approaches are apparently meeting the practical needs of employers. The number of companies developing new alcoholism programs increased 357% from 1959 to 1965.

Folklore and Alcoholism

All employers face broad problems regarding alcoholism among employees, but there are certain practical technics that can be applied in the field of occupational health.

In an age that has produced the computer, consumer research, and new systems of cost control, there are many new areas where action of the business community can be based upon objective facts and rational thought. Nevertheless, every alert leader of government, labor, and industry knows that there are many areas of personnel practice where folklore, not fact, continues to dominate many of our discussions; one of the most important to the productivity and longevity of employees is alcoholism.

IRON DEFICIENCY

ANEMIA

Imferon®
(iron dextran injection)

There's as much iron . . . 250 mg. . . . in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron . . . or orally administered iron proves ineffective or impractical . . . or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves. Precise dosage is easily calculated.

LAKESIDE

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

Folklore can represent the accumulated practical wisdom of a people. Our deep-rooted beliefs about democratic processes is an example. The folklore about democratic methods is based upon hard-won, practical experience. It works because it is folklore built upon facts. In contrast, the prevalent folklore about alcoholism is the product of ignorance, prejudice, half-truths, frustration, and the heritage of the "wet-dry" controversy in this country. In order to cope intelligently and effectively with alcoholism, we must make an attempt to free ourselves of the effects of this folklore with which our minds have been inundated since childhood.

Erroneous folklore about alcoholism affects our actions regarding employees. In suggesting more constructive approaches, I will be drawing, not only from my own professional work in this field, but more importantly, from the 20 years of experience which the *NCA* has had in working with most of the companies, unions, and government groups that have attempted to develop alcoholism programs. Knowledge gained from this experience has now become extensive. Naturally, it includes both stories of success and lessons of failure. Only a small fraction of that information can be discussed in the time allotted to us. Therefore, I have arbitrarily selected 4 crucial areas in which folklore misdirects our action on the industrial scene: 1: identification of the scope of the problem, 2: company policy, 3: the role of labor unions, and 4: procedures that supervisors might use.

(To be continued in January 1968)

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edemo and enema; syndrome and symptom; sewage and seweroge. And when and why we should use 12 point Coslon Bold instead of 10 Stymie.

If you, too, need a good printer, let's communicate!

DIURESIS

MERCUHYDRIN®
(meralluride injection)

Twenty years ago the publication of "A System for the Routine Treatment of the Failing Heart"[1] established a schedule of diuretic therapy as a primary factor in the treatment of acute congestive failure. With emphasis upon daily injections of Mercuhydrin (meralluride injection) until dry weight was obtained, Gold, et al. achieved a 40% increase in improvement, in ⅓ the time, over other methods then current. Today, most medical texts continue to recommend parenteral mercurials in acute congestive failure when prompt diuresis is indicated.

Recently Modell[2] has stated: "The mercurial diuretics are the injectable diuretics of choice since they are the most potent as well as the most dependable. Their toxicity is not an important consideration either by comparison with other potent diuretics or in relation to the seriousness of the conditions in which they provide such excellent relief."

LAKESIDE

IN BRIEF

Mercuhydrin is indicated in edema of cardiac or hepatic origin and in the nephrotic syndrome; it is contraindicated in acute nephritis and in anuric or oliguric states. *The usual adult dose is one to two cc. daily or every other day until "dry weight" is obtained.* Sensitivity is rare but small initial doses are advised to minimize potential reactions; vertigo, fever, and rash have occurred. Overdosage may produce electrolyte depletion, muscle cramps, and G.I. reactions. Supplied: 1 cc. and 2 cc. ampuls in boxes of 12, 25 and 100; 10 cc. rubber capped, multiple-dose vials (intramuscular or subcutaneous use only) in boxes of 6 and 100.

DECEMBER, 1967 MRS. HARRY L. BERMAN, Editor

INTERNATIONAL NUCLEAR MEDICINE MEETING IN LONDON

The Imperial College of London was the site recently for the International Nuclear Medicine Symposium, arranged by the Institute of Cancer Research, Royal Cancer Hospital, England.

Approximately 300 physicians with a specific interest in this field, along with various scientists and equipment manufacturers who have related interests, met to discuss the common problems involving the use of radioisotopes in the localization of tumors.

Many came with their wives to combine pleasure and work, to visit and revisit treasure-filled museums, sights of historic interests, and/or shop at hard-to-find tucked-away places. Guided tours were conducted to Hampton Court Palace, built in 1514 by Cardinal Wolsey and "presented" to Henry VIII, to the Houses of Parliament, and to the Tower of London. Following the tour a uniquely presented evening feature on the history of the "Tower" was given in the form of a play. Last, but surely not the least for the ladies, was the inevitable fashion show presented by Harrod's of London.

The purpose of the meeting was to enable physicians to make earlier diagnoses of cancer, and show whether or not these cancers have spread beyond their original sites. To cover this rapidly expanding field would require far more space than is available here.

However, strong emphasis continues to be placed on research in the early detection of cancer, and devices of various kinds for the detection of tumors in different sites of the body formed the principle basis for discussion. Since these intruments involved a display of images with distinctive patterns facilitating diagnosis of tumors the technical details involved in the production of such images consumed a large part of the presentation.

This was the first international meeting of its kind in the field of Nuclear Medicine. As one might anticipate, some of the work shown is still in the developmental stages and not ready for the practicing physician.

The over-all management of the Symposium, its technical and scientific exhibits, the opportunities for sight-seeing in London and the programs for the ladies were all managed commendably. Those who attended are looking forward to the next, yet unannounced, meeting of this group.

ANNUAL MEETING

Woman's Auxiliary to Med-Chi

THURSDAY, APRIL 18, 1968

Headquarters: Sheraton Belvedere Hotel, Baltimore

SPECIAL FEATURE—Wednesday evening, April 17, 1968, *AMA-ERF BENEFIT*—under the auspices of the Auxiliary. A night at the Morris Mechanic Theater, Baltimore, "You Know I Can't Hear You When The Water's Running" starring Eddie Bracken

For Information: Mrs. H. Melvin Radman, Chairman, AMA-ERF Committee, Esplanade Apartments, Baltimore, Md. 21217. Tel: LA 3-4410

DEPRESSION

NORPRAMIN®
(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) in depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

LAKESIDE

IN BRIEF:

INDICATIONS: In depression of any kind —neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, anxiety, agitation and stimulation, insomnia, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy, agranulocytosis, altered liver function, ataxia, and extrapyramidal signs.

DOSAGE: Optimal results are obtained at a dosage of 50 mg., t.i.d. (150 mg./day). **SUPPLIED:** NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1000; and tablets of 50 mg., in bottles of 30, 250 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

COMPONENT MEDICAL SOCIETIES

BALTIMORE CITY

The meeting of the Board of Directors was called to order by Harry J. Connolly, MD, on Tuesday, October 10, 1967 at 4:30 P.M. at 1211 Cathedral Street, Baltimore, Md. Ten of the members were present at this meeting. The minutes for the September 5th meeting were read and unanimously approved. The first item on the agenda was membership review, in which two members of the Society requested transfer of their active membership to associate status. A waiver of dues was granted for a member of the Society because of prolonged illness. D. Frank Kaltreider, MD, brought the board up to date on the matter of the abortion bill and reviewed many of the details associated with such a bill. He reviewed the two bills proposed by Dr. James Prescott, a member of the Maryland Psychological Association. It would appear that one of Dr. Prescott's bills is very similar to that of the American Medical Association, while the second bill presents a new thought and approach to the problem by putting the matter in the hands of the medical profession rather than with the Legislature. An enthusiastic discussion by the board followed the presentation of this subject. A vote was taken by the board members as Dr. Kaltreider wished to report the unofficial opinion of the board of directors to I. M. Cushner, MD, before the October 18th meeting of the Legislative Council of the Senate and House. Six members of the board approved in principal the Prescott Bill and three voted in favor of the *AMA* bill. The subject of classified telephone directory listings was reviewed by the board. The following motion was made, seconded and passed:

["We are in favor of the mediation committee's recommendation regarding listings and that the Baltimore City Medical Society inform its membership at the November 3rd meeting of this action."] Several physician-patient complaints were considered in detail by the board and recommendations were appropriately made. The meeting was adjourned at 5:50 P.M.

Arthur E. Cocco, MD
Journal Representative
From the Baltimore City Medical Society

MONTGOMERY COUNTY

"BURST INTO FASHION" BENEFIT LUNCHEON AND FASHION SHOW

Last call! For eight dollars you can have a wonderful lunch, marvelous entertainment and benefit two wonderful causes. This is really an inexpensive package deal. Plan now to attend the Woman's Auxiliary to the Montgomery County Medical Society's annual Benefit.

Wednesday January 17, 1968
Cocktails 11:30 AM; Luncheon 12:30 PM
Indian Spring County Club
Fashions by Rizik Brothers, Inc.
Music by Devron; Master of Ceremonies—Al Ross, WRC
Fashion Commentator—Inga

The proceeds will benefit American Medical Association Educational Research Foundation and Montgomery County Workshop for the Handicapped.

Mrs. John B. Umhau, Jr. is President of the Auxiliary and Mrs. Ira Tublin and Mrs. Albert Zelna are Co-Chairman of the Benefit.

For tickets call or write, Mrs. Richard Lukes, 9906 Old Spring Road, Kensington, Maryland, 20795, telephone WH 2-1540; or Mrs. Albert Grollman, 11300 Rolling House Road, Rockville, Maryland, 20852, telephone 881-4461.

We'll look forward to seeing you on January 17th for a day full of fun and excitement that will help other people.

NEW PRESIDENT FOR MONTGOMERY COUNTY MEDICAL SOCIETY

Marvin I. Mones, MD, a leading Silver Spring pediatrician, will assume the presidency of the Montgomery County Medical Society the first of December 1967. The office of president will not be the first elective office for Dr. Mones, as he was the President of the Board of Holy Cross Hospital in 1965 and has held various other offices in the Society. In addition to his local memberships, Dr. Mones is also a member of the American Academy of Pediatrics, the American Board of Pediatrics, and the American Medical Association.

A native of Philadelphia, Pa., Dr. Mones received his B.S. from Villanova College in 1940, saw service in the Army during World War II and graduated from Johns Hopkins Medical School in 1947. After completing his residency there, he entered private practice in Silver Spring in 1950, where he is still engaged in the practice of pediatrics. A busy doctor he is, nonetheless, an instructor at Georgetown University School of Medicine and Attending Pediatrician at Children's Hospital, as well as a member of the Board of the Nursery School for Brain Damaged Children.

MARVIN I. MONES, MD

PRESENTATION TO OUT GOING PRESIDENT OF MONTGOMERY COUNTY MEDICAL SOCIETY

Late Friday evening, November 17, at the Woodmont Country Club during the Annual Dinner Dance of the Montgomery County Medical Society, where more than 150 physicians and their wives were present, John O. Robben, MD, a Montgomery County surgeon was presented with a specially designed hammered copper plaque in recognition of his outstanding leadership of the medical community during 1967. This will be the last time that Dr. Robben will officially preside and will present the symbol of chairmanship—*the walnut gavel*—to Marvin I. Mones, MD, a Silver Spring pediatrician, the 1968 president of the Society.

MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

DECEMBER, 1967

MEDICAL-LAW COURSE FOR BALTIMORE ASSOCIATION

The Baltimore Association of Medical Assistants offered a course in medical-law, from September 14, 1967, through November 9, 1967. Raymond V. Rangle MD, conducted the classes held at the Baltimore Junior College for eight weeks.

Members of the Baltimore Association of Medical Assistants and guests attended the meetings at the college. The course proved to be a valuable aid to the members of the association who intend to take the certification examination in June, 1968.

Dr. Rangle is an internist and director of a clinical laboratory in Baltimore city. He received his BS degree from the University of Maryland, and his MD degree from the University of Maryland School of Medicine. Following his internship at University Hospital, he was Assistant Resident Pathologist at Baltimore City Hospitals. He was Assistant Pathologist at Maryland General Hospital, and Chief Pathologist at North Charles Street General Hospital. In 1965, Dr. Rangle received his LLB degree from Mount Vernon School of Law.

Dr. Rangle has been most active in many civic organizations, and in 1967 was selected as Outstanding Community Leader by the Outstanding Civic Leaders of America. In 1963 he was chairman of the Equal Opportunity Commission of Baltimore City, and he is presently on the advisory board of the Salvation Army Day Nursery. In 1958, Dr. Rangle received the Salvation Army Certificate Award for charitable medical services rendered from 1944 until the present.

R. V. RANGLE, MD
Instructor for Medical B.A.M.A.
Medical Law Course.

GORDON GRAU, MD SPEAKS TO MEDICAL ASSISTANTS

E. Gordon Grau, MD, was the guest speaker at the October meeting of the Baltimore Association of Medical Assistants. Dr. Grau spoke on the *Psychiatric Treatment of Sexual Deviations.*

Dr. Grau's presentation was most interesting

and enlightening to the audience, for he explained the psychological problems and motivations of people with sexual deviations. During his talk, he elaborated on the unhappy lives of homosexuals, and the uncharitable manner in which many homosexuals are treated. Unfortunately in psychiatric treatment of homosexuals, sometimes the patient is not cured; however, as with any other disease, the patient is aided in living with his problem. Dr. Grau explained the various psychiatric techniques employed in dealing with sexual deviations, and emphasized the responsibility of the medical assistant to act in a professional and kind manner when encountering patients with this particular illness.

Dr. Grau was graduated from Loyola College with a BS degree in 1944. He received his MD degree from the University of Maryland, School of Medicine. He did his internship at St. Joseph's Hospital and his residency at Lutheran Hospital. Dr. Grau was in private practice in medicine until 1964, when he joined the staff of The Sheppard and Enoch Pratt Hospital as a resident in Psychiatry. He is president of The Baltimore County Medical Association.

Code Of Fair Practices In The Promotion Of Drug Products

The Pharmaceutical Manufacturers Association hereby promulgates and adopts the following Code of Fair Practices in the Promotion of Drug Products as a revision of its 1958 Statement of Principles on the same subject:

A. Code Standards

1. As used in this Code:

(a) The term "drug product" means any pharmaceutical or biological product intended for use in the diagnosis, cure, mitigation, treatment or prevention of disease in humans, or to affect the structure or any function of the human body, which is promoted and advertised to the medical profession rather than directly to the lay public.

(b) The term "promotional communications" means (1) journal advertising, mailing pieces, and similar written materials (including, to the extent reasonably practicable, films, exhibits and similar visual presentations) directed to members of the medical profession by the pharmaceutical industry for the purpose of promoting a drug product and (2) written instructions and materials prepared for sales or professional representatives containing representations to be made by them to members of the medical profession. Where compliance with the requirements of this Code is not reasonably practicable within the format of a film, exhibit or similar visual presentation, written materials meeting those requirements shall be distributed to all members of the medical profession attending the presentation.

(c) The term "medical profession" includes allied professions in the health field.

2. Complete and accurate information concerning marketed drug products should be made available promptly to the medical profession. Promotional communications to the medical profession which include a description of indicated uses or dosage recommendations for a prescription drug product should also include a summary (or full disclosure where required by law) of side effects, precautions, warnings and contraindications, and of effectiveness for the described indicated uses. Such summary should have sufficient prominence in terms of type size, location and similar factors to provide reasonable assurance that it will be observed.

3. Statements in promotional communications should be based upon substantial scientific evidence or other responsible medical opinion. Claims should not be stronger than such evidence warrants. Every effort should be made to avoid ambiguity. Whenever statistical or background information or references to unpublished literature or observations are used in promotional communications, the source material should be available to the medical profession upon request.

4. Statements with respect to or quotations from medical literature or from the personal communications of clinical investigators in promotional communications should not distort the intended meaning of the author or the significance of the study.

5. Any comparison with other drug products should be made upon a valid scientific basis.

6. No public communication by a manufacturer shall be made with the intent of promoting a drug product as safe and effective for any use before the required approval of the drug product for marketing for such use is obtained. However, this provision is not intended to abridge the right of the scientific community and the public to be fully informed concerning scientific and medical progress. Thus it is not intended to restrict a full and proper exchange of scientific information concerning a drug product, including appropriate dissemination of investigational findings in scien-

tific or lay communications media, nor to restrict public disclosure to stockholders and others concerning any drug product as may be required or desirable under law, rule or regulation.

7. Promotional communications should have medical clearance before their release.

B. Code Administration

It is the unqualified intent of the Association that each member shall follow strictly the principles set forth in the Code. To that end the members of the PMA are encouraged to submit information to the President with respect to any alleged breach of this Code by any other member. On the basis of such information and any other information available to him, the President shall take appropriate action including, if required, referral of the information to an ad hoc committee of the Board. The committee shall be chosen by the Chairman of the Board unless the member company represented by the Chairman has submitted such information or is the subject of such information, in which case the President shall make the appointments. The General Counsel of the Association shall act as secretary of each ad hoc committee and shall report the committee's findings to the President who in turn will refer the findings to the Board of Directors.

Any member firm which clearly and persistently violates the Code may be asked by the Board of Directors to resign from the Association.

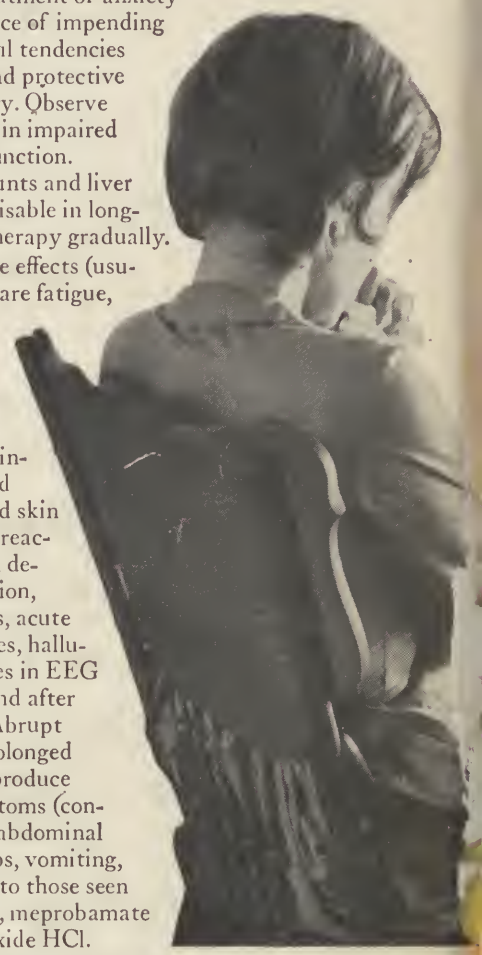
Tears without grief

Crying Spells–psychic tension with depressive symptoms?
"I don't know what's the matter with me lately...I cry and I cry... and I really don't know why I do."

A woman often is not conscious of the real reasons for her crying spells or refuses to admit them to herself. On probing, you may find that frequent weeping, like insomnia or neurotic fatigue, often is an expression of psychic tension. She needs sympathy and reassurance, and perhaps a calming agent to help her over her crisis. Consider prescribing Valium (diazepam) for her. It usually reestablishes calmness promptly. Crying spells and other secondary depressive symptoms normally subside as the tension is relieved. Your patient then can cope more easily with stresses to which she is subjected. Valium (diazepam) is generally well tolerated, and on proper maintenance dosage usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.

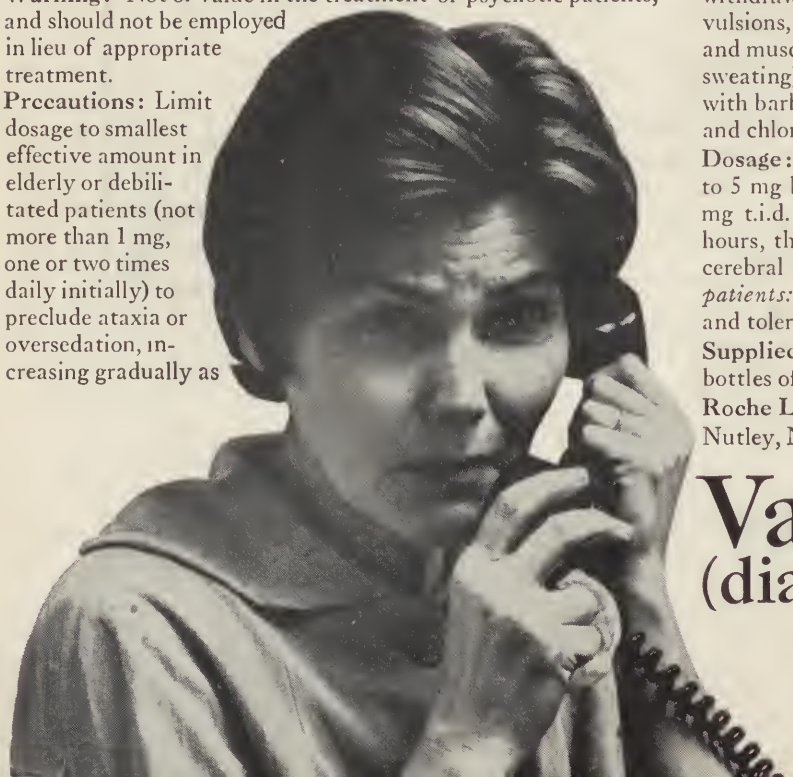


Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Infants, patients with history of convulsive disorders, glaucoma or known hypersensitivity to drug.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly or debilitated patients (not more than 1 mg, one or two times daily initially) to preclude ataxia or oversedation, increasing gradually as needed or tolerated. As is true of all CNS-acting drugs, until correct maintenance dosage is established, advise patients against possibly hazardous procedures requiring complete mental alertness or physical coordination. Driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. If such combination therapy is used, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), such as phenothiazines, barbiturates, MAO inhibitors and other antidepressants. Advise patients against simultaneous ingestion of alcohol or other CNS depressants. Safe use in pregnancy not established. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.



Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, acute hyperexcited states, hallucinations); changes in EEG patterns during and after drug treatment. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms (convulsions, tremor, abdominal and muscle cramps, vomiting, sweating) similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage: *Adults:* Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. *Geriatric patients:* 1 or 2 mg/day initially, increase gradually as needed and tolerated. (See Precautions.)

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 and 500.

Information for Authors

COPYRIGHT. Material that is published in the MARYLAND STATE MEDICAL JOURNAL is protected by copyright and may not be reproduced without the written permission of both the author and the JOURNAL.

MANUSCRIPTS. Manuscripts will be accepted for consideration with the understanding that they are original, have never before been published, and are contributed solely to the MARYLAND STATE MEDICAL JOURNAL. Address manuscripts to Editor, 1211 Cathedral St., Baltimore Maryland 21201.

Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the JOURNAL and are not returned. The JOURNAL is not responsible for loss of manuscripts through circumstances that are beyond its control.

Specifications: Manuscripts must be original typed copy (not all capitals), not carbons, on firm typewriter paper, doublespaced throughout (including text, case reports, legends, tables, and references), with margins of at least 1½ inches. Subheads should be inserted at reasonable intervals to break the typographic monotony of lengthy texts. A carbon copy is to be retained by the author. The manuscript should include the title of the article (titles are best brief and concise), the full name of the author (or authors) with degrees, academic or professional titles, affiliations, complete addresses, and any institutional or other credits. Pages should be numbered consecutively. Uncommon and parochial or esoteric abbreviations if used must be explained and the generic as well as the trade names of pharmaceutical products given. Italics are rarely used.

Tables: Each table should be typed on a separate sheet of paper, be numbered consecutively, have a brief descriptive title, and its position in text indicated. Take care that columns add up correctly and that statistics are consistent in both tables and text.

Permissions: When material is reproduced from other sources, full credit must be given to both author and publisher and written permission from these sources included. Where work is reported from a governmental service or institution, clearance by requisite authority should accompany the manuscript.
